Dr. Barry R. Wallerstein
 Executive Officer
 South Coast Air Quality Management District
 21865 Copley Drive
 Diamond Bar, CA 91765

Dear Dr. Wallerstein:

The Orange County Transportation Authority (OCTA) appreciates the opportunity to review and comment on the Draft 2012 Air Quality Management Plan (AQMP) for the South Coast Air Quality Management District (District). The related socio-economic report has not yet been made publically available; therefore, OCTA would appreciate an extension of the comment period in order take this additional analysis into consideration. Please note that the comments provided below may require additions or modifications once OCTA reviews the results of the socio-economic report.

There are three issues that currently raise concerns with OCTA:

1. Inclusion of the ozone attainment strategy;
2. The suggested "Enhanced Environmental Analysis" that is discussed in Chapter 9; and,
3. The "Infrastructure Planning Actions" that are discussed in Appendix IV-B under control measure ADV-01.

According to federal law, the current AQMP is required to demonstrate attainment for inhalable coarse particles (PM₁₀) and fine particles (PM_{2.5}); however, it is not required that ozone attainment be addressed until the 2015 AQMP. The ozone target needs to be looked at in a comprehensive manner, rather than piecemeal, to ensure that we are actually reducing emissions in the most cost efficient and effective manner. This would be best achieved by reserving discussion of the ozone attainment to the 2015 AQMP. OCTA looks forward to participating in these discussions, and working with the District to develop an achievable 2015 AQMP that meets all of the federal Clean Air Act standards.

The Enhanced Environmental Analysis recommends performing additional analysis that goes beyond the requirements of the California Environmental Quality Act (CEQA). As noted in the Draft AQMP, the *Ballona Wetlands Land*

R-1

R-2

Dr. Barry R. Wallerstein
August 31, 2012
Page 2

Trust v. City of Los Angeles (2011) and the *South Orange County Wastewater Authority v. City of Dana Point* (2011) ruled that this type of analysis is not required under CEQA. Therefore, OCTA suggests omitting this policy recommendation from the 2012 AQMP.

R-2

Regarding the Infrastructure Planning Actions identified in ADV-01, the District is suggesting that in order to support zero and near-zero emission technologies for freight trucking, new infrastructure such as wayside electric or magnetic power built into roadways, refueling and battery recharging stations, and dedicated truck lanes may be required. Furthermore, the District states under the ADV-01 actions and schedules, it is important that project approvals for near-term goods movement projects ensure implementation of these types of infrastructure. However, the District also states that at this time it is unknown if the zero and near-zero emission technologies will requires these types of infrastructure.

R-3

OCTA believes that there are too many unknowns regarding the zero and near-zero technologies to justify including infrastructure commitments in project approvals at this time. The types of infrastructure suggested could have significant financial implications. Furthermore, they may not be feasible for any number of reasons, such as costs, right-of-way limitations, resulting environmental impacts, or limited availability of the specific technology(ies). For these reasons, OCTA requests removal of the language suggesting that project approvals ensure implementation of infrastructure to support zero and near-zero emission technology.

Thank you again for the opportunity to comment on the Draft AQMP. OCTA requests that the District address these concerns and recommendations in the Final Draft 2012 AQMP. Please contact Greg Nord, Senior Transportation Analyst, at (714) 560-5885 to further discuss these comments.

Sincerely,

Kurt Brotcke
Director, Strategic Planning

Responses to Comment Letter R
OCTA

Response to Comment R-1:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically adopted in regulatory form at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large “black box” in the existing approved 2007 AQMP (241 fpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NOx and VOC emission reduction commitments contained

in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment R-2:

The commenter correctly states that recent court rulings have found that CEQA does not require this type of "enhanced environmental analysis" (with the exception of new school sites). However, lead agencies retain the authority to conduct an analysis of potential health effects on project occupants either within a CEQA document, or outside of it prior to making a decision on the project. Text has been added to Chapter 9 to clarify that AQMD staff recommendations for enhanced environmental analysis will continue to be consistent with existing guidance from both the CARB Air Quality and Land Use Handbook and the AQMD Clean Communities Plan.

Response to Comment R-3:

Staff believes that transportation projects should be designed with recognition of the environmental impacts of freight transport, and that such projects should be part of the solution to our air quality problems. The AQMP language referred to in this comment merely states the district’s view that it is “important” that near-term decisions on major freight transportation infrastructure (such as the I-710 project and new railyards) not miss what may be the only opportunity to incorporate environmental conditions needed for our region to attain air quality standards. Staff notes that the control measure does not state that “it is important that project approvals for near-term goods movement projects ensure implementation of” “wayside electric or magnetic power built into roadways, refueling and battery recharging stations, and dedicated truck lanes.” as indicated by the Commenter, rather, the measure description is far more general: It is therefore important that such project approvals be fashioned to assure that the projects participate in the technology development and demonstration activities for trucks described below, and that the project approvals ensure implementation of resulting technologies when determined to be feasible. This language (which the Commenter requests be removed) is in a paragraph describing that certain “major regional infrastructure projects” will be considered for approval in “the near term, while the technology development and demonstration actions described below are being

undertaken.” The paragraph specifically refers to three projects: the proposed new Southern California International Gateway Railyard, the proposed expansion of the Union Pacific Intermodal Transfer Facility, and the I-710 project. The paragraph notes that other major projects may also be considered for approval in the same timeframe. The main point of the paragraph is that these projects will “comprise key portions of regional freight infrastructure for many decades to come” and “the action to approve such projects will be a key opportunity to establish appropriate operating and environmental requirements for the infrastructure.” In some cases, the paragraph notes, “the project approval action may be the only opportunity to establish requirements.” Staff continues to believe the statements in the above paragraph are accurate, and the comment does not dispute them. We also continue to believe it to be “important” that major freight movement projects such as the two railyards and I-710 “participate” in technology development and demonstration activities, and that project approvals (which, again, may be the only opportunity to include environmental conditions) require implementation of clean technologies “when determined to be feasible.” All of this language is, in our view, reasonable for projects of the magnitude described in the paragraph.

Regarding the commenter’s concern about the need for and feasibility of the infrastructure it mentions (e.g. wayside electric or magnetic power built into roadways), the measure sets out a schedule over the coming decade to determine whether such infrastructure will be needed. Specifically, the measure’s Major Agency Implementation Actions sets out a schedule for AQMD, SCAG and CARB actions. These include a determination in the 2015-2016 timeframe regarding “the need for wayside power infrastructure for trucks on major freight movement corridors.” It is staff’s intent that these determinations would be made based upon the ability of zero and near zero emission on-road technologies to serve the needs of the region without wayside power. Key questions would include the range and cost (and other factors bearing on feasibility) of technologies not relying on wayside power. By 2015-16, these agencies, and the other “implementing agencies” listed at the end of the measure (e.g. LA Metro, Caltrans, ports, etc) would have the benefit of additional years of technology development and evaluation. We believe this sets an appropriate schedule to collaboratively make determinations regarding needed and feasible technologies. We also note that these provisions are consistent with the proposed action schedules to develop zero and near zero emission transport that are included in the RTP update adopted earlier this year.

Mr. Philip Fine
Planning and Rules Manager
South Coast Air Quality Management District
Planning, Rule Development & Area Sources
21865 Copley Drive
Diamond Bar, CA 91765-4182

Dear Mr. Fine:

Subject: Comments on the Draft 2012 South Coast Air Quality Management District (AQMD) Draft Air Quality Management Plan (AQMP) and Related Documents

Dear Mr. Fine:

The Los Angeles Department of Water and Power (LADWP) has reviewed the Draft 2012 Air Quality Management Plan (AQMP) and appreciates the opportunity to provide preliminary comments on the proposed control measures that have the potential to impact LADWP operations, as well as on the associated documents, including the California Environmental Quality Act (CEQA) and Socio-economic analysis and the Joint Vision document. General comments are discussed in the following summary; technical comments have been also been provided on specific control measures. It is noted that at this time neither the full CEQA document, nor the socio-economic analysis has been made available for public review. As such, after review of these documents, LADWP may submit additional comments when the next draft AQMP and CEQA analysis are released.

GENERAL COMMENTS

1. The primary purpose of the 2012 AQMP is to identify control measures needed to attain the federal standard for particulate matter less than 2.5 microns in diameter (PM2.5) by 2014. Although there is no federal requirement to submit an ozone plan at this time, LADWP is aware of the enormous challenge with regards to ozone and the urgency AQMD sees for developing an ozone strategy. LADWP would be supportive of keeping the ozone strategy in the plan, but not submit as part of the State Implementation Plan (SIP) which would result in legally binding emission reductions upon approval by the Environmental Protection Agency (EPA).

Telephone: (213) 367-4211 Cable address: DEWAPOLA

Mr Philip Fine
Page 2
August 31, 2012

2. Although the CEQA scoping document identifies the analysis of the PM2.5 measures as a feasible alternative, the Draft Environmental Impact Report (EIR) has not been completed and released for public review. Specifically, this alternative will be reviewed as it relates to environmental impacts on the environment if this alternative is deemed the "project". LADWP will be reviewing the analysis and providing comments on the full EIR upon its availability.
3. AQMD predicts attainment of the PM2.5 standard within several years (2014). As such, LADWP supports the deferral of a Regional Clean Air Incentive Program (RECLAIM) shave to the 2015 AQMP. Since the average rulemaking schedule for a "shave" can take up to two years, dividing the "shave" into two phases as proposed under the 2012 AQMP may not be feasible. With the conversion factor of Nitrogen Oxides (NOx) to PM2.5, minor emission reductions will be achieved through RECLAIM for PM2.5. LADWP recommends substituting a PM2.5 measure for the proposed RECLAIM shave.
4. The Joint "Vision" document has been discussed and vetted in a Public Hearing; however, it is also embedded in the 2012 AQMP as a reference document. LADWP supports unlinking the Vision document from the 2012 AQMP as it is not regulatory in nature.
5. A substantial amount of emission reductions are projected from the implementation of "incentive" programs. It is possible that given the current economic state, a majority of those funds will no longer be available. LADWP is concerned that if emission reductions cannot be achieved through mobile sources, the stationary sources could be held responsible for additional emission reductions.
6. LADWP is concerned that with the proposed electrification in the Basin, impacts on utilities have not been thoroughly evaluated in the CEQA document. This is especially true for many of the incentive programs that aim to reduce emissions from federal sources (ships/trains/aircraft) by requiring sources to substitute electricity for fuel when possible. The CEQA document should carefully evaluate this category for impacts, and identify potential mitigation measures.

S-3

S-4

S-5

COMMENTS ON PROPOSED CONTROL MEASURES

CMB-01 Further Emission Reductions from NOx RECLAIM [NOx]

LADWP is concerned that this control measure, if fully implemented, could have the potential to impact the operation of in-basin power plants and inadvertently limit the ability of electric utilities to fully advance electrification technology in the transportation sector.

S-6

Mr. Philip Fine
Page 3
August 31, 2012

In May, 2011, AQMD's Governing Board adopted the "AQMD Energy Policy" which supports many of the existing policies and programs that are going forward on a statewide and local level. LADWP participated and supported the policy, which adopts policies and principles relative to energy use. LADWP has been aggressively pursuing the same goals of achieving emission reductions through the use of clean and efficient energy technologies to meet air quality, renewable energy and climate change objectives. A key strategy to achieving emission reductions is the transition of existing energy sources to the established statewide renewable energy mandate of 33% by 2020. As LADWP implements projects to meet this mandate, the repowering of our in-basin facilities to reduce air pollutant emissions under provisions of the RECLAIM program have been a major undertaking.

LADWP agrees that the increased use of electricity is an essential part of a comprehensive plan to reduce the existing levels of air pollution and bring the basin into compliance with federal air quality standards. LADWP supports these policies that promote the electrification of the transportation sector while recognizing that electrification could result in a shift in emissions to utilities. With the anticipation of an emissions shift to utilities from the transportation sector, preservation of the electric sector's NOx allocation becomes a critical issue; and any "shave" will need to be closely examined to determine the extent of impact it will have on electricity generation.

The determination of Best Available Retrofit Control Technology (BARCT) versus Best Available Control Technology (BACT) levels that are currently in place is also of interest to LADWP during AQMD's proposed second phase of the NOx shave. Any changes in the BARCT levels may have a significant impact on LADWP and the operation of its in-basin power plants. Although it has been portrayed that this measure will not have a significant impact on RECLAIM facilities, LADWP has concerns with the approach to divide the NOx shave into two phases. From a compliance perspective, as well as from an administrative view, the proposed NOx shave ought to be evaluated as a complete measure. LADWP requests that AQMD carefully review the impacts this proposed shave may have on the RECLAIM market, in particular how it will affect the availability of future NOx credits and its pricing. LADWP also requests that during the rulemaking process, AQMD hold a series of public workshop regarding amendments to BARCT standards with an adequate review and comment period.

In summary, LADWP is supportive of an alternative to AQMD's proposed NOx shave. LADWP would support deferring a NOx shave to the 2015 AQMP, thoroughly assessing impacts related to a shift in emissions from transportation to utilities, and protecting existing NOx allocations for electrical generating facilities to achieve AQMD's goal of promoting electrification in the South Coast Air Basin.

MCS-01 All Feasible Measures Assessment [All Pollutants]

This control measure is to address the state law requirement for all feasible measures for ozone. Existing rules and regulations for pollutants such as Volatile Organic Compounds (VOC), NOx, Sulfur Oxides (SOx) and Particular Matter (PM) reflect current BARCT. However, BARCT continually evolves as new technology becomes available that is feasible and cost-effective. This control measure has the potential to impact every piece of LADWP equipment permitted with the AQMD, from internal combustion engines to power plant boilers, as this is a "catch all" measure. The issue of BARCT implementation at power plants is a critical discussion for LADWP. LADWP supports that during the rulemaking process, AQMD identify a working group and hold a series of public meetings regarding amendments to BARCT standards with adequate review and comment period.

S-7

I appreciate your consideration of these comments and look forward to AQMD's final AQMP. Should you have any questions, please contact me at (213) 367-0403.

Sincerely,

Mark J. Sedlacek
Director of Environmental Affairs

Responses to Comment Letter S
LA Department of Water and Power

Response to Comment S-1:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large “black box” in the existing approved 2007 AQMP (241 fpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NOx and VOC emission reduction commitments contained

in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment S-2:

The two tons per days reduction proposed for the 1st phase of the RECLAIM shave will be incorporated as a contingency emissions reduction measure to satisfy CAA requirement to be triggered if the NAAQS is not attained by 2015. The BARCT assessment phase of the NO_x RECLAIM shave is to be completed fully by 2015 to be fully achieved by 2020. As such, staff plans to commence the rule amendment process beginning in late 2012 targeting a midyear 2013 adoption date. Staff recognizes that this is an aggressive timetable; regardless every effort will be made to expedite the rule amendment process. The CAA requires that contingency measures be fully adopted and in place prior to the SIP submittal. While the contingency measure is targeted for implementation for 2015 if triggered, U.S. EPA will take into consideration the progress (or completion) of the rule amendment when evaluating the Draft 2012 AQMP for completeness prior to making its recommendation on the plan’s approval. Staff believes that as long as the rule making process is well under way with a reasonable date established for the Public Hearing, that U.S. EPA will not consider this as a barrier to the evaluation and approval process.

Moving the proposed RECLAIM shave control measure to the 2015 ozone AQMP could postpone full implementation of the Phase II reduction to a later date. Staff believes that there are currently sufficient unused RTCs available in the RECLAIM market to provide a cushion for the transition. As part of the Phase II BARCT assessment technology availability, cost, and market impacts will be thoroughly addressed. The rule making process will undergo a fully transparent public evaluation of the potential for emissions reductions coupled with the key element of the BARCT assessment listed above. It should also be noted that the state law requires the RECLAIM program not only undergo periodic BARCT review, but also achieve equivalent reductions as the command and control program.

Response to Comment S-3:

The Vision document serves as a resource document for the development of AQMPs. The actions in the Vision document are possible pathways that show how the region can attain air quality standards by their applicable dates. The Vision document is not a control measure in the 2012 AQMP.

Response to Comment S-4:

Staff appreciates the comment regarding funding. The emission reductions associated with a majority of the funding programs are not proposed to be committed as emission reductions in the SIP.

Response to Comment S-5:

The Program EIR for the 2012 AQMP contains a comprehensive and robust analysis of potential energy impacts, including impacts from increased demand for electricity. Energy impacts associated with PM2.5 control measures were evaluated and determined to be less than significant for electricity, natural gas, petroleum fuels, and alternative fuels impacts. Energy impacts associated with the ozone control measures (see Table 4.3-1 of the Program EIR) were evaluated and determined to be significant for electricity, and less than significant for natural gas, petroleum fuels, and alternative fuels impacts. Please see Subchapter 4.3 of the Draft Program EIR for the complete analysis of potential energy impacts from the 2012 AQMP.

Response to Comment S-6:

Approximately 30 percent of the RTC's in the NOx RECLAIM market are currently not being utilized. The two tons per days reduction proposed for the 1st phase of the RECLAIM shave will be incorporated as a contingency emissions reduction measure to satisfy CAA requirements to be triggered if the NAAQS is not attained by 2015. The BARCT assessment phase of the NOx RECLAIM shave is to be completed in 2015 and fully achieved by 2020. The two to three tons per day shave proposed in the 2012 AQMP is expected to have only a minor impact on the stakeholders. (The form of the Phase I proposed shave, to be initiated as a contingency measure, is anticipated to be implemented across the board with reductions to be shared equally by the RECLAIM universe. The form of the subsequent BARCT shave will be determined as a component of the rule development process.)

Moving the proposed RECLAIM shave control measure to the 2015 ozone AQMP could postpone full implementation of the Phase II reduction to a later date. Staff believes that there are currently sufficient unused RTCs available in the RECLAIM market to provide a cushion for the transition of the existing energy sources to a 33 percent renewable energy base by 2020. As part of the Phase II BARCT assessment technology availability, cost, and market impacts will be thoroughly addressed. The

rule making process will undergo a fully transparent public evaluation of the potential for emissions reductions coupled with the key element of the BARCT assessment listed above. It should also be noted that the state law requires the RECLAIM program not only undergo periodic BARCT review, but also achieve equivalent reductions as the command and control program.

Response to Comment S-7:

The District agrees with the commenter's suggestion. BARCT implementation at any facilities needs to be carefully discussed and analyzed, thus the District will identify a working group, hold necessary public meetings, and provide adequate review and comment periods during the rule making period.

T. Southern California Business Coalition (SCBC), August 31, 2012

August 31, 2012

Dr. William A. Burke, Chairman
Members of the SCAQMD Governing Board
South Coast Air Quality Management District
21865 Copley Dr.
Diamond Bar, CA 91765

RE: 2012 Air Quality Management Plan

Dear Chairman Burke and Governing Board Members:

The Southern California Business Coalition (Coalition) appreciates the opportunity to provide comments on the Draft 2012 Air Quality Management Plan (AQMP). The Coalition is comprised of leaders from some of Southern California's largest regional business entities and associations. The final 2012 Air Quality Management Plan, and the rule making that will eventually stem from it, will directly affect many of these businesses' interests. The Coalition's highest priority is to work with SCAQMD to develop a well-balanced strategy that addresses federal requirements through an economically feasible compliance program. To that end, we offer the following comments:

1. Delays and Changes Have Hampered our Ability to Respond Effectively

The District released the initial version of the draft proposed AQMP control measures on June 12. However, the descriptions of those control measures in the CEQA Initial Study, released on June 28, conflicted with the actual measures themselves. To further confuse the process, the Draft AQMP released on or about July 17 had revisions to some of the proposed control measures that had been included in the Initial Study. Most recently, the Notice of Preparation and Initial Study were released again for "recirculation" on August 1 with a comment deadline of August 31. Finally, although the District held five public meetings in July to discuss the Draft AQMP, the Draft AQMP was not released until after the fourth meeting, which regrettably prevented meaningful public comment.

The District has strongly recommended that comments on the Draft AQMP be submitted by August 31. Unfortunately, the regulated community has had limited time to review the AQMP, and we still have not seen the entire document. Appendix V, the Modeling and Attainment Demonstrations, was only released on August 10. At the time this letter was developed, the separate Socio-Economic Analysis and Draft Program EIR were still pending. These documents are integral to our full and comprehensive understanding of the impacts of the Plan and the various proposed control measures. *We cannot adequately analyze or comment on the AMQP without them.*

T - 1

In contrast to the previous AQMP adopted in 2007, documents were initially released for review October 6, 2006. The document was not formally adopted until September 7, 2007 – a full eleven months. *This year's process has been rushed into a much tighter time frame.*

Nevertheless, based on the amount of information available to us at this time, we are providing these initial comments. Moving forward, we respectfully ask that the AQMD release all future documents in a timely manner and then allow sufficient time for a comprehensive review by the regulated community.

2. Proposed Alternatives to the Project as Currently Defined

The legal requirement for the current AQMP is to demonstrate attainment of the federal 24-hour standard for PM-2.5 by 2014, whereas an ozone attainment Plan is not required until 2015, three years from now.

If the current Plan were focused solely on PM-2.5 attainment, attainment of both the 24-hour and the annual PM-2.5 standards could be achieved by 2014, at a level of cost and effort that is not likely to be objectionable. However, by contrast, the proposed "early action" 183(e)(5) ozone strategy is reasonably expected to require significantly greater effort. For example, the District has estimated that the annual cost will exceed \$115 million per year. This is the sum of the annual costs for only the six mobile source control measures, which are the only sources for which annual costs have been estimated. The annual cost of the fifteen stationary source measures has not been determined and is not included.

We respectfully request that the Board consider adopting an alternative project as the Air Quality Management Plan. The alternative project would be comprised of only the proposed short term PM-2.5 attainment measures since that is all that is required. That is, the 182(e)(5) stationary source and mobile source measures are not required now.

This alternative project will allow the Governing Board to consider all the options provided to it for a 2015 Ozone Plan, and will ensure much needed flexibility and additional time in developing those options. While it is appropriate to be discussing the next wave of ozone controls at this time, we recommend that the District Board fully utilize the three years provided by federal regulations to craft a well-integrated, economically defensible ozone attainment plan. This alternative project strategy avoids putting the fragile regional economic recovery at risk.

Further, the Coalition has specific comments on control measure CMB-01, NOx RECLAIM, now included in the Draft AQMP as Phases I and II. Although Phase I is included as a short term PM-2.5 control measure, we understand that the proposed NOx reduction of between two and three tons per day has virtually no beneficial impact on the PM-2.5 attainment demonstration. We further understand that the District has not yet taken credit for NOx reductions associated with the Residential Wood Burning and Open Burning control measures, BCM-01 and -02, which we understand to be several times greater than the proposed Phase I RECLAIM NOx reductions. Residential Wood Burning and Open Burning NOx reductions should be substituted for the proposed NOx RECLAIM Phase 1 measure in the PM 2.5 control strategy.

T-1

T-2

T-3

In summary:

- We strongly believe that the District would be better served by a PM 2.5-only AQMP at this time.
- We recommend that the Draft EIR present and analyze a project alternative that represents a PM 2.5-only control strategy.
- We recommend that the District take credit for the significant NOx reductions associated with BCM-01 and -02, and that these credits substitute for CMB-01 Phase I, which should be deleted from the Plan.
- Finally, we recommend that the ozone attainment strategy be developed as one entire integrated package for the 2015 AQMP.

As the process moves forward, we look forward to our continued partnership with SCAQMD. Please know that the business community remains committed to helping develop a balanced, workable 2012 AQMP that provides for both environmental and economic success.

We welcome further discussion of these comments; please contact Tracy Rafter, CEO of BizFed (Tracy.rafter@bizfed.org) or Matt Petteruto, Vice President of Economic Development for the Orange County Business Council (mpetteruto@ocbc.org).

Sincerely,

Southern California Business Coalition - AQMP Stakeholders Working Group

Responses to Comment Letter T
SCBC

Response to Comment T-1:

AQMD staff agrees that the 2012 AQMP development schedule was initially compressed. The attainment demonstration modeling could not begin until input data from SCAG's 2012 RTP and CARB's emissions inventories were available. AQMD staff has made every effort to provide all data and information to the public as soon as it became available in an open and transparent process. The review period for many of the documents has also been extended, additional workshops and regional public hearings have been added, scheduled for November 13-15, and the Governing Board adoption hearing date has been delayed to December. The AQMD staff is committed to providing sufficient time for public comment, and continues the enhanced outreach efforts to all stakeholders, while keeping the U.S. EPA submittal deadline in December of 2012 in mind.

Response to Comment T-2:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called "black box" emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large "black box" in the existing approved 2007 AQMP (241 fpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NO_x and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA’s recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs will need to further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment T-3:

The Draft Final 2012 AQMP has removed the RECLAIM Phase I NO_x reductions from the list of control measures directed towards achieving attainment of the 24-hour PM_{2.5} standard. The Phase I NO_x RECLAIM measure has been moved to the contingency measure category, to be implemented if the Standard is not achieved in 2014. Staff is committed under the contingency measure provisions of the CAA to have the measure in rule form ready to be implemented based on a trigger of non-attainment. To this end, staff will commence the process to amend Rule 2002 to meet the contingency requirement of having the provisions in place by June of 2013. If not implemented as a contingency measure, the Phase I NO_x RECLAIM commitment of 2 tons per day will be incorporated with the following Phase II NO_x RECLAIM BARCT assessment targeting full implementation by 2020. Proposed control measures BCM-01 and BCM-02 will constitute the proposed control strategy to achieve attainment of the 24-hour PM_{2.5} standard by 2014. Regional air quality modeling simulations presented in the Draft Final 2012 AQMP have demonstrated that with implementation of control measures BCM-01 and BCM-02, the Basin is expected to attain the 24-hour PM_{2.5} standard by 2014. Like the Phase I NO_x RECLAIM rule, adoption of these control

measures is targeted towards the 2nd quarter of 2013 to meet U.S. EPA's completeness requirements for evaluation of the SIP submittal.

August 30, 2012

Summary of Attached Pages:

- 1) Enstrom Criticism of Draft 2012 AQMD AQMP Appendix I Health Effects makes the primary points that a) overwhelming epidemiologic evidence indicates particulate matter is not killing Californians; b) since 2001 AQMD has not prepared reports on "the health impacts of particulate matter in the South Coast Air Basin" in accord with California Health and Safety Code (CHSC) Section 40471 (b); c) the AQMD Advisory Council failed to properly peer review AQMP Appendix I Health Effects; and d) AQMD must hold a Governing Board Hearing on AQMP Appendix I Health Effects before the 2012 AQMP is finalized.
- 2) Enstrom Op-Ed for The Desert Sun on particulate matter in the Coachella Valley, which was scheduled to be published on April 4, 2012 but which has never been published, makes a strong case that a) particulate matter is not currently harming Coachella Valley residents and b) there will be no health risk from particulate matter after the Sentinal Power Plant is operational.
- 3) Figure 21 from 2000 Health Effects Institute Reanalysis Report by Krewski, Jerrett, et al., shows clear and large variation in PM2.5 mortality risk across the US, with low risk in California
- 4) Enstrom Table 1 summary of the epidemiologic evidence shows NO relationship between PM2.5 and total mortality in California.
- 5) Enstrom Table 2 summary of the epidemiologic evidence shows NO relationship between PM10 and total mortality in California; also, US EPA summary of PM NAAQS indicates revocation of the annual PM10 standard in 2006 due to lack of long-term health effects.
- 6) NCHS US map shows 2009 age-adjusted total death rate by state, with California third lowest; also, California county data shows that the death rate in the South Coast Air Basin is lower than the death rate in every state except Hawaii.

Criticism of Draft 2012 South Coast Air Quality Management District
Air Quality Management Plan Appendix I Health Effects

The Southern California Air Quality Management District (AQMD) has released its Draft 2012 Air Quality Management Plan (AQMP) (<http://www.aqmd.gov/aqmp/2012aqmp/index.htm>). This plan proposes aggressive and costly emission control measures, such as, increased use of zero emission vehicles and severe restrictions on wood-burning fireplaces, in order to reduce air pollution in the South Coast Air Basin (SCAB). This air basin includes about 17 million residents in Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino Counties. The primary goal of the AQMP is to bring the SCAB into compliance with the US Environmental Protection Agency (EPA) National Ambient Air Quality Standards (NAAQS) for criteria pollutants, such as, particulate matter (PM2.5 and PM10) and ozone. These standards are based on the nationwide health effects of these pollutants (<http://www.epa.gov/air/criteria.html>).

However, the AQMP needs to address the health effects of air pollution in the SCAB. In particular, California Health and Safety Code (CHSC) Section 40471 (b) specifically states "On or before December 31, 2001, and every three years thereafter, as part of the preparation of the air quality management plan revisions, the south coast district board, in conjunction with a public health organization or agency, shall prepare a report on the health impacts of particulate matter air pollution in the South Coast Air Basin. The south coast district board shall submit its report to the advisory council appointed pursuant to Section 40428 for review and comment. The advisory council shall undertake peer review concerning the report prior to its finalization and public release. The south coast district board shall hold public hearings concerning the report and the peer review, and shall append to the report any additional material or information that results from the peer review and public hearings." (<http://www.leginfo.ca.gov/cgi-bin/displaycode?section=hsc&group=40001-41000&file=40460-40471>).

As best I can determine, AQMD never prepared a "report on the health impacts of particulate matter air pollution in the South Coast Air Basin" at the end of 2001, 2004, 2007, or 2010. The only "health impacts" reports that I can find are Appendix I "Health Effects" of the 2003 AQMP, 2007 AQMP, and Draft 2012 AQMP. However these reports do not specifically address "the health impacts of particulate matter air pollution in the South Coast Air Basin." Indeed, the 2003 AQMP Appendix I states "The purpose of this appendix is to provide an overview of air pollution health effects, rather than to provide estimates of health risk from current ambient levels of pollutants in specific areas of the SCAB." (http://www.aqmd.gov/aqmp/docs/2003AQMP_AppI.pdf).

Failure to comply with CHSC Section 40471 (b) is a serious matter because the local health effects of PM provide the primary public health justification for the entire AQMP. Overwhelming epidemiologic evidence now indicates that there is NO relationship in California between PM and total mortality (also known as "premature deaths"), as I explained in the June 4, 2012 Orange County Register (<http://www.ocregister.com/articles/air-357230-california-pollution.html>).

U-1

This null relationship in California has been known since 2000, but the specific null evidence is only partially presented in the Draft 2012 AQMP and was entirely omitted from the earlier AQMPs. For instance, each AQMP Appendix I cites the 2000 Health Effects Institute Special Report "Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality," a major report relied upon by EPA and AQMD. However, only the nationwide PM2.5 mortality risk results in this report are cited in the AQMP, whereas Figures 5 and 21 show substantial geographic variation in PM2.5 mortality risk across the US, with Los Angeles ranking fifth lowest among 49 cities (<http://www.scientificintegrityinstitute.org/HEIFigure5093010.pdf>).

U-2

In total, ten separate analyses of five major California cohorts have found no relationship between PM2.5 and total mortality. Indeed, detailed analyses of two of these cohorts, funded by AQMD and completed in 2011, have found no relationship between any criteria pollutant and total mortality in California (www.scientificintegrityinstitute.org/Enstrom081512.pdf). Keep in mind, total mortality is the primary health impact that justifies the NAAQS. However, these national standards are not based on health effects or mortality in California or the SCAB. In 2009 the SCAB had an age-adjusted total death rate lower than the death rate in every state in the continental US (<http://www.scientificintegrityinstitute.org/NCHSRR070811.pdf>).

The 16 members of the 2012 AQMD Advisory Council were asked on June 7, 2012 to review and comment on Appendix I, particularly regarding the "health impacts of particulate matter air pollution in the South Coast Air Basin," and to attend a July 11, 2012 meeting at AQMD regarding Appendix I. Only 7 members submitted any written comments. The three members with the most relevant scientific expertise on PM did not address the "health impacts of particulate matter air pollution in the South Coast Air Basin". UCLA Professor John R. Froines did not submit any written comments; USC Professor Rob S. McConnell did not submit any comments on PM health effects; and LLU Professor Samuel Soret failed to reveal the null PM findings from AHSMOG in the December 2011 LLU Dr. P.H. dissertation of Lie Hong Chen (http://books.google.com/books/about/Coronary_Heart_Disease_Mortality_and_Long.html?id=pA8ltwAACAAJ).

U-3

Dr. Soret served on the committee for Dr. Chen's highly relevant dissertation, CORONARY HEART DISEASE MORTALITY AND LONG-TERM EXPOSURE TO AMBIENT PARTICULATE AIR POLLUTANTS IN ELDERLY NONSMOKING CALIFORNIA RESIDENTS. The Abstract states "The purpose of this study is to assess the effect of long-term concentrations of ambient PM on risks of all causes The health effects of long-term ambient air pollution have been studied with up to 30 years of follow-up in the AHSMOG cohort, a cohort of 6,338 nonsmoking white California adults."

Before the Draft 2012 AQMP is finalized and approved, AQMD must hold a public hearing on the health impacts of air pollution in the SCAB, in accordance with CHSC Section 40471 (b). If the hearing confirms the overwhelmingly null evidence cited above, then the AQMP should not propose emission control measures necessary to comply with NAAQS that are not appropriate for California or the SCAB. Instead, AQMD should request a waiver from compliance with the NAAQS using the special waiver status granted to California in Section 209 of the Clean Air Act (<http://www.epa.gov/otaq/cafr.htm>).

Subject: RE: Proposed Op-Ed on Particulate Matter Health Effects in CV

Dr. Engstrom, here's the edited version. I did minimal editing, just a few tweaks to match AP style. I replaced $\mu\text{g}/\text{m}^3$ with "micrograms per cubic meter." Please let me know if that's acceptable.

Also, I took your website references out of the body of the column and put them in a breakout (below) to make it more readable.

It will be in Wednesday's edition. Thanks for the contribution.

The Desert Sun has recently published a special report and an editorial on the Sentinel power plant that is under construction by Competitive Power Ventures. Substantial concern has been expressed about the impact of the particulate matter (PM) pollution that will be generated by the plant. I would like to provide my perspective on the PM levels associated with the plant and the health effects associated with PM. PM consists of "inhalable coarse particles" (PM10) and "fine particles" (PM2.5).

Based on the April 15, 2010, California Energy Commission air quality assessment for the Sentinel plant, Table 13 indicates that the maximum annual background PM10 level in the Coachella Valley will be increased from 54.9 microgram per cubic meter to 55.33 during plant operation. This represents a "worse case (maximum)" increase of only 0.8 percent. Based on the South Coast Air Quality Management District (AQMD) Final 2007 Air Quality Management Plan, the maximum annual average PM10 level in the Coachella Valley (Salton Sea Air Basin) is only 45.7 micrograms per cubic meter.

All these levels are quite similar to the U.S. EPA's 1987-2006 annual standard for PM10 of 50 micrograms per cubic meter. However, this standard was revoked in 2006 due to "inadequate" evidence of long-term health effects of PM10, as summarized in the 2004 and 2009 EPA Integrated Science Assessment for Particulate Matter.

The Desert Sun claim that "the Sentinel plant would increase the (PM10) level to 277 percent above the state standard" is highly misleading because it is based on the California Energy Commission's Table 13 comparison of 55.33 micrograms per cubic meter with the California annual standard for PM10 of 20. But this state standard was established by the California Air Resources Board in 2002 and does not reflect the extensive null evidence on PM10 health effects that has been published since 2002.

In January 2007, the Air Resources Board and AQMD approved \$1,034,358 in funding, half from each agency, for two major epidemiologic studies on the relationship between PM (PM10 and PM2.5) and death in California. The study based on the American Cancer Society cohort was conducted by UC Berkeley professor Michael Jerrett and 13 other investigators.

The study based on the California Teachers Study cohort was conducted by Michael Lipsett of the California Department of Public Health and nine other investigators. A primary purpose of these studies was to produce new California evidence "to assist with the review of ambient air quality standards."

The results of these two studies were published in 2011 and they both found no relationship between PM and total mortality in California. The Jerrett Study found that total mortality during 1982-2000

among about 75,000 California adults was not related to either PM10 or PM2.5 in eight of nine models tested. The Lipsett Study found that total mortality during 2000-2005 among about 75,000 female

California teachers was not related to either PM10 or PM2.5.

The studies found some unexplained evidence of increased cardiovascular disease risk and decreased cancer risk, but there was no overall increased risk of death. These null results agree with the overwhelmingly null results for California that have been published since 2000, which include my 2005 results.

Thus, based on all the evidence described above, there is no health risk associated with PM in the Coachella Valley or in California as a whole and there will be no health risk from PM after the Sentinel power plant is operational. However, since AQMD and others have a different perspective and since The Desert Sun stated that "Robust debate on this issue is needed," I propose that an open forum be organized so that AQMD Executive Officer Barry Wallerstein and I can debate our different views on the health effects of PM in the Coachella Valley. Hopefully, our debate will help resolve the PM health effects issue.

James E. Enstrom is on the research faculty at the UCLA School of Public Health and has been conducting epidemiologic research there since 1973. Email him at jenstrom@ucla.edu

Photo is fine. I'll try to remember to send you the edited version. Feel free to pester me on Tuesday, but we can never promise exactly when a column will run depending on what's happening in the news.

Thanks.

Responses to Comment Letter U
Enstrom, James

Response to Comment U-1:

The AQMD has prepared an Appendix I to the past Air Quality Management Plan updates which include a discussion on the health impacts of particulate matter, which are applicable to the South Coast Air Basin. Staff believes that these reports fulfill the California Health & Safety Code requirements contained in section 40471(b). Staff also notes that the Clean Air Act requires the attainment of the National Ambient Air Quality Standards. The AQMP updates provide the plan to attain the particulate matter standards.

The commentator appears to believe that the purpose behind Appendix I is to promote criticism of the PM 2.5 NAAQS, with the ultimate goal of having the Governing Board reject the applicable NAAQS and seek a waiver from it. The legislative analysis of SB 1195, which led to section 40471(b), refutes this belief. Thus, the Senate Floor analysis of SB 1195, just prior to the bill's adoption, states that one of the purposes of the bill is "intended to require the district to update its most recent plan adopted for the attainment of [fine particulate matter] standards." And to make it perfectly clear that the legislators were concerned about the health impacts of fine particulate matter, the analysis noted the following fact: "Recent scientific studies have linked fine particulate air pollution with serious public health problems, including premature death, aggravated asthma and acute respiratory distress."

Response to Comment U-2:

The commenter refers to a "null relationship" in California regarding particulate matter and mortality and that this was only "partially presented" in the draft 2012 AQMP, and that there were variations in the PM2.5 mortality risk across the U.S. noted in a study from the Health Effects Institute. Staff has included additional discussion on the range of findings in the studies referenced in the Appendix. However, that there were regional difference in the association of PM2.5 and mortality in the report (Krewski, 2000) was, in fact, noted in the draft Appendix. Commenter also refers to two reports co-funded by AQMD (Lipsett, 2011 and Jerrett, 2011). Staff has presented a summary of several studies on particulate matter health effects, including those referred to by the commenter. Also included are the findings of two studies that looked specifically at the effects of PM2.5 among the American Cancer Society cohort residents of the Los Angeles metropolitan area. (Jerrett, 2005 and Krewski, 2009), both of which reported associations of mortality with PM2.5, and found that the associations were higher than those reported in the national cohort. Additionally, since the initial draft of the 2012 AQMP Appendix I was compiled, the U.S. EPA issued a Regulatory Impact Report (Regulatory Impact Analysis related to the Proposed Revisions to the National Ambient Air Quality Standards for Particulate Matter EPA-452/R-12-003, June 2012

(http://www.epa.gov/ttn/ecas/regdata/RIAs/PMRIACombinedFile_Bookmarked.pdf), in conjunction with a proposal to revise the PM2.5 NAAQS (<http://www.gpo.gov/fdsys/pkg/FR-2012-06-29/pdf/2012-15017.pdf>), that looked at California specific studies regarding PM2.5 and mortality published in the scientific literature. The EPA analyses concluded "most of the cohort studies conducted in California report central effect estimates similar to the (nation-wide) all-cause mortality risk estimate we applied from Krewski et al. (2009) and Laden et al. (2006) albeit with wider confidence intervals. A couple cohort studies conducted in California indicate higher risks than the risk estimates we applied." Thus in EPA's judgment, the California related studies provided estimates of mortality consistent with or higher than those from the national studies.

Response to Comment U-3:

As required by the California Health and Safety Code section 40471(b), Appendix I was submitted to the Advisory Council appointed pursuant to section 40428 to review and comment on Appendix I. Section 40428 provides that the Governing Board appoint the Advisory Council, which was done according to procedures adopted by the Governing Board. Briefly, each Governing Board member has authority to nominate a member to the Council, and each of the Governing Board standing Advisory Groups also nominated one member. Comments from the Advisory Council were given at the July 11, 2012, and October 11, 2012 meetings, as well as in written comments received. All comments received were included in the Appendix I. The Draft Appendix I will be revised in the process of developing the final report, as informed by comments received from the Advisory Council and from the public hearings, as well as other comments from the public, other reviewers and other information that comes to staff's attention. As requested by the Advisory Council, there will be additional opportunities to review and comment on the updated drafts. Also as called for by the Health and Safety Code, any additional material or information resulting from the review and public hearings will be appended to Appendix I.

Response to Comment U-4:

The commenter refers to the requirement that public hearings be held concerning Appendix I and its peer review. The AQMD has held public regional hearings on the entire Draft AQMD, including Appendix I. Also, the Appendix I will be discussed at the Board Adoption Hearing scheduled for December 7, 2012. In staff's opinion, this fulfills the requirements of the California Health and Safety Code. Commenter further implies that the AQMD may request a waiver from compliance with the NAAQS under provision of Section 209 of the Clean Air Act. There is no provision in the Clean Air Act that allows exemption by Districts for meeting National Ambient Air Quality Standards. Section 209 refers to mobile source emission controls, and provides procedures in which California may seek waiver from federal motor vehicle standards if they are replaced with at least equally protective standards.

The Draft Appendix I relies on the conclusion of EPA reviews on the health effects of air pollutants. Tables summarizing the EPA conclusions are included in the discussion. The purpose of Appendix I is not to provide a re-evaluation of the National Ambient Air Quality Standards. See also response to Comment U-1. The establishment of the NAAQS are under the sole discretion of the EPA Administrator, as provided in the Clean Air Act. The District has no authority to establish or alter ambient air quality standards. The Draft 2012 AQMP is designed to provide a pathway to attain the NAAQS for PM_{2.5} by the statutory deadlines. Failure to adopt or implement a plan to attain the NAAQS by the deadlines can trigger severe adverse consequences to the region, restrictions on transportation and highway funds to the region, increases in required emissions offset ratios, and implementation of a Federal Implementation Plan to attain the standard.

Re: AHRI Comments on the Draft 2012 Air Quality Management Plan

Dear Sir/Ma'am:

These comments are submitted by the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) in response to the South Coast Air Quality Management District's (AQMD) issuance of the draft 2012 Air Quality Management Plan (AQMP).

AHRI is the trade association representing manufacturers of heating, cooling, water heating, and commercial refrigeration equipment. More than 300 members strong, AHRI is an internationally recognized advocate for the industry, and develops standards for and certifies the performance of many of the products manufactured by our members. In North America, the annual output of the HVACR industry is worth more than \$20 billion. In the United States alone, our members employ approximately 130,000 people, and support some 800,000 dealers, contractors and technicians. The membership of the AHRI Furnace Section includes all the major manufacturers of commercial space heating equipment being sold in the district today.

In general, we recognize the AQMD staff's dedication to do what it can within its authority to improve the air quality in the district. We ask that staff consider the following comments regarding one of the control measures proposed in the draft 2012 AQMP:

CMB-03: Reductions from Commercial Space Heating [NOx]

The estimated NOx reduction of 0.18 tons per day (TPD) is not sufficiently validated. We recommend that at this stage of AQMP development the potential NOx reduction for this measure be noted as "To be determined."

Page IV-A-64 of Draft 2012 Appendix IV-A states "staff estimates that 45 to 60% of all commercial, light manufacturing, warehouse, office, school and government building floorspace is heated by commercial forced air units." This estimate was based on national estimates that were developed by the U.S. Department of Energy (DOE). The estimates of the current daily NOx emissions from commercial space heating equipment and the potential reductions in this control measure should have been based on information that reflects the commercial space heating inventory and the percentage of commercial buildings heated by commercial gas furnaces within the district. The

V-1

characteristics of the district respective to population and the high saturation of gas-fired equipment are so above average that national average values should not be used.

V-1

Another concern with the draft AQMP analysis for this measure is that it fails to account for the energy savings that will be achieved by the implementation of the California Energy Commission's (CEC) 2013 *Building Energy Efficiency Standards* (California Code of Regulations, Title 24). In particular, the improved building envelope requirements of the 2013 Title 24 regulations will reduce building heating loads, thereby lowering the amount of gas consumed to heat the building. This reduction in gas consumption directly reduces the NOx emissions and must be factored in any estimates of NOx reductions from this control measure. Furthermore, this factor of the analysis would be conservative since California's building efficiency standards are updated on a three-year cycle, so it is highly likely that there will be at least one more revision to the Title 24 standard before the AQMP's proposed 2018 implementation period.

V-2

The projected implementation date for this measure is 2018. In view of the complexities in developing gas-fired equipment with reduced NOx emissions and the current ongoing project to reduce NOx emissions from residential gas furnaces, we recommend that this 2018 implementation date not be changed to any earlier date as the associated rule is developed. The manufacturers of commercial gas central furnaces are the same companies who manufacture residential gas furnaces. Those manufacturers are already working towards redesigns that would allow equipment to satisfy the requirements of Rule 1111. Technical feasibility studies are ongoing but it has not yet been confirmed that the 14 ng/J NOx emission limit for gas-fired furnaces less than 175,000 Btu/h is practical in the field. Recognizing that manufacturers are being required to provide furnaces that are compliant with Rule 1111 by 2014, 2015 or 2016, depending on the particular furnace category, the proposed adoption date associated with CMB-03 within the 2012 draft AQMP is nominally only 2 to 3 years later. Past experience with rules on redesigning gas fired equipment to reduce NOx emissions suggests that even a 2 to 3 year lead time may not be enough. However, that experience clearly shows that it cannot be anything shorter.

V-3

The adoption schedule in the draft 2012 AQMP does not allow adequate time for manufacturers to shift their focus from furnaces less than 175,000 Btu/h to furnaces greater than or equal to 175,000 and less than 2,000,000 Btu/h. In our opinion, manufacturers should not be required to work on developing new designs for residential and commercial furnaces simultaneously. It cannot be assumed that the emission reduction technologies are easily transferrable from residential to commercial products. Manufacturers would have to undergo extensive research to ensure that no adverse impact is placed on product safety while meeting the AQMD's reduction requirements. Hence, we recommend that the adoption dates be postponed so that manufacturers have sufficient lead times to comply with the requirements of the 2012 AQMP; Phase I (technical assessment) should be moved to 2015 and Phase II should be moved to 2017. The implementation period may need to be adjusted as well to accommodate the postponement of the adoption dates.

V-4

Chapter 3 and Appendix IV-A of the draft 2012 AQMP do not provide any reference to the NOx inventory of 2.2 TPD for commercial space heating equipment. How was this baseline estimate deduced for the district? We believe that the reduction levels specified

V-5

in CMB-03 need to be investigated further. The draft 2012 AQMP does not explain how the proposed reduction of 0.18 TPD by 2023 was achieved. Furthermore, the total reduction of 0.6 TPD was calculated based on national estimates and not the inventory available in the district. We feel that the AQMD will have a better understanding of the reduction levels upon the completion of the technical assessment. Hence, we recommend that at this stage of the AQMP development, the potential NOx reduction for both these reduction levels be replaced with the phrase "To be Determined."

Responses to Comment Letter V
AHRI

Response to Comment V-1:

The methodology for developing the commercial space heating emissions inventory is well established, has been used in previous AQMPs and incorporates EPA emission factors, local data on gas use by different sectors from local gas utilities and information from the California Energy Commission, CARB and local agencies. The inventory incorporates local growth projections and gas utility provided energy conservation projections. The factor in inventory development that may need further enhancements is the proportion of heating provided by forced air furnaces versus boilers. Both kinds of heating are used with a split of approximately 50% each. While it is true that Southern California uses more gas-fired heating appliances than other parts of the country, our boilers are also gas-fired. The percentage of floor space heated by forced air versus boilers depends more upon the numbers and size of various types of commercial buildings (their construction) than on other factors. The percentage of floor space heated by forced air units may be more than the 45% used by staff to estimate a minimum total reduction of 0.6 tons/day after 20 years of implementation. If this is the case, AQMD staff will use local floor space data when available and adjust the inventory and the emission reduction higher during rule development.

Response to Comment V-2:

The baseline and future inventories for space heating incorporate federal, state and local energy conservation measures. The emission reductions from this proposed measure are in addition to reductions achieved by potential energy conservation beyond current standards of funded programs.

Response to Comment V-3:

AQMD staff does not expect the compliance date for a rule based on control measure CMB-03 to be earlier than 2018.

Response to Comment V-4:

The current project to develop prototypes of Rule 1111 compliant residential furnaces is progressing well and is expected to be completed by the summer of 2013. Based on progress to date, AQMD staff does not expect a delay in Rule 1111 implementation. Staff believes that the current schedule in measure CMB-03 provides sufficient time for development of larger products based on residential furnace technology (multiple small burners) or single burner technologies used in other applications.

Response to Comment V-5:

Please refer to response to comment V-1. The inventory methodology for commercial space heating is well established and has been accepted for previous AQMPs. Current and future emission inventories are based on gas consumption by categories of use provided by local gas utilities. The baseline inventory uses emission factors developed by EPA. The methodology for estimating NO_x reductions from control measure CMB-03 is explained in the control measure. The reduction of 0.18 ton/day in 2023 is based on a compliance date of 2018 for new sales and an average equipment life of 20 years. Thus each year 1/20 of the total number of commercial space heaters will be replaced by compliant units resulting in a reduction of 0.18 ton/day in 2023 (0.06 ton/day X 1/20 X 6 years = 0.18 ton/day reduction in NO_x).

Re: **Comments on the Draft 2012 Air Quality Management Plan (AQMP)**

Dear Dr. Wallerstein:

The Western States Petroleum Association (WSPA) is a non-profit trade association that represents twenty-seven companies that explore, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California and five other western states. WSPA has been an active participant in air quality planning issues for over 30 years. WSPA member companies operate petroleum refineries and other facilities in the South Coast Air Basin and thus have a major stake in the Air Quality Management Plan (AQMP) being prepared by the South Coast Air Quality Management District (SCAQMD or District), and any rule developments that might stem from the final AQMP as adopted by the District's Governing Board.

WSPA appreciates the opportunity to submit these comments on the Draft 2012 AQMP and continues to support the South Coast regional air quality planning process and the successes achieved to date. The attainment of the National Ambient Air Quality Standard (NAAQS) for PM_{2.5}, which is now imminent, represents a significant public health milestone for Southern California residents and industry. We also wish to acknowledge that the technical inputs and tools used by the District staff for this AQMP represent a significant improvement over prior plans. These important advances provide the opportunity for stakeholders and decision makers to be better informed about the state of air quality in Southern California and the regional economy. Over the last two decades, Southern California's industrial facilities (i.e., stationary sources including the region's petroleum refineries) have reduced their emissions by over 70 percent for most criteria pollutants including nitrogen oxides (NO_x) and sulfur oxides (SO_x).

This letter presents WSPA's general comments, with detailed comments on specific AQMP measures to follow under a separate letter. WSPA may submit additional comments during this process as the District releases additional 2012 AQMP documents including, but not limited to a reported second Draft AQMP. We understand all submissions will be given due consideration by the District staff and the Governing Board.

Our general comments on the Draft 2012 AQMP (dated July 2012) are as follows:

1. **Although the District has prepared an integrated AQMP that addresses both PM_{2.5} and ozone, the focus of the 2012 AQMP control strategy and the associated State Implementation Plan (SIP) submittal, should be limited exclusively to the PM_{2.5} plan consistent with EPA requirements.**

The District's current obligation under the Clean Air Act is to prepare an AQMP to attain the PM_{2.5} standard and continuing to implement 2007 AQMP measures. Showing attainment of the 8-hour ozone standard is the obligation of the 2015 AQMP. This strategy makes sense because there are scientific and technical improvements that need to be made before the District can provide a meaningful update to the basin's ozone strategy at this time. The magnitude of the ozone challenge for future milestone years (i.e., 2023 and 2032) is a function of forecasts and assumptions which will only become better understood with time, but under any scenario the District's "Black Box" commitment under Clean Air Act Section 182(e)(5) still requires significant emission reductions for which this plan quantifies very little. That is because the overwhelming majority of these emission reductions must come from transportation and can only be provided by new technologies which are as yet unidentified. While the District has "sketched out" a path for identification, development and commercialization of such technologies, this part of the AQMP remains speculative. Meanwhile, potential co-benefits from other regulatory initiatives like the California Air Resources Board's (CARB) AB32 Program (e.g., Cap-and-Trade, Low Carbon Fuel Standard, etc.) remain largely unconsidered in this plan.

Given these facts, there is no benefit to pushing new ozone measures into the SIP at this time. Rather, such action would only serve to unnecessarily constrain the future options available to the District and Southern California businesses. The District should wait and develop the revised ozone attainment strategy when it is required as part of the 2015 AQMP. At that time, we will all have a better understanding of the needed emission reductions and better information on the economic factors and technologies required to meet the region's air quality challenge. New control measures in the 2012 AQMP and the associated SIP submittal should be limited exclusively to the PM_{2.5} attainment demonstration consistent with EPA requirements.

W-1

2. WSPA agrees that the region can attain the PM_{2.5} NAAQS by 2014 through the use of focused, time & place control measures. This is the most efficient and cost effective path to attainment of the PM_{2.5} standard.

Most of the basin is already in attainment of the PM_{2.5} NAAQS, and the District's modeling forecast suggests that the area around the Mira Loma monitoring station will be very close to achieving the standard by 2014. Based on the information provided in the Draft AQMP, measures BCM-01 and BCM-02 are by themselves sufficient to demonstrate PM_{2.5} attainment in 2014. These measures would enhance restrictions on residential wood burning (BCM-01) and open burning (BCM-02) whenever key areas of the air basin are forecast to approach the federal 24-hour PM_{2.5} standard. Similar measures been successfully implemented in other jurisdictions and are technologically feasible and cost effective.

The Draft AQMP currently proposes eight short term PM_{2.5} control measures, but as summarized in Table 1, only three of these measures have any quantified emissions benefits for 2014.

TABLE 1: 2012 AQMP Proposed PM_{2.5} Control Measures (Tons per Day)¹

2014 Emissions	NO _x	SO _x	PM _{2.5}	VOC	NO _x Equiv	Reference
Baseline Emissions	499.9	18.4	70.4	451.4	1821.6	App III, Table A-2
CMB-01	-2.0	0	0	0	-2.0	App IV-A
BCM-01	-14.84	-0.37	-5.36	-6.46	-95.4	App IV-A & App III Table A-2
BCM-02	-1.52	-0.47	-4.60	-3.23	-70.4	App IV-A & App III Table A-2
BCM-03	0	0	0	0	0	App IV-A

IND-01	0	0	0	0	0	App IV-A
EDU-01	0	0	0	0	0	App IV-A
MCS-01	0	0	0	0	0	App IV-A
Total Measures	-18.36	-0.84	-9.96	-9.69	-167.7	
Controlled Emissions	481.5	17.6	60.4	441.7	1653.9	

W-2

The Draft AQMP reports that BCM-01 and BCM-02 will reduce direct PM_{2.5} emissions,² but these two measures also yield significant reductions in NO_x and VOC emissions during control episodes which were not presented in the AQMP report. Those emission reductions, which are presented in Table 1, are based on the emission inventory presented in Appendix III of the Draft AQMP, will significantly contribute to attainment of the 24-hour PM_{2.5} NAAQS.

Using the District's "NO_x equivalent" weighting system, BCM-01 and BCM-02 would provide about 166 tons per day (tpd) of NO_x equivalent emission reductions which includes 16 tpd of

¹ "NO_x Equivalent" emissions are computed based on the relative contributions of precursor emissions reductions to simulated controlled future-year 24-hour PM_{2.5} concentrations discussed in Section 5 of the Draft AQMP. As presented in Table 5-2, PM_{2.5} has a standardized contribution to ambient PM_{2.5} mass of 14 times that of NO_x. The factors for SO_x and VOC are 6 and 0.5, respectively. (See Draft AQMP, p. 5-15).

² SCAQMD, Draft 2012 AQMP, Table 4-2.

NO_x reductions. Based on these figures, 99% of the emission reductions quantified for the PM_{2.5} attainment demonstration are attributable to BCM-01 and BCM-02. These two measures, by themselves, will deliver the needed emissions reductions and represent the most efficient and most cost effective path to attainment of the PM_{2.5} standard by 2014.

3. Proposed Control Measure CMB-01 (Further NO_x Reductions from RECLAIM - Phase I) is not needed for the PM_{2.5} attainment demonstration. CMB-01 should be removed from the Short-Term PM_{2.5} Control Measures.

In part, the 2012 AQMP is designed to evaluate potential control measures and their effectiveness in meeting the federal 24-hour PM_{2.5} NAAQS. The predicted 24-hour PM_{2.5} Design Value for 2014 at the Mira Loma monitoring station was 37.3 µg/m³, which exceeds the 24-hour PM_{2.5} standard of 35 µg/m³.³ The controlled scenario includes measures BCM-01 and BCM-02 which would restrict residential wood burning and open burning on a basin-wide basis on days predicted to have an ambient concentration of 30 µg/m³ or greater (approximately 60 no-burn days used in the modeling). With those controls, the Design Value for 2014 was predicted to be 34.2 µg/m³ which is below the 24-hour NAAQS.⁴

The Draft AQMP does not include a sensitivity analysis for the short-term PM_{2.5} control measures, but using the District's "NO_x equivalent" weighting system it is reasonably deduced that CMB-01 (Phase I) does not meaningfully contribute to the PM_{2.5} attainment demonstration. As shown above in Table 1, BCM-01 and BCM-02 would provide about 166 tpd of "NO_x equivalent" emission reductions, including 16 tpd of NO_x. By comparison, proposed measure CMB-01 (Phase I) would only reduce 2 tpd NO_x which represents a mere 1% of the NO_x equivalent emission reductions proposed for 2014. This equates to less than 0.1 µg/m³ of quantified ambient improvement which is statistically irrelevant to the PM_{2.5} attainment demonstration for 2014.

The Draft AQMP succeeds in showing that Control Measures BCM-01 and BCM-02 can provide all of the air quality improvement needed for the District to demonstrate attainment of the 24-hour PM_{2.5} NAAQS by 2014. As such, CMB-01 should be removed from the Short-Term PM_{2.5} Control Measures in this plan.

W-3

³ 2012 AQMP Chapter 5 and Appendix V.

⁴ It is not clear from the Draft AQMP and supporting Appendix V whether the pollutant co-benefits (e.g., 16 tpd NO_x) attributable to measures BCM-01 and BCM-02 were accounted in the CMAQ model. If not, that inclusion would drive the predicted design value for the controlled scenario lower than the reported value of 34.2 µg/m³.

4. **Proposed Control Measure CMB-01 (Further NO_x Reductions from RECLAIM) needs to be wholly reconsidered. The Draft AQMP fails to properly consider RECLAIM market demand, or the cost implications of supply reductions. CMB-01 should be removed from the 2012 AQMP.**

As recognized by all stakeholders, the region still has a long way to go to meet the federal ozone NAAQS. The Draft AQMP notes:

“The Basin faces several ozone and PM attainment challenges, as strategies for significant emission reductions become harder to identify and the federal standards continue to become more stringent.

... In finding the most cost-effective and efficient path to meet multiple deadlines for multiple air quality and climate objectives, it is essential that an integrated planning approach is developed.”⁵

We agree with this concept and would suggest that the Draft AQMP does not achieve this objective. Proposed Control Measure CMB-01 (Phase I) suggests:

“The proposed Phase I reductions are designed to enhance timely attainment of the 24-hr PM_{2.5} standard by 2014 by taking advantage of currently approximately 8 tpd of excess RTC in the market. A shave of 2 tpd of NO_x RTCs should not cause a significant impact to the market.”⁶

This statement is inaccurate for several reasons: (1) the Draft AQMP provides no evidence to support the assertion concerning the future RECLAIM RTC supplies; (2) there is no evidence presented or implied to support a position that a 2 tpd NO_x reduction in the market is reasonable nor feasible in the short- or long-term; and (3) there is no suggestion of a control strategy that would be the basis for such emission reductions. Finally, we reiterate that Control Measure CMB-01 is unneeded for the PM_{2.5} attainment demonstration.

- **The market data used to support CMB-01 (Phase I) reflected a major recession (i.e., 2008-2010); those data do not reflect a “normal” economy and are not indicative of the RECLAIM RTC supply needed to support the Southern California economy.**

The Draft AQMP suggests that the NO_x RECLAIM market has a surplus which can be “shaved” with no significant impact to the market. This supposition is based on the District’s review of NO_x RTC data from 2008-2010. Elsewhere in the Draft AQMP it is acknowledged that the 2008-2010 period was impacted by a major recession. That recession significantly suppressed economic activity in most sectors of the economy including transportation, goods movement, and electricity demand. Those recessionary impacts are indeed reflected in the referenced 2008-2010

⁵ SCAQMD, Draft 2012 AQMP, p. ES-12.

⁶ SCAQMD, Draft 2012 AQMP, Appendix IV-A, p. IV-A-14.

W-4

RTC market data. But more importantly, that time period is an inappropriate basis for forecasting future RTC demand.

- The District's ozone attainment strategy is dependent on the advancement of zero/near-zero technologies for transportation. That strategy will require that the NO_x RECLAIM market have sufficient RTC supply for significant new electricity generation.

W-4

As explained in the Regional Transportation Plan (RTP) and the Draft AQMP, attainment of the ozone NAAQS will not be possible without significant NO_x emission reductions from the transportation sector. The Draft AQMP notes this repeatedly:

"...a transition to zero- and near-zero emission technologies is necessary to meet 2023 and 2032 air quality standards and 2050 climate goals. Many of the same technologies will address air quality, climate and energy goals."⁷

"Since most significant emission sources are already controlled by over 90%, attainment of the ozone standards will require broad deployment of zero- and near zero emission technologies in the 2023 to 2032 timeframe. On-land transportation sources such as trucks, locomotives, and cargo handling equipment have technological potential to achieve zero- and near-zero emission levels. Current and potential technologies include hybrid-electric, battery-electric, and hydrogen fuel cell on-road vehicle technologies. Other technologies and fuels may also serve regional needs, e.g. natural gas-electric hybrid technologies."⁸

W-5

In short, this strategy involves transitioning the transportation sector from petroleum-based energy sources to electricity. California has some of world's most aggressive policies to reduce emissions from the electricity sector including demand management (e.g., energy efficiency) programs and emission standards. Part of that strategy includes the Renewable Portfolio Standard (RPS) which would eventually have utilities supplying 33% of electricity generation from zero emission technologies like solar and wind. But that leaves 60+% of our electricity coming from fossil-fueled sources for the foreseeable future.⁹

Terminology aside, electricity is not zero-emissions and going forward much of the increased electricity demand in Southern California would need to be delivered from fossil-fueled power plants in the South Coast Air Basin. That electricity generation will need to be accommodated under the NO_x RECLAIM market, and it is not in the 2008-2010 baseline.

⁷ SCAQMD, Draft 2012 AQMP, p. ES-13.

⁸ SCAQMD, Draft 2012 AQMP, p. 4-20.

⁹ Hydroelectric and nuclear power plants are expected to supply less electricity to Southern California going forward due to declining snow packs and the threatened retirement of SONGS (in part or whole).

- The District needs to consider electricity sector impacts associated with a broad-scale electrification initiative for transportation before proposing any new NO_x RECLAIM shave. Failure to plan for such a structural change would challenge the feasibility of the District's zero/near-zero technologies strategy, negatively impact the Southern California economy, and may be contrary to State requirements under Assembly Bill 1318.

Broad-scale transportation electrification will mean significant new demand for electricity. The District has worked to preserve emission offsets availability for electricity generation, in particular with certain exemptions for non-RECLAIM pollutants under Regulation XIII. But that could prove irrelevant if the NO_x RECLAIM market lacks sufficient RTC supply to cover the NO_x emissions associated with natural gas-fueled power plants needed to serve future load demand. And failure to plan for this under the RECLAIM market would complicate this AQMP's ambitions for zero/near-zero emission technologies. Yet the Draft AQMP fails in this regard:

"Energy projections made in this chapter reflect past energy usage in the South Coast Basin and energy projections made from utility and other agencies' planning documents. These projections reflect existing policies and regulations. **This review does not include an analysis of energy implications from the control measures within this AQMP; this analysis is conducted within the EIR review.**"¹⁰ (emphasis added)

W-5

In fact, CARB is working on a similar study as required under California Assembly Bill (AB) 1318. That law requires CARB, in consultation with the California Energy Commission (CEC), California Public Utilities Commission (CPUC), California Independent System Operator (CAISO), and the State Water Resources Control Board (SWRCB) to prepare a report for the Governor and Legislature that evaluates the electrical system reliability needs of the South Coast Air Basin. The report is to include recommendations for meeting those reliability needs while ensuring compliance with state and federal law requirements for emission offsets (i.e., ERCs and RTCs).

The AB 1318 study was demanded by the legislature specifically because of concerns about current air permitting issues facing power plants under SCAQMD jurisdiction. The CARB report is to include recommendations for long-term, sustainable permitting of additional needed capacity. Under the statute, this report was due on or before July 1, 2010 but was not delivered. At this time, the draft AB 1318 report is scheduled for release in "Fall 2012."¹¹ The results of this study, which is the first of its kind for Southern California, are critical to understanding the baseline forecast against which the District would consider the additional electricity sector impacts associated with a broad-scale electrification initiative for transportation. It would be

¹⁰ SCAQMD, Draft 2012 AQMP, p. 10-1.

¹¹ CARB, AB 1318 Project Overview and Status Report: South Coast Air Basin Electric Reliability and Offset Needs Assessment, June 22, 2012.

premature to consider any new NO_x RECLAIM shave which could constrain future power plant operations prior to the review of this report and additional needs analysis.

Based upon the above and given that the proposed NO_x RECLAIM shave under CMB-01 (Phase I) is not needed for the PM_{2.5} attainment demonstration, we recommend that CMB-01 (Phase I and Phase II) should be removed from the 2012 AQMP.

- Any future RECLAIM shave should be limited to those required under BARCT authority.

According to the Draft AQMP, the California Health and Safety Code (H&SC) requires the District to monitor the advancement in Best Available Control Retrofit Technology (BARCT), and if BARCT advances the District is required to periodically reassess the RECLAIM market, overall facility caps, and reduce the RTC holdings, as if the equipment located at the facilities would be subject to applicable equivalent command-and-control BARCT levels. The BARCT evaluation must include an evaluation of the maximum degree of reduction achievable with advanced control technologies taking into account the environmental, energy, and economic impacts for each class or category of source.

Any proposed NO_x RECLAIM shave should be limited to those required under this BARCT authority. The size of any such shave cannot be specified until the required BARCT evaluation has been completed.

- Any NO_x RECLAIM shave would impose significant costs on the Southern California economy. The AQMP must include a proper cost effectiveness analysis for CMB-01.

The Draft AQMP makes several representations concerning the cost effectiveness of Control Measure CMB-01.

CMB-01 (Phase I): "It is expected that the cost effectiveness for this control measure would be in the neighborhood of \$7,950 per ton for Phase I based on the most recent RTC trading prices."¹²

CMB-01 (Phase II): "It is expected that the cost effectiveness for this control measure would be in the neighborhood of \$16,000 per ton NO_x reduced."¹³

Subsequent to the release of the Draft, District staff suggested in several public meetings that the cost of the Phase I NO_x shave could actually be "zero." The cost to Southern California businesses of the proposed CMB-01 would most certainly not be zero, and we would respectfully submit that the cost figures presented in the Draft AQMP are also improperly deduced.

W-5

W-6

W-7

¹² SCAQMD, Draft 2012 AQMP, Table 6-4 and Appendix IV-A-15.

¹³ SCAQMD, Draft 2012 AQMP, Table 6-5 and Appendix IV-A-59.

RECLAIM is the oldest locally designed and implemented air emissions “cap and trade” program. As with any cap and trade program, the cost of allowances (i.e., RTCs) is dictated by both the market’s view of the current supply-demand balance and the market’s view of the future supply-demand balance. Any reduction in market supply (e.g., a shave), will cause the market to reassess the supply-demand relationship and the RTC market price will adjust accordingly. Past market prices cannot be used to forecast future prices when a major structural change is being proposed, such as a nearly 20% supply reduction. And if RECLAIM is unable to support key industrial sectors, the economic consequences could be enormous.

W-7

Stakeholders and decision makers need to be presented a cost effectiveness analysis that is based on appropriate economic principles and information. The Draft 2012 AQMP fails to do that for proposed Control Measure CMB-01 (Phase I or Phase II).

- **There is insufficient time to implement the proposed CMB-01 (Phase I) control measure.**

The Draft AQMP proposal for Control Measure CMB-01 (Phase I) suggests that the rulemaking for amending Regulation XX would be completed in 2013 and be in effect in 2014. This timetable is inadequate. First, a rulemaking of this type would be difficult to complete in 12 months especially because the proposed measure includes a number of controversial issues. Key among those issues would be the shaving methodology. The Draft AQMP states “staff will work with stakeholders to evaluate various shaving methodology (e.g., sector-specific or across-the-board).”¹⁴ That analysis alone will take time. Depending on the outcome of that evaluation, certain stationary sources may need to evaluate installation of new emission controls. Stationary sources would need no less than 2-4 years to design, construct, and operationalize new emissions controls necessitated by a reduction of NO_x RTC allocations (assuming control technology options are available). Given these realities, the implementation schedule for proposed measure CMB-01 (Phase I) is simply not achievable.

W-8

- **In summary, proposed measure CMB-01 (Phase I or Phase II) is not well considered. Since CMB-01 (Phase I) is not needed for the PM_{2.5} attainment demonstration, proposed measure CMB-01 (Phase I and Phase II) should be removed from the 2012 AQMP.**

5. **If EPA issues a SIP call for an updated attainment plan for the (now revoked) 1-hr ozone NAAQS, that should be covered in a standalone plan (i.e., not in the 2012 AQMP).**

W-9

There has been much discussion over the last several months concerning recent litigation and court decisions suggesting that the District might need to prepare a new 1-hour ozone SIP. Should the District actually receive a SIP call to prepare a 1-hour ozone plan (which has not yet

¹⁴ SCAQMD, Draft 2012 AQMP, Appendix IV, p. IV-A-14.

occurred), that requirement should be satisfied in a separate plan in accordance with the schedule applicable to that SIP call. The District should not attempt to deal with that requirement in the 2012 AQMP because the requirements applicable to the 1-hr ozone standard, including inventory, model performance, modelled output, and emission reduction strategies are wholly different from those required under the current AQMP.

We expect that a revised 1-hour ozone plan will be eclipsed by the District's 8-hour ozone strategy as presented in the 2007 AQMP and revised in the 2015 AQMP. The compliance milestones for the 1-hour and first 8-hour (80 ppb) ozone plans would both be 2023. Based on prior District estimates, the overall emission reduction requirements for meeting the 1-hour ozone standard are within the range needed for the 8-hour ozone standard (particularly the 75 ppb NAAQS). To date, no full-scale assessment has been made to confirm this assertion.

The District has not prepared a recent attainment demonstration for the 1-hour ozone NAAQS, so the existing analyses are based on outdated inputs, models and EPA guidance. The 1-hour and 8-hour ozone NAAQS also have different forms (beyond the averaging periods) which make quantitative comparisons problematic. The Draft 2012 AQMP notes these issues:

"If a 1-hour ozone SIP is requested by U.S. EPA, the SIP would be due within 12 months of such a SIP call. The attainment demonstration in the SIP would have to show attainment within 5 years with a potential 5-year extension, which would be a similar timeframe as is required for the 1997 8-hr ozone standard (deadline of 2023). However, many new technical issues such as modeling for the attainment demonstration and other CAA requirements would require U.S. EPA's guidance, since the previous preambles/guidelines are no longer directly applicable. Based on previous modeling estimates, the control strategies that are needed to attain the 8-hour ozone standard are nearly identical to those that would be needed to attain the 1-hour ozone standard."¹⁵ (emphasis added)

Should EPA issue a 1-hour ozone SIP call, the District should take the full 12 months allotted to develop a standalone 1-hour ozone AQMP using current inputs, models and updated EPA guidance. The 2012 AQMP should make no assertions concerning the attainment strategy for the 1-hour ozone NAAQS; the required technical analyses have not been completed.

6. Proposed Control Measure MCS-03 (Improved Startup-up, Shutdown and Turnaround Procedures) was covered in the 2007 AQMP and is already in rule development based on that authority. The measure should be removed from the 2012 AQMP.

As noted in the Draft AQMP, this proposed measure would be a carryover from the 2007 AQMP and SIP submittal. The District has already commenced rule development activities for this measure on the basis of the 2007 AQMP authority. For that very reason, the inclusion of proposed measure MCS-03 in the 2012 AQMP is duplicative and unnecessary.

W-9

W-10

¹⁵ SCAQMD, Draft 2012 AQMP, p. 8-3.

Proposed Control Measure MCS-03 should be removed from the 2012 AQMP. Notwithstanding this fact, WSPA will submit detailed comments on proposed Control Measure MCS-03 under separate cover.

W-10

7. The schedule for this AQMP has not provided stakeholders with the opportunity to effectively review and comment on key documents. The District should lengthen the AQMP schedule to ensure stakeholder input and comments can be given due consideration.

Despite the best intentions of District staff, the process and schedule for this AQMP has been altered and compressed, which has impaired stakeholders ability to effectively review and comment on key documents. Despite months of AQMP Advisory group and Scientific, Technical & Modeling Peer Review (STMPR) group meetings, the strategy outlined in the Draft AQMP released on 12 July was radically different from that which had been presented by District staff to public stakeholders only two weeks earlier. We cannot understand how such abrupt change of direction occurred given that EPA and CARB stakeholders were active participants in those Advisory and STMPR group meetings.

Then the Notice of Preparation/Initial Study required for compliance with the California Environmental Quality Act (CEQA) was released on 28 June. That document contained outdated information and other material errors which led to a revised NOP/IS having to be issued on 2 August. Despite that, stakeholders are being "strongly urged" to deliver their comments on the Draft AQMP by 31 August when it has already been announced that a brand new Draft AQMP is set to be released in mid-September with as-yet-unspecified changes. It seems unlikely that public comments submitted by 31 August could reasonably be considered prior to issuance of the second draft plan. Furthermore, the as-yet-unseen socioeconomic analysis and the Draft Environmental Impact Report (DEIR) won't be released until mid-September, yet the District continues to suggest this public process can be completed by December 2012.

W-11

This continued schedule compression has left stakeholders without sufficient time for review of AQMP products (those actually released, as well as yet to be released). Furthermore, District staff are not going to have sufficient schedule or resources to fairly consider and respond to stakeholders' comments. This is an unacceptable situation for a plan of such importance to the health and welfare of Southern Californians. The only available remedy for this condition is to relax the 2012 AQMP schedule to allow for full and proper consideration of stakeholder inputs and comments.

As for the 2015 AQMP, we would strongly encourage the District staff to defer debate on the region's ozone strategy for that plan and begin that public process much earlier. The District should confer with key stakeholders early to ensure the current AQMP process situation is not repeated.

8. Economic impacts need to be considered in the AQMP. The Draft AQMP has not provided sufficient information to stakeholders and decision makers. Information on the economic impacts of the AQMP should be released with sufficient schedule to allow proper review, comment, and decision making.

The regional air quality plan should strive to achieve our environmental objectives as cost efficiently as possible. And plan actually states that as an objective:

“...this Draft 2012 AQMP strives to identify the most cost-effective and efficient path to achieve federal clean air standards.”¹⁶

Stakeholders and the Governing Board need to have a full and (reasonably) complete understanding of the costs and benefits of the policy options before them. While the Draft AQMP provides some of this information, to date it has fallen short of providing an acceptable level of detail on the economic costs and impacts associated with the proposed plan. The cost analyses provided in this Draft AQMP have often been incomplete, deferred or summarily dismissed. The plan suggests certain control measures are cost effective without providing evidence to support those claims. And certain economic analyses, most notably the socio-economic analysis, are still yet-to-be-released. This is interesting given that one of the actions under the “AQMD Air Quality-Related Energy Policy” directed the following:

“Conduct appropriate socioeconomic studies to identify the societal costs and benefits for the implementation of zero and near-zero emissions strategies, including but not limited to, further electrification and impacts on businesses and jobs.”¹⁷

These studies have not been released to the public, leaving stakeholders and the Governing Board without sufficient information to consider important policy choices. We would suggest that the AQMP schedule needs to be revised (i.e., extended) to allow these important economic information to be released and sufficient time for stakeholders to review, understand, and comment on the economic information related to this plan. In the meantime, we reiterate our position that the SIP submittal for this 2012 AQMP should be limited exclusively to the PM_{2.5} attainment demonstration consistent with EPA requirements to allow proper consideration of the region’s next ozone strategy.

W-12

¹⁶ SCAQMD, Draft 2012 AQMP, p. ES-12.

¹⁷ SCAQMD, Draft 2012 AQMP, p. 10-3.

WSPA appreciates the opportunity to submit these general comments. As noted in our preamble, WSPA intends to submit detailed comments on specific measures contained in the Draft 2012 AQMP under separate cover. WSPA may submit additional comments during this process as the District staff release additional 2012 AQMP documents.

Please contact me with any questions at (310) 678-7782 or psenecal@wspa.org.

Sincerely,

Patty Senecal
Manager, Southern California Region and Infrastructure Issues
Western States Petroleum Association

Responses to Comment Letter W
WSPA

Response to Comment W-1:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large “black box” in the existing approved 2007 AQMP (241 fpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NOx and VOC emission reduction commitments contained

in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment W-2:

AQMD staff agrees that the proposed PM_{2.5} control strategy is the most efficient path in achieving the 24-hour PM_{2.5} NAAQS, as well as providing co-benefits in equivalent NO_x emissions.

Response to Comment W-3:

You are correct in your conclusion that the short-term strategy outlined in the Draft 2012 AQMP that incorporates Control Measures BCM-01 and BCM-02 can provide the necessary air quality improvements to demonstrate attainment. As a result, CMB-01 has been removed from the short-term strategy and is listed now in the revised Draft 2012 AQMP as a contingency measure.

Response to Comment W-4:

As discussed in the responses to comment S2 and S6, the proposed 2 TPD NO_x RECLAIM emissions shave will be incorporated into the 2012 AQMP as a contingency emissions reduction measure to be triggered if the Basin does not attain the 24-hour PM_{2.5} standard in 2015. If not triggered, the 2 TPD shave will be rolled into the proposed Phase II BARCT rule amendment process. This process will undergo a full assessment of available technology, costs, affordability, and market impacts to the RECLAIM stakeholder community.

Response to Comment W-5:

The 2012 AQMP, as with all previous plans, does incorporate growth factors for all sectors of our economy, including the fossil-fueled power plants to meet future demand. Please also note that the revised Draft 2012 AQMP, except for a few technology demonstration measures, does not include any specific zero- and near-zero technology penetration targets that would necessitate commensurate adjustments to the baseline emissions. However, as future revisions to the AQMP begin to better define such

penetration targets, it would be reasonable to expect appropriate adjustments be accounted in emissions inventories and targets. During the BARCT evaluation phase, future needs for electrification will be considered.

Response to Comment W-6:

The District partially disagrees with the commenter. The commenter is correct by stating that the California H&SC requires the District to monitor the advancement of BARCT, and if BARCT advances the District is required to reduce the facility RTC holdings as if the equipment located at the RECLAIM facilities would be subject to applicable BARCT. The commenter however is incorrect by stating that the District cannot estimate the projected size of such shave in the AQMP until the District has completed the BARCT evaluations. The current reductions estimates were based on applicable BARCT established for non-RECLAIM sources. However, BARCT continually evolves as new technology becomes available. Therefore, the size of the shave may vary as a result of the rule making process. It is important for the RECLAIM facilities to know as soon as possible the potential impact of the shave and the direction that the District is heading so that the RECLAIM facilities can provide input and engage early in the development of the AQMP. As an example, the BARCT evaluations were refined continuously through the 2005 and 2010 RECLAIM rule development and resulted in larger shaves than those estimated in the 2003 and 2007 AQMPs.

Response to Comment W-7:

Staff plans to commence rule amendment for the RECLAIM NO_x Phase I contingency emissions reductions of 2 TPD in late 2012. The NO_x shave will target surplus unused RTC's currently in the NO_x RECLAIM market. The 2 TPD target represents approximately 25 percent of the un-used RTC's in the RECLAIM universe. While staff acknowledges that the economic turndown post 2008 had an impact on the RECLAIM market, the current RECLAIM market has approximately one third (8 TPD) of the total RTC's not being utilized which is a significant safety margin. Therefore, the 2 TPD shave proposed in the 2012 AQMP is expected to have only a minor impact on the program. The rule making process will undergo a fully transparent public evaluation of the potential for emissions reductions, and potential economic impacts.

Response to Comment W-8:

As discussed in response to comment S2, staff plans to commence the rule amendment process for the contingency measures in late 2012 targeting a midyear 2013 adoption date. Staff recognizes that this is an aggressive timetable; regardless every effort will be made to expedite the rule amendment process.

Response to Comment W-9:

U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. The attainment demonstration for the 1-hour ozone standard was analyzed and the results provided in a separate appendix to the 2012 AQMP for consideration of the Governing Board at the same time. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019, for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment W-10:

It is correct that Control Measure MCS-03 is a carry-over measure from the 2007 AQMP. Although the implementation of the control measure has already commenced in terms of gathering information from various facilities, the rulemaking process is far from being complete. Therefore, considering the importance of the control measure in evaluating the potential for additional emission reductions from the start-up, shut-down and turn-around operations and the strong desire and interest from the community to better quantify and reduce emissions from this source category, MCS-03 is included in the 2012 AQMP, which will help insure its enforceability.

Response to Comment W-11:

AQMD staff agrees that the 2012 AQMP development schedule was initially compressed. The attainment demonstration modeling could not begin until input data from SCAG’s 2012 RTP and CARB’s emissions inventories were available. AQMD staff has made every effort to provide all data and information to the public as soon as it became available in an open and transparent process. The review period for many of the documents has also been extended, additional workshops and regional public hearings have been added, and the Governing Board adoption hearing date has been delayed to December 2012. The AQMD staff is committed to providing sufficient time for public comment, and continues the enhanced outreach efforts to all stakeholders, while keeping the U.S. EPA submittal deadline of December of 2012 in mind.

Response to Comment W-12:

A socioeconomic report on the 2012 AQMP was released to the public on September 28, 2012, with a 45-day public review and comment period until November 12, 2012. The Revised Draft 2012 AQMP had been released three weeks earlier but the ability to comment was extended to overlap with the socioeconomic report comment period. The socioeconomic report provides the cost of the control measures, including capital,

installation, operation and maintenance. The socioeconomic analysis also determines the benefits to clean air as result of implementing the Plan, such as improved health, visibility and material, as well the job impact. The cost effectiveness (in terms of dollars per tons of emission reductions) of each control measure can be found in Appendices IV-A and IV-B if such data was available and/or applicable. Some control measures require technology assessment to establish emission reduction potential and control effectiveness before a cost effective value can be determined (e.g., dairy measure). The ranking of control measures based on cost effective values can be found in Chapter 6. Specifics on how the cost effective values were determined was made available to the public in early August after the July 2012 AQMP Advisory Group meeting and can be found at

http://www.aqmd.gov/gb_comit/aqmpadvgrp/2012AQMP/meetings/2012/july26/agenda.html.

X. Bear Valley Electric Service, August 31, 2012

August 31, 2012

Dr. Elaine Chang
Deputy Executive Officer
Planning, Rule Development, and Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

SUBJECT: Bear Valley Electric Service Comments on AQMD Draft 2012 Air Quality Management Plan

Dear Dr. Chang:

Bear Valley Electric Service (BVES) is pleased to submit the attached comments on the South Coast Air Quality Management District (AQMD) Draft Air Quality Management Plan (AQMP). We appreciate the opportunity to provide input before it is finalized.

BVES is a division of Golden State Water Company (GSWC), an investor owned utility (IOU). BVES provides electric distribution service to approximately 21,500 residential customers in a resort community with a mix of approximately 40 percent full-time and 60 percent part-time residents. Its service area also includes about 1,400 commercial, industrial and public-authority customers, including two ski resorts.

BVES purchases wholesale power to meet the majority of its energy requirements. To aid in meeting peak demand for electric energy, BVES installed and now operates the Bear Valley Power Plant (BVPP), a natural gas-fired, 8.4 MW generation plant in its service area. The BVPP became commercially operational on January 1, 2005.

BVES is supportive of the goals of the AQMP, including some specific AQMP measures. Listed in the attached are the chapters and measures that we believe are particularly relevant to BVES operations, as well as associated background information and comments. Some of the measures are goals that BVES either has been working toward already, or is willing to consider; others may not be appropriate for a small utility such as BVES. While we are interested in working with the AQMD, it is important to note that BVES is under the jurisdiction of the CPUC, and BVES' actions, therefore, must be approved by the CPUC prior to implementation.

If you have any questions or comments regarding the above, please feel free to contact me at (909) 866-4678.

Sincerely,

A handwritten signature in blue ink that reads "Tracey Drabant".

Tracey Drabant
Energy Resource Manager

Bear Valley Electric Service Comments on the
AQMD Draft 2012 Air Quality Management Plan

Bear Valley Electric Service (BVES) appreciates the opportunity to submit comments regarding the South Coast Air Quality Management District (AQMD) Draft Air Quality Management Plan (AQMP) that was released on July 19, 2012. Listed below are the chapters and sections that we believe are particularly relevant to BVES operations, as well as associated background information and comments. It is important to note that BVES is under the jurisdiction of the California Public Utilities Commission (CPUC), and BVES' actions, therefore, must be approved by the CPUC prior to implementation.

Chapter 4, EDU-1: Further Criteria Pollutant Reductions from Education, Outreach, and Incentives (page 4-29)

Background: BVES has made a number of attempts to work with its customers in the area through discussions regarding renewable energy and energy efficiency measures. In 2005, BVES' parent company (Golden State Water Company) installed a 165 kW solar array in Apple Valley that is still in operation. The energy is used onsite, with excess generation contributing to Southern California Edison's grid.

Comment: BVES has implemented several energy efficiency programs for its customers that have been in place since 2009. Also, if approved by the CPUC, in 2013 BVES will offer incentives via the Bear Valley Solar Initiative (BVS). The BVS will offer rebates similar to those offered by the California Solar Initiative. BVES maintains its interest in trying to work with energy users in its area to promote energy conservation and efficiency. BVES is also seeking approval for a solar demonstration project called the Green Zone (Phase I). The Green Zone would include a rooftop solar array at BVES' offices. BVES welcomes AQMD and other support that may facilitate cooperative initiatives in the future.

X-1

Chapter 4, ONRD-01: Accelerated Penetration of Partial Zero-Emission and Zero-Emission Vehicles (page 4-31)

Background: BVES has been transitioning into the CPUC-adopted policies of AB 32. BVES evaluates, at least annually, how best to reduce its carbon footprint. BVES recently purchased hybrid vehicles as part of its fleet. BVES has considered purchasing some all-electric vehicles as part of its fleet, but due to BVES' service territory requiring 4-wheel drive capability during the winter season, and because all-electric vehicles are predominantly 2-wheel drive, BVES cannot yet justify acquisition of electric-only vehicles at this time.

Comment: BVES would be willing to consider potential electrification of a portion of its fleet. Additionally, BVES would be willing to work with the AQMD to investigate the options for installing a Plug-in Electric Vehicle (PEV) station for public use. A potential first step may be to design and send a survey to BVES customers to determine local interest in PEVs. Electricity rate structures that incentivize off-peak charging and other electricity use would be a major consideration for helping BVES to balance its loads and resources. Any changes to existing customer rate structures would require approval from the CPUC.

X-2

Chapter 4, Reductions from District's Stationary Source Control Measures (page 4-41)

Background: Appendix A-IV includes proposed measures for the reduction of pollutants from stationary sources that contribute to ozone, including VOC, NOx, and PM. In reviewing the appendix, it appears (Table IV-A-2) that measure MCS-03 applies to all stationary sources that involve start-up, shutdown, and related operations where emissions are not currently well understood. However, the corresponding discussion section for MCS-03 later in the appendix seems to apply only to refinery flares and similar operations.

Comment: BVES requests that the AQMD clarify that measure MCS-03 applies only to refinery and similar processes, and does not more generally apply to all stationary sources that have start-up and shutdown operations. BVES' Bear Valley Power Plant is a natural gas-fired peaking plant, and energy generation from its operations is not similar to refinery operations. BVES believes it is possible that the AQMD did not intend to include all stationary sources as part of MCS-03. If the AQMD did intend to include all stationary sources, then BVES requests that it become a member of the working group(s) that inventory, assess, and develop recommended control measures for start-up and shutdown operations.

X-3

Chapter 10, Efficiency Incentives and Financing (page 10-22)

Background: There are two basic forms of demand-side management. These are energy efficiency and demand response. BVES does not currently have a formal demand response program. In California, there are two general types of ratepayer funded energy efficiency programs. Those programs are low-income energy efficiency (LIEE), which provides direct install energy efficiency upgrades for income qualified residential customers; and non-income specific residential and nonresidential energy efficiency financial incentives/rebates (EE). BVES has offered the LIEE program since 2002 (now called Energy Savings Assistance, or ESA, Program); in its 2009 general rate case decision, BVES received approval to offer ratepayer funded EE rebate programs. BVES' non-low income EE Programs are designed to replace specific customer equipment (lighting, refrigeration, etc.) with more efficient equipment. These programs are now fully operational.

Comment: BVES already has an aggressive energy efficiency program. BVES is willing to consider expanding its programs further to incorporate additional, targeted activities that could contribute to the AQMD's goals of improving air quality in the South Coast Air Basin. Implementing such actions, as noted above, would be subject to the approval of the CPUC.

X-4

Chapter 10, Southern California's Energy Future (page 10-23)

Background: As noted above, if approved by the CPUC, in 2013 BVES will offer incentives via the Bear Valley Solar Initiative (BVSI). BVES is also seeking approval for a solar demonstration project called the Green Zone (Phase I).

Comment: If approved by the CPUC, the BVSI will offer rebates similar to those offered by the California Solar Initiative. The Green Zone would include a rooftop solar array at BVES' offices. As part of its Green Zone, BVES would be willing to consider adding a small demonstration wind turbine (Phase II) to further increase public education and awareness, and would also be willing to consider adding a location where the public can properly dispose of CFL light bulbs.

X-5

Chapter 10, Transformation of the Energy Sector (page 10-25)

Background: As noted above, BVES has made a number of attempts to work with customers regarding renewables and energy efficiency measures. BVES continues to support programs that help achieve air quality and energy goals.

Comment: BVES maintains its interest in participating in AQMD efforts that promote energy efficiency and renewables. BVES requests that it be notified in advance regarding upcoming opportunities to contribute to AQMD meetings, conferences, and workshops, including interagency working groups, and welcomes AQMD and other support that may facilitate cooperative initiatives in BVES' service territory in the future.

X-6

Responses to Comment Letter X
Bear Valley Electric

Response to Comment X-1:

Implementation of renewable energy projects such as the one mentioned are good examples of clean air and energy projects to be promoted. We will contact utilities with any support we might provide to incentivize these types of projects through utilities.

Response to Comment X-2:

Staff appreciates BVES's offer to partner to further expand the deployment of zero-emission vehicles in the Bear Valley region. Staff will keep BVES apprised of such opportunities.

Response to Comment X-3:

Control measure MCS-03 is carried over from the 2007 AQMP. Although the initial scope of review for startup, shutdown and turnaround activities is likely to focus on the minimization of potential flaring emissions at refineries, staff believes that it is possible to develop procedures that can lead to optimization, operational efficiency and emission minimization opportunities applicable to other industries.

The District approach under MCS-03 would be to initially focus on better quantifying emission impacts from startup, shutdown and turnaround activities at refineries, as well as analyzing emission reduction potential. Should the results of these analyses and emission assessments warrant further investigation, a review of potential emission reduction efforts would follow, including a determination of the applicability to other industries. Any subsequent rulemaking efforts would include technical feasibility, socioeconomic impact, and environmental impact assessments, including safety considerations, and certainly involve outreach to affected stakeholders.

Response to Comment X-4:

Staff appreciates your support on this measure and will work with utilities during implementation.

Response to Comment X-5:

Adding a wind turbine for educational purposes and cfl recycling program are good educational and resource components under this measure. As this measure is implemented we will keep these in mind and partner with utilities.

Response to Comment X-6:

We will provide outreach to inform utilities, the public, and other stakeholders in advance regarding meetings, conferences/forums, and workshops relating to implementation of this measure.

Y. Southern California Edison, August 31, 2012

August 31, 2012

Dr. Barry Wallerstein
Executive Officer
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

RE: 2012 Air Quality Management Plan

Dear Dr. Wallerstein:

Southern California Edison (SCE) appreciates the opportunity to comment on the South Coast Air Quality Management District's (District) proposed 2012 Air Quality Management Plan for PM_{2.5} (Plan or AQMP) and additional early action measures for ozone (Early Action Measures). Moving the District's air basins into attainment is a step toward improved air quality and improved economic growth by increasing the ability of businesses to operate in this region. The District's proposed Plan is an effective set of control measures that if adopted into rules by the District and other agencies will lead the region toward attainment with the National Ambient Air Quality Standards (NAAQS) for PM_{2.5} through cleaner transportation and stationary source technologies. SCE recognizes that adopting the control measures in the AQMP is the first step in the process through which the District, CARB and other agencies will develop the control measures into proposed rules, and that the rulemaking process is the point at which the detailed examination of issues such as cost-effectiveness, feasibility, total cost, environmental impacts and "upstream" energy sectors impacts will occur. SCE also recognizes that many control measures will not become rules but instead require the District and stakeholder community to secure additional funding sources to enable research, development and demonstrations as well as education programs and incentive based commercialization programs. SCE supports this overall direction and effort to bring the region into attainment with NAAQS.

Regarding the Early Action Measures, SCE shares the concerns expressed by CCEEB regarding the legally binding reductions associated with the measures (not with the concepts in the measures). CCEEB is suggesting an alternative approach in which, if these reductions were not met, other sources in the District would not be penalized. We believe this approach is worthy of exploration.

SCE also recognizes that, occasionally, past control measures have not been developed successfully into rules because of issues discovered in the rulemaking process, and that the result was that other rules on different source categories or new incentive programs were developed to replace the emission reductions from the original proposed measures. Given this challenging situation, SCE will continue to work with the District, community stakeholders, and other agencies to determine the most cost-effective, least impact rules resulting from the control measures in this AQMP and to secure funding for cost-effective pollution reductions from incentive programs.

Y-1

Additionally, SCE stresses the need for reform of the New Source Review requirements. The current emission reduction credit (ERC) shortage has resulted in the lack of ability to site new needed natural gas fired electric generation. Unless this problem is resolved, the reliability of the region's electric supply system is at significant risk. Moreover, the District's vision of relying more on electricity to provide clean power for the transportation sector will be threatened. SCE is participating in the Regulatory Flexibility Group represented by Latham & Watkins to develop alternatives to the present NSR process to achieve the goals of the Clean Air Act. The District should look closely at these methods and integrate the ideas into the District's approach to make needed changes to the program.

Y-2

SCE is working with the District to facilitate development of goods movement electrification and public awareness for plug-in electric vehicles. These two programs complement the direction taken in the AQMP for PM_{2.5} reduction measures, and in the Early Action Measures for ozone reduction. We also are collaborating with the District and the Southern California Association of Governments (SCAG) to develop plans for new infrastructure for the next AQMP in 2015.

As SCE mentioned in our September 2011 letter on the District's draft Air Quality Related Energy Policy, we believe it is important for the District to work with other state agencies to ensure there is consistency in the state's energy and environmental policies. The District continues to demonstrate inter-agency collaboration in this AQMP and the related Vision for Clean Air process. SCE reiterates our interest working with the District and other agencies to examine complex issues holistically, especially in the rule development process in order to help understand both the positive role that electricity can play in helping meet NAAQS attainment and the impacts of proposed rules on the operation and affordability of the electric energy supply system.

We look forward to continued work with the District on this AQMP and Early Action Measures. Our comments on some specific parts of the Plan follow.

1. Support for Further Controls on Emissions from Berthing of Ships and Port Drayage Trucks

SCE supports control measure ONRD-05, that calls for CARB to develop a new rule by 2015 to require port drayage trucks that service rail yards within five miles of the port to have zero-emission miles by 2020. We also note that four of the five suggested technologies will have significant impacts on the electricity grid, and recommend the examination of this and related "upstream" issues in the rule-development process.

If the grid-connected approach is found to be the preferred approach in the rule development progress, then we note the need to also solve the shortage of ERCs which makes the siting of new generation (likely needed to support ONRD-05) very difficult in the South Coast Air Basin.

SCE supports control measure OFFRD-05, that calls for CARB, SCAQMD, and the San Pedro Bay Ports to develop a rule which, through grid connection or alternative means, further reduces emissions from ocean-going marine vessels while at berth. As with ONRD-05, impacts on the grid and the requirements for adequate generation will need to

Y-3

be examined in the rule development process. SCE also supports the proposed backstop rule for the ports (IND-01).

2. Support for Early Actions to Deploy Advanced Control Technologies

SCE supports the efforts to accelerate the commercialization of advanced control technologies, including the aforementioned electrification technologies in control measures ADV-01, ADV-02, ADV-03, ADV-04, and ADV-06. SCE can provide assistance, as appropriate, to the District regarding aspects of the draft early action control measures' proposed actions, including:

- o Seeking of funding sources
- o Evaluation of technology options and funding mechanisms
- o Demonstrations
- o Deployments and field evaluation / testing
- o Working groups that will examine electrification among other alternatives, and
- o Technology symposiums.

Commercializing new technologies is not easy. The normal process of research, development, prototypes, field testing/demonstrations, and large-scale deployment must be implemented. The AQMP has thoughtfully considered the complexity of the issues and processes and provided time for each stage.

Y-4

3. Support for Continuation and Expansion of Incentive Funds

SCE supports control measures (ONRD-01 and ONRD-03) to extend or supplement the funding of two existing CARB rebate programs (HVIP and CVRP) in order to encourage the purchase of the cleanest on-road vehicles. These programs are important because they encourage the transition to near-zero and zero-emission vehicles.

SCE supports control measures (ONRD-02 and ONRD-03) to fund accelerated retirement of older light-, medium-, and heavy-duty vehicles with a focus on small fleets and/or vehicles that are high-emitting in between smog check tests. SCE similarly supports the similar control measures for off-road equipment (OFFRD-01 and MSC-04C). We further request the inclusion of a sliding-scale incentive in the final control measures, when outlining the design of the proposed voucher program for purchase of a replacement vehicle or equipment. The replacement voucher should provide a larger incentive for the purchase of near-zero and/or zero-emission vehicles/equipment and use a definition that considers multiple environmental issues.

Y-5

4. Support for Continued Education and Outreach

SCE supports EDU-01, which will be used to educate the general public on the environmental benefits of energy-efficiency measures, and the environmental impacts of using high-VOC solvents and cleaners. The general public, in most cases, does not see the clear benefit to air quality that results from their own reduced energy use. We believe this education program will help the public understand this critical connection. In many cases the general public is not aware of the effects caused by the use of certain cleaning products and coating materials. Education on the contribution of VOCs to

Y-6

ozone creation would allow for well-informed consumers to understand the need for changes in cleaning solvents and coatings in order help reduce harmful air pollutants.

SCE also supports education outreach on the use of plug-in electric vehicles and battery electric vehicles as a means to reduce air pollution and move the South Coast Air Basin toward attainment with the NAAQS. Education and outreach in this area would be in agreement with the goals of the District's 2011 Air Quality Related Energy Policy.

Y-6

5. SCAG Control Measures (Appendix IV-C)

With regard to Appendix IV-C, Regional Transportation Strategy and Transportation Control Measures (TCMs), many of the strategies and TCMs improve efficiency of the existing system and would have no impact on SCE operations. However, the measures in Appendix IV-C call for more than \$150 billion in capital improvements (funded and unfunded) to the local transit, commuter, and high-speed rail and goods-movement systems (pages 7-8), many of which include a "zero or near-zero" emissions component. As noted above, this expansion of electric transportation would have an impact on the electric system and the need for new transmission, distribution and generation, and is yet another example of the need to address New Source Review reform. Another issue that is not clear from TCM Emissions Tables 1 & 2 is whether the District has accounted for emissions from the construction and operation of energy infrastructure to feed the increase in electric, natural gas, and other alternative fuels. While page 10 of the appendix recognizes the need for improved infrastructure planning and investment to support alternative-fueled vehicles, it does not discuss if any TCMs will be updated or amended to account for and support the development of the required infrastructure.

Y-7

SCAG is a strategic partner in a regional effort to accelerate fleet conversion to near-zero and zero-emission transportation technologies. A significant expansion of alternative-fuel infrastructure is also needed throughout the region to accommodate the anticipated increase in alternative-fueled vehicles. SCE is working with SCAG and the District to develop a framework for the necessary infrastructure changes.

SCE encourages the District to support development of infrastructure for alternative-fueled vehicles as part of future TCMs in the 2015 AQMP. Example locations include destination locations or locations such as park-and-ride lots where vehicles park for long period. Future TCMs could also include monetary or non-monetary incentives to encourage infrastructure for zero and near-zero emission transportation. Similarly SCE urges consideration of publicly accessible car-share services to serve as a critical component to completing the "last mile" of trips taken by transit.

6. SCE Supports INC - 01

This proposal will incentivize conversion to near-zero and zero-emission technology for boilers, water heaters, and space heating. These technologies, if developed, could have a significant impact in reducing criteria pollutant emissions. SCE looks forward to the development of this control measure and the introduction of new technology in this area.

Y-8

7. SCE Supports INC - 02

The Southern California region is still suffering the effects from the economic downturn. This control measure would seek to address that by calling for incentives for companies to manufacture zero-and near-zero emission technologies locally. Specifically, the incentives are to include expedited air permits and facilitation of the applicable CEQA documents. The call for accelerated permitting for these new technology projects is an important element for success since there are substantial costs associated with delays during the permitting process.

Y-9

8. Define the Term "zero emissions" Broadly to Include Other Environmental Considerations

The AQMP appropriately recognizes the interrelatedness of air quality and air toxics issues with other environmental issues such as climate change and water quality. SCE recommends the AQMP continue to do this by defining the term "zero emissions" in a broad manner so as to include other environmental considerations. Similarly, the term "near-zero-emissions" should be defined in a broad manner, but keep the AQMP's flexibility to define "near-zero" differently for different control categories.¹

Y-10

Southern California Edison appreciates the work that has been put into the AQMP and we look forward to working closely with the District during the rulemaking process.

Sincerely,

Michael Hertel

¹ Draft 2012 AQMP Appendix IV-B-5.

Responses to Comment Letter Y
Southern CA Edison

Response to Comment Y-1:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large “black box” in the existing approved 2007 AQMP (241 fpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NOx and VOC emission reduction commitments contained

in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment Y-2:

District staff is committed to continue to work with all stakeholders in exploring and evaluating alternative approaches and/or enhancements that will ensure the long-term viability of the New Source Review program in meeting the Clean Air Act goals and future demands of our region.

Response to Comment Y-3:

Staff appreciates SCE’s support for the ozone implementation measures. As these measures are implemented, the energy demands and capacity will be analyzed and further actions may be needed to enhance current infrastructure. Such analyses will be conducted with all stakeholder input.

Response to Comment Y-4:

See Response to Comment Y-3.

Response to Comment Y-5:

The incentives measures provided in the AQMP recognize on-going funding programs and the need for such programs in the 2015 – 2023 timeframe. The on-going funding programs do contain a “sliding scale” for funding cleaner technologies. We would expect to have a similar approach with any new programs.

Response to Comment Y-6:

We appreciate your support for this control measure and willingness to work with AQMD on implementing this measure.

Response to Comment Y-7:

Staff appreciates the comments regarding the need to expand the alternative fuel infrastructure. By definition in EPA's conformity rules, TCMs are projects and programs that reduce emissions or concentrations of air pollutants from transportation sources by reducing vehicle use or changing traffic flow or congestion conditions. Per the U.S. EPA's Transportation Conformity Regulations, vehicle technology-based, fuel-based, and maintenance-based measures which control the emissions from vehicles under fixed traffic conditions are not TCMs.

For the next South Coast Ozone SIP, SCAG will consider holding interagency consultation via SCAG's Transportation Conformity Working Group to discuss whether monetary or non-monetary incentives to encourage infrastructure for zero and near-zero emission transportation could be considered as TCMs.

Response to Comment Y-8:

We appreciate support for this measure and developing/implementing zero and near-zero new technologies.

Response to Comment Y-9:

The District recognizes the effects of the recent recession (see Chapter 1) and has strived to develop a cost-effective control strategy that seeks necessary emission reductions from actions with minimal impact on affected sources and the economic recovery effort. Creative measures, such as INC-02, have been developed to incentivize the manufacturing zero and near-zero emission technology by easing the potential burden of the permitting and CEQA process. We appreciate your support.

Response to Comment Y-10:

Staff appreciates the comments regarding the definitions of zero and near-zero emission technologies. As indicated in the ADV measures, staff is seeking every opportunity to commercialize and deploy zero-and near-zero emission technologies as early as possible and where such opportunities are most appropriate.

 Diamond Bar, CA 91765

Subject: Comments of the Draft 2012 Air Quality Management Plan and Notice of Preparation

Dear Dr. Wallerstein:

The Orange County Council of Governments (OCCOG) welcomes its responsibility to comment on the Draft 2012 Air Quality Management Plan (AQMP) and Notice of Preparation (NOP). Additionally, efforts to reach out to Orange County local jurisdictions and stakeholders by the South Coast Air Quality Management District (AQMD) staff and yourself have been well received.

Given the timing of the 2012 AQMP comment period, the comments below have not been considered by the full OCCOG Board of Directors. The OCCOG Technical Advisory Committee and an ad-hoc group of local jurisdiction have reviewed the draft and their input is included below. We have also collaborated on further review with other stakeholders such as the Association of California Cities-Orange County. I believe these preliminary comments to be a reflective consensus review of OCCOG's 39 member agencies based on what we know to date. As additional information related to the AQMP is released, we may have additional comments.

1. OCCOG is concerned that some required documentation related to the AQMP is, as of the writing of this letter, still not available for review. Specifically the socio-economic report has yet to be released. This document is crucial for local jurisdictions to review. OCCOG requests that all AQMP support documents be released as soon as possible and that the public comment period be extended an additional 45-days to allow for required review and comment. While it is unclear as to when comments are officially due, we have been told by AQMD staff that comments received by August 31, 2012 will be responded to. OCCOG desires to have a response to our comments.

Z-1

Dr. Barry Wallerstein
August 31, 2012

2. The draft 2012 AQMP is required to address PM 2.5, not ozone, yet ozone is addressed throughout the draft 2012 AQMP. This is distracting to the primary review. It is recommended that the references to ozone and the proposed control measures to address ozone be postponed for further discussion of the 2015 AQMP.
3. Should the AQMP continue to include references to ozone and control measures, we strongly suggest that they are included in an appendix to the document and not in the AQMP itself. Further, OCCOG requests that it be clearly stated throughout the document and in any adopting resolution that the ozone control measures are strictly VOLUNTARY.
4. OCCOG is also interested in how ozone control measures will be addressed in the Draft Environmental Impact Report (DEIR). Since the ozone control measures are voluntary, they should not be included as mitigation measures in the DEIR but should be referenced in an appendix as Best Management Practices that can be voluntarily implemented.

Z-2

Z-3

Z-4

Again, OCCOG appreciates the opportunity to provide preliminary comments on the 2012 AQMP and NOP. We look forward to working with AQMD on a final plan that balances environmental stewardship with the need for projects and programs needed to keep Orange County moving forward. We look forward to receiving your response to our comments.

Respectfully,

Leroy Mills
OCCOG Chairman

cc: OCCOG Board of Directors

Responses to Comment Letter Z
OCCOG

Response to Comment Z-1:

AQMD staff agrees that the 2012 AQMP development schedule was initially compressed. The attainment demonstration modeling could not begin until input data from SCAG's 2012 RTP and CARB's emissions inventories were available. AQMD staff has made every effort to provide all data and information to the public as soon as it became available in an open and transparent process. The review period for many of the documents has also been extended, additional workshops and regional public hearings have been added, and the Governing Board adoption hearing date has been delayed to December 2012. The AQMD staff is committed to providing sufficient time for public comment, and continues the enhanced outreach efforts to all stakeholders, while keeping the U.S. EPA submittal deadline in December of 2012 in mind.

Response to Comment Z-2:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically adopted in regulatory form at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called "black box" emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large "black box" in the existing approved 2007 AQMP (241 fpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NO_x and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment Z-3:

Please refer to response to comment Z-2 with regard to the ozone control strategies and measures.

Response to Comment Z-4:

Since the ozone control measures are included as part of the 2012 AQMP, they are analyzed under CEQA in the same way that the PM_{2.5} control measures are analyzed. They are not treated as mitigation measures nor are they treated as best management practices. Regardless of whether or not the ozone control measures are voluntary measures, the analysis takes a conservative approach, uses the assumptions regarding affected sources in the control measure, and analyzes potential environmental impacts accordingly. This approach is consistent with CEQA requirements to analyze the project in its entirety. In addition, the CEQA document does include an alternative of a PM_{2.5} control only strategy.

Re: Draft 2012 Air Quality Management Plan

To Whom It May Concern:

This letter is submitted on behalf of the County of Orange ("County") in its capacity as the owner and operator of John Wayne Airport, Orange County ("JWA"). This letter contains JWA's written comments on the Draft 2012 Air Quality Management Plan ("2012 AQMP") issued by the South Coast Air Quality Management District ("SCAQMD" or "District") in July 2012. JWA appreciates the opportunity to comment on the 2012 AQMP, which is an important planning and regulatory document for purposes of improving air quality in the South Coast Air Basin. In order to advance the overall objectives of the District, and the 2012 AQMP, JWA offers the following comments:

A. ABSENCE OF AIRPORT-SPECIFIC INVENTORY DATA

As noted in our July 27, 2012 comment letter on the District's Notice of Preparation and Initial Study for the 2012 AQMP, in early May 2012, JWA provided the District with aircraft activity data specific to JWA for incorporation into the 2012 AQMP. JWA provided additional airport-specific data in a number of enclosures to its July 27 letter. In light of JWA's good faith efforts to provide accurate baseline information on airport operations, we anticipated that the 2012 AQMP would include emissions inventories specific to the aviation sector on an airport-by-airport basis.

However, based on our review of the 2012 AQMP, it is difficult to discern whether the airport-specific data provided by JWA was utilized when preparing the aviation forecasts. There is little information in the 2012 AQMP on the aviation forecasts; and, JWA is not broken out in the forecasts as all aviation sector emissions – from 43 airports – are reported on a combined basis.

Relative to the emissions estimate for the 2012 AQMP's 2008 base year, page III-1-15 of Appendix C states that the "sources of activity data included airport operators (for several commercial and military airports), Federal Aviation Administration's (FAA) databases ..., and SCAG's projections." Relative to future emission projections, as provided on page 3-9 of the 2012 AQMP:

"For commercial air carrier operations, SCAG's 2035 forecast, which is consistent with the forecast adopted for the 2012 RTP, reflects the future aircraft fleet mix. The emissions calculation methodology is primarily based

3160 Airway Avenue

949.252.5178 fax
www.ocair.com

AA-1

South Coast Air Quality Management District
August 31, 2012
Page 2

on the application of FAA's [EDMS] model for airports with detailed activity data for commercial air carrier operations (by aircraft make and model). For other airports and aircraft types (i.e., general aviation, air taxi, military), the total number of landing and takeoff activity data is used in conjunction with the U.S. EPA's average emission factors for major aircraft types (e.g., general aviation, air taxi, military)."

Further, Appendix III of the 2012 AQMP states that "[a]ircraft GHG emissions were determined from jet fuel consumption in California from the Energy Information Administration. The fuel consumption for the Basin was obtained by a ratio of the SOx emissions for the state and the Basin."

As a result of the ambiguities concerning what aircraft activity data specific to JWA was utilized in preparing the emissions inventories presented in the 2012 AQMP, JWA authorized one of its consultants – Fred Greve of Landrum & Brown – to contact SCAQMD and request additional information regarding the emissions inventories' data inputs. On August 28, 2012, Mr. Michael Krause (SCAQMD) provided Mr. Greve with a copy of the *Aircraft Emissions Inventory For 2008 and 2035* (August 2012) prepared by Integra Environmental Consulting, Inc. ("Integra Report") for the District.

Because Mr. Greve did not receive the Integra Report until three days before the close of the public comment period on the 2012 AQMP, JWA is not able to provide detailed comments on the assumptions utilized in preparing the 2012 AQMP's emissions inventories at this time. However, JWA will expeditiously review the Integra Report and anticipates providing additional comments, as necessary, by Friday, September 7, 2012.

B. CONTROL MEASURE REQUIRING FURTHER EXPLANATION

Based on our review of the control measures outlined in the 2012 AQMP, we also have the following specific comment.

ADV-07, Actions For The Deployment Of Cleaner Aircraft Engines, calls for the District to "work with the airlines and local airport authorities to *develop mechanisms to route the cleanest aircraft to serve the South Coast Air Basin.*" (2012 AQMP, p. 4-40; italics added.) The parameters of this measure need to be better explained in order to verify that the regulatory purview of the District and local airport authorities is not being incorrectly described because neither the District nor airport operators can ensure that only the "cleanest aircraft" operated by commercial airlines serve the basin; such a requirement would trigger federal preemption and interstate commerce implications.

AA-1

AA-2

South Coast Air Quality Management District
August 31, 2012
Page 3

In 2010, and as acknowledged in the 2012 AQMP (page 4-40), the FAA initiated the Continuous Lower Energy, Emissions and Noise ("CLEEN") Program. The CLEEN Program is designed to spur the creation of aircraft technology that reduces fuel burn, energy consumption, greenhouse gas emissions, NOx emissions associated with the landing-and-takeoff cycle, and noise. To the extent that ADV-07 is intended to provide support for the CLEEN Program, JWA has no immediate objections. However, to the extent that ADV-07 is intended to impose some other affirmative obligation on the District or local airport authorities to regulate the aircraft fleet mix serving the South Coast Air Basin, JWA objects to the measure as being incompatible with the jurisdictional authorities and powers of both the District and airport owners/operators. Therefore, JWA requests that the 2012 AQMP be revised to provide more information on the ultimate intent of ADV-07.

AA-2

C. EXPANDED SCOPE OF 2012 AQMP

As provided in the 2012 AQMP's Preface, the "primary task" of the 2012 AQMP is to bring the South Coast Air Basin into attainment with the federal National Ambient Air Quality Standards ("NAAQS"). This particular AQMP is focused on achieving the U.S. Environmental Protection Agency's NAAQS for fine particulate matter ("PM_{2.5}") by 2014, and ozone by 2023. Nonetheless, the scope of the 2012 AQMP is broader than its stated regulatory purpose. More specifically, the 2012 AQMP includes two chapters – Chapter 9 (Near Roadway Exposure and Ultrafine Particles) and Chapter 10 (Energy and Climate) – that address issues beyond the current regulatory framework established by the U.S. Environmental Protection Agency via the NAAQS program, including ultrafine particles, black carbon, and greenhouse gases.

JWA supports further study and evaluation of ultrafine particles, black carbon, and greenhouse gases so that future regulatory or rulemaking efforts, if any, are fully informed. That being said, JWA is concerned about the inclusion of such discussion in the 2012 AQMP, and fears that it may confuse the public regarding the current scope of regulated pollutants. Therefore, JWA encourages the District's Board to adopt a focused, on-point AQMP that exclusively addresses achievement of the PM_{2.5} and ozone NAAQS; the issues addressed in Chapters 9 and 10 of the current draft of the 2012 AQMP then can be separately addressed through the consideration and adoption of stand-alone policy documents considered by the Board.

AA-3

JWA also supports such a bifurcated approach in light of the expedited public review and hearing process that District staff has identified for the 2012 AQMP. Stated differently, while the federal Clean Air Act requires submittal of a plan by December 14, 2012 outlining how the District will achieve the NAAQS for PM_{2.5} in the South Coast Air Basin (see 2012 AQMP, p. ES-2), there is no such deadline for ultrafine particles, black carbon, and greenhouse gases, which are not regulated by NAAQS. We believe it would be prudent for the District and the stakeholders to focus their attention on NAAQS achievement within the narrow window of time available; other air quality-related issues can be addressed via a separate and subsequent process.

South Coast Air Quality Management District
August 31, 2012
Page 4

In closing, JWA thanks the District again for this opportunity to comment on the 2012 AQMP. We look forward to engaging in an open, thorough and responsive public process on the 2012 AQMP, and continuing to assist the District with its efforts to improve air quality in the South Coast Air Basin. If you have any questions regarding the comments set forth in this letter, please do not hesitate to contact me at your convenience.

Sincerely,

Alan L. Murphy
Director

Michael Krause, South Coast Air Quality Management District

Responses to Comment Letter AA
John Wayne Airport

Response to Comment AA-1:

AQMD staff has revised the draft emissions inventory to reflect the updated information provided by the airport authority.

Response to Comment AA-2:

Control measure ADV-07 recognizes the efforts with the CLEEN Program to develop cleaner aircraft engines. However, in order to route cleaner aircraft to region, the AQMD staff is proposing to work with the local airport authorities to determine if there are mechanisms, which may include incentives, that will bring cleaner aircraft to the region. We recognize that this effort will involve state and federal agencies and the airlines.

Response to Comment AA-3:

Chapters 9 and 10 of the Draft 2012 AQMP are informational only, and do not contain any SIP-related commitments. As you state, the issues surrounding GHG emissions and near roadway exposure to non-regulated pollutants such as ultrafine particles and black carbon are important topics of concern to Southern California residents. These chapters merely provide background information to inform potential future actions. In Chapter 9, it is clearly stated that ultrafine particles are as yet unregulated in the U.S. One of the main purposes of Chapter 10 is to describe the air quality implications of California's regulatory GHG programs. The Energy discussion in Chapter 10 is a direct follow up to our Governing Board's Air Quality-Related Energy Policy adopted last year, and the inclusion of Chapter 10 in the AQMP is one of the specific actions (Action 10) called for in this Policy. Therefore, we feel these chapters help to educate, rather than confuse, the public regarding the information and current regulatory framework for these pollutants.

RE: Initial Comments – 2012 Draft AQMP

Dear Dr. Chang,

The California Council for Environmental and Economic Balance (CCEEB) is a coalition of business, labor and public leaders that strives to advance collaborative strategies that protect public health and the environment while allowing California's economy to grow. CCEEB greatly appreciates the time that you, Dr. Wallerstein and your staff have spent with CCEEB and other stakeholders in developing the draft 2012 Air Quality Management Plan. The following are CCEEB's initial comments.

Scope

EPA requires the SCAQMD to submit a 2012 AQMP to show attainment of the 2006 24-hour PM_{2.5} standard by 2014. EPA does not require this plan to address ozone. CCEEB is well aware of the enormous challenge facing the District with regard to ozone, but we are highly concerned about including an "early action" ozone strategy with associated legally binding emissions reductions when not required by EPA.

A good example of our concern can be found with Proposed Control Measure OFFRD-01 "Extension of the SOON (Surplus Off-Road Opt-In for NO_x) Provision for Construction/Industrial Equipment." It commits the District to a 7.5 tpd NO_x reduction by 2023. This is a highly ambitious goal (half the inventory for this category) that relies on \$30 million per year of incentive funding. The District has no history of achieving reductions of this magnitude from one source category in such a short time. Our concern is not with the measure, but with the legally binding commitment as part of the State Implementation Plan (SIP). If the funding source for this program falls short, it is unlikely the reductions will be met. If this were to occur, the District would be required to make up the shortfall by turning to other sources. We suggest that the staff recommendation to the Board should identify this control measure, as well as all control measures in the ozone strategy (with suggested changes), as a locally approved measure only, and not submitted to EPA as part of the SIP. As a locally approved measure, other

BB-1

Elaine Chang, Dr. P.H.
August 31, 2012
Page 2

sources in the District would not be penalized for failure to achieve targeted reductions under this measure.

CCEEB is aware that as a result of a court order, EPA staff is close to providing the District with guidance, a SIP call or other information associated with the federal one-hour ozone standard. Should that material influence our views on this AQMP, we will notify you in a timely manner.

With regard to scope and SIP submittal for this plan, CCEEB recommends the following:

- For the PM_{2.5} - 24 hour standard, adopt the plan (with suggested changes) and include as part of SIP.
- For measures in the ozone strategy, keep them in plan (with suggested changes) and seek Board approval as locally approved measures, but do not include them in the SIP.

RECLAIM

CCEEB has several comments with regard to RECLAIM. Our primary concern is the multiple shaves in the NO_x RECLAIM market over the next few years. The Southern California economy is slowly recovering from recession. Particularly in this fragile period, businesses in the RECLAIM program want greater certainty in order to plan needed emission reduction programs and to assess the market. As currently proposed, facilities would face a 2-3-tpd shave in 2014. In a second phase, staff would determine the amount of the shave through an extensive BARCT analysis. An additional shave will likely be included as a control measure in the 2015 AQMP. Finally, as discussed above, we have yet to see the SIP call for the one-hour ozone standard, and we are concerned that it may result in a RECLAIM shave as well.

We recognize that any shave to meet the SIP call may be in-lieu of the 2015 shave, but even under this scenario, the NO_x RECLAIM community is facing at least three shaves in a very short period of time. Because so little is known about these shaves, (percent reduction, timing, impacted facilities, etc.), a high level of uncertainty results for those in the program. Business decisions necessary to establish long-range capital and compliance plans are severely jeopardized due to a lack of certainty.

Our next area of concern with regard to RECLAIM is its inclusion as a control measure for PM_{2.5} (CMB-01). We believe using NO_x RECLAIM to achieve PM_{2.5} reductions is not cost-effective. We instead suggest taking credit for the NO_x emissions associated with "Further Reductions from Residential Wood Burning Devices" (BCM-01) and "Further Reductions from Open Burning" (BCM-02).

In addition to the shaves discussed here, we ask staff to further explain the accounting of the shave that occurred from 2008 to 2011. Specifically, what happened to the 3.7 tpd of NO_x reduction and how was this reduction applied to the SIP? We note that 3.7 tpd of NO_x equates to .26 tpd of PM_{2.5}, a reduction that would help show attainment of PM_{2.5}.

BB-1

BB-2

Elaine Chang, Dr. P.H.
August 31, 2012
Page 3

During a recent meeting of the AQMP Advisory Committee, members were told that there is zero cost associated with a RECLAIM shave if there is a surplus in the system. We do not agree. Based on our review of recent data, there is no surplus for the top 24 emitters. These facilities will incur significant cost, either through the purchase of credits or the installation of pollution control equipment. We ask for greater clarification on this point.

BB-2

In summary with regard to RECLAIM, CCEEB recommends that staff delay implementation of all RECLAIM measures until the next required ozone submittal. At that time, any reduction should be based on a complete BARCT analysis.

Cost Effectiveness

The current draft identifies additional steps necessary to approve a measure that exceeds certain cost thresholds. We support the concept of including such language in the plan, but encourage staff to consider additional steps or a cap, to limit exposure to all stakeholders. There is strong sentiment, particularly with respect to the ozone aspects of the plan, that there is no limit to the ever-spiraling costs of the ozone precursor control measures. At some point, the cost of the draft plan will become unbearable and a legislative fix, as discussed in Board committee meetings, must be undertaken. We look forward to seeing the full socio-economic report and hope that it will address this concern.

BB-3

Enhanced Environmental Analysis

CCEEB notes that in Chapter 9 (Near Roadway Exposure and Ultrafine Particulates), there is discussion of an enhanced environmental analysis for projects that would locate sensitive populations close to freeways. In particular, the plan states, "Because of the District's concern about the potential public health impacts of siting sensitive populations within close proximity of freeways, District staff will continue to recommend that, prior to approving the project, lead agencies consider the impacts of air pollutants on people who will live in a new project and provide mitigation where necessary." CCEEB supports this approach. In addition, we suggest that you consider broadening the approach so that it also applies to all projects that would locate residences near industrial facilities.

Responses to Comment Letter BB
CCEEB

Response to Comment BB-1:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large “black box” in the existing approved 2007 AQMP (241 fpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NOx and VOC emission reduction commitments contained

in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

The commenter suggests it would be appropriate to include the ozone measures as part of the locally adopted AQMP, but not included as enforceable SIP measures. Staff disagrees. With so little time remaining to replace the “black box” with concrete measures, it is important that the relatively modest proposed ozone measures be committed and enforceable. This action will demonstrate that the region and state fully intend to attain the 8-hour ozone standards on time and are committed to the actions needed to do so. The committed reductions represent a small fraction of total reductions needed (i.e., approximately 5% of needed NO_x reductions). Therefore, should substitution measures be needed to meet the SIP commitment, they most likely are needed anyway to meet the standard.

Response to Comment BB-2:

The two tons per days reduction proposed for the 1st phase of the RECLAIM shave will be incorporated as a contingency emissions reduction measure to satisfy CAA requirement to be triggered only if the NAAQS is not attained by 2015. The BARCT assessment phase of the NO_x RECLAIM shave is to be completed in 2015 and fully achieved by 2020. Approximately 30 percent of the RTC’s in the NO_x RECLAIM market are currently not being utilized. The 2 TPD shave proposed in the 2012 AQMP represents approximately 25 percent of the un-used RTC’s in the RECLAIM universe. The 2 TPD target will have only a minor impact on the stakeholders as a whole, recognizing that there will be buyers and sellers individually.

Moving the proposed RECLAIM shave control measure to the 2015 ozone AQMP could postpone full implementation of the Phase II reduction to a later date. Staff believes that there are currently sufficient unused RTCs available in the RECLAIM market to provide a cushion for the transition. As part of the Phase II BARCT assessment technology availability, cost, and market impacts will be thoroughly addressed. The rule making process will undergo a fully transparent public evaluation of the potential for emissions reductions coupled with the key element of the BARCT

assessment listed above. It should also be noted that the state law requires the RECLAIM program not only undergo periodic BARCT review, but also achieve equivalent reductions as the command and control program.

As previously stated, as of the most recent RECLAIM annual report (July 2012), there existed approximately a 30 percent surplus of unused credits in the market. Overall, there is expected to be no regional socioeconomic impact associated with the 2 TPD shave since the impact to buyers will be offset by the gains made by the sellers in the market. Staff recognizes that some stakeholders will be impacted whereby they would need to ascertain additional RTC's to meet the shave requirement. Conversely, others will be able to sell surplus credits at profit. The potential costs to some stakeholders will be analyzed during the rule making process.

Response to Comment BB-3:

The Socioeconomic Report on the 2012 AQMP was released on September 28, 2012, and includes the costs, benefits, and employment impact from implementing the Plan. Most of the proposed control measures (see Appendix IV-A and Appendix IV-B) include cost effectiveness values in dollars per ton of emission reduction, and the proposed control measures are ranked (see Chapter 6 of the Plan) based on these cost effectiveness values. As noted in Chapter 4 of the Plan, the District proposes to establish a cost effectiveness threshold of \$16,500 per ton of VOC reduction and \$22,500 per ton of NO_x reduction. This threshold will trigger further analysis and a Board pre-hearing before the final rule proposal is presented. Only one control measure, CTS-01, has the potential to exceed the VOC threshold on the upper end of the cost effectiveness range. All the other proposed control measures have a cost effective value less than the threshold. Regardless, it should be noted that during rule development a public review and decision process is instituted to seek lower viable cost alternatives.

Response to Comment BB-4:

Staff appreciates CCEEB's support on the District's approach encouraging an enhanced environmental analysis for projects that would locate sensitive populations close to freeways. Staff also agrees that broadening the approach for all projects would locate residences near industrial facilities, particularly those facilities that would pose a health risk, is health protective. CARB's Air Quality and Land Use Handbook does address locating residences and other sensitive land uses near certain types of industrial facilities and provides recommended siting distances. As part of the AQMD's Clean Communities Plan, the AQMD staff will be developing a document entitled "Proximity Matters." This document will expand the list siting recommendations included in CARB's handbook as well as provide additional guidance to reduce exposure toxic air contaminants to residential and sensitive land uses.

Subject: Comments on the Draft 2012 Air Quality Management Plan

Dear Dr. Chang:

Paramount Petroleum Corporation (Paramount) appreciates the opportunity to comment on the Draft 2012 Air Quality Management Plan. Paramount requests that the South Coast Air Quality Management District reconsider the magnitude of NOx reductions proposed in CMB-01 phase 1 and phase 2, as significant financial harm may result to regulated entities from the proposed measures.

In Appendix IV-A of the Draft 2012 AQMP it is stated that the estimated target reduction on a tons per day basis of NOx RTC allocations will account for approximately 38-63 percent of unused RTC holdings. The NOx RTC availability was analyzed for years 2008, 2009, and 2010. Due to recent economic downturn these three years are not representative of potential emissions under normal or preferred financial conditions. Should RECLAIM facility operators have the opportunity to return to the capacity they were at prior to this time period, the proposed NOx shave will have significant negative impacts on their ability to do so. Paramount therefore requests that the District take into account not only the potential for growth within the RECLAIM universe, but also take into consideration the emissions from past years when many facilities were operating under more favorable economic conditions and therefore higher

CC-1

U:\AQMP update 2012\Draft 2012 Air Quality Management Plan_Comments.doc PPC File 12.103.150

14700 Downey Avenue
P.O. Box 1418
Paramount, CA 90723-1418
(562) 531-2060

capacities. Considering all these facts, the magnitude of the proposed NOx RTC reduction will be largely detrimental.

CC-1

Additionally please take into account the fact that many facilities retain a buffer of RTCs as a precautionary measure to avoid potential future compliance issues. This buffer accounts for a significant portion of the current unused RTC holdings that the District plans to target for reductions. The significance of the NOx RTC reduction would therefore be under accounted for by the assumption that all unused RTCs are available or otherwise not needed on the market. When realized, the actual percentage of the unused RTCs that the proposed reduction will eliminate will be much greater.

CC-2

Thank you again for the opportunity to participate in the AQMP process. If any additional information is required, please contact Rebecca Nolan at (562) 748-4706.

Regards,

June Christman
Managing Director of Environmental Affairs

Responses to Comment Letter CC
Paramount Petroleum

Response to Comment CC-1:

District staff has factored the potential of growth in the estimation of future emission inventory and will include growth to refine the emission reductions (or shave) during the rule development phase of CMB-01. Please note that the petroleum industry has firmly asserted that its growth factor is 1.0 (or no growth) ever since the inception of the RECLAIM program. Economic downturn may result in a small increase in RTC surplus (as shown in the RECLAIM audit reports, the surplus for 2009-2010 were 29%-30% of the total allocations in comparison to the surplus of 17%-23% for 2002-2008.) The audit reports reveal that under the favorable economic conditions, there is an average of about 20% surplus RTCs for each compliance year, or about 26.48 tpd x 20% = 5 tpd. This 5 tpd surplus coincides with the upper end of the emission reduction range (3 tpd -5 tpd) proposed by CMB-01. The District is committing to submit only 3 tpd into SIP. Therefore, the District believes that the magnitude of the proposed range reductions for CMB-01 is reasonable. Please note that under the 24-hour PM2.5 attainment strategy, CMB-01 is now being proposed as a contingency measure to deliver 1-2 tpd of NOx reductions. Under the proposed 8-hour ozone attainment, a subsequent phase of CMB-01 will seek to reduce 3-5 tpd reductions beginning in 2017. As stated above, only 3 tpd of reduction range is proposed to be included as a SIP commitment.

Response to Comment CC-2:

District staff disagrees with the commenter. The RECLAIM facilities are expected to operate their equipment efficiently to comply with the facility caps and resolve potential compliance issues either by installing control equipment to reduce the facility's emissions or purchasing RTCs to offset the facility's emissions increase. District staff understands the desire for retaining a buffer of RTCs as a precautionary measure to cope with unexpected adversary scenarios. As such, during the rule development phase in 2005 and 2010, the District incorporated a compliance margin of 10% when determining the shaves. In addition, the District has incorporated other necessary safety valves to sustain market viability, e.g. the District added rule language to establish a non-tradable RTC account starting in 2015 so that whenever the market price of discrete RTCs is higher than \$50,000 per ton, the Governing Board can hold public hearings to decide whether or not to convert any portion of the non-tradable RTCs to tradable and help balance the trading market. The 10% compliance margin and safety valves are applied to assure that there is sufficient buffer of RTCs available for RECLAIM facilities.

Re: Regulatory Flexibility Group Comments

Dear Chairman Burke and Members of the SCAQMD Governing Board

Thank you for the opportunity to provide comments regarding the draft SCAQMD 2012 Air Quality Management Plan (AQMP). These comments are submitted on behalf of the Regulatory Flexibility Group (RFG), a coalition of California entities whose operations are subject to regulation under the Clean Air Act and corresponding state and regional air quality programs. RFG members include aerospace and electronics manufacturers, electric utilities and electric generating facilities, natural gas utilities, oil and chemical companies and other regulated entities. RFG members have participated in the review of and comment on SCAQMD regulations since the fall of 1990, when the coalition was formed.

I. OVERVIEW AND MAJOR RECOMMENDATIONS

We appreciate the Board's increasing sensitivity to the delicate balance between the region's economic health and continued air quality progress. We believe that the next decade poses unique and unprecedented challenges in crafting an air quality strategy that can meet the region's dual economic and environmental goals. Most of the readily identifiable control strategies for sources within the District's traditional jurisdiction already have been implemented. Future regulation thus will require that the District craft new approaches that are tailored to the region's unfinished business. Future strategies may need to focus to a greater degree on sources that have not yet been fully regulated and for which some opportunities may still remain to achieve cost-effective reductions (e.g., legacy fleets). We also agree with the SCAQMD staff recommendation that the District should consider selective time and place control measures to address specific problem areas without harming the economy.

William Burke
August 31, 2012
Page 2

LATHAM & WATKINS LLP

Recognizing the extent of existing stationary source regulation, future measures for such sources should proceed only after very careful technical evaluation of the feasibility of achieving further reductions at a reasonable cost. Given the economic and employment risk of further burdening stationary sources, we strongly believe that future stationary source regulation should include very clear incremental cost-effectiveness benchmarks to ensure that control measures, as implemented, remain within reasonable economic boundaries.¹ Furthermore, any future stationary source measures should contain appropriate alternative compliance mechanisms (e.g., an alternative compliance fee set at the relevant incremental cost benchmark level and used to fund clean technologies) to ensure that sources have a ready compliance alternative when costs near the benchmark level. We applaud the District for considering the adoption of cost benchmarks in the draft AQMP and urge the District to use the benchmarks appropriately, as noted below.

DD-1

Although the current draft AQMP is limited in scope to the attainment of the PM2.5 standard, we note that the plan contains the seeds of an emerging ozone attainment strategy.² Because both attainment strategies raise significant policy issues, we believe that the development of this year's plan is an appropriate time for the Board to consider some of the most important, overarching challenges that have emerged in recent years. These include the need to streamline stationary source permitting, to constrain regulatory costs and to reform significantly the region's offset program.

Before discussing the RFG recommendations in each of these three areas, we note the reasons why we believe that such reform will be critically important to the region. First, although we believe that, in theory, economic and environmental health can go hand in hand, coincident outcomes are unlikely without major change. Currently there is a material risk that the traditional burdensome permitting process, offset scarcity and continued imposition of technology-forcing regulations will result in environmental regulations thwarting economic health. This can happen whenever stationary sources choose not to site their operations, and their jobs, in Southern California due to the length, uncertainty and relatively high cost of seeking a permit here rather than in more hospitable regions. In many circumstances, we find that it is not even practical or cost-effective to site new "cleantech" operations (e.g., renewable energy projects for electricity generation or low-carbon transportation fuels) in the South Coast Air Basin. We are also concerned that we may lose many of the businesses currently operating

DD-2

¹ For some context on this subject, consider President Clinton's July 16, 1997 memorandum to EPA ("Presidential Memorandum"), issued contemporaneously with the adoption of the eight-hour ozone and fine particulate standards. 62 Fed. Reg. 38421 (July 18, 1997). As stated in the Memorandum, "[i]t was agreed that \$10,000 per ton of emission reduction is the high end of the range of reasonable cost to impose on sources."

² As explained below, because the 2012 AQMP does limit its scope to the attainment of the PM2.5 standard, we also believe that the Clean Air Act 182(e)(5) commitments in the draft AQMP are premature and better left for the 2015 AQMP. Waiting for the 2015 AQMP will allow the various stakeholders sufficient time to work with the District in identifying, fully vetting, and implementing "black box" control strategies without the expedited timing pressures associated with this 2012 AQMP process.

William Burke
August 31, 2012
Page 3

LATHAM & WATKINS LLP

in the District if they believe they will be unable to achieve or afford emerging regulations. These unfavorable conditions can be avoided, or at least substantially reduced, by reforming the current regulatory program.

Significant reform can no longer wait. As recently as 1990, there were reported to be 1,141,167 manufacturing jobs in the Los Angeles-Long Beach-Santa Ana region. In just 20 years (by 2010), this number has dropped by fifty percent, to only 569,085, while population in the region has grown during the same period from 11.3 million to 12.8 million.³ We understand that the loss of manufacturing is not unique to Southern California and has been experienced to some degree throughout the United States. But, given the economic opportunity value associated with manufacturing and manufacturing jobs, we want Southern California to preserve those manufacturing jobs that it still has and to capture those that may become available. This opportunity is currently being squandered *because our region cannot permit new facilities fast enough or cheaply enough to compete with alternative destinations*. When such projects go elsewhere, we often lose not just the jobs but also the opportunity to build a more sustainable community, in which energy and consumer good production and consumption are co-located.⁴

DD-2

We recommend three major actions to preserve existing manufacturing and to capture new opportunities:

A. Expedite and Streamline Stationary Source Permitting

The District now has almost forty years of experience in evaluating control options (e.g., Best Available Control Technology (BACT)) for the permitting of new and modified stationary sources. Certainly, the time has come when the District can identify, in advance, for the vast majority of the stationary sources it permits in the region, precisely what the control technologies will be for sources permitted here. We urge the District to develop a presumptive BACT approach by which sources can immediately receive a permit for most equipment types without the traditional extensive review period. We believe that such an approach can be approved under existing law provided that the District develops a process for distinguishing between permit applications that reasonably require further evaluation and those that do not.

DD-3

³ See US Department of Commerce Bureau of Economic Analysis; <http://bea.gov/iTable/iTable.cfm?ReqID=70&step=1>. Manufacturing employment in the same region was as high as 24% of the employable population in 1970 and is now only 7.8%.

⁴ Remarkably, it takes truly extraordinary effort, including special state legislation (e.g., Assembly Bill 1318) and litigation, to permit the very cleanest natural gas-fired power plants in the region even when those plants are essential to back up the state's growing renewable energy portfolio or are essential to avoid blackouts. These problems have existed for over a decade - recall the need for special federal, state and regional executive orders and special administrative orders during the 2000-01 power crisis to allow Southern California to bring in even the cleanest new generation.

William Burke
August 31, 2012
Page 4

LATHAM & WATKINS LLP

B. Reform the Offset Program

For over a decade we have urged the SCAQMD, the ARB and the EPA to pursue major offset reform. The current system is seriously broken and the result is that it is near impossible for a manufacturing or energy project to be sited in the South Coast even though any such facility would necessarily install BACT. We have proposed a three-tier approach to reform the current system. Under this approach, (1) a facility would seek to obtain any available offsets at or below a predetermined offset price (e.g., similar to the AQMP cost-effectiveness benchmarks); (2) if a sufficient supply is not available on the market, then the facility would purchase offsets from a pre-funded clean air investment fund (CAIF)⁵ administered by the District or by other appropriate publicly-accountable entities; and (3) to the extent a sufficient offset supply is still not available, then the facility would pay the benchmark fee to the CAIF. The CAIF would invest in appropriate emerging low-emissions technologies that the Board determines will be necessary for attainment and to meet the region's public health objectives.

DD-4

C. Ensure AQMP Flexibility and Compliance Flexibility and Provide Safe Harbor

As the District considers even more stringent, technology-forcing regulations, it must recognize that some of the anticipated technologies may never develop, may emerge later than predicted or may cost more than anticipated.⁶ Accordingly, the District should take special care to ensure that control measures can in fact be achieved at the projected scale and the predicted cost.⁷ We strongly recommend

DD-5

⁵ See, e.g., Presidential Memorandum, *id.* at 38429 (“The EPA will encourage the use of concepts such as a Clean Air Investment Fund, which would allow sources facing control costs higher than \$10,000 a ton for any of these pollutants to pay a set annual amount per ton to fund cost-effective emissions reductions from non-traditional and small sources. Compliance strategies like this will likely lower the costs of attaining the standards through more efficient allocation, minimize the regulatory burden for small and large pollution sources, and serve to stimulate technology innovation as well.”)

⁶ We are particularly concerned about proposed further volatile organic compound (VOC) reductions from the reformulation of coatings and solvents. We are highly skeptical of whether yet another tightening of such rules can be achieved without harming the regional economy, which relies heavily on the use of such materials.

⁷ We note, for example, that the current draft AQMP contains some measures for which the necessary technical and economic feasibility work has not been done. Early indications are, for example, that the available emission reductions for off-road industrial equipment (SOON) may be only a fraction (e.g., ~10%) of the estimated 7.5 tons per day of NOx. Further, while we fully support the SOON program and its ability to achieve near-term NOx emission reductions (and obtain these reductions effectively for both the regulators and the regulated entities through incentives), in these budgetary times, the continued funding for the SOON program unfortunately cannot be counted upon moving forward. We argue that the more prudent approach is to vigorously pursue programs like SOON,

William Burke
August 31, 2012
Page 5

LATHAM & WATKINS LLP

that the District take the following steps to protect against unintended harm to regulated stationary sources. It should:

1. Conduct appropriate technology evaluations before placing measures in the AQMP;
2. Avoid making SIP emission reduction commitments until it has very high confidence that a measure can be achieved at the anticipated cost;
3. State emission reduction commitments in a manner that maximizes the District's flexibility to shift reductions, as necessary, should technologies not emerge as hoped, without the need to seek EPA approval for necessary reduction in credit for technology-forcing rules; and
4. Ensure that future stationary source regulations include both alternative compliance options and an appropriate safe harbor (e.g., ceiling price "in lieu" payment to a CAIF) or some other appropriate cost-containment mechanism.

DD-5

We stand ready to work closely with the District and other stakeholders on these major recommendations.

II. SPECIFIC ADDITIONAL AQMP COMMENTS

In addition to the foregoing, we wish to share the following specific comments regarding the draft AQMP:

A. RECLAIM

Ever since the 2001 RECLAIM amendments, we have been concerned that the program is no longer a true market, but is instead being used as a transitional device to compel the installation of Best Available Retrofit Control Technology (BARCT). So long as this is how the program is used, we believe the District should allow sources that have installed BARCT to be removed from RECLAIM. Otherwise, the program merely becomes a tax on already well-controlled units. The proposed RECLAIM control measure raises this risk by suggesting that a ratchet wholly unrelated to BARCT equivalency should be included in the AQMP simply because there is a belief that there are surplus RECLAIM Trading Credits in the market. If the District wishes to return RECLAIM to a market model, instead of a BARCT transition model, then it should specify a formal price cutoff – i.e., a price point at which the program would automatically come to a stop - or implement a ceiling price for RTCs that can guarantee compliance. Without such a circuit breaker, the District runs that risk that it may be wrong about the excess credits in the market. We note, for example, that many of the largest RECLAIM

DD-6

but not make legally binding emission reduction commitments in the 2012 AQMP. We are also highly skeptical of whether the estimated RECLAIM ratchet would be warranted by a more detailed analysis of available control technologies. See further discussion of the RECLAIM in this letter.

William Burke
August 31, 2012
Page 6

LATHAM & WATKINS LLP

facilities are in fact short, not long, on RTCs and that the weak economy may mask the actual long-term demand for credits. We strongly recommend that the District defer further RECLAIM NOx reductions until it has conducted a thorough BARCT equivalency analysis. The risk of harming the market prematurely is too great.

DD-6

B. Cost-Effectiveness Benchmarks

We applaud the use of cost-effectiveness benchmarks, but urge the District to define such benchmarks so that costs are calculated individually for each specific type of technology or source. To be useful, control costs must be highly differentiated and must reflect incremental, not average, cost-effectiveness. Further, as noted above, we recommend that the District take other precautions to ensure that errors in predictions about technology development pace or cost do not result in harm to businesses or jobs.

DD-7

C. Clean Air Act 182(e)(5) Commitments

While the current draft of the AQMP limits the scope of attainment to the PM2.5 standard, it also includes Clean Air Act §182(e)(5) proposed implementation measures with binding ozone reduction commitments. We acknowledge that significant ozone emission reductions will be needed to demonstrate attainment in 2023 and 2032 and are committed to working with the District and fellow stakeholders to identify and implement control measures for VOC and NOx that will provide these "black box" reductions. However, the abbreviated planning process for the 2012 AQMP does not afford stakeholders the time to fully review, analyze, and offer input on the proposed control measures currently in the draft AQMP. As touched on above, while we think many of the identified actions have value, we think additional technical and economic feasibility studies are necessary prior to committing to reductions. These control measures and reduction commitments are better left for the 2015 AQMP (or if the upcoming SIP call for the one hour ozone standard requires them), which will give the District and the various stakeholders time to develop a comprehensive and fully vetted ozone attainment plan without the expedited timing pressures of this 2012 AQMP.

DD-8

Thank you for the opportunity to submit these comments. We look forward to further discussions with the SCAQMD staff and with other stakeholders.

Sincerely,

Robert A. Wyman
of LATHAM & WATKINS LLP

Responses to Comment Letter DD
Latham & Watkins

Response to Comment DD-1:

District staff is very cognizant of the environmental and economic challenges our region is facing. We recognize that that the road to attainment is steep and that there are cost implications associated with future regulatory actions intended to improve air quality and protect the health of the breathing public. Undoubtedly, the state of our economy renders the task at hand all the more difficult. But such challenges should not be a cause for complacency because there are even greater societal costs associated with inaction. Therefore, given the challenges at hand, we agree with you that any future regulatory proposals must be very carefully designed and implemented. To that end, in developing the current attainment strategy for the federal 24-hour average PM_{2.5} standard, staff and the stakeholders as you know, collectively, invested countless hours sifting through volumes of information to arrive at the current control strategy proposal which reflects the shortest and least costly path to attainment. We are committed to do the same with respect to the 8-hour ozone and other future attainment demonstrations. Furthermore, in an effort to reflect our commitment and sensitivity toward addressing the cost concerns that many stake holders articulated during the plan development process, the 2012 AQMP, as you point out, includes specific cost-effectiveness bench marks that, if triggered, would necessitate even more robust and detailed evaluation and analysis of the cost impacts of a proposed regulation than what would currently be conducted.

With respect to your comments regarding the 182(e)(5) measures, please note that the District is committed to develop a comprehensive attainment plan for the new 0.75 ppm 8-hour ozone standards in the 2015 timeframe. However, given the fact that the attainment year for the 1997 0.80 ppm 8-hour ozone standard is 2023 and considering the sizable “black box” of the 2007 AQMP and, hence, the significant level of emission reductions that must be achieved during the few remaining years, it is of paramount importance that the emission reduction effort is maintained. The proposed ozone control measures, while constituting about 5% of reductions included in the black box, are intended to provide a modest but significant advanced payment towards the black box obligation.

Response to Comment DD-2:

As indicated in response to comment Y-2, staff is committed to continue to work with all stakeholders to evaluate and explore avenues to further improve the efficacy of the New Source Review (NSR) program, including offsets. As indicated in response to comment DD-1, staff is also committed to redouble its efforts in evaluating the cost impacts of its proposed regulations. Similarly, staff is open and would always welcome permit streamlining suggestions that would allow the District to achieve the Clean Air

Act goals in a more efficient manner. Please note that the Draft 2012 does include two incentive measures: Control Measure INC-01 intended to promote and encourage adoption and installation of cleaner more-efficient equipment and Control Measure INC-02 intended to provide expedited permitting and CEQA preparation to facilitate the manufacturing of zero- and near-zero technologies. Staff is certainly open to additional suggestions. While identifying NSR offsets with respect to certain pollutants (especially for PM10) in the open market could be highly challenging, the District has taken several creative steps in recent years to address the challenge and meet the demand for offset credits. Please note that these efforts allowed the District to continue to issue annually approximately 10,000 permits to new and existing facilities. Staff would be interested in hearing more concrete examples of sources having difficulty in locating to the District and the specific reasoning.

Response to Comment DD-3:

Thank you for your suggestions regarding expediting and streamlining stationary source permitting. Staff would like to receive additional clarification with regards to the presumptive BACT approach. Please be mindful that when identifying BACT for major sources, the District is obligated to rely on the LAER Clearinghouse. With respect to minor sources, please note that the District's BACT can act as a presumptive BACT.

Response to Comment DD-4:

We appreciate your concern about the availability of offset credits and thank you for your suggestions to address the issue. As discussed in response to comment DD-2, District staff has taken a number of steps to address the offset scarcity in the open market with respect to certain pollutants by opening its internal bank for certain critical projects for our region. Unfortunately, a portion of our past efforts intended to provide relief to a larger number of regionally critical projects did face legal challenges and was held up by the courts. We acknowledge that much more needs to be done and are open to new and all ideas that would contribute to the resolution of this very important issue provided they are within the bounds of the Clean Air Act and approvable by CARB and USEPA, and would not set our local stakeholders in legal jeopardy.

Response to Comment DD-5:

Thank you for your AQMP flexibility and compliance flexibility suggestions. Please note that the District is already implementing many of your suggestions in designing the AQMP control strategy and in developing its regulations. For instance, we do conduct technology evaluations prior to including a control measure into the AQMP. Granted, the District conducts a much more thorough and detailed technology assessment during the rule making stage, initial technology evaluations such as those conducted in support of a control measure are critical in determining the emission reduction potential of the measure and its cost impacts. To address uncertainties with

respect to these initial evaluations, often the emission reduction potential and cost effectiveness are expressed as ranges that include a lower and an upper bound estimate. The AQMP would typically commit the lower bound emission reduction estimate into the SIP. Furthermore, in formulating its emission reduction commitment for the SIP, the AQMP, typically, commits to a grand total emission reduction figure that reflects the grand sum of the lower bound reduction estimates of the emission reduction ranges of each measure in a manner that allows emission reduction substitution among measures to cover any potential shortfall from a particular measure(s). The idea of providing alternative compliance options, including “in lieu fee” payments to extend effective dates has been used in numerous prior rulemakings and we intend to continue this practice in the future, as necessary. Relative to your comment regarding the technology not evolving to the level set by a technology forcing limit by the applicable dates, in addition to exploring the “in lieu fee” option, the District often revisits the rule in question and either extends the effective dates or modifies the applicable limits to reflect the state of the technology or both. The existing 2007 AQMP includes a “set-aside” of emission reductions that can be used if rule limits are modified. We would welcome further discussion on these issues.

Response to Comment DD-6:

As indicated elsewhere, Control Measure CMB-01 is no longer an element of the control strategy for the 24-hour average PM_{2.5} standard and is now listed as a contingency measure for the 24-hour PM_{2.5} attainment demonstration. Based on the initial analysis conducted to support this control measure, it appears that there are additional reductions to be gained through the installation of BARCT to certain emission sources. Many of your concerns that you express in your comment are germane to how these reductions are translated into percent RTC shave and how the shave is distributed among the facilities participating in the program. The control measure deliberately does not commit to a specific shave methodology to allow the discussion of various different approaches during the rulemaking process, which staff intends to initiate promptly.

Response to Comment DD-7:

Thank you for supporting the cost-effectiveness bench marks proposed for inclusion in the 2012 AQMP. These bench marks, if triggered during the rulemaking process, would necessitate a more robust cost analysis compared to the one normally conducted, and would trigger a Board “pre-hearing” on the measure, but would not act as a bar to preclude adoption of the measure. Please be cognizant that costs and cost-effectiveness are typically estimated based on specific technology or set of technologies. While estimating source specific cost-effectiveness may be desirable from the affected facility’s perspective, it may not be practical, especially with industry sectors with multiple sources (i.e. industry sectors with hundreds or even thousands of sources).

Using cost-effectiveness ranges that reflect the variability in cost effectiveness across a source category would be a more reasonable approach.

Response to Comment DD-8:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large “black box” in the existing approved 2007 AQMP (241 fpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NOx and VOC emission reduction commitments contained

in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

EE. Dairy Cares, August 31, 2012

Diamond Bar, CA 91765

Re: Comments on Draft 2012 Air Quality Management Plan

Dear Dr. Burke:

On behalf of Dairy Cares, we submit the following comments on the Draft 2012 Air Quality Management Plan for the South Coast Air Quality Management District (SCAQMD). Dairy Cares is a coalition of California's dairy producer and processor associations, including the state's largest producer trade associations (*Western United Dairymen*, *California Dairy Campaign*, and *Milk Producers Council*) and the largest milk processing companies and cooperatives (including *California Dairies, Inc.*, *Dairy Farmers of America-Western Area Council*, *Hilmar Cheese Company*, *Joseph Gallo Farms*, *Producer Bar 20 Dairy*, and *Land O'Lakes*). Formed in 2001, Dairy Cares is dedicated to promoting the long-term sustainability of California dairies.

SCAQMD released the draft version of the 2012 Air Quality Management Plan (2012 AQMP) in July 2012. As a stakeholder group, dairy representatives have reviewed material related to dairy control measures before the Draft 2012 AQMP was released. We appreciate the SCAQMD staff taking the time to meet with our representative, Rob Vandenhuevel of Milk Producers Council, on June 29 regarding the proposed control measure "BCM-04: Further ammonia reductions from livestock waste."¹ We appreciate that several changes have been made to the current version of the measure consistent with our requested revisions.

The Draft 2012 AQMP states that Phase I will consist of a technical assessment of the application of SBS at local dairies to evaluate the technical and economic feasibility of the measure. We support the decision to complete this technical assessment before any rulemaking for dairy control.

EE-1

¹ Previously MCS-04B.

We have a few remaining comments about the existing language listed below.

Technical Comments

We would like to reiterate the technical concerns we have, as described in more detail in the summary² (Attachment A) we provided in advance of our meeting.

1. Evidence of ammonia reductions is limited to laboratory experiments of dairy slurry, not corrals. As you are aware, dairy slurry reacts very differently than dry corral manure.
2. Field experiments using SBS on dairies, which SCAQMD previously used to determine proposed application rates and calculate cost effectiveness, are not applicable to the proposed measure.
3. SBS impacts to worker safety and animal health are unknown for the proposed use.
4. SBS threatens groundwater quality by adding salt to manure that will be used as a fertilizer. This is particularly important in the Inland Empire where the Chino Water Basin and San Jacinto district face severe salt issues.

EE-2

Suggested Revisions

We suggest that the following changes be made to the language for BCM-04 included in the draft AQMP:

1. **Applicability to other jurisdictions.** The Draft 2012 AQMP states that the Phase I technical assessment “will evaluate the application of SBS at *local dairies*” (emphasis added). Any determination resulting from this technical assessment should clearly state that the suitability of SBS as a dairy NH₃ control measure is specific to the area in the jurisdiction of the SCAQMD – or, more specifically, to the dairies in the South Coast Basin (Basin) similar to the local dairies where this type of SBS application will be evaluated. This can in no way be presumed to be a “Reasonably Available Control Measure” in other nonattainment areas, such as the San Joaquin Valley. Multiple research projects and modeling analyses have shown that in the San Joaquin Valley, NO_x controls, and not NH₃ controls, would be the most effective control strategy to reduce PM_{2.5} concentrations.
2. **Excessive salt loading.** The Draft 2012 AQMP states that “the use of SBS should be carefully considered in areas that are sensitive to salts and/or with existing high salt loading in soil.” However, we encourage the SCAQMD to be clearer in the Draft 2012 AQMP that applying large quantities of SBS to manure (as may be needed to achieve potential reductions) that will eventually be land applied may not be feasible or allowed. The Regional Water Quality Control Board (RWQCB) would need to be consulted to determine if current or proposed regulations would prohibit or restrict the application to land of manure treated with SBS. BCM-04 should indicate that is a required component of the Phase I assessment.

EE-3

EE-4

² Acid salt (SBS) ammonia reduction claims lack evidence from 'real-world' dairies.

Comment letter to South Coast AQMD
August 31, 2012
Page 3 of 5

3. **Worker safety and animal health.** SBS is a caustic salt that irritates skin and is hazardous if ingested or inhaled.³ There is minimal discussion in the Draft 2012 AQMP of the effects of SBS on animal health and no discussion on the impacts to worker safety. We strongly suggest that SCAQMD review the potential safety hazards to workers and impacts to animal health and include these risks in the AQMP measure. These impacts must be analyzed in the Phase I assessment.

EE-5

ATTACHMENT A

ACID SALT (SBS) AMMONIA REDUCTION CLAIMS LACK EVIDENCE FROM 'REAL-WORLD' DAIRIES

Current research doesn't support effectiveness, while potential concerns remain for animal health, worker safety and water quality

South Coast Air Quality Management District (SCAQMD) is considering episodic application of acid salt (sodium bisulfate or SBS) to fresh dairy livestock waste to reduce ammonia emissions. This proposal is premature, given no evidence quantifying SBS' ammonia reduction efficiency in real-world dairy conditions.

Laboratory experiments suggest SBS may reduce ammonia under tightly controlled conditions. But no known experiments quantify actual ammonia reductions under non-optimal, real-world conditions outside the lab. Even if future study validates field effectiveness, SCAQMD should consider worker safety, animal health, groundwater quality and other environmental impacts before suggesting dairies apply large amounts of caustic acid salts:

1. Evidence of ammonia reductions in dairy slurry is limited to laboratory experiments. UC Davis researchers (Sun et al, 2008)⁴ collected and carefully mixed manure in a lab, creating ideal conditions to maximize ammonia emissions in the control, and for even application of SBS for maximum effectiveness. These ideal conditions simply do not exist on real-world dairies, where mixing of manure, temperature variation, wind, drying, disturbing of manure by animals and many other factors would influence effectiveness of mitigation, likely reducing both initial emissions and mitigation effectiveness. Without field information, no effectiveness or cost-effectiveness analysis is possible, nor can SCAQMD determine what impact the rule would have on design values used for modeling air quality improvements.
2. Field experiments using SBS on dairies, which SCAQMD uses to determine proposed application rates and calculate cost effectiveness, are not applicable to the proposed measure. Limited work (Stackhouse et al)⁵ in dairy corrals *did not* measure ammonia reductions and therefore is not applicable.
3. SBS impacts to worker safety and animal health are unknown for the proposed use. A caustic salt, SBS irritates skin and is hazardous if ingested or inhaled.⁶ In other settings, such as poultry, SBS use requires special protective equipment and management to safeguard workers and animals. It's not clear that SBS safety to workers or animals is established for the proposed use, which generally would require larger and more frequent application than in other uses and settings. Exposure may increase due to open-air use and mixing with corral dust that can become windblown.
4. SBS threatens groundwater quality by adding salt to manure that will be used as fertilizer. Even if SBS were to be proven effective and safe for ammonia control, it would likely result in significant

Comment letter to South Coast AQMD
August 31, 2012
Page 5 of 5

additional impacts to groundwater by adding salt to manure, all of which is used as fertilizer for agricultural crops. Use of SBS would add at least 70,000 pounds of sodium⁷ and up to 930,000 pounds of sodium to manure every week it is used in the air basin. Virtually all of this salt could be expected to end up in groundwater, even if the manure were exported outside of the basin.

Conclusion

SBS on dairies should be approached with caution. Its efficacy, safety, impacts to animal health and the environment and cost-effectiveness should be fully investigated before considering actions that could result in expanded use.

⁷ Assuming the product is only used on about 7.5 percent of dairy surface areas, otherwise identified as "high traffic" areas.

Responses to Comment Letter EE
Dairy Cares

Response to Comment EE-1:

AQMD staff appreciates the support of the dairy industry to conduct a technical assessment of sodium bisulfate (SBS) in advance of seeking additional rule requirements and would appreciate feedback as part of the stakeholder process.

Response to Comment EE-2:

For the technical assessment, staff is seeking one or more dairy partners that are representative of the majority of operations here in the South Coast Air Basin. The AQMD will conduct the assessment at its own expense and is optimistic that application may contribute to improved air quality, with a focus of application during episodic periods of forecasted poor air quality.

Response to Comment EE-3:

AQMD staff acknowledges that, due to climatic conditions, there is a certain uniqueness of local dairy operations as compared to elsewhere in the state and country. As such, the requirements may not be applicable to dairies elsewhere where a site-specific assessment would need to be made relative to those particular operations. Each air district will likely need to conduct its own assessment as to application of SBS in their jurisdiction. This has been clarified in the control measure.

Response to Comment EE-4:

AQMD staff intends to assess the potential impact of salt loading on groundwater from the land spreading of manure treated with SBS. Although the incremental increase is expected to be low, the overall impact relative to Regional Water Quality Control Board threshold requirements will need to be examined. Staff intends to work with stakeholders at the water board relative to the potential ground water impacts. This too has been clarified in the control measure.

Response to Comment EE-5:

Although not noted in the control measure, health impacts associated with use of SBS would be included in the Phase I technical assessment. Upon review of the MSDS and the comment letter attachment, staff has added to the control measure that the technical assessment will also examine impacts to animal and worker health and safety associated with uses of SBS.

Dr. Elaine Chang
South Coast Air Quality Management District
21865 Copley Dr
Diamond Bar, CA 91765

Re: Clean Energy's comments on SCAQMD's 2012 Air Quality Management Plan

Dear Dr. Chang,

Clean Energy is appreciative for the opportunity to comment on the draft "2012 Air Quality Management Plan" (2012 AQMP), a plan focused on reducing particulate matter and ozone emissions by the South Coast Air Quality Management District. Clean Energy, a California-based company and AB 32 success story, fuels approximately 26,000 vehicles daily at over 310 strategically located refueling stations nationwide with compressed natural gas (CNG), liquefied natural gas (LNG) and renewable natural gas (RNG).

Upon reviewing the 2012 AQMP, we believe the document would benefit from a broader discussion of promising strategies that could provide environmental, economic and energy security benefits to the South Coast Air Quality Management District (AQMD). As a California-based company focused on delivering clean lower carbon fuels to market, we support the goal to advance zero and near-zero emission strategies. However, we believe that if the 2012 AQMP is to achieve the attainment goals outlined, the 2012 AQMP must include an informed discussion of natural gas, conventional and renewable, used as a transportation fuel in compressed and liquefied form. These fuels, inherently and in combination with existing or developing clean air technologies, can play a significant role in tackling the AQMD's air quality challenges for ozone (O₃) and fine particulate matter (PM), as well as other criteria pollutants and greenhouse gases (GHG).

FF-1

While the 2012 AQMP outlines the benefits of zero and near zero emission technologies with an extraordinary focus on hydrogen fuel cell and electric vehicles, the draft would be more comprehensive in scope if the specific 2050 emissions inventories needed were identified with corresponding vehicle emissions in grams/mile or grams/bhp-hr for the number of vehicles proposed to be in the marketplace in 2050. Then clean alternatives to electric and hydrogen technologies could also be identified. This would be the appropriate fuel neutral signal to the transportation industry that AQMD should send. Highlighting certain fuels more than others throughout the report could erupt into a battle between fuel types and drastically hinder progress. It would be much more beneficial to the transportation industry and the air if various alternative fuels worked together to create optimal strategies.

FF-2

Further, natural gas applications should be viewed in this document as a fuel strategy that can offer low to ultra low carbon results, capable of achieving near zero emissions for oxides of nitrogen and particulate matter with indications of further reductions by engine manufacturers, one that can be combined with efficiency strategies, and one that can deliver these benefits in the near, mid- and long-term to each class of vehicle today.

FF-3

North America's leader in clean transportation

Lastly, while the report mentions the importance of economics briefly throughout, it needs a more in depth economic analysis for each fuel type in order to better evaluate the feasibility of implementation. Without economics, the report optically reads that fuel cell and battery technologies are better than all other clean air strategies when in reality this may not be the case. Instead of foregoing economic analyses of clean fuel strategies and presenting illustrative zero emission scenarios (even though they are extremely costly and not technologically capable) that appear to demonstrate favoritism, the report should provide a balanced analysis that broadly covers all promising strategies capable of helping the AQMD attain its air quality goals.

As the report itself states, "*it is imperative for the District to work closely with businesses and industry groups to identify the most cost-effective and efficient path to meeting clean air goals*" (1-20). Natural gas as a vehicle fuel can achieve this goal exactly. This point would become clearer if the AQMD performed a more in-depth economic analysis of each fuel type to recognize that natural gas is one of the most cost-effective strategies that can meet the Air Basin's standards while hydrogen fuel cell and battery electric are much more expensive, experimental and in need of significant development and technological advancement.

Natural Gas Can Help the AQMD Meet State and Federal Air Quality Goals

Heavy-duty trucks are constantly on California's roads and consume on average 15,000-20,000 gallons of diesel fuel per year. The significant cost savings associated with natural gas, up to \$2.00 per gallon, could therefore present a market pull scenario for clean trucks operating throughout the South Coast Air Basin. For example, the emissions benefits associated with the conversion of a *single* diesel truck to natural gas has the potential to reduce up to 23 tons of criteria emissions over the lifetime of the truck (Calculated using Moyer Calculator, pre-2002 trucks). When RNG is applied, emissions reduction benefits can be nearly four times greater. Because emissions from the ports of Los Angeles and Long Beach are large emitters of criteria and climate change pollutants, heavy-duty trucks that run on natural gas instead of diesel can directly and significantly combat these harmful emissions threatening both federal attainment and the state's AB 32 goals.

A. Natural Gas Vehicles Significantly Reduce NOx Pollution

In Figure 3-8 and 3-9 of the AQMP, the graphs show heavy-duty diesel trucks are by far the largest contributor to NOx. In order to significantly curb this, heavy-duty diesel trucks could be converted to natural gas, and natural gas engine technologies and fuels could be further advanced. Natural gas engines have historically achieved low NOx emissions performance and have made the case for tighter NOx emission standards for medium- and heavy-duty trucks. In fact, SULEV was a category created by natural gas light-duty vehicles as these vehicles achieved a 90% reduction of emissions from the ULEV standard. Another and more recent example would be the fact that natural gas engines were able to meet the 2010 NOx

FF-4

FF-5

North America's leader in clean transportation

and PM standards as early as 2007 – three years in advance of the federal deadline. In fact, today’s natural gas engines far surpass the existing NOx emissions standard for heavy-duty truck engines by 35%, and engine manufacturers have since announced plans to target a 75% reduction in NOx over the next few years.

What’s more, newer technology that is currently being demonstrated promises even cleaner NOx results. Clean Energy supports the immediate adoption of a series of optional low NOx standards for California that will allow manufacturers to begin the process of receiving credit for lower emissions technology. Clean Energy also would like AQMD to identify emissions targets needed to meet attainment of both NOx and PM emissions rather than implicate certain “preferred” clean air strategies so that the 2012 AQMP can be a more “fuel neutral” document that will encourage all clean air strategies to blossom.

B. Natural Gas Engines Significantly Reduce PM Pollution

Figure 3-14 from the draft shows that heavy-duty diesel trucks are the second largest contributor to PM 2.5. According to certification data produced by the California Air Resources Board, natural gas engines can reduce particulate matter emissions by 80% below the federal 2010 heavy-duty truck standard. These superior PM emissions have been achieved using a simple three-way catalyst technology and certainly could be improved upon with further technology advancement.

C. Natural Gas Engines Significantly Reduce GHG Pollution

Both CNG and LNG are listed as low carbon fuels under California’s Low Carbon Fuel Standard and can reduce GHG emissions by up to 23% for heavy-duty vehicles and 29% for light-duty vehicles when compared to their diesel and gasoline counterparts. If RNG is used to power a natural gas vehicle, GHG emissions can be further reduced by up to 88.1%, which exceeds the federal and state’s 2050 emissions goals today. Not only is RNG listed as an ultra low carbon fuel, it is the best performing ultra low carbon fuel across the board and it can be delivered to natural gas vehicle engines in both compressed and liquefied form.

D. Emissions Performance for Natural Gas Engines Are Bound to Improve on Near Zero Emissions Levels

While current natural gas engine technology is achieving near zero emissions already, it is about to significantly improve further. Recently, Cummins-Westport announced plans to develop an engine with <0.05 g/bhp-hr NOx. Their focus is on NOx because Cummins-Westport engines already provide virtually zero PM emissions. The development of this near zero engine technology is currently underway and is expected to be commercially available in 3 to 5 years.

North America’s leader in clean transportation

FF-5

In addition, ICR Turbine Engine Corporation (ICRTEC) has teamed up with Kenworth to create a natural gas hybrid engine with NOx emissions of 0.0249 g/bhp-hr (8x lower than EPA standards) and CO emissions of 0.0205g/bhp-hr (750x lower than EPA standards). This new engine is cheaper than current natural gas engines and is estimated to retail for the same price as a diesel engine, yet it has the potential to deliver near zero emissions. It also provides 10-20% better fuel efficiency, is half the size of a conventional diesel or natural gas engine, significantly reduces maintenance, and significantly reduces emissions far below CARB/EPA standards without sophisticated pre- or after-treatments.

FF-5

NGVs Offer the South Coast Air Basin with a Great Opportunity to Improve Air Quality Today and Well Into the Future

A. Natural gas and renewable natural gas are both abundant and domestic.

Not only is natural gas clean, it is domestic and abundant in North America with over a 100-year supply, and new reserves are being discovered almost daily. In fact, the United States currently produces about 20 billion cubic feet per day from shale, and that number is predicted to double by 2020 [Navigant Consulting, Inc. (2012, January). Drilling Redirection, Supply Abundance, and Exports. Retrieved August 13, 2012, from [www.navigant.com/http://www.navigant.com/~media/www/site/downloads/energy/ngmarket_notejanuary2012pdf.aspx](http://www.navigant.com/~media/www/site/downloads/energy/ngmarket_notejanuary2012pdf.aspx)].

B. Greater natural gas use as a transportation fuel can boost the economy.

Due to its abundance, natural gas as a transportation fuel is extremely cheap and is thereby capable of providing high discounts to its users. For whatever reason, the 2012 AQMP draft appears to overlook the importance of cost-effectiveness.

For business and government funding alike, based on our experience, cost-effectiveness is one of the most important aspects for justifying the transition of a vehicle or fleet to an alternative fuel. Most of the energy sources mentioned in the 2012 AQMP are more expensive than gasoline or diesel, except for one source – natural gas. With all of the new shale discoveries in recent years, natural gas prices have dropped considerably and can save consumers up to \$1.50 per gallon over the energy equivalent of gasoline and diesel. This is a huge benefit that provides businesses and individuals with a cost-effective way to fuel cleanly. Due to the fuel savings, more people will buy natural gas vehicles, which will ultimately lead to greater emissions reductions across the board. Furthermore, as more heavy duty trucks switch from diesel to natural gas as a cheaper alternative fuel, their aggregate fuel usage will displace a significant proportion of emissions.

FF-6

C. The economics of natural gas is creating a competitive market for the NGV Industry

At last count, Clean Energy has identified more than 40 private competitors in the NGV space providing services to build out infrastructure:

North America's leader in clean transportation

Air and Gas Technologies
- CNG and LNG Station Provider

Allsup
- CNG Station; Owner/Operator

ALT
- LNG Plant Owner; LNG Fuel Provider

American CNG
- CNG and LNG Station Owner/Provider

American Natural Gas
- LNG Station Owner

Atlas Copco-Greenfield Compression
- Equipment Provider

AVSG LP
- CNG Station Network; Owner/Operator

CH-4
- LNG Station; Owner/Operator

Chart Industries
- LNG Equipment Provider; Station Installer

Chesapeake Energy
- CNG Station Owner/Operator

Clean Energy Fuels
- CNG, LNG Fuel Provider; Station Network Owner/Operator

CN Gas Group Corp.
- CNG Equipment & Stations/US Agira Representative

Enviro Express Natural Gas LLC
- LNG Station; Owner/Truck Operator

General Electric
- CNG and LNG Equipment Provider

Go Natural Gas
- CNG Station; Owner/Operator

General Physics
- LNG Equipment Provider; Station Installer, Operator

Gulf Oil
- CNG Station Owner

Integrlys
- Pinnacle Gas Systems LLC;
o CNG; Fuel Station Owner/Operator
- Trillium USA
- CNG; Fuel Station Owner/Operator

Kwik Trip Inc.
- CNG Station; Owner/Operator

Lehigh Gas
- CNG Station; Owner/Operator

Linde
- LNG Fuel Provider; Equipment Supplier

Love's
- CNG Station Owner

Mansfield Gas Equipment System, Inc.
- CNG Station; Supplier/Owner/Operator

Nopetro
- CNG and LNG Fueling Systems

FF-6

North America's leader in clean transportation

Encana
- CNG & LNG; Station Owner

Engineered Energy Solutions
- Engineering and Design Firm, CNG Station Owner/Operator

OnCue Express
- CNG Network; Owner/Operator

Peake Fuel Solutions
- CNG and LNG Station Equipment Supplier for Stations and Home Refueling

With the realization that it will take billions in investment to transition our country away from conventional fuels, natural gas shows the most promise in weaning ourselves off of foreign oil by the demonstration of strong and growing competition in the natural gas vehicle fueling space.

D. Every Heavy-Duty Truck Manufacturer is now in the business of NGV Trucks due to Demand

As one of the leading indicators of success, most if not all engine manufacturers for heavy- to medium-duty trucks are adopting some form of natural gas vehicle option for their customers. This not only presents an opportunity for American businesses, it also presents an opportunity for clean air as natural gas platforms have consistently presented regulatory authorities, such as the AQMD, with opportunities to reduce both criteria and climate change emissions.

- Freightliner
 - Currently offers CWI 8.9 liter and 11.9 liter expected by 2013
- Navistar / International
 - Committed to deploy full natural gas truck product line
 - Currently offering 7.6 liter Navistar and CWI 8.9 liter
 - 13 liter model expected mid-2013
- Kenworth
 - Currently offers CWI 8.9 liter and 15 liter, 11.9 liter expected by 2013
- Peterbilt
 - Currently offers CWI 8.9 liter and 15 liter, 11.9 liter expected by 2013

North America's leader in clean transportation

FF-6

- Volvo
 - Currently offers CWI 8.9 liter, 13 liter announced for 2014 launch

E. Natural gas refueling infrastructure is flourishing nationwide.

There are currently about 500 natural gas stations in California, and recently the heavy-duty sector is taking off with LNG station deployment from distribution fueling leaders such as Clean Energy and Royal Dutch Shell. While the infrastructure of natural gas refueling stations is somewhat established, the current 500 stations in California were not strategically placed to accommodate the trucking routes of the goods movement, nor were the majority of them designed to handle heavy-duty trucks. We can only imagine that the hydrogen and EV infrastructure referenced by the AQMP will befall the same fate, particularly when heavy-duty applications have not been proven for hydrogen fuel cells or EV batteries.

Furthermore, if there is real concern about capturing and cleaning up the 30% of the trucks on California's roads that are from out of state, natural gas provides an option to reduce emissions substantially. Several national networks of LNG and CNG stations have since been proposed directly targeting the goods movement sector. Shell, TravelCenters of America, Integrys, AmericanCNG, and Clean Energy have all announced plans to construct national refueling infrastructure networks. In fact, Clean Energy is on target to build 150 stations from coast to coast and border to border by the end of 2013.

North America's leader in clean transportation

FF-6

F. Biomethane production is increasing

Being a California-based company supportive of CARB's Low Carbon Fuel Standard, Clean Energy has embraced the business of producing the lowest carbon fuel identified by the LCFS: biomethane, or RNG. Since then, Clean Energy has founded its subsidiary – Clean Energy Renewable Fuels (CERF) – to finance, build and operate RNG production facilities across the lower 48 states. To date, CERF has been very successful in its efforts to produce RNG from landfill and agricultural-based projects, and it is very interested in participating in sanitation-based projects. CERF's success has come despite the regulated utilities' current ban applied to in-state produced RNG entering the pipeline.

Clearly, it would be beneficial for this 2012 AQMP not only to evaluate the potential of RNG use in transportation fuels, but also to suggest policy actions that can take place to remove existing bans on RNG from entering in-state pipelines as this would directly and efficiently deliver RNG to in-state NGV vehicle fleets.

Why is AQMD Picking Winners?

Throughout the 2012 AQMP, hydrogen fuel cells and battery electric vehicles are highlighted as key clean air strategies that should be used for multiple applications: from light duty passenger cars to heavy duty trucking, even though these technologies are not optimal or cost effective.

While fuel cells and battery electric vehicles (EVs) can help reduce both criteria and climate change emissions from the transportation sector, the infrastructure is not developed enough to reduce emissions a significant amount, and the cost to consumers is far too high. Most importantly, there are large hurdles in technology limitations for these types of fuels that need to be overcome to be practical.

Battery or fuel cell technology does not currently exist to power a vehicle as large as a heavy-duty truck that meets the demands for shippers or carriers. EVs do not have the range that LNG, CNG or RNG have, leaving customers with substantial "range anxiety": the fear of being stranded due to lack of power. Furthermore, while electric vehicles do not have tail-pipe emissions, it is important to consider how their electricity is generated. Electric vehicles receive their power from the common electricity grid, which in California is derived from 52.7% natural gas, 28.9% renewables, 15.8% nuclear 1% coal and 0.5% petroleum (U.S. Energy Information Administration. (2012). *State Electricity Profiles 2010*. Washington, DC: U.S. Energy Information Administration.). Thus, the largest portion of the power comes from natural gas, so it would be more energy efficient to directly fuel cars with natural gas and cut out the dirty fuels like coal and petroleum.

As for fuel cells, their energy comes from natural gas, hydrogen and alcohols. Currently, the largest source of hydrogen for fuel cells is natural gas. Again, if fuel cells initially derive their

FF-6

FF-7

energy from natural gas, wouldn't it make more sense to fuel cars with natural gas and further develop natural gas technology using advanced NGVs?

The results of the 2012 AQMP need to be compared to the results of a recent (Aug 1, 2012) National Petroleum Council (NPC) report on all alternative fuels and the role they will play in the marketplace by 2050. In that study, all alternative fuels are "on the table," and the study evaluated the economics of the fuels, vehicles, infrastructure, and fuel production. The results are very different from the 2012 AQMP document. In the NPC study, all alternative fuels made significant inroads against petroleum – but electric and hydrogen technologies were not dominant in the market. The NPC study evaluated greenhouse gas reductions at the end once economic-based market penetrations were determined for each fuel. Results indicated that alternative fuels, based upon economics, would achieve a national reduction of greenhouse gases of about 50% from 2005 levels.

Whether or not the intention of 2012 AQMP was to pick winners, optically the report gives the impression that hydrogen fuel cell and batter technologies are the answer for fueling all applications in the future. Because of this we are worried that decision makers, who are not as versed in air quality and fuels as CARB, SCAQMD, and SJVAPCD, will look at the report and make regulations and legislation based on this assumption. As a natural gas vehicle fueling company, we are worried that because the benefits of natural gas were scarcely mentioned in the report that decision makers will leave natural gas out of the mix in future plans.

In addition, if alternative fuel companies believe that regulatory bodies are favoring certain alternative fuels over others, it will cause arguments and battles to erupt that greatly delay forward progress. Instead of working against each other, different alternative fuels should work together to bring the best technologies to market. In order to achieve this, the 2012 AQMP should identify the various hurdles that each fuel-type faces instead of assuming all hurdles will be overcome and hydrogen fuel cell and battery technologies will dominate the market. Once the report can accomplish this, companies from various alternative fuel companies will be more likely to integrate strategies instead of working against each other.

The definitions of zero and near zero emissions are not clearly defined in the document, and it sounds like fuel cell and battery electric are synonymous with these classifications. Instead of stating the specific technologies, it would be more beneficial to the alternative fuel industry if "zero" and "near zero" emissions were more clearly defined so that all alternative fuels can strive to meet those classifications. It does not make sense to use electricity or fuel cells in a hybrid system with another fuel if the fuel can meet zero or near zero emissions on its own.

NGVs Deserve Equal Consideration under the 2012 AQMP

We are asking that the natural gas industry receive equal, not special, treatment under SCAQMD's incentives and implementation plans. Natural gas vehicles provide comparable,

FF-7

FF-8

if not better, environmental and energy security benefits in relation to other alternative fuels, and they deserve similar support. Instead of advocating for future technologies like hydrogen fuel cell and electric vehicles, rules and incentives should set attainable goals for all fuel types to strive for to develop clean vehicle options for consumers and businesses. By being fuel neutral, SCAQMD can lead the Air Basin's transportation sector into reduced emissions and cleaner air by supporting alternative fuel infrastructure, alternative vehicles, lowering costs to consumers, and pushing alternative fuel providers to improve engine technology. We ask for the same treatment for the natural gas industry. Because there is a great deal of uncertainty regarding which individual fuel-vehicle systems will overcome technology hurdles to become economically and environmentally attractive by 2050, regulations, policies and funding should be technology neutral while market dynamics drive commercialization.

In regards to natural gas incentives, the station fueling infrastructure for natural gas is well established and has more than 40 competitors in the industry, and the fuel makes economic sense, so policies and incentives should be directed toward natural gas vehicles (NGVs). This will help the consumer either cover the initial premium cost NGVs have over conventionally-fueled vehicles or justify paying the premium in their minds.

Concluding Remarks

Clean Energy would truly like to thank the South Coast AQMD for drafting a framework for air quality and climate planning as well as for giving us the opportunity to comment on this document. While the document provides a basis of methods to meet the Air Basin's PM 2.5 and ozone emissions standards, it is troubling to us that a draft by the AQMD, a rule-making regulatory body, barely touches on the current and potential benefits of natural gas used as a transportation fuel.

The 2012 AQMP seems to be a strong proponent of fuel cell and electric vehicles, which are extremely costly, lack infrastructure, have a low range, have technology limitations, and are not realistic for heavy-duty applications. While these energy sources may be an alternative far down the road, natural gas, which is clean, cheap, domestic and abundant, can help the South Coast Air Basin and California accomplish our emissions goals today and beyond and should be considered by AQMD as such. While the natural gas vehicle fueling industry is well established, it continues to grow at a fast pace and needs the support from regulatory bodies like SCAQMD with fuel neutral policies that promote clean fuels and propulsion strategies. As long as it has state support, natural gas technology will advance to the point of complete zero emissions extremely soon. Clean Energy feels that the 2012 AQMP should be edited to illustrate the benefits of natural gas and should position the report as well as future state regulations/incentives as fuel neutral. If natural gas is pushed aside, the South Coast Air Basin's PM and ozone emissions goals will not be met.

Clean Energy strongly recommends that SCAQMD reviews the entire NPC study noted earlier. The study can be found at: <http://www.npc.org/FTF-80112.html>. The NPC study based on economics comes to an entirely different conclusion than the 2012 AQMP. In the study natural gas plays a significant role in changing the transportation fuel mix in the U.S. through 2050 for heavy-duty vehicles and the light duty consumer market. If the South Coast Air Basin focuses on a technology specific agenda – it may be totally out of step with the rest

FF-8

FF-9

North America's leader in clean transportation

of the U.S. which may cost the Air basin and California the ability to economically compete with the rest of the country.

Thank you,

A handwritten signature in black ink, appearing to read "Todd Campbell".

Responses to Comment Letter FF
Clean Energy

Response to Comment FF-1:

Staff appreciates the comments relative to the role of clean lower carbon fuels in helping to meet air quality goals in the South Coast Air Basin. While the draft 2012 AQMP covers a broad set of strategies in order for the region to attain future air quality standards, the AQMP refers to discussions such as the AQMD Technology Office Clean Fuels Plan, which provide more specific details in conducting research and demonstration of various vehicle technologies using cleaner carbon fuels. Staff welcomes the commenter's participation in these efforts.

Response to Comment FF-2:

Staff believes the commenter is referring to the "Vision for Clean Air" document relative to the greenhouse gas 2050 goal since the draft 2012 AQMP does not contain any emissions inventories beyond 2035. The comments will be considered as the draft "Vision for Clean Air" document is finalized. In addition, see Response to Comment FF-1.

Response to Comment FF-3:

As noted in the discussion of setting lower emission standards discussed in the draft Appendix IV-B, staff recognizes the importance for such standards and that alternative fuel engine technologies that include the use of natural gas will play in helping the region achieve future air quality standards.

Response to Comment FF-4:

The draft 2012 AQMP provides a set of actions that the region needs to continue to move forward in the near-term to help reach the 2023 ozone air quality standard and does not provide a specific set of strategies that are needed to demonstration attainment of the 2023 ozone air quality standard. As such, more specific analysis including economic analyses will be included in the next AQMP, which will focus on the 2023 and 2032 ozone attainment demonstration strategies.

Response to Comment FF-5:

Staff appreciates the comments relative to the development of natural gas engine technologies and the potential greater emissions benefits natural gas engine technologies have to offer. Such benefits will be considered as staff implements the "ADV" measures identified in Appendix IV-B. See also Response to Comments FF-1 and FF-3.

Response to Comment FF-6:

See Responses to Comments FF-1, FF-3, and FF-5.

Response to Comment FF-7:

Staff believes that as battery-electric and fuel cell technologies are further developed, there will be potential integration with alternative fuel based engine technologies such as natural gas. Staff will continue to work with all technology stakeholders to commercialize the cleanest engine technologies as early as possible.

Response to Comment FF-8:

Staff believes that the ADV measures provided in Appendix IV-B does consider all available engine and fuel technologies and does not favor one technology over another. However, some technologies are more mature than others. As such, greater research and development emphasis are placed on those technologies that need to be further developed. While other technologies that are more mature, staff has emphasized the need for incentives to accelerate deployment of such technologies.

Response to Comment FF-9:

Staff appreciates the comments relative to the benefits of natural gas engine technologies. Staff is reviewing the NPC study along with other studies as part of the efforts on the "Vision for Clean Air" document. See also Responses to Comments FF-8.

August 31, 2012

Dr. Elaine Chang
Deputy Executive Officer
South Coast Air Quality Management District

RE: Draft 2012 Air Quality Management Plan (AQMP)
Submitted to: 2012aqmpcomments@aqmd.gov

Dear Dr. Chang:

Southern California Gas Company (SoCalGas) appreciates the opportunity to provide comments with respect to the South Coast Air Quality Management District's (SCAQMD) Draft 2012 AQMP. SoCalGas strongly supports the efforts of the SCAQMD to develop an AQMP that will demonstrate attainment of the PM_{2.5} 24-hour Clean Air Act standard through cost-effective control measures. The attainment of Clean Air Act standards is important to all communities in which SoCalGas operates and provides natural gas service. We continue to demonstrate our support of SCAQMD through participation in your regulatory processes, operation of our in-basin facilities in compliance with SCAQMD's existing rules, and support to our customers in the clean and energy-efficient operation of their natural gas-fueled equipment.

We first would like to inform you of a new rule just announced by EPA and NHTSA that is a major development for natural gas vehicles. (Go to <http://epa.gov/otaq/climate/regs-light-duty.htm>) EPA and NHTSA will now allow vehicle manufacturers to count NGVs they produce when calculating their Corporate Average Fuel Economy (CAFE) and EPA's Light-Duty Vehicle Greenhouse Gas Emissions Rule, known as the National Program of harmonized greenhouse gas and fuel economy standards. This is an important change, because it removes a regulatory disincentive to vehicle manufacturers who wish to market NGVs. The national natural gas industry worked hard to get this change; SoCalGas participated. Here is the relevant excerpt from the EPA rule discussion in the Federal Register:

In order to provide temporary regulatory incentives to promote advanced vehicle technologies, EPA is finalizing, as proposed, an incentive multiplier for CO₂ emissions compliance purposes for all electric vehicles (EVs), plug-in hybrid electric vehicles (PHEVs), and fuel cell vehicles (FCVs) sold in MYs 2017 through 2021. In addition, in response to public comments explaining how infrastructure and technologies for compressed natural gas (CNG) vehicles could serve as a bridge to use of advanced technologies such as hydrogen fuel cells, EPA is finalizing an incentive multiplier for CNG vehicles sold in MYs 2017 through 2021. This multiplier approach

GG-1

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

means that each EV/PHEV/FCV/CNG vehicle would count as more than one vehicle in the manufacturer's compliance calculation. EPA is finalizing, as proposed, that EVs and FCVs start with a multiplier value of 2.0 in MY 2017 and phase down to a value of 1.5 in MY 2021, and that PHEVs would start at a multiplier value of 1.6 in MY 2017 and phase down to a value of 1.3 in MY 2021.⁸⁶ EPA is finalizing multiplier values for both dedicated and dual fuel CNG vehicles for MYs 2017-2021 that are equivalent to the multipliers for PHEVs. All incentive multipliers in EPA's program expire at the end of MY 2021. See Section III.C.2 for more discussion of these incentive multipliers.

GG-1

As you can see, EPA based its decision upon the idea that compressed natural gas fueling infrastructure could serve as a bridge to hydrogen fueled vehicles. SoCalGas has researched reforming of natural gas into hydrogen, and continues to discuss possibilities with interested parties. However any future plans will likely depend upon the outcome of our compression services tariff request to the CPUC. We will need policy clarification from the CPUC to plan how, and to what extent, SoCalGas can participate in the compressed natural gas fueling infrastructure.

We are also supportive of the direction of the change in the definition of "near-zero emissions:"

GG-2

The term —near-zero emissions refers to emissions approaching zero and will be delineated for individual source categories through the process of developing the Air Quality Management Plan/State Implementation Plan and subsequent control measures. Based on current analyses, on-land transportation sources will need to achieve zero emissions where possible, and otherwise will need to be substantially below adopted emission standards — including standards with future effective dates. Near-zero emissions technologies can help meet this need, particularly if they support a path toward zero emissions (e.g. electric/fossil fuel hybrids with all-electric range). (Please see Chapter 4 - Control Strategy and Implementation page 4-19, of the draft 2012 AQMP.)

This new approach will allow more flexibility, and the opportunity for more cost effective approaches to getting down to these very low emission levels. For example see the discussion of the concept of "Net-Zero" emission locomotive system" on page 20 of this comment letter.

GG-3

As set forth in greater detail in our comments, SoCalGas would like to underscore the following points with respect to SCAQMD AQMPs in general:

- 1) The draft 2012 AQMP should focus on attainment of the 2006 24-hour PM_{2.5} standard, and SCAQMD should not make legally binding commitments beyond attainment of this standard, until they are necessary.
- 2) SCAQMD should continue to address the "black-box" commitments in the 2007 AQMP with cost-effective measures, but should not submit the Section 185(e)(5) control

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

measures for inclusion in the CA SIP at this time. SoCalGas remains committed to working with the SCAQMD and all stakeholders to overcoming the challenge of the black box, and has put forward studies of how to do this and new technologies that make the use of natural gas even cleaner; and

- 3) All SCAQMD planning efforts, analyses and control measures should remain fuel neutral.

GG-3

The comments are organized and presented in the following attachments by control measure. To facilitate further discussion and mutually beneficial coordination, we have included a contact person's name and contact information for each of the control measure comments. The most effective way to contact SoCalGas staff is through email, but please do not hesitate to contact me directly (213-244-8851).

Comments are provided on the following control measures:

Attachment	Control Measure	SoCalGas Contact
Attachment 1	CMB-01: Further NO _x Reductions from RECLAIM	Charles Humphrey chumphrey@semprautilities.com
Attachment 2	CMB-03: Reductions from Commercial Space Heating	Steve Simons SSimons@semprautilities.com
Attachment 3	BCM-03: Further PM Reductions from Under-Fired Charbroilers	Steve Simons SSimons@semprautilities.com
Attachment 4	EDU-01: Further Criteria Pollutant Reductions from Education, Outreach, and Incentives	Lance DeLaura LDelaura@semprautilities.com
Attachment 5	INC-01: Economic Incentive programs to Adopted or Near-Zero Technologies	Lance DeLaura LDelaura@semprautilities.com
Attachment 6	Federal CAA Section 182(e)(5) Implementation Measures for Ozone - Mobile Sources	Cherif Youssef CYoussef@semprautilities.com

SoCalGas has not been able to independently verify the modeling for demonstration of attainment of the PM_{2.5} standard. And, therefore, expresses no independent opinion on the need for any of the specific control measures to be used to meet the 2006 PM_{2.5} standard by 2014.

Sincerely,

Lee Wallace

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

Attachment 1

SoCalGas has not been able to independently verify the modeling for demonstration of attainment of the PM_{2.5} standard. And, therefore, expresses no independent opinion on the need for these Control Measures to be used to meet the PM_{2.5} requirement by 2014.

Short-Term PM_{2.5} Control Measure

CMB-01: Further NO_x Reductions from RECLAIM (Phase I and Phase II) [NO_x]

Summary Description of Control Measures

Phase I is classified as a short-term PM_{2.5} control measure and seeks further reductions of 2 TPD of NO_x by 2014 by reducing (shaving) the equivalent number of RTCs in the RECLAIM market.

Phase II of this control measure is classified in the draft 2012 AQMP as a federal CAA Section 182(e)(5) implementation measure. Section 182(e)(5) allows extreme ozone nonattainment areas to include measures that rely on the development of new technology or advancement of existing technology. Such measures are known as "black box" measures. In the draft 2012 AQMP, the Section 182(e)(5) implementation measures such as Phase II, are designed to implement some of the "black box" measures from the 2007 AQMP. Phase II seeks NO_x reductions of an additional 1 TPD over that of Phase I.

Proposed Method of Control and Emissions Reduction

Phase I: The proposed measure states that the annual RECLAIM audits from 2008 to 2010 showed approximately 22–30% programmatic excess in RTC holdings (6.5 TPD – 8.0 TPD) over the three years. Thus, the measure proposes to reduce the total program's RTC allocations by 2–3 TPD by 2014. Staff would seek, with stakeholder input, to identify appropriate approaches during rulemaking to evaluate various shaving methodologies; e.g., a sector-specific or across-the-board reduction. Rulemaking to begin Phase I is expected to begin in 2013 for implementation in 2014.

Phase II: The proposed measure states that the RECLAIM program is subject to the California Health and Safety code, which requires evaluation of the advancement in Best Available Control Retrofit Technology (BARCT). Thus, the measure proposes a periodic facility reassessment and if BARCT changes, the facility's NO_x RTC holdings would be reduced by an equivalent amount as if the facility's equipment was subject to applicable command-and-control BARCT levels. The draft 2012 AQMP states that the January 2005 amendment to the RECLAIM rules "reflected" such a BARCT reassessment resulting in NO_x RTC reductions of approximately 22.5%. Staff may incorporate concepts of facility modernization, and other feasible control measures such as increased energy efficiency and zero and near-zero emission technologies during the rulemaking process that is scheduled to be complete in 2015 with implementation in 2020.

Comments

Phase I: As a point of clarification, there are various references to the amount of reductions sought from Phase I alternatively indicate either as 2 TPD NO_x (Chapter 4, page 4-9) or 2-3 TPD

} GG-4

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

NO_x (Chapter 4, Table 4-2 and Appendix IVA). Phase II, a Section 182(e)(5) implementation measure, proposes an additional 1-2 TPD of NO_x reduction. In Appendix IVA, the table at the top of page IV-A-57 (CMB-01, Phase II) lists the combined NO_x reductions from Phase I and Phase II as a minimum of 3 TPD to a maximum of 5 TPD. A footnote on the table notes that the lower ends of the range (2 and 1 TPD, respectively) will be the SIP commitment for the control measures. Finally, the parenthetical in the first sentence at the top of page IV-A-59 states “from overall 3-5 tpd NO_x RTC reductions discussed in the first phase.” These references are confusing, appear inconsistent and could be construed as misleading with respect to the proposed Phase I RECLAIM NO_x reductions.

GG-4

For consistency and to avoid confusion as this control measure undergoes rulemaking, SoCalGas strongly urges that all text references and tables in the draft 2012 AQMP should only list the SIP commitment of 2 TPD.

Phase II: We question the need for two RECLAIM “shaves” so close together in the draft 2012 AQMP. We note that the difference in emission reductions between the adopted SIP and those achieved from the Phase I rulemaking could be significant as evidenced by the 2007 AQMP and subsequent RECLAIM rulemaking. This is borne out in the Annual RECLAIM Audit Report for 2009 Compliance Year, Chapter 3 - Emissions Reductions Achieved in which it is stated that cumulative changes will result in 22.5% reductions when fully implemented. Given the estimated 2010 excess in RTC holdings of 8 TPD (page IV-A-15), it is reasonable to expect that the Phase I rulemaking will propose more reductions than the 2 TPD SIP commitment for Phase I. As such, a periodic technology assessment only need be performed when the BARCT “true-up” is actually expected to result in emission reductions. The draft 2012 AQMP does not provide information on the impacts of such a BARCT evaluation prior to implementation of the proposed Phase II RTC shave. An evaluation of the potential impacts is necessary to ensure the proposed cost-effective threshold of \$22,500/ton is realistic, especially in light of new technologies being developed resulting in near-zero or zero emissions. The BARCT true-up must not underestimate future energy utilization, which is significantly lower due to continued economic doldrums, but energy use might return to historic levels as long as the cost of additional, incremental regulatory control does not affect manufacturers’ competitiveness.

SCAQMD must also consider that most of the stationary sources in RECLAIM are also regulated under California’s AB32 Cap and Trade regulations. As a result, these sources will likely have reductions in both criteria pollutants and GHGs. Impacts to businesses as a result of the Cap and Trade regulation could be significant, including relocation and shut down, or reduced production at existing operating facilities. The draft 2012 AQMP should provide an analysis of the potential likelihood and magnitude of emissions co-benefits due to other drivers as well as impacts of other regulations prior to initiating Phase II. We believe additional NO_x reductions should not be committed under Phase II, and that such commitment should be incorporated into the 2015 8-hour ozone AQMP.

GG-5

Finally, we anticipate that widespread industry involvement in Cap and Trade programs will have an impact on overall energy use as companies endeavor to streamline operations and began to operate more efficiently. The incentive to increase operational efficiency will lead companies to ultimately reduce fuel use thus reducing combustion emissions from daily operations. Though

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

changes in energy demand cannot be readily quantified at this time, stationary sources, fleets and other mobile sources will all be affected to the extent that the Cap and Trade Program will be a strong ally of the AQMP’s NO_x reduction efforts.

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

Attachment 2

Short-Term PM_{2.5} Control Measure
CMB-03: Reductions from Commercial Space Heating [NO_x]

Summary Description of Control Measure

This proposed control measure proposes NO_x emission reductions from commercial fan-type central furnaces used for space heating and rated from > 175,000 Btu/hr to < 2,000,000 Btu/hr and will apply to manufacturers, distributors, sellers, installers and purchasers of this type of equipment.

Proposed Method of Control and Emission Reductions

This measure proposes to establish a NO_x emission limit for new space heaters for commercial applications, which can be achieved through the use of low NO_x burners.

Comments

SoCalGas wants to ensure that the technological, economic, and operational impacts of this control measure on commercial businesses is minimized and ameliorated. The proposed control measure will require the development of advanced furnace products, which do not exist today and yet must meet existing safety and efficiency standards, and be reliable, durable and affordable. Our specific comments follow.

1. **Proposed Timing:** This measure will be implemented in two phases. Beginning in Phase I with a technical assessment to be completed by 2014, and completing Phase II rule development by 2016. SoCalGas supports this proposed two phase approach for this control measure. However, we do have concerns regarding the proposed time allowed for manufacturers to develop and commercialize these new low-emission products. Manufacturers are already being pushed to meet the 2014 deadline required for condensing residential furnaces and the 2015 deadline for non-condensing residential furnaces (SCAQMD Rule 1111). Based on the current research projects that are jointly co-funded by SoCalGas and SCAQMD, manufacturers may be hard-pressed to complete initial furnace designs and to have prototype residential units adequately field tested and safety certified in to order to meet commercialization timing targets in 2014 and 2015. Potential delay with the Rule 1111 residential products could impact the timing for development and commercialization of commercial units as proposed in this control measure. The Phase I technical assessment should consider the number of models of residential and commercial furnaces that have to be developed, field tested and safety certified before public sale by a manufacturer and the cumulative time needed to meet the emissions standard and accomplish these challenging tasks. The Phase I assessment should consider the technological, economic, and operational impacts upon specific customer categories. These customer categories cannot be treated as if they will react in the same way to the additional costs and maintenance requirements.
2. **SIP Commitment:** SoCalGas has concern regarding the SIP commitment of 0.18 TPD NO_x by 2023 and 0.6 TPD NO_x total proposed for this control measure. Our concern is

GG-6

GG-7

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

based on what SCAQMD admits is a poorly defined equipment inventory. Because the SIP commitment is legally enforceable under the Federal Clean Air Act, we believe a more prudent approach would be to submit this control measure without a specified emissions reduction target. This approach is consistent with other control measures where equipment and emission inventories are not well defined.

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

Attachment 3

Short-Term PM_{2.5} Control Measure

BCM-03: Further PM Reductions from Under-Fired Charbroilers [PM_{2.5}]

Summary Description of Control Measure

This proposed control measure would reduce PM_{2.5} emissions directly emitted from restaurant operations that use under-fired charbroilers by applying unspecified emission control technologies.

Proposed Method of Control and Emissions Reduction

The proposed control measure would be implemented in two phases. Phase I involves the assessment of several candidate emission control technologies/equipment at the University of California at Riverside's Center for Environmental Research & Technology's (CE-CERT) test kitchen. Phase II includes technical and economic feasibility analysis and evaluation of rule development (or amendment of existing Rule 1138 - Control of Emissions from Restaurant Operations) to implement feasible controls for under-fired charbroilers.

Comments

SoCalGas wants to ensure that the impacts of this proposed control measure on the restaurant industry are minimized and ameliorated. The SCAQMD must ensure that any hood capture-systems or other control technologies developed to control PM_{2.5} emissions from under-fired charbroilers meet existing safety standards, and are reliable and affordable. Additionally, the cost effectiveness analysis must demonstrate that the cost of control is reasonable. Our specific comments follow.

1. Phase 1 Feasibility Study: SoCalGas supports the proposed plan to conduct an initial Feasibility Study to identify cost-effective particulate controls for use with under-fired charbroilers. It is important that this study thoroughly investigates capital, operating and routine and periodic maintenance costs of the system and equipment. The cost assessment for maintenance should include labor and non-labor costs such as energy expenses, costs for cleaning agents such as soap and solvents, replacement filters and all other materials used in day-to-day operations.

If testing at CE-CERT identifies a good candidate control technology, then SoCalGas would be interested in cosponsoring (with SCAQMD and the California Restaurant Association) a follow-on field demonstration at an area restaurant to further validate operating costs and emission reductions of the equipment.

2. Technology issues: Other unique technical challenges include the need for direct access to the front of the under-fired charbroiler to manage the cooking process and the need for the cooked meats to maintain a charbroiled taste and appearance. Many restaurants base their culinary reputations on charbroiled foods. The Feasibility Study needs to consider all these technical issues, in addition to emission reduction capabilities.

GG-8

GG-9

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

In summary, the SCAQMD should take the time necessary to understand fully the technology and product issues, related costs, and assess the impacts on various food service operations. As part of this assessment, SCAQMD should provide complete data for the incremental cost effectiveness and estimated emission reduction calculations. Finally, SoCalGas would consider co-funding a field demonstration of equipment that is shown to be good candidate technology in the Phase 1 laboratory evaluations conducted by CE-CERT.

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

Attachment 4

Federal CAA Section 182(e)(5) Implementation Measures for Ozone
EDU-01: Further Criteria Pollutant Reductions from Education, Outreach, and Incentives
[All Pollutants]

Summary Description of Control Measure

This proposed control measure seeks to provide educational outreach and incentives for consumers to contribute to clean air efforts. In addition, this proposed measure intends to increase the effectiveness of energy conservation programs through public education and awareness as to the environmental effects and benefits from conservation. Educational and incentive tools to be used include comparison of energy usage and efficiency, social media, and public/private partnerships.

Proposed Method of Control and Emissions Reduction

Emissions reductions have not yet been quantified but examples of emissions reduction methods include the usage of energy efficient products, new lighting technology, "super compliant coatings," tree planting, and the use of lighter colored roofing and paving materials to reduce energy usage by lowering ambient temperature.

Comments

Assuming SCAQMD has the funding and resources, SoCalGas supports the adoption of this measure and programs to help promote clean air purchases, efficiency projects, and conservation techniques that provide criteria pollutant emissions benefits. We believe that creating awareness of the benefits of choosing efficient equipment, making energy upgrades, and using cleaner energy sources are critical to reaching the state's public health, air, and greenhouse gas goals. SoCalGas offers a number of rebates, incentives, and other programs to help transform the market towards more energy efficient products. We believe there are opportunities to work closely with SCAQMD to help craft effective programs and partner on these types of efforts.

GG-10

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

Attachment 5

Federal CAA Section 182(e)(5) Implementation Measures for Ozone
INC-01: Economic Incentive programs to Adopted or Near- Zero Technologies [NO_x]

Summary Description of Control Measure

The primary objective of this measure is to develop programs that promote and encourage adoption and installation of cleaner, more efficient combustion equipment with a focus on zero and near-zero technologies, such as boilers, water heaters, and commercial space heating, through economic incentive programs, subject to the availability of public funding.

Proposed Method of Control

Avail economic incentive programs from public funding including grants and loans for new purchase of equipment where long term cost savings from increased efficiency are achieved.

Comments

Assuming SCAQMD has the funding and resources, SoCalGas supports the adoption of this measure and programs that promote and encourage the adoption and installation of cleaner, more efficient stationary combustion equipment. We believe that providing incentives and loans to replace combustion equipment will accelerate their replacement and help reduce the public's exposure to air pollutants and greenhouse gas emissions. Providing incentives to help mitigate the costs associated with new purchases and other energy saving upgrades can significantly impact whether or not customers participate in these types of activities. SoCalGas offers a number of rebates, incentives, and other programs to help transform the market towards more energy efficient products. We believe there are opportunities to work closely with SCAQMD to help craft effective programs and partner on these types of efforts.

GG-11

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

Attachment 6

Federal CAA Section 182(e)(5) Implementation Measures for Ozone - Mobile Sources

General Comments

The draft 2012 AQMP demonstrates attainment of the federal 2006 24-hour PM_{2.5} standard of 35 µg/m³ by 2014. It also updates the approved 8-hour ozone AQMP with new commitments for short-term NO_x and VOC reductions and updated emissions inventories and projections to make major progress toward achieving the 1997 8-hour ozone standard of 0.08 parts per million (ppm) by 2023 and the 2008 standard of 0.075 ppm by 2032. As stated previously, SoCalGas does not believe SCAQMD should submit control measures for inclusion in the SIP if they are not needed to show attainment with the 2006 PM_{2.5} 24-hour standard, but we do in general support the concepts in the Section 185(e)(5) mobile-source control measures.

GG-12

As a matter of policy, SoCalGas supports a technology agnostic approach to meeting emission reduction goals. Within that perspective, SoCalGas believes that the draft 2012 AQMP incorporates too little natural gas technology. This is not based on SoCalGas' role as a distributor of natural gas but rather on the demonstrated performance and predictable advances in natural gas technologies, while achieving emission reductions in both criteria pollutants and green-house gases (GHG). Natural gas technologies offer one of, if not the, lowest cost alternatives for reduction of criteria and GHG emissions, and vehicles running on renewable natural gas (biogas) have been certified by CARB as the lowest GHG-emitting vehicles. CARB analysis shows that natural gas vehicles (NGVs) employing biogas fuel are lower GHG emitters than both battery-electric vehicles (BEVs), and fuel-cell vehicles (FCVs). Additionally tailpipe criteria emissions can be mitigated to very near-zero levels.

GG-13

The focus of the mobile source measures in the draft 2012 AQMP includes accelerated retrofits or replacement of existing vehicles or equipment, acceleration of vehicle turnover through voluntary vehicle retirement programs, and greater use of cleaner fuels in the near-term. The draft 2012 AQMP envisions that, in the longer-term, in order to attain the federal 8-hour ozone standard, there is a need to increase the penetration and deployment of near-zero and zero-emission vehicles such as plug-in hybrids, BEVs, and FCVs, increased use of cleaner fuels (either alternative fuels or new formulations of gasoline and diesel fuels), and additional emission reductions from locomotive and aircraft engines. The proposed technology solutions all have merit but in general are currently very expensive, may require expensive infrastructure improvements, and major technology development to meet the stated goals cost effectively. Natural gas technology, on the other hand, is cost effective now and relatively mature. Even if viewed as a bridge fuel, good public policy would support aggressive adoption of compressed natural gas (CNG) and liquefied natural gas (LNG) now, and let technology advances determine the role of natural gas fuel beyond 2025.

Natural gas, a domestically produced fuel, is expected to continue to offer cost advantages over diesel and gasoline (mostly refined from imported crude oil) for a long time. Natural gas also offers more reductions in NO_x, CO, CO₂ and PM_{2.5} than liquid fuels.

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

SoCalGas believes the incorporation of near-zero emissions technology along with flexibility to define that term both in terms of current emissions and progress toward zero-emission pathways is a positive step toward the type of performance-based, technology-agnostic and pragmatic approaches that SoCalGas advocates. SoCalGas looks forward to working with the SCAQMD on supportive paths to zero emissions such as hydrogen-CNG blends, biogas, advanced after-treatment and reformation of natural gas to produce hydrogen fuel.

SoCalGas can support all the Advanced Control Technologies measures that accelerate the penetration of lower emissions (On-Road & Off-Road) vehicles, marine vessels and locomotives, if they are not submitted as control measure in the PM_{2.5} SIP, include the potential for NGVs as near-zero emission technologies, and the use of NGVs and infrastructure as a path to zero-emission technologies. Natural gas technologies that are currently available or being developed can provide cost effective alternative solutions in addition to the other fuels being considered.

Our specific comments are divided into five categories as follows:

Category 1: Control measures related to partial-zero and zero-emission vehicles and light-, medium- and heavy-duty vehicles.

ONRD-01: Accelerated Penetration of Partial-Zero Emission and Zero-Emission Vehicles
Summary Description of Control Measure

This measure proposes to continue incentives for the purchase of zero-emission vehicles and hybrid vehicles that have a portion of their operation in an all electric range mode. The state Clean Vehicle Rebate Pilot (CVRP) program is proposed to continue from 2015 to 2023 with a proposed funding for up to \$5,000 per vehicle. The proposed measure seeks to provide funding assistance for up to 1,000 zero-emissions or partial-zero emission vehicles per year.

ONRD-02: Accelerated Retirement of Older Light- and Medium-Duty Vehicles
Summary Description of Control Measure

This proposed measure calls for promoting the permanent retirement of older eligible vehicles through financial incentives currently offered through local funding incentive programs and the AB 118 Enhanced Fleet Modernization Program (EFMP). The proposed measure seeks to retire up to 2,000 older light- and medium-duty vehicles (up to 8,500 lbs gross vehicle weight) per year. Funding incentives of up to \$2,500 per vehicle are proposed for the scrapping of the vehicle, which may include a replacement voucher for a newer or new vehicle.

Light-Duty Vehicles: ONRD-01 and ONRD-02

Category 1, Light-Duty Vehicles Comments

SoCalGas requests inclusion of light-duty PZEV NGVs in the draft 2012 AQMP as qualifying partial-zero emission vehicles. Although the Honda GX (dedicated CNG) is the only certified Partial-Zero Emission Light-Duty vehicle, other OEM's have indicated interest in developing vehicles. The development of a cost effective Home Refueling Appliances (HRA) can provide a large boost for light-duty market potential and other technology advances such as CNG/Electric hybrid, engine efficiency advances and numerous other technology advances can reduce

GG-13

GG-14

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

emission further. SoCalGas would welcome the opportunity to consider joint technology programs with SCAQMD to advance these technologies and other zero-emission pathway approaches such as hydrogen-CNG blends.
Medium-Duty Vehicles: ONRD-03

GG-14

ONRD-03: Accelerated Penetration of Partial-Zero Emission and Zero-Emission Light Heavy and Medium Heavy-Duty Vehicles
Summary Description of Control Measure

The objective of the proposed action is to accelerate the introduction of advanced hybrid and zero-emission technologies for Class 4 through 6 heavy-duty vehicles. The state is currently implementing a Hybrid Vehicle Incentives Project (HVIP) program to promote zero-emission and hybrid heavy-duty vehicles. The proposed measure seeks to continue the program from 2015 to 2023 to deploy up to 1,000 zero- and partial-zero emission vehicles per year with up to \$25,000 funding assistance per vehicle. Zero-emission vehicles and hybrid vehicles with a portion of their operation in an all electric range mode would be given the highest priority.

Category 1, Medium-Duty Vehicles Comments

SoCalGas requests inclusion of medium-duty PZEV NGVs as qualifying partial-zero emission medium-duty vehicles. At this time the Ford 150, Chrysler Ram and Chevy Silverado are the only CNG bi-fuel trucks and they do not qualify as partial-zero emission vehicles. Landi Renzo, USA announced that USEPA certified a CNG-fueled 2012 Ford 6.8L V10 engine (Ford F-450/550/650 Chassis Cab and F53/F59 Step Van Chassis). Other OEMs and third party up-fitters have expressed interest in the development of other medium-duty vehicles that have the potential of achieving partial-zero emissions. SoCalGas proposes to jointly co-fund, with the SCAQMD, the demonstration of newly developed lower emissions trucks and vans.

GG-15

Heavy-Duty Vehicles: ONRD 04, ONRD 05, ADV-01 and ADV-03

ONRD-04: Accelerated Retirement of Older On-Road Heavy-Duty Vehicles
Summary Description of Control Measure

This proposed measure seeks to replace up to 1,000 heavy-duty vehicles per year with newer or new vehicles that at a minimum, meet the 2010 on-road heavy-duty NO_x exhaust emissions standard of 0.2 g/bhp-hr. Given that exceedances of the 24-hour PM_{2.5} air quality standard occur in the Mira Loma region, priority will be placed on replacing older diesel trucks that operate primarily at the warehouse and distribution centers located in the Mira Loma area. Funding assistance of up to \$35,000 per vehicle is proposed and the level of funding will depend upon the NO_x emissions certification level of the replacement vehicle. In addition, a provision similar to the Surplus Off-Road Option for NO_x (SOON) provision of the statewide In-Use Off-Road Fleet Vehicle Regulation will be sought to ensure that additional NO_x emission reduction benefits are achieved.

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

ONRD-05: Further Emission Reductions from Heavy-Duty Vehicles Serving Near-Dock Railyards

Summary Description of Control Measure

This proposed control measure calls for a requirement that any cargo container moved between the Ports of Los Angeles and Long Beach to the nearby railyards (the Intermodal Container Transfer Facility and the proposed Southern California International Gateway) be with zero-emission technologies. The measure would be fully implemented by 2020 through the deployment of zero-emission trucks or any alternative zero-emission container movement system such as a fixed guideway system. The measure calls for CARB to either adopt a new regulation or amend an existing regulation to require such deployment by 2020. To the extent the measure can feasibly be extended beyond near-dock railyards, this would be considered for adoption by CARB.

ADV-01: Actions for the Deployment of Zero- and Near-Zero Emission On-Road Heavy-Duty Vehicles

Summary Description of Control Measure

This measure would continue the efforts underway to develop zero-emission and near-zero emission technologies for on-road heavy-duty vehicle applications. Such technologies include, but not limited to, fuel cell, battery-electric, hybrid-electric with all electric range, and overhead catenary systems. Hybrid-electric systems incorporate an engine powered by conventional fuels or alternative fuels such as natural gas. The actions provided in the proposed measure are based on the SCAG 2012 Regional Transportation Plan.

ADV-03: Actions for the Deployment of Zero- and Near-Zero Emission Cargo Handling Equipment

Summary Description of Control Measure

This measure recognizes the actions underway to develop and deploy zero- and near-zero emission technologies for various cargo-handling equipment. The San Pedro Bay Ports are currently demonstrating battery-electric yard tractors. In addition, battery-electric, fuel cell, and hybridized systems could be deployed on smaller cargo handling equipment. In addition, the use of alternative fuels for conventional combustion engines could potentially result in greater emissions benefits.

Category 1, Heavy-Duty Vehicles Comments

SoCalGas requests changes to these control measures to include and encourage development of natural-gas powered partial-zero emission vehicles. The current Federal and CARB NO_x emission standard for heavy-duty vehicles is 0.2 g/bhp-hr, while the draft 2012 AQMP proposes a 95% reduction, or 0.01 g/bhp-hr (Appendix IV –B-54). In our research and demonstration projects, SoCalGas is targeting near-term emission reductions of 80%, or 0.05 g/bhp-hr. Several engine manufacturers are developing various sizes of heavy-duty engines to meet less than 0.2 g/bhp-hr. Doosan (a Korean engine manufacturer) is developing an eleven-liter engine that will utilize blended hydrogen fuel and other emissions control techniques to achieve near-zero emissions. Brayton Energy is developing microturbines, and hybrid-CNG heavy-duty engines. US Hybrid is working with Freightliner and GTI in demonstrating a hybrid-CNG engine in a class-eight drayage truck. SoCalGas and several other parties are participating in demonstrating

GG-16

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

catenary CNG-hybrid trucks at the Port of Los Angeles. Also, Ebus is demonstrating a new CNG-Hybrid bus. All of these projects have one common goal, which is to use natural-gas fuel along with innovations to achieve near-zero emissions. As an example, the SCAQMD could encourage future development by setting several qualifying emission-reduction levels over time, such as 50% NO_x reduction over 2010 emission standards within the next 5 years, 75% NO_x reduction over 2010 emission standards within the next 10 years and provide higher incentives for higher emission reductions.

Hybrid technology, including CNG-hybrid trucks, would be encouraged by the use of the concept of “zero-emission miles traveled” as another metric to determine whether or not a technology is a near-zero emission technology or even a zero-emission technology. We urge SCAQMD and CARB to consider further discussion of this concept soon, in order for truck manufacturers to understand the concept of zero-emission miles traveled so they may incorporate it into their development plans. As you know, truck manufacturers must have a long lead time to develop and introduce new vehicles. They need to know the new “rules of the game” as soon as possible.

GG-16

Category 2: Control measures related to Surplus Off-Road Options for NO_x (SOON)

OFFRD-01: Extension of the SOON Provision for Construction/Industrial Equipment
Summary Description of Control Measure

This measure seeks to continue the Surplus Off-Road Option for NO_x (SOON) provision of the statewide In-Use Off-Road Fleet Vehicle Regulation beyond 2014 through the 2023 timeframe. In order to implement the SOON program in this timeframe, funding of up to \$30 million per year would be sought to help fund the repower or replacement of older Tier 0 and Tier 1 equipment, with reductions that are considered surplus to the statewide regulation with Tier 4 or cleaner engines.

ADV-06: Actions for the Deployment of Cleaner Off-Road Equipment

Summary Description of Control Measure

SCAQMD, its Mobile Source Air Pollution Reduction Review Committee (MSRC), and CARB have been conducting an off-road —showcase program for retrofit technologies to further reduce emissions from older off-road equipment. In addition, several major off-road engine manufacturers are investigating the potential use of hybrid systems to further reduce criteria pollutant and greenhouse gas emissions. Potential advanced technologies include hybrid systems that utilize batteries, fuel cells, or plug-in capabilities, which could result in lower emissions compared to Tier 4 emission levels when combined with future Tier 4 compliant engines. The measure is implemented by the District, CARB and U.S. EPA.

Category 2 Comments

SoCalGas requests modifications to both OFFRD-01 and ADV-06 control measures to explicitly allow the use of natural gas equipment for off road applications to achieve partial-zero emissions.

GG-17

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

Category 3: Control measures related to locomotives

OFFRD-02: Further Emission Reductions from Freight Locomotives

Summary Description of Control Measure

The proposed control measure is to meet the commitment in the 2007 SIP for the accelerated use of Tier 4 locomotives in the South Coast Air Basin. The measure calls for CARB to seek further emission reductions from freight locomotives through enforceable mechanisms within its authority to achieve 95 percent or greater introduction of Tier 4 locomotives by 2023.

OFFRD-03: Further Emission Reductions from Passenger Locomotives

Summary Description of Control Measure

This measure recognizes the recent actions by the Southern California Regional Rail Authority (SCRRA or Metrolink) to consider replacement of their existing Tier 0 passenger locomotives with Tier 4 locomotives. The SCRRA adopted a plan that contains a schedule to replace their older existing passenger locomotives with Tier 4 locomotives by 2017. More recently, SCRRA released a Request for Quotes on the cost of new or newly manufactured passenger locomotives with locomotive engines that meet Tier 4 emission levels.

ADV-02: Actions for the Deployment of zero- and Near-Zero Emission Locomotives

Summary Description of Control Measure

This measure calls for the development and deployment of zero-emission and near-zero emission technologies for locomotives. Such technologies include overhead catenary systems, hybrid locomotives that have some portion of their operation in an all electric range mode, and alternative forms of external power such as a battery tender car. The actions provided in the proposed measure are based on the SCAG 2012 Regional Transportation Plan.

Category 3 Comments

SoCalGas requests modifications to OFFRD-02, OFFRD-03 and ADV-02 control measures to explicitly allow the use of natural gas-powered partial-zero emission locomotives. SoCalGas is collaborating with Energy Conversions Inc. (ECI) and Ioxus on an ARPA-E project to develop the systems for a Tier 5 CNG-hybrid commuter locomotive. This technology offers a viable near-zero emission transition for passenger rail. The project will develop and demonstrate novel locomotive architecture that integrates several recently proven technologies at locomotive scale. It offers reduced operating costs and emissions with enhanced performance and redundancy. Because of its economic practicality and small infrastructure footprint, it could result in a very practical transition from diesel to natural gas in the publicly visible sector of the United States transportation system. In some instances it will prove to be a practical and economic substitute for rail electrification.

Converting to CNG-hybrids in the existing fleet of F40/59 locomotives will provide cleaner, higher performing locomotives at a similar cost to buying new diesel passenger locomotives. This could lower fuel cost by 80% and yield a yearly savings of approximately \$17.1 million. Emissions are 75% below Tier 4 NO_x and result in a 40% decrease in GHGs. In terms of performance it could double the acceleration rate, increase average train speed by 10%, and offer a minimal increase in energy expenditure for additional train stops.

GG-18

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

A TIAX report discussing the LNG switcher locomotive demonstration project below is attached (Attachment 6-B) for reference.¹

In 2009, the ports of Long Beach and Los Angeles, working with Pacific Harbor Line, Inc. (PHL) acquired one switcher locomotive fueled by liquefied natural gas (LNG) to demonstrate the technology's suitability and emissions reduction characteristics at the Port of Los Angeles' West Basin Container Terminal (WBCT). This 1,200 HP LNG locomotive (BNSF 1203) was the primary switcher locomotive used at WBCT during the duration of the demonstration project. The objective of the demonstration was to compare the performance of the system with PHL's older (phased out) 1,200 HP diesel-electric switchers, using recent historical data. This provided an "apples to apples" comparison because the two types of switcher locomotives are similar in size and capabilities. In addition, emissions comparisons were made under the revised plan of the LNG switcher versus both types of diesel-electric locomotives (the older phased out baseline switcher, and the new Tier 2 switcher). Using the modified demonstration test plan as approved by the Ports, the LNG switcher was operated by PHL for a period of 36 weeks.

Based on PHL-provided data and observations from the demonstration, the following conclusion can be made: Overall, the LNG locomotive performed "adequately to well" in railcar switching service. Although there were a few logistics and mechanical issues associated with storing and combusting LNG fuel that negatively impacted the locomotive's reliability and service capability, and despite the apparent higher rate of fuel consumption, the LNG locomotive cost approximately 23% less to fuel on an energy-equivalent basis, due to the lower price paid by PHL per Btu of LNG fuel compared to diesel fuel. LNG is also a viable option for switchers and might provide further fuel cost benefits. Additionally, the LNG switcher locomotive emits an estimated 92% less NO_x and 76% less PM compared to the baseline (uncontrolled) diesel locomotives. The LNG switcher locomotive emits an estimated 81% less NO_x and 57% less PM than PHL's new Tier 2 locomotives.

OFFRD-2 seeks to accelerate the locomotive fleet turn over to have 95% of locomotives operating in the South Coast Air Basin at Tier 4 emissions levels. This would require the participating railroads to purchase new locomotives in order to retire reliable and functional locomotives. Not only are these new locomotives a significant and unnecessary capital cost, these newer locomotives will cost more to operate and require more routine maintenance. LNG conversion systems can be a cost effective option for re-powering existing EMD locomotives, despite the possible need after treatment. These systems would not only exceed the reductions required by Tier 4, but cut operating costs in half.

Regarding OFFRD-3, SCAQMD, SoCalGas and Metrolink participated in a program called GasRailUSA. This program ended abruptly when the participating engine manufacturer stopped supporting it, but in the process it generated test results on several different natural gas locomotive engine technologies. For NO_x reduction and thermal efficiency, the most promising technology was micro pilot prechambers (MPPC). MPPC uses a micro pilot of diesel fuel in a prechamber to ignite a very lean mixture of premixed natural gas. This technology has recently

¹ Demonstration of a Liquid Natural Gas Fueled Switcher Locomotive at Pacific Harbor Line, Inc.

GG-18

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

been tested and refined in several research programs for smaller engines with even more promising results.

In a collaborative effort ECI, Ioxus, SoCalGas and SwRI submitted a grant proposal to ARPA-E to develop the needed systems to upgrade existing EMD passenger locomotives to CNG-hybrid commuter locomotives. Utilizing the frequent start-stop operation of the commuter-rail duty cycle combined with MPPC, natural gas engines, and ultra capacitive energy storage this system is predicted to have NO_x emissions below the upcoming Tier 4 emission standard.

It appears that SCAQMD staff is looking for optional NO_x standards that could be incorporated into the draft 2012 AQMP. The CNG-hybrid system discussed above could facilitate discussion towards a new, optional "Tier 5" emission standard for Commuter Locomotives.

The CNG-hybrid system is more likely to accelerate the transition of the passenger locomotive fleet because it reduces operating costs by 70% and doubles the acceleration performance of the trains. In the long term the performance increase is highly desirable and the fuel cost savings over the life of the system make the CNG-hybrid system less expensive than any diesel fueled Tier 3 or Tier 4 systems.

The "Tier 5" CNG-hybrid commuter locomotive is also a viable and practical step toward a "Net-Zero" emission locomotive system. The natural-gas piston engines could be replaced when they need overhaul with ultra-low NO_x natural gas turbines. In 8 to 10 years, the Intercooled Recuperated Gas Turbine engines in development with ceramic turbines will have the reliability and efficiency of current diesel locomotive engines with NO_x outputs below 5 ppm. This future engine-technology upgrade will benefit from current investment in natural-gas storage and hybrid equipment.

SoCalGas believes conversion to natural gas of EMD 2-stroke engines is an early action to meet Tier 4 standards and a viable path to near-zero emissions with future replacement of the piston engine with a gas turbine.

Natural gas conversion is a promising early and rapid Tier 4 adoption for rail because it will also cut fuel operating costs in half. This is in contrast with SCR and high EGR as Tier 4 solutions, which will increase operating costs. Unlike electrification it does not require significant infrastructure change; and, unlike Tier 4 diesel, it cuts operating costs in half.

Category 4: Control measures related to Marine Vessels and Harbor Craft

OFFRD-04: Further Emission Reductions from Ocean-Going Marine Vessels while at Berth
Summary Description of Control Measure

This measure seeks additional emission reductions from ocean-going marine vessels while at berth. The actions would affect ocean-going vessels that are not subject to the statewide Shore Power regulation (Title 17 Section 93118.3, Airborne Toxic Control Measure for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At-Berth in a California Port) or vessel calls that are considered surplus to the statewide regulation. The measure seeks at a minimum to have an additional 25 percent of vessel calls beyond the statewide regulation to deploy shore

GG-18

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

power technologies or alternative forms of emissions reduction as early as possible. Such actions could be implemented through additional incentives programs or through the San Pedro Bay Ports as part of the implementation of the Ports Clean Air Action Plan.

OFFRD-05: Emission Reductions from Ocean-Going Marine Vessels

Summary Description of Control Measure

This measure recognizes the recent actions at the Ports of Los Angeles and Long Beach to initiate an incentives program for cleaner ocean-going vessels to call at the ports. The program has been initiated as part of the San Pedro Bay Ports Clean Air Action Plan. The program will provide financial incentives for cleaner Tier 2 and Tier 3 ocean-going vessels to call at the ports. This measure also recognizes the need to monitor progress under such programs and augment them as necessary to ensure sufficient results. The program will be monitored on annual basis and, if necessary, any adjustments to the program will be made.

ADV-04: Actions for the Deployment of Cleaner Emission Commercial Harbor Craft

Summary Description of Control Measure

Several commercial harbor craft operators have begun deployment of hybrid systems in their harbor craft to further reduce criteria pollutant emissions and improve fuel efficiency. Other cleaner technologies include the use of alternative fuels, retrofit of existing older marine engines with selective catalytic converters, and diesel particulate filters. This measure recognizes several efforts between SCAQMD and the Ports of Los Angeles and Long Beach to further demonstrate control technologies that could be deployed on commercial harbor craft that could go beyond the statewide Harbor Craft regulation (Title 17 Section 93118.5, Airborne Toxic Control Measure for Commercial Harbor Craft and Title 12 Section 2299.5, Low Sulfur Fuel Requirement, Emission Limits and Other Requirements for Commercial Harbor Craft).

ADV-05: Actions for the Deployment of Cleaner Ocean-Going Marine Vessels

Summary Description of Control Measure

The Ports of Los Angeles and Long Beach, CARB, and SCAQMD have sponsored research and demonstration of various control technologies to further reduce emissions from ocean-going vessels. In addition, the San Pedro Bay Ports Clean Air Action Plan contains a measure to further demonstrate such technologies on ocean-going vessels. This measure recognizes many of these efforts and the need to further demonstrate retrofit technologies on existing ocean-going vessels.

Category 4 Comments

SoCalGas supports these control measures with the caveats set out in our general mobile source comments. Both CNG and LNG fuels have the potential to achieve near-zero emissions for marine vessels and harbor craft. Please see the attached detail report by American Clean Skies Foundation (Attachment 6-A) on this topic².

This study offers the first in-depth look at the challenges and prospects of converting U.S. marine vessels to liquefied natural gas, which is more often viewed as a fuel for long haul

GG-19

² NATURAL GAS FOR MARINE VESSELS - U.S. MARKET OPPORTUNITIES

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

trucking. Most marine vessels operate on liquid petroleum fuel—either marine distillate or marine residual oil.

Based on current forecasts, natural gas delivered for production of LNG is now at least 70% less expensive on an energy equivalent basis than marine residual fuel and 85% less expensive than marine distillate fuel. EIA currently projects that this relative price advantage will continue, and even increase, through 2035. In addition, conversion of vessels to LNG operation is expensive, it can cost up to \$7 million to convert a medium-sized tug to operate on natural gas, almost \$11 million to convert a large car and passenger ferry, and up to \$24 million to convert a Great Lakes bulk carrier. Approximately one sixth of this cost relates to conversion of the vessel engines and the rest is for installation of LNG storage tanks and related safety systems and ship modifications.

Another issue which will affect the economics of LNG conversion for some vessels is implementation of federal emissions regulations and fuel sulfur restrictions, which become effective between 2016 and 2020. In particular, significant reductions in allowable fuel sulfur, for vessels operating in federal waters and in the North American and Caribbean Sea Emission Control Areas, will require switching to more expensive distillate fuel, or installation of expensive emission controls for vessels that currently burn residual fuel. For these vessels, the incremental cost of compliance relative to current fuel costs may significantly improve the economics of conversion to naturally low-sulfur LNG.

Below³ is a link to an article about Fjord Line Ferries that converted to 100% LNG. Bergen Fosen is building two ships with Rolls-Royce BV12PG engines. Two new international cruise ferries by the Egersund, Norway-based Fjord Line will be powered solely by LNG, rather than the originally announced dual fuel system.

Category 5: Control measures for aircraft engines

ADV-07 –Actions for the Deployment of Cleaner Aircraft Engines

Summary Description of Control Measure

Mobile Source Air Pollution Reduction Review Committee (MSRC): This measure recognizes the efforts of the Federal Aviation Administration's Continuous Lower Energy, Emissions and Noise (CLEEN) Program. The goal of the CLEEN Program is the development of new aircraft engines that potentially can be up to 60 percent cleaner in NO_x emissions than current aircraft engines. The actions under this measure are to continue the development of cleaner aircraft engines and work with the airlines and local airport authorities to develop mechanisms to route the cleanest aircraft to serve the South Coast Air Basin.

³ http://www.fleetandfuel.com/files/lng/2012/07/fjord-line-ferries-100-lng.htm_source=FleetFuel01August2012&utm_campaign=August152012&utm_medium=email

GG-19

SoCalGas - Comments on the SCAQMD Draft 2012 AQMP

Category 5 Comments

SoCalGas has no comments on this control measure except that we advocate that only those control measures required to demonstrate attainment with the 2006 24-hour PM_{2.5} standard be submitted for the SIP at this time.

Responses to Comment Letter GG
SoCal Gas / Sempra

Response to Comment GG-1:

Thank you for your comments regarding the recent EPA and NHTSA rulemaking. We are aware of the proposed credit approach for greenhouse gas purposes and continue to support greater use of alternative fueled vehicles as a vital solution to meeting ambient air quality standards in the South Coast Air Basin.

Response to Comment GG-2:

District staff looks forward to the next generation of cleaner alternative fueled combustion engines. District staff believes that the potential to integrate the next generation of cleaner combustion engines with hybrid systems that have the capability of operating in a "zero-emission" mode will be necessary in order for the South Coast Air Basin to achieve air quality standards by their applicable dates. We look forward to working with all stakeholders in the development of the cleanest engine technologies as early as possible.

Response to Comment GG-3:

These three main points are addressed in detail in the following responses. The district is committed to fuel neutral policies and actions, provided that the associated emissions are zero or near-zero allowing the Basin to reach its air quality goals.

Response to Comment GG-4:

Several improvements have been made to Control Measure CMB-01 to clarify its intent. Most importantly, please note that, as pointed out in response to comment W-3, reductions from Control Measure CMB-01 are no longer needed for demonstrating attainment with the 24-hour PM_{2.5} standard. As a result, Control Measure CMB-01 in the revised Draft 2012 AQMP is listed as a contingency measure for PM_{2.5} and not as part of the short-term control strategy, although the proposed BARCT adjustment is now listed as an ozone measure.

Response to Comment GG-5:

Please see response to comment GG-4. District staff is cognizant that implementation of the AB32 program, in addition to the GHG reductions, in many instances, may result in criteria pollutant reduction co-benefits. Such co-benefits in criteria pollutants would be welcome and could be factored in future program designs to the extent such benefits could be quantified during the program design phase.

Response to Comment GG-6:

AQMD staff does not expect the compliance date for a rule based on control measure CMB-03 to be earlier than 2018. The current project to develop prototypes of Rule 1111 compliant residential furnaces is progressing well and is expected to be completed by the summer of 2013. Based on progress to date, AQMD staff does not expect a delay in Rule 1111 implementation. Staff believes that the current schedule in measure CMB-03 provides sufficient time for development of larger products based on residential furnace technology (multiple small burners) or single burner technologies used in other applications. The various types of commercial space heaters will be evaluated as part of the rule development process.

Response to Comment GG-7:

The methodology for developing the commercial space heating emissions inventory is well established, has been used in previous AQMPs and incorporates EPA emission factors, local data on gas use by different sectors from local gas utilities and information from the California Energy Commission, CARB and local agencies. The inventory incorporates local growth projections and gas utility provided energy conservation projections. The factor in inventory development that may need further enhancements is the proportion of heating provided by forced air furnaces versus boilers. Given the inventory for this control measure is based on sound data and AQMD staff has used a conservative approach to estimate emission reductions, staff proposes to take credit for this reduction and revise the emission reduction upward during rule development if it is warranted.

Response to Comment GG-8:

As outlined, the Phase I of the technical assessment will evaluate all costs associated with the purchase, installation, and operation and maintenance of the charbroiler control device. Consideration will be given to compatibility and local codes (e.g. fire suppression) relative to implementing the technology. The assessment of costs will also include the cleaning and/or replacement of filters. This has been clarified in the control measure.

AQMD staff hopes for and anticipates more than one affordable and feasible technology and appreciates the offer to co-sponsor and co-fund one of technologies in the field. A real-world assessment would be most beneficial to proving the success of the control device. It should be noted that the San Joaquin Valley APCD created a program with \$500,000 to demonstrate technologies at a restaurant and had no takers. So, the Gas Company's assistance in identifying a restaurant would be most helpful and will be discussed as part of the stakeholder process.

Response to Comment GG-9:

One of the intents of the testing program at CE-CERT is to demonstrate a technology that any control installations not augment the cooking process; therefore the focus is for in-hood or rooftop/duct work placement of the device so as not to impact the taste or appearance of the charbroiled meat. This has also been clarified in the control measure.

Recognizing that any feasible control device must be affordable to the restaurant operator, one focus of the testing program was to evaluate potential control devices that have a capital and installation cost below \$30,000 and annual operating costs below \$10,000. Evaluation of cost (including incremental cost) impacts associated with purchase, installation, and operation and maintenance (e.g., cleaning and/or replacing filters) of the equipment will also be assessed. This has also been clarified in the control measure. AQMD appreciates the offer to co-fund a demonstration project.

Response to Comment GG-10:

We appreciate your support for this control measure and willingness to work with AQMD on implementing this measure.

Response to Comment GG-11:

We appreciate your support for this control measure and willingness to work with AQMD on implementing this measure.

Response to Comment GG-12:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically adopted in regulatory form at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also

underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large “black box” in the existing approved 2007 AQMP (241 fpd NO_x & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NO_x and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment GG-13:

As noted in the draft 2012 AQMP, the primary focus is on attainment of the 24-hour PM_{2.5} air quality standard. However, actions needed in the near-term to help attain the 2023 ozone air quality standards are identified with no emission commitments. As with previous AQMPs and SIP submittals, emission reduction commitments are designed with the flexibility to substitute specific control measures to achieve the emission reduction commitments. Staff believes that it is important that the early actions identified in the draft AQMP will provide more certainty in the types of research, development and demonstration, and deployment efforts needed for advanced cleaner combustion engines and zero- and near-zero emission technology development.

Response to Comment GG-14:

ONRD-1 and ONRD-2 focus on existing incentives programs based on guidelines that focus on partial-zero and zero-emission vehicles developed by the state. The Commenter is urged to provide similar comments as the state continues to enhance its guidelines for future funding programs. The AQMD staff welcomes the opportunities with work stakeholders in the development of natural gas-hybrid vehicle technologies.

Response to Comment GG-15:

See Response to Comments GG-14 as it applies to medium-duty vehicles.

Response to Comment GG-16:

Staff appreciates the comments regarding cleaner engine emissions levels, and is in discussions with various stakeholders for the development of such technologies.

Response to Comment GG-17:

OFFRD-01 is specific to the deployment of commercially available Tier 3 and Tier 4 technologies. There are no restrictions in funding alternative fueled engine technologies as long as such engines are commercially available. Relative to ADV-06, staff welcomes proposals for alternative-fueled engines integrated with hybrid systems in off-road applications. There are no limitations on proposed projects that have the potential for emission reductions beyond Tier 4 off-road engine standards.

Response to Comment GG-18:

OFFRD-02, OFFRD-03, and ADV-02 do not limit Tier 4 or cleaner locomotive engine technologies to conventionally fueled technologies. As such, if natural gas locomotive engines that meet Tier 4 or cleaner emission levels are commercialized, such technologies will be welcomed. As discussed in "ADV-02", natural gas locomotive engines have a potential role in meeting cleaner than Tier 4 emission levels. See discussions beginning on Page IV-B-63.

Response to Comment GG-19:

Staff appreciates the comments relative to ocean-going vessels and harbor craft and the references to deployment of natural gas engine technologies. Staff will continue to work with stakeholders in the development of such technologies.

HH. Port of Los Angeles & Port of Long Beach, August 30, 2012

August 30, 2012

Barry Wallerstein, D. Env.
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765

Re: Comments on the Draft 2012 Air Quality Management Plan

Dear Dr. Wallerstein:

The Port of Long Beach and Port of Los Angeles (Ports) appreciate the opportunity to serve on the South Coast Air Quality Management District's (AQMD) 2012 Air Quality Management Plan (AQMP) Advisory Committee. We support the AQMD's clean air goals and have a proven leadership record of developing and implementing appropriate and effective strategies that have resulted in the port-related goods movement industry's achievement of real and dramatic emissions reductions. Although the Ports do not own or control the emission sources, the Ports have worked cooperatively with business operators in the port area and the air quality regulatory agencies (i.e. Environmental Protection Agency, California Air Resources Board, and AQMD) to help the port industry reduce its fair share of air quality impacts to the region from port-related operations, as outlined in the San Pedro Bay Ports Clean Air Action Plan (CAAP) and the associated San Pedro Bay Standards. As a result, between 2005 and 2011 emissions from port-related sources were reduced by 73 percent for diesel particulate matter (DPM) and by 50 percent for nitrogen oxides (NOx). The Ports' San Pedro Bay Standards for 2014 established goals to reduce port-related DPM by 72 percent and NOx by 22 percent. Therefore, as a result of implementation of aggressive actions by the port industry, port-related emission reductions have exceeded our goals several years ahead of schedule.

While we remain a committed partner in the effort to improve air quality in the region, we have significant concerns with several proposed control measures in the Draft 2012 AQMP that improperly misclassify the Ports as "stationary sources" or "indirect sources" under AQMP Stationary Source measures, or as "implementing agencies" of specific AQMP mobile source measures. In particular, the proposed Stationary Source Measure IND-01, "Backstop Measures for Indirect Sources of Emissions from Ports and Port-Related Sources" contains many legal flaws, as explained in greater detail below, and inappropriately proposes to impose enforcement actions on the Ports for emissions generated by emissions sources that the Ports do not own,

HH-1

Dr. Wallerstein
August 30, 2012
Page -2-

operate, or control, which is counterproductive to the cooperative relationship that our agencies have established since we began working together on the voluntary CAAP in 2006.

HH-1

This letter provides the Ports' specific comments on the control measures in the Draft 2012 AQMP that we believe must be addressed prior to finalization and adoption by your agency.

Proposed Stationary Source Measure IND-01

There are three fundamental problems with Proposed Measure IND-01, "Backstop Measures for Indirect Sources of Emissions from Ports and Port-Related Sources." First, the proposed backstop rule would transform the Ports' voluntary CAAP into the AQMD's mandatory regulation of the Ports. This would jeopardize the Ports and the Port-related emissions sources' grant funding for equipment replacement and modernization if it is now necessary to comply with regulation, while offering nothing to assist the Ports with compliance in terms of additional technologies, facilitating regulations, tools, or funding. Second, although the CAAP was a voluntary cooperative effort of the Ports and the air agencies designed to encourage the industry operators of regulated equipment to go beyond regulation, the proposed backstop rule would improperly subject the Ports to the AQMD's enforcement action for industry's missed emissions reductions by equipment not operated or controlled by the Ports, or even potential loss of federal funding under federal conformity principles if the AQMP is adopted into the State Implementation Plan (SIP) and approved by the U.S. EPA as federal law. Third, the proposed backstop rule exceeds the AQMD's authority and if implemented may violate the State Tidelands Trust. If Measure IND-01 (as well as the Offroad Mobile Source Measures discussed below) are in reality the AQMD's regulation of Port-related mobile emissions sources such as locomotives, ships, rail, and trucks, then this is beyond AQMD's legal authority and AQMD should obtain a waiver under the Clean Air Act from the U.S. EPA. The Ports provide further detailed comments on Proposed Measure IND-01 below, and object to it being included in the 2012 AQMP.

HH-2

Based upon the AQMD's modeling results, existing control measures are expected to result in attainment of the Federal 24-hour PM2.5 standard by the 2014 deadline without Measure IND-01. Section 39602 of the California Health and Safety Code states that the State Implementation Plan (SIP) shall only include those provisions necessary to meet the requirements of the Clean Air Act. Hence, there is no identified need or legal basis for implementing Measure IND-01. The AQMD's proposed measure will not result in any additional benefit for the region beyond what is currently being achieved and expected to be achieved in the near future, and is therefore unnecessary.

HH-3

The Ports are neither "direct emissions sources" nor "stationary sources" subject to AQMD permitting, and the AQMD has not complied with requirements for regulation under Health and Safety Code. The Ports are also not "indirect sources" subject to an AQMD indirect source review program within the meaning of the Clean Air Act, and the AQMD has not complied with requirements of the Clean Air Act, 42 U.S.C. §7410 and various other requirements for indirect source classification. The Ports are also not air agency regulators. The Ports do not own, operate, regulate, or control any of the goods movement equipment serving the Ports that are

HH-4

Dr. Wallerstein
August 30, 2012
Page -3-

targeted emissions sources under Measure IND-01. Additionally, the equipment are mobile sources regulated by state, federal, and/or international regulation, sometimes under jurisdiction preempting Port or AQMD action. It is inappropriate for the AQMD to regulate the Ports without the Ports' ownership, operation, or jurisdiction to regulate the various industry businesses actually causing the emissions within our boundaries.

HH-4

The proposed backstop measure continues to state that if there is a South Coast Air Basin-wide shortfall in emission reductions, then the AQMD will mandate additional emission reductions from the Ports, even if the port-related sources have already met their commitments. This moving target standard is unconstitutionally vague and therefore illegal. The Ports are unfairly targeted, as there are no backstop measures proposed for other entities or source categories should other modeling assumptions not come to pass, such as anticipated natural fleet turnover, or other non-regulated initiatives failing to meet their goals, such as those expected by the Carl Moyer Program. If the AQMD's emissions projections for achieving attainment are incorrect, including control factors and growth rates, this measure appears to imply that the Ports will be specifically tasked with rectifying the shortfall. If the Basin fails to achieve the federal air quality standard, the proper channel to address this is through the established SIP process, not to establish a contingency rule to unfairly burden one specific industry out of the entire Basin.

HH-5

AQMD staff has indicated that Measure IND-01 is proposed to account for measures that are not backed by enforceable requirements. However, significant programs such as the CAAP's Clean Truck Program, Ocean-going Vessel Low Sulfur Fuel Program, Cargo-handling Equipment requirements, and the Shore-side Power/Alternative Maritime Power programs are currently backstopped by CARB and International Maritime Organization (IMO) regulations. The Ports also require higher rates of vessel or equipment compliance than regulation through terminal leases, when such commercial opportunities are able to be negotiated with tenants. Therefore, Proposed Measure IND-01 is unnecessary.

HH-6

Measure IND-01 is vague and incomplete. It is unclear whether the AQMD has taken credit for actual/current emission reductions in the baseline only, or if assumptions have been made for future year reductions. We take issue with a measure moving forward where emissions projections are "on-going." Further, no detail is provided on the level of emission reductions that are needing to be maintained. This is further complicated by the differences that exist between the emissions inventories produced by the Ports and the inventory used for the AQMP. It is unclear if a specific emission reduction shortfall will trigger implementation of the measure, or if it is simply left to the discretion of the AQMD. Additionally, the control costs have not yet been developed or justified in a cost-benefit analysis.

HH-7

The CAAP is a planning document that provides a guideline of strategies and targets that are often "stretch goals," which ultimately are implemented through individual actions adopted by the Long Beach and Los Angeles Boards of Harbor Commissioners (Boards). The Ports are sovereign Tidelands granted to the cities of Los Angeles and Long Beach by the state under the oversight of the State Lands Commission. Each city has been appointed as a trustee and has established their respective Board of Harbor Commissioners with exclusive control and management of the Tidelands and revenues and expenditures from the Tidelands. However,

HH-8

Dr. Wallerstein
August 30, 2012
Page -4-

such discretion must be exercised in accordance with their obligations to prudently manage Tidelands assets and revenues within a nexus and proportionality to the Tidelands Trust interests, as well as in accordance with applicable laws such as the California Environmental Quality Act (CEQA) and principles of federal preemption.¹ The AQMD cannot mandate action by each Port's Board of Harbor Commissioners, nor can the AQMD direct how the Ports obligate state Tidelands money; only the appointed trustee can make discretionary actions to obligate state Tidelands funds. Specifically, the CAAP measures listed in the Draft 2012 AQMP each require the Boards to authorize the expenditure of incentive monies and program costs, or to approve conditions of infrastructure project development in their discretion as CEQA lead agency and as Tidelands trustees.

HH-8

We strongly believe that the voluntary and cooperative CAAP process established by the Ports remains the most appropriate forum for the Ports and the air regulatory agencies to discuss technical and policy issues related to reducing emissions from port-related sources. As stated above, we remain committed to achieving the clean air goals identified in the CAAP and working with port industry and the air regulatory agencies on implementation of appropriate strategies.

For your reference, attached is our comment letter dated July 10, 2012, expressing our preliminary concerns related to the proposed Measure IND-01 and a comment letter dated May 4, 2010, in which the Ports initially expressed concerns regarding backstop rules.

Proposed Off-Road Mobile Source and Advanced Control Technology Measures

The Draft 2012 AQMP also identifies the San Pedro Bay Ports as "Implementing Agencies" for several of the proposed Off-Road measures (OFFRD-02, OFFRD-04, and OFFRD-05) and Advanced Control Technology measures (ADV-01, ADV-02, ADV-03, ADV-04, and ADV-05). The Ports should not be listed as Implementing Agencies, which the AQMP Appendix IV-A defines as "the agency(ies) responsible for implementing the control measure." While the Ports have been moving forward with voluntary efforts in these areas, as mentioned above, the Ports are not air agency regulators. We also do not own or operate the equipment identified in the proposed measures, and therefore we do not have direct control over any of the sources listed. During the Advisory Committee meetings, AQMD staff has provided clarification that the Ports are listed as Implementing Agencies because of our voluntary commitments to work on these

HH-9

¹ The Ports' experience with the first phase of the 2006-2010 CAAP showed that in actual implementation, many CAAP measures were carried out in a different manner than originally conceptualized, or not carried out at all, based on limitations on the Boards' opportunities and their exercise of their discretion to manage Tidelands assets and funds under real-world circumstances. Some of the CAAP measures can only be implemented if businesses apply to the Ports for permits to build or expand their lease premises and CEQA mitigation required by law or lease conditions that can be negotiated with a Port tenant. Other CAAP measures involve emissions sources (rail or ocean vessels) that may assert federal preemption against efforts to compel use of specific technology, so the CAAP goals involve the Ports offering economic incentives in voluntary compliance programs, such as the Ocean Vessel incentive programs. However, only the Boards have the legal authority to fund such incentives or impose CEQA mitigation or lease conditions to project approval, which decisions also fall within the Boards' sole discretion regarding their respective Port's properties and their individual Harbor Revenue Fund budgets, which may be affected by the global economy.

Dr. Wallerstein
August 30, 2012
Page -5-

efforts, and that being listed as an implementation agency does not obligate the Ports to any specific requirement, however, this is contrary to the language of the AQMP that implementing agencies are "responsible for implementing the control measure." We believe that listing the Ports, and not including all of the other public and private partners that are also working on these efforts, gives the impression that the Ports do have an assigned obligation, or that the Ports must bear a larger burden in the effort to implement these programs. We also repeat our comment stated above that the AQMD cannot mandate in the AQMP that the Ports must expend monies in these voluntary efforts, since most of these Off-Road and Advanced Control Technology measures require incentive monies to fund demonstration projects or accelerated use of new technology.

HH-9

We believe that the appropriate Implementing Agencies for these measures are the United States Environmental Protection Agency and the California Air Resources Board.

The Ports urge AQMD to make all of the above-requested changes to the draft 2012 AQMP, in particular, to eliminate Measure IND-01 Port Backstop Rule as a legally unnecessary measure exceeding AQMD's authority and violating the State Tidelands Trust. We believe it is much more effective to advance our mutual clean air goals for our agencies to continue working cooperatively together, but if the AQMD takes the above 2012 AQMP measures forward, the Ports will have no choice but to vigorously oppose such action through the administrative and legal process.

Sincerely,

Chris Lytle

Responses to Comment Letter HH
Ports of Long Beach and Los Angeles

Response to Comment HH-1:

The AQMD staff acknowledges the Ports efforts in reducing emissions from port related sources through the CAAP and other efforts. Responses to specific concerns are presented in Responses to Comments HH-2 through HH-8.

Response to Comment HH-2:

The AQMD staff acknowledges that inclusion of IND-01 – Backstop Measure for Indirect Sources of Emissions from Ports and Port-related Facilities in the 2012 AQMP would be a mandatory regulation enforced under the AQMD’s indirect source authority. However, IND-01 does not affect any potential grant funding for equipment replacement or modernization since it does not prescribe specific controls or equipment similar to state regulations on port-related sources. This control measure is based on an overall emission reduction targets from port-related sources, and “backstops” those emission targets already expected from existing air quality rules, regulations, and commitments. In addition, the cooperative relationship between the AQMD and the Ports will not change with the adoption of IND-01 in the 2012 AQMP. The AQMD staff is committed to continue our existing relationship with the Ports in order to facilitate our mutual efforts on demonstrating and introducing lower-emitting port-related equipment and vehicles. As previously mentioned above, this control measure is based on emission targets from port-related sources expected from existing air quality rules, regulations, and commitments. Under IND-01, the Ports will not be responsible for reducing emissions beyond their “fair share” original targets. In the situation where the original basin-wide carrying capacity is amended, the District will seek additional reductions from all available sources, including port-related sources. Under this scenario, all sources (including stationary sources) will have a new “fair share” reduction target. Various legal arguments are made in this general comment. We respond to these comments more specifically in response to the individual comments below. Although the commenter claims that including IND-01 in the Draft 2012 AQMP may violate the State Tidelands Trust, no explanation was provided regarding how this control measure could violate the State Tidelands Trust.

The comment reasserts the commenters’ position that the District lacks legal authority to adopt Control Measure IND-01. In brief, the District has authority to regulate indirect sources under existing law. Health & Safety Code §§40716(a)(1); 40440(b)(3). The Ports satisfy the definition of indirect source because they are a “facility, ...installation...[or] real property...which attracts, or may attract, mobile sources of air pollution. 42 U.S.C. §7410(a)(5)(C). Air districts may regulate indirect sources even though the regulation is intended to reduce emissions from the mobile sources associated with the indirect source, and although the district would be preempted from

setting emission standards for those mobile sources. See *Nat'l Ass'n of Home Builders v. San Joaquin Valley APCD*, 627 F. 3d 730 (9th Cir. 2010)

Response to Comment HH-3:

The commenter is correct in that IND-01 only requires additional action by the Ports if their “fair share” reduction is not met or is amended due to the original basin-wide carrying capacity being changed. Furthermore, the AQMD staff considers this control measure to be necessary to ensure that the Basin achieves the federal 24-hour PM_{2.5} ambient air quality standard by 2014. Since IND-01 is included in the Draft 2012 AQMP in order to provide an “insurance policy” or backstop measure to ensure that the needed emission reductions from port-related sources assumed in the plan are met, it does not conflict with Section 39602 of the California Health and Safety Code. Other State Implementation Plan measures have been adopted and approved by EPA which do not themselves provide additional emission reductions, but provide additional assurance that the emission reductions will be achieved, such as monitoring and recordkeeping requirements in Rule 109 and RECLAIM. In addition, the federal CAA, 42 USC sect. 7410 a(5)(a)(i) expressly allows a SIP to include an indirect source review program, such as IND-01.

Response to Comment HH-4:

The AQMD can regulate Port sources under its existing authority under state law. As stated in control Measure IND-01, the District has the authority to adopt rules to control emissions from “indirect sources” under existing law. The Clean Air Act defines an indirect source as a “facility, building, structure, installation, real property, road or highway which attracts, or may attract, mobile sources of pollution,” 42 U.S.C. § 7410(a)(5)(C); CAA § 110(a)(5)(C). Under this definition, the Ports are an indirect source. Specified in the California State Air Pollution Control Laws, as codified in the California Health & Safety Code, districts are further authorized to adopt rules to “reduce or mitigate emissions from indirect sources” of pollution. (Health & Safety Code § 40716(a)(1)). The AQMD is also required to adopt indirect source rules for areas where there are “high-level, localized concentrations of pollutants or with respect to any new source that will have a significant impact on air quality in the South Coast Air Basin,” (Health & Safety Code § 40440(b)(3)). We believe that the Ports fit within the definition of an indirect source. The comment does not explain what it means when it contends that AQMD has not complied with requirements of the Clean Air Act for indirect source regulations. We are not aware of any such deficiency. Also, there is no authority that we are aware of saying that an indirect source measure may only affect mobile sources that are owned or operated by the indirect source. For example, Rule 2202 applies to employers of 250 or more but is intended to reduce emissions from vehicles owned by the employees of the regulated indirect source. An indirect source measure may be valid even though it affects mobile sources for which the Clean Air Act preempts the agency from requiring emission standards. See National Assn of

Home Builders vs. San Joaquin Valley APCD, 627 F. 3d 730 (9th Cir. 2010). In comment HH-2, the Port concedes there are Port-related mobile source emissions, which would otherwise not exist except for the Port.

Response to Comment HH-5:

The justification to include this control measure in the draft Plan is that if the need arises for additional emission reductions due to a shortfall in the original target or to a change in the Basin-wide carrying capacity for 2014 federal 24-hr PM_{2.5} ambient air quality standard, the mechanism for further emission reductions from port-related sources is included as a control measure in the AQMP and staff can proceed with rule development if needed. The measure is not unconstitutionally vague since during the rule development process the emissions reduction target will be set, and if it is later required to be changed, there will be an open and public process before any new target is established and becomes enforceable. The AQMD staff does not think the Ports are unfairly targeted since the emissions from port-related sources are a significant portion of the overall emissions inventory and other sources, including stationary sources are extensively regulated. The Ports have misunderstood the measure. IND-01 does not require them to make up the shortfall from other non port-related sources. The AQMD staff considers IND-01 to be the most appropriate method of addressing any shortfall in port-related source emission reductions or changes to the Basin-wide carrying capacity.

The doctrine against unconstitutionally vague laws is designed to assure that a penal statute defines “the criminal offense with sufficient definitiveness that ordinary people can understand what conduct is prohibited “, and to ensure that the statute establishes “minimal guidelines to govern law enforcement.” *Kolender v. Lawson*, 461 U.S. 352, 357-58 (1983). Control Measure IND-01 does not violate this doctrine because it has not yet been developed into a rule and hence cannot subject anyone to criminal enforcement.

Response to Comment HH-6:

Control Measure IND-01 is based on emission targets from port-related sources, and “backstops” those emissions assumed in the 2012 emission inventory, such as rate of participation of vessel speed reduction, penetration of new clean vessels, as well as existing air quality rules, regulations, and railroad MOUs.

Response to Comment HH-7:

As previously mentioned above, the emission targets in Control Measure IND-01 are based on those emission reductions already expected from existing air quality rules, regulations, and commitments. These reductions are currently assumed in the existing and future baselines emissions from port-related sources. Since no additional emission reductions are needed to meet the 2014 emission target, none were provided in the control measure write-up. We apologize for any confusion this may have caused, but it

is common practice in emission inventory development to project future emissions using “on-going” emission reductions which are codified into existing law and expected to occur in future years. The AQMD staff is aware of the relative differences in emission inventories developed by the Ports and CARB (used for developing the 2012 AQMP). These differences were taken into account when developing the emissions presented in the control measure write-up. Future refinements in emission targets for IND-01 will take into account any additional differences between the two inventories. The “backstop” requirements of IND-01 only will be triggered if the reported emissions for 2014 for port-related sources exceed the 2014 target milestone, or the Basin fails to meet the federal 2014-hr PM_{2.5} standard due to change in the Basin-wide carrying capacity and further emission reductions are needed. This trigger is not discretionary because it is based on objective results. No control costs are provided in Control Measure IND-01 because there are no additional controls placed on the Ports, except for those already existing in state and federal laws, and existing commitments. Any future changes to the emission targets which would require additional controls beyond existing regulations and commitments are unknown at this time. Providing control costs for these unknowns at this time is speculative at best, and as such are not included. Furthermore, the ports will have the flexibility to design the most effective controls they deem feasible and necessary.

Response to Comment HH-8:

The AQMD staff is unsure of what control measures the commenter is referring to as “CAAP measures listed in the Draft 2012 AQMP.” Further clarification is needed for staff to respond to this comment. However, the commenter is referred to the response to comment HH-4 for our rationale in regulating the Ports under existing statute. AQMD staff was unable to locate any legal prohibitions in the Tidelands Trust doctrine that would preclude implementation of this control measure.

The comment asserts that there are serious legal feasibility questions regarding Measure IND-01, including federal preemption because the ports do not own or operate the sources.

The District recognizes the preemption arguments raised by various industries but does not believe that these arguments establish that there can never in any case be a state or local rule affecting such sources. For example, a state rule affecting foreign-flagged vessels, even outside the 3-mile state boundary, was upheld by the Ninth Circuit, and the US Supreme Court declined to review the case. *Pacific Merchant Shipping Ass’n. v. Goldstene*, 639 F. 3d 1154 (9th Cir. 2011). And the Ninth Circuit has held that when a state or local air pollution rule affecting railroads has been approved by EPA into the State Implementation Plan, the courts will harmonize the purposes of the Clean Air Act with the Interstate Commerce Commission Termination Act to determine whether the state or local rule is preempted. Preemption is not automatic. *Ass’n. of American Railroads v. South Coast AQMD*, 662 F. 3d 1094(9th Cir. 2010)

Response to Comment HH-9:

The definition will be expanded to describe agencies that have an ability to implement such measures. Relative to measures involving incentives programs, the definition will be expanded to cover agencies that have historically implemented such programs and are envisioned to implement such programs if funding is available to the agency.

The comment asserts that Measure IND-01 violates constitutional limits requiring that exactions imposed on a party be proportional to the party's contribution, because the ports do not own, operate, or control the emissions sources, when it fails to include all parties involved in the CAAP, including the actual emissions sources.

The basic concept of indirect source contemplates that the emissions to be controlled are from sources not owned or operated by the indirect source. For example, Rule 2202 applies to employers of 250 or more and focuses on emissions from employee vehicles which are not owned or operated by the source. The concept of an "exaction" generally refers to a requirement that, as a condition of a development approval, a developer must dedicate sites for public or common facilities, or make payments to defray the costs of land or facilities or otherwise provide public amenities. Abbott, et al. *"Exactions and Impact Fees In California"* (Solano Press 2001), p. 15. Therefore, a regulation to reduce air pollution would not normally be considered an exaction. Moreover, the principle of proportionality referred to by the commenter was established by the United States Supreme Court which decided that a land dedication requirement must bear a "rough proportionality" to project impacts. *Dolan v. City of Tigard*, 512 U.S. 374 (1994). In this case, all of the impacts of concern are ultimately the result of the fact that the two major ports operate here in the District, so the concept of proportionality to impacts is not violated. Finally, the state and the District are also seeking to impose all feasible emission reduction measures on all types of mobile sources found within the ports, so the regulatory program does not fail to include all parties.

II. International Fragrance Association North America (IFRANA), August 31, 2012

August 31, 2012

via e-mail - echang@aqmd.gov

RE: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The International Fragrance Association North America (IFRANA) appreciates the opportunity to offer initial comments on the South Coast Air Quality Management District's (AQMD's) Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. These comments focus on Section CTS-04 of that proposal. IFRANA strongly objects to the inclusion of this measure in the draft AQMP, and urges that CTS-04 not be included in the final 2012 AQMP. In addition to the comments outlined below, we fully support those submitted by the Consumer Specialty Products Association on this issue.

} II-1

IFRANA represents the fragrance materials industry in the United States and Canada. Our member companies create and manufacture perfumes and fragrances for personal care, home care, and industrial and institutional uses. IFRA North America also represents companies that supply fragrance ingredients, such as essential oils and other raw materials.

Publication of Evaporation Study is Crucial to Provide Adequate Comments to AQMP

In the draft AQMP, section CTS-04 (pages 4-25) states:

"This measure seeks to eliminate or revise the exemption for low vapor pressure solvents in CARB's consumer products regulation, which exempts low vapor pressure volatile organic compounds (LVP-VOC) from counting towards the compliance obligation for consumer product VOC limits. Recent testing conducted by the District on institutional cleaners found that traditionally formulated consumer products may contain significant amounts of LVP-VOC solvents. In some cases, such as certain multipurpose solvents, the products were 100

INTERNATIONAL FRAGRANCE ASSOCIATION

Tel: 571.346.7580
Fax: 571.384.7959
www.ifrana.org

percent LVP-VOC solvents. Further testing indicated that many of the LVP-VOC solvents evaporate nearly as quickly as the traditional solvents they were meant to replace and have Maximum Incremental Reactivity (MIR) values well above the threshold considered to be non-reactive, currently based on ethane. Therefore, an evaluation of the continued need for use of LVP-VOC solvents in certain categories is warranted.”

In addition to the referenced AQMP, IFRANA has obtained a SCAQMD document dated June 21, 2012 and titled “Non-volatile, Semi-volatile or Volatile: Redefining Volatile for Volatile Organic Compounds”. This document contains suggestions of technical data that relate to evaporation rate studies which are apparently being used to support the proposals being made by SCAQMD on the matter of the Low Vapor Pressure material exemption. Despite repeated inquiries by industry representatives to obtain the original technical report upon which this document was based—a report that was promised to be shared with the Ozone Transport Commission in November 2011 and to the public several times in the recent weeks—it has not yet been released, so we are still unable to review the technical basis for the SCAQMD recommendations, yet comments on the proposal are due by August 31, 2012. The lack of availability of this report makes it impossible for interested stakeholders to provide meaningful comments in several key areas that are under review. Therefore, we ask that no decisions be taken until adequate time has been allowed for the public to thoroughly analyze and review this technical report.

II-2

Proposal to Remove LVP Exemption Would be Devastating to Consumer Products Industry

The main focus of the SCAQMD initiative appears to concentrate on cleaning and related products having a defined ‘solvent’ component and effect. However, removal of the existing exemption for low vapor pressure “solvents” threatens the existence of entire classes of consumer products without regard for differential contribution to VOC burden. In particular, those consumer product categories that may contain fragrance as an ingredient would be unduly impacted.

As suppliers of fragrance to major consumer product companies across the country, IFRANA (formerly the Fragrance Materials Association of the United States) has worked diligently with California regulators since the inception of the California Air Resources Board (ARB). Our representatives have visited California numerous times and met with ARB staff to provide background information on our products, our business practices, and the technical criteria that must be fulfilled in order to achieve consumer expectations for marketplace products containing fragrance. Those consumer products, particularly in the air care category, have been carefully constructed in order to comply with air quality regulations and also to deliver the consumer benefit stated by the manufacturer. While the SCAQMD proposal seems to focus on a narrow product segment (i.e., solvent-based cleaners) IFRANA’s concern is the potential for broad sweeping impacts across many consumer product categories, gravely damaging whole industry segments.

II-3

Conclusion

IFRANA appreciates the opportunity to comment on the 2012 AQMP. We point to the SCAQMD goal statement: “We are committed to protecting the health of residents, while remaining sensitive to businesses” when analyzing the impact of these control measures on the consumer products industry

II-4

and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Additionally, IFRANA believes that the process for review of SCAQMD proposals, particularly relating to the exemption for Low Vapor Pressure materials in current law, cannot proceed without the availability to interested stakeholders, of the technical report that apparently forms the basis for the AQMD recommendations. After a thorough review of this technical report, IFRANA will provide more in depth comments on the proposal to the AQMD.

If you should have any questions regarding these comments, please do not hesitate to contact me at jwishneff@ifrana.org or 571-346-7584.

Sincerely,

Jane E. Wishneff
Director, Government Affairs & Counsel

Responses to Comment Letter II
IFRANA

Response to Comment II-1:

Staff acknowledges IFRANA's support of the Consumer Specialty Products Association (CSPA) earlier comments and has addressed CSPA's comments elsewhere in the document.

Response to Comment II-2:

Staff has not received a previous request for this paper from IFRANA until this comment letter. Staff had a preliminary discussion regarding this ambient evaporation study with staff from Ozone Transport Commission (OTC) in the fall of 2011, but did not 'promise' a final report to the OTC or any other entity or member of the public.

The paper, "Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds" U. Vō and M. Morris, August 2012, has recently been released and may be accessed from <http://aqmddev/prdas/Coatings/VOCs/vocsMainPage.htm>. The paper contains detailed analysis of an ambient evaporation study, which is the document dated June 21, 2012 that the commenter refers to, and compares the results to established VOC content test methods. While the paper is likely to be important in the determination of appropriate LVP-VOC criteria, the control measure is recognizing the necessity and prudence of reevaluating the LVP-VOC criteria. While staff recognizes that the paper provides additional discussion, the document you already have includes data necessary to highlight the need to re-evaluate the LVP-VOC criteria. However, any potential amendments to the Consumer Products Regulation will involve a public process, providing ample opportunity for stakeholders to provide detailed input.

Response to Comment II-3:

The proposed control measure recognizes the necessity and prudence of reevaluating current LVP-VOC criteria. The reevaluation does not necessarily include the removal of the LVP-VOC exemption as the 'only' option. The paper identifies non-volatile organic compounds that do not evaporate under ambient conditions and therefore are not available for ozone formation. The paper recommends establishing criteria for an LVP-VOC exemption that better represent compounds that do not contribute to ozone formation. Currently, the Consumer Products Regulation contains special provisions for products containing two percent or less VOC-containing fragrance. It is possible that the proposed control measure may impact products (excluding Personal Fragrance Products) that contain more than two percent fragrance. However, the inclusion of fragrances that readily evaporate and are available for ozone formation should be acknowledged in the products' overall VOC content.

Proposed Control Measure CTS-04 calls for a phased in approach, starting with the most volatile and reactive compounds that may have the greatest emission impacts. To date, staff has identified multi-purpose solvents and institutional cleaners as two such categories of interest, but is also calling for CARB staff to conduct detailed surveys of LVP-VOC content currently found in different categories of Consumer Products in an effort to develop a revised inventory and assess potential additional impacts from the use of LVP-VOCs.

Response to Comment II-4:

The availability of the paper has been addressed in response to comment II-2.

JJ. Natural Resources Defense Council (NRDC), September 5, 2012

NATURAL RESOURCES DEFENSE COUNCIL

September 5, 2012

Dr. Phillip Fine
South Coast Air Quality Management District
21865 Copley Dr.
Diamond Bar, CA 91765

Re: Initial Comments on 2012 Draft AQMP

Dear Dr. Fine:

On behalf of the Natural Resources Defense Council ("NRDC"), I submit these comments on the 2012 Draft Air Quality Management Plan ("AQMP"). NRDC appreciates the opportunity to provide these comments. The comments specifically focus on some of the proposed control measures.

I. DISTRICT'S STATIONARY SOURCE CONTROL MEASURES

IND-01: Backstop Measure for Indirect Sources of Emissions from Ports and Port-Related Activities [NOx, SOx, PM2.5]

We appreciate AQMD's on-going recognition that the Ports are the largest single fixed source of air pollution in Southern California, and that emissions from these facilities must be controlled in order for the region to attain the PM2.5 and ozone standards. See AQMP at IV-A-35. As the District is also aware, we have been a long time supporter of a "back-stop" rule for the Ports ever since the concept of the rule was articulated by the Chairman of the Board within the District's "Clean Port Initiative Workplan" in January 2006.

With that said, however, we must communicate some frustration on our part that *over six years* have gone by since AQMD first announced its intentions of adopting a back stop rule, and yet the rule has yet to be fully developed, let alone adopted. Moreover, the measure—as drafted in the 2012 AQMP—lacks any meaningful detail, and is in fact, far less detailed than the drafts of the proposed rule that the District circulated back in Spring/Summer of 2010. Our specific comments on the proposed measure within the 2012 AQMP are as follows:

- We appreciate that the back stop rule will be implemented through a District "rule" as opposed to through another implementation mechanism (e.g., a voluntary, incentive program).

2012 AQMP Comments
September 5, 2012
Page 2 of 6

- The rule will require the Ports to meet emissions targets for 2014. If these targets are not met, then the requirements of the rule will kick-in. Whether the targets are met will be based on the Ports' annual emission inventory. Given that emissions inventories are conducted after the close of every year, this means that no one will know if 2014 emissions targets have been met until 2015, *and after* the 2014 attainment demonstration deadline. Although the District believes, based on the Ports' latest inventories, that the Ports will meet the 2012 AQMP targets necessary for meeting the 24-hr PM2.5 ambient air quality standard, AQMP at IV-A-35, we nevertheless request that adopting the back-stop measure be given priority by the Board and District staff given that 2014 is fast approaching, and the dominance of port emissions in regional air pollution estimates. Further, efforts to develop this rule should resume where they left off two years ago so that resources and stakeholder input is not wasted.
- Important details are omitted from the measure's description, which must be filled-in including:
 - What the 2014 emissions targets will be (e.g., what levels of NOx, SOx and PM2.5 must the Ports achieve).
 - Deadlines for when the Ports' Emission Control Plans will be to be submitted and implemented if the rule is triggered. These deadlines must be extremely short since they will only be required if emissions milestones are exceeded. In other words, the Ports cannot be permitted to emit excessive levels of pollution for months or years as Emission Control Plans are developed, approved and implemented.
 - Details on how the District would enforce the rule (e.g., civil penalties, etc.). We request that the District consider penalties that could mitigate for the excess emissions that will result after milestones are exceeded, and before Emissions Control Plans are implemented. For instance, are there operational limits the District could place on the Ports if milestones are not met and there is a significant delay before the necessary reductions can be achieved?
 - Emissions targets beyond 2014. As the District is aware, Port emissions will not remain flat after 2014, and in fact, according to the control measure's summary, AQMP at IV-A-34, are expected to increase between 2014 and 2019 for both NOx and PM2.5. Accordingly, the District should devise emissions targets for 2014 and beyond.
 - Assuming that the District sets "triennial" emissions targets, as it did in previous iterations of the measure (see 2007 AQMP), we request that the District also set annual milestones to ensure the Ports are on schedule for meeting the emissions targets.
 - Health risk targets with milestones should be added. Previous versions of the rule from 2010 included not only emissions targets but also health risk targets.

JJ-2

JJ-3

2012 AQMP Comments
September 5, 2012
Page 3 of 6

However, there is no discussion of the latter in the current description of the control measure. Given the District’s acknowledgement that Port sources contribute to cancer risk, *see* AQMP at IV-A-35, and its compelling research on this issue (MATES I, II, III), we urge the District to include health risk targets within its rule.

- o BACT requirements should be included. In AQMD’s “Clean Port Initiative Workplan,” the Chairman envisioned that the back stop measure would “prohibit emission increases from new or expanded terminals or other port-related facilities unless best available controls are employed and emissions increases are offset.” While the District has been a strong advocate for the implementation for BACT within its CEQA and NEPA comment letters with respect to major port expansion projects, including a BACT requirement within an enforceable regulation would amplify the District’s abilities to require BACT. Such authority is especially critical given the upcoming Pier S and BNSF SCIG projects which are expected to increase health risks for local communities.

JJ-3

IND-02: Expedited Permitting and CEQA Preparation Facilitating the Manufacturing of Zero and Near-Zero Technologies [All Pollutants]

We support this measure and appreciate the District’s attempts to accelerate the manufacturing and deployment of zero-emissions technologies in the region. As the District mentions in the AQMP, this control measure will not only benefit air quality, but also result in local job creation. We also appreciate the District’s reassurances that

By agreeing to manufacture and distribute zero and near-zero emission technologies, a proponent would be rewarded with a streamlined administrative review by the SCAQMD *The expedited permitting and review program would only accelerate the processing of applications, which would still need to comply with all applicable rules, regulations, and guidelines.*

JJ-4

AQMP at IV-A-89 (emphasis added). In other words, while we support the District moving forward expeditiously on permits that would enable the manufacturing of zero-emission technologies in the region, we do not support any broader efforts to streamline CEQA. Along those same lines, while we support AQMD elevating or prioritizing the subject permits for administrative review, we would oppose any curtailment of public participation opportunities with respect these permits.

II. PROPOSED SECTION 182(E)(5) IMPLEMENTATION MEASURES

We appreciate the urgency in which the AQMD discusses closing the black box to meet the 80 ppb ozone standard by 2023. AQMP, at IV-B-4. However, we provide the following input on some of the specific measures.

2012 AQMP Comments
September 5, 2012
Page 4 of 6

Group 1: On-Road Mobile Sources

ONRD-04: Accelerated Retirement of Older On-Road Heavy-Duty Vehicles [NOx, PM]

We support this measure in concept, including its attempts to prioritize public funding towards the retirement of older trucks serving warehouse and distribution centers. However, the District does not identify where the additional "\$50 million per year" will come from to incentivize the turnover of older diesel trucks; it merely states that "CARB, SCAQMD, or U.S. EPA could jointly or separately implement incentive programs" to offset the costs associated with the replacement, repower or retrofit of older trucks.

JJ-5

ONRD-05: Further Emissions Reductions from Heavy-Duty Vehicles Serving Near-Dock Railyards [NOx, PM]

This measure seeks to accelerate the replacement of up to 1,000 existing heavy-duty vehicles with zero-emission vehicles or a zero-emissions container movement system. This measure would be accomplished by convincing CARB to adopt a regulation by 2015 that would require, by 2020, all containers transported between the Ports and near-dock railyards (e.g., UP ICTF and proposed BNSF SCIG) to use zero-emissions technologies. We support the deployment of zero-emission technologies generally, and particularly with respect to reducing health risks near the UP ICTF and proposed BNSF SCIG.

JJ-6

We encourage the District to provide greater specificity in how this regulation would work, including identifying the regulated party (would it be the Ports, the railroads or both?). Given CARB's historical reluctance to regulate the rail industry, the District should be abundantly clear about how this measure would be implemented, against whom it will be enforced, and how the State has authority to adopt the measure.

Group 2: Off-Road Mobile Sources

Offrd-02: Further Emission Reductions from Freight Locomotives [NOx, PM]

The measure seeks to accelerate replacement of existing freight locomotive engines with engines meeting tier 4 or cleaner exhaust standards. Again, while we are very supportive of measures that seek to require clean up of rail operations, we can't help but point to CARB's historical reluctance to regulate the rail industry. In fact the "2010 Commitments" that CARB entered into with UP and BNSF suggest that CARB will be taking a "hands off approach" with respect to rail emissions so long as the railroads meet set emissions caps by certain dates with respect to four railyards. Accordingly, to increase the chances of this measure being adopted by CARB, the District may want to provide greater specificity on how this measure would be implemented by CARB, how it would be enforced, and how the State has legal authority to adopt

JJ-7

2012 AQMP Comments
 September 5, 2012
 Page 5 of 6

the measure. The District should also describe how this measure intersects with the 2010 Commitments, and in particular, if the terms of the Commitments impose limitations on CARB's ability to regulate BNSF and UP.

JJ-7

Offrd-04: Further Emissions Reductions from Ocean-going Vessels While at Berth [All Pollutants] and Offrd-05: Emissions Reductions from Ocean-going Marine Vessels [NOx, PM]

These two measures seek to incentivize (a) emissions reductions from vessels for which shoreside power is not a viable option; and (b) early introduction and deployment of vessels to the San Pedro Bay ports that have cleaner/newer engines. We support measures that aim to reduce emissions from ocean-going vessels. To improve the strength of these measures, the District should provide details on how much these incentive programs will cost and who will be funding them. The District should also specify when the incentive programs would need to be adopted in order to ensure all of the necessary reductions are timely achieved.

JJ-8

III. SCAG AND AQMD SHOULD MORE EFFECTIVELY USE TRANSPORTATION CONTROL MEASURES ("TCM").

NRDC remains concerned that the 2012 AQMP does not effectively incorporate a range of Transportation Control Measures ("TCM") commensurate with the air quality challenges this region faces. Accordingly, we suggest that the agencies cooperating on this air plan reevaluate the potential for additional TCMs that can enhance mobility while helping tackle the region's persistent air quality challenges.

A. Elements of SCAG's RTP Should Be Included in the AQMP as TCMs.

JJ-9

SCAG's excellent work to adopt its RTP/SCS in April, 2012 resulted in a plan with many useful elements, some of which should be adopted into this plan as TCMs. We recommend:

1. Active Transportation Component, \$6.7B (AQMP, at IV-C-7);¹
2. Transit Component (*id.*); and
3. Passenger and High Speed Rail Component.

B. Expanding parking should not be included as a TCM without evidence that it will lead to real, cost-effective reductions in emissions

JJ-10

Several projects propose to add hundreds of new parking spaces, either at park and rides or at transit facilities. Expanding parking at transit stations, unless priced appropriately to offset the cost of the spaces, increases costs for all transit system users, including the many who do not drive, and takes valuable land in the vicinity of transit stations off the market for what could be

¹ The current list of TCMs includes some bike projects, but it remains unclear what is the criteria for inclusion of these projects as TCMs. Overall, NRDC supports including a much more robust set of active transportation projects as TCMs.

2012 AQMP Comments
September 5, 2012
Page 6 of 6

viable commercial or residential development. Please provide background documentation to suggest that such parking expansions lead to real, cost-effective, equitable reductions in vehicle use and emissions.

JJ-10

C. Expansion of mixed-flow lanes should not be included as TCMs.

Several projects propose to widen roads by adding mixed-flow lanes. Section 108(f)(1)(a) lists high occupancy vehicle (HOV) lanes as appropriate TCMs, but it is less clear that construction of new mixed-flow facilities will yield permanent reductions in vehicle use and emissions. More likely, such expansions—if intended to reduce bottlenecks—may have temporary emissions benefits, and in short order lead to new, induced trips, and potentially induced land development to take advantage of new capacity. The literature on induced demand is extensive and the Regional Transportation Plan guidelines adopted by the California Transportation Commission acknowledge this now broadly accepted planning phenomenon. We strongly recommend that SCAG, AQMD and its member CTCs reconsider whether capacity expansion projects belong on a list of Transportation Control Measures, or whether there are other projects that will more effectively achieve the worthy goals of reducing vehicle use and emissions.

JJ-11

D. NRDC also Recommends Additional Efforts.

Page IV-C-8 references the \$22.1 billion the RTP will invest in arterials. For such a significant investment of resources, we believe an additional goal of the program should be, to create a network of slow-speed streets that are safer for bicyclists and pedestrians. New bike lanes are critical, but even with lanes many riders, particularly women and children, will not ride when the bike lane is on a high-speed street. Low speed streets make these clean, healthy, non-polluting modes of transportation accessible to more SCAG residents and SCAG should work with its member cities and CTCs to identify the best streets for these networks.

JJ-12

On page IV-C-7, we recommend that SCAG supplement its adopted list of TSM strategies with improved data sharing. A plethora of transit-user apps has sprung up since the 2007 AQMP. High quality, real-time, easily-accessible transit vehicle departure and arrival information can help to leverage significant new transit investments with higher ridership. Releasing data is a low-cost way to leverage outside talent to improve usability of transit, biking, and walking.

JJ-13

We appreciate your consideration of our comments. Please do not hesitate to contact Adriano Martinez at (310) 434-2300 if you have questions about these comments.

Sincerely,

Adriano L. Martinez
Staff Attorney

Responses to Comment Letter JJ
NRDC

Response to Comment JJ-1:

While the AQMD staff supports voluntary and other incentive-based efforts by the Ports to reduce emissions from port-related sources, Control Measure IND-01 is necessary to ensure that if additional emission reductions are needed to demonstrate attainment of the federal 24-hr PM_{2.5} ambient air quality standard due to changes in the basin-wide carrying capacity, a mechanism for further emission reductions from port-related sources is included as a control measure in the AQMP. In addition, the AQMD staff thanks the commenter for their support of the measure.

Response to Comment JJ-2:

The AQMD staff acknowledges the importance of timely adoption of IND-01. The anticipated adoption date for the control measure is 2013 as specified in Chapter 4 and Appendix IV-A. Specific timing of rule adoption for control measures contained in the Final 2012 AQMP will be formalized in future rule adoption forecasts. The implementation period is going to take place 12 months after the current regulatory requirements and voluntary reduction strategies specified by the ports are not realized. Under IND-01, emission targets are based on future controlled baseline emission inventories and rely upon emission reductions already expected from existing air quality rules, regulations, and commitments. The AQMD staff will consider adequate enforcement mechanisms to ensure the timing of expected emission reductions during future rulemaking efforts.

Response to Comment JJ-3:

Specific details of the rule adoption for Control Measure IND-01 will be developed and presented during the rule development process. Previous rule development efforts will be used as a basis for future rule requirements, but the AQMD staff will address the commenter's concerns during the rule development process. For purposes of inclusion in the Draft 2012 AQMP, sufficient detail is provided in the current version of control measure write-up.

Response to Comment JJ-4:

Thank you for your support of INC-02 to incentivize the manufacturing of zero and near-zero emission technology through means of reducing the potential burden from the permitting and CEQA process. As noted by the commenter, it is our intent in this control measure to incentivize while maintaining compliance with established rules, regulations and guidelines. The incentive to streamline permitting or CEQA is strictly administrative. Although the program has not been fully developed, the incentive might, for example, advance the processing of an air quality permit or prioritize work

on a CEQA evaluation. It is not intended to bypass any legal requirements, shorten comment periods or avoid public participation.

Response to Comment JJ-5:

Staff appreciates the support for the measure. Funding for the program could come from existing programs such as Proposition 1B or Carl Moyer over the next two to three years. Future funding will depend on programs authorized at that time.

Response to Comment JJ-6:

The implementing agencies discussion has been expanded to include the San Pedro Bay Ports, CARB, and AQMD to the extent that the Ports could extend the Clean Truck Program or the AQMD may have potential funding. This could complement any efforts by CARB to adopt a regulation or amend existing regulations.

Response to Comment JJ-7:

Staff appreciates the comments regarding specificity on implementation approaches. The specifics on implementation will be further developed as stakeholders begin discussions on achieving the objectives of the control measure.

Response to Comment JJ-8:

At this time, the Ports are implementing incentives programs to bring cleaner ocean-going vessels into the Ports. However, it is not clear if the incentive levels are adequate. As such, the Ports will be monitoring the effectiveness of the program and may suggest revisions to the incentives levels. Given the uncertainty in the participation, emission reductions are not provided at this time. However, actual emission reductions from the existing programs will be incorporated in the backstop rule.

Response to Comment JJ-9:

The U.S. Environmental Protection Agency's (EPA) Transportation Conformity Regulations define transportation control measures (TCMs) as those projects and programs that reduce emissions or concentrations of air pollutants from transportation sources by reducing vehicle use or changing traffic flow or congestion conditions. Note, SCAG facilitates interagency consultation regarding TCM related issues through SCAG's Transportation Conformity Working Group but SCAG does not have the discretion to expand this regulatory definition, for purposes of conformity.

The Clean Air Act requires TCMs to be included in SIPs only for "serious" and above ozone non-attainment areas. In the SCAG region, only the South Coast Air Basin and the Ventura County portion of the South Central Coast Air Basin are serious or above nonattainment areas and thus include TCMs in their ozone SIPs. To add new TCM

categories that are not in the applicable ozone SIPs, an ozone revision would be required. Nevertheless, TCM type projects are planned for and implemented throughout the six-county SCAG region irrespective of whether or not they are included in an applicable SIP. Specifically, the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (2012-2035 RTP/SCS) constitutes the transportation strategy and control measures portion of the 2012 AQMP (Appendix IV-C), inclusive of all TCMs and TCM type projects therein.

As discussed in the Appendix IV-C and also specified in the 2007 South Coast Ozone SIP, TCM type projects and programs in this plan include the following three main categories of transportation improvement projects and programs:

1. High occupancy vehicle (HOV) measures,
2. Transit and systems management measures (including capacity-expanding active transportation projects such as new bike lane projects), and
3. Information-based transportation strategies.

While all TCM type projects in the 2012-2035 RTP/SCS are included in the transportation strategy and control measures portion of the AQMP, only those TCM type projects which have funding programmed for right-of-way or construction in the first two years of the prevailing Federal Transportation Improvement Program (FTIP) developed by SCAG are considered committed for air quality planning purposes in the applicable SIP. As TCM type projects become committed TCMs through the biennial FTIP process, they are automatically rolled into the SIP as committed TCMs (the “TCM Rollover Process” as described in SCAG’s FTIP Guidelines and 2007 Ozone SIP). To add any new TCM projects that are not in the adopted 2012-2035 RTP/SCS, an RTP/FTIP amendment/update would be required.

Response to Comment JJ-10:

Comments noted. SCAG’s FTIP Guidelines include a Transportation Control Measures chapter with detailed information on the TCM development process including definitions and project categories of TCMs, addition of new TCMs, and the TCM “Rollover” Process.

In the SCAG region, new TCMs are identified by the FTIP process. Projects that meet the TCM criteria become committed TCMs and part of the applicable SIP after the following occurs: 1) funds are committed for right-of-way or construction in the first two years (the fiscally constrained portion) of the FTIP; 2) the FTIP is approved by the Regional Council; 3) state and federal approval of the FTIP; and 4) concurrence with regard to TCMs by US EPA and California Air Resources Board (ARB).

Park-n-ride lot expansion projects are TCMs because park-n-ride lots are intermodal transfer facilities that can increase usage of public transit services.

Response to Comment JJ-11:

As discussed in Appendix IV-C, TCMs for purposes of conformity are projects and programs that reduce emissions or concentrations of air pollutants from transportation sources by reducing vehicle use or changing traffic flow or congestion conditions. TCMs in this plan include the following three main categories of transportation improvement projects and programs:

- High occupancy vehicle (HOV) measures,
- Transit and systems management measures, and
- Information-based transportation strategies.

To facilitate TCM tracking, TCMs are listed by project ID and project description as specifically set forth in the FTIP since TCM project inclusion in the FTIP is the means to track timely implementation. To avoid confusion that may arise from the project descriptions listed in Appendix IV-C, Attachment A, a footnote will be included that clarifies that the TCM is only that portion of the project that meets the definition of the TCM. For example, for a project that adds both mixed flow lanes and HOV lanes, only the HOV portion of the project is considered a TCM.

Response to Comment JJ-12:

SCAG's 2012-2035 RTP/SCS identifies opportunities to increase funding for active transportation. SCAG will continue to work with the County Transportation Commissions in the region to develop new policy strategies that can generate funding for transportation projects that support the goals identified in the 2012-2035 RTP/SCS. Further, at its July 5, 2012, SCAG's Regional Council approved the development of an Active Transportation subcommittee, among 5 other subcommittees responsible for developing policy recommendations to implement the 2012-2035 RTP/SCS. This subcommittee will specifically be responsible for recommending to the SCAG's Transportation Committee (TC) policies which implement the 2012-2035 RTP/SCS as it relates to Active Transportation. Policy recommendations approved by the TC will be forwarded to SCAG's Regional Council for final review and approval. These anticipated, new SCAG policies may assist local jurisdictions and the County Transportation Commissions in initiating additional efforts and funding in support of active transportation.

Response to Comment JJ-13:

The 2012-2035 RTP/SCS was intended to reflect the most feasible, practical and effective TSM Strategies, including Transit Automatic Vehicle Location (AVL), universal transit fare media, next vehicle arrival display etc. SCAG will consider updating the TSM Strategies list in the future to reflect the most current technology applications to transit services in the future RTP/SCS updates as necessary and appropriate.

RE: Comments to the 2012 Draft Air Quality Management Plan

Dear Dr. Wallerstein,

Mesa Consolidated Water District (Mesa Water) appreciates the opportunity to submit comments on the draft 2012 Air Quality Management Plan (AQMP).

Mesa Water provides water service to an 18-square-mile area that includes most of Costa Mesa, parts of Newport Beach, and portions of unincorporated Orange County, including John Wayne Airport. A coalition of Orange County water and wastewater agencies, lead by the Association of California Cities - Orange County (ACC-OC) has developed a list of common concerns and suggested improvements regarding the AQMP from the perspective of local governments.

In general, Mesa Water agrees with the issues and suggestions for improvement raised by the coalition regarding the draft AQMP and its potential negative impacts on the local government community and the economy as a whole. Some of the major points of concern are listed described below:

1. **Complete an economic analysis as part of the draft AQMP.** This multi-year, regional plan will cost hundreds of millions of dollars to implement and will have significant negative cost impacts on government agencies. At all times, and particularly when municipal budgets are being raided by the state and property and sales tax revenue is low, AQMD should make a concerted effort to identify the potential economic impacts of its plans prior to broad distribution.
2. **The comment period should reflect the significant delay of an economic study.** Due to a lack of an economic impact study, AQMD should significantly extend any comment period following the release of the full economic impact analysis. We understand the constraints imposed by state, federal and other timelines; nonetheless, it would be irresponsible of the AQMD to move forward with this plan without a complete economic analysis.
3. **Ozone Implementation Measures should be included as an appendix or removed from the draft AQMP.** Ozone targets are more than a decade away and implementation measures are not required as part of the 2012 AQMP.

- 4. **FUG-01 will unintentionally harm cities and local governments without realizing measurable results.** FUG-01 has a stated purpose of expanding AQMD's regulation of vacuum trucks into the petroleum industry. Numerous cities, water, and sanitation districts operate these trucks on a limited basis to comply with State Water Resources Control Board Order No. R3-2006-0003-DWQ, Statewide General Waste Discharge Requirements for Sanitary Sewer Overflows (SSOs). These trucks are essential to preventing hazardous wastewater from overflowing onto public streets and into homes, businesses, natural habitats and eventually into the ocean. Additional regulation and required retrofits would add considerable costs to already heavily burdened local agencies and achieve limited emissions reductions due to the relatively limited operating hours of these vehicles. Therefore, we request that local governments be exempted from FUG-01.
- 5. **The AQMP ought to focus on a philosophy of "do no fiscal harm."** AQMD and other air quality districts have been tremendously successful over the past decades in reducing air pollution. The air in the South Coast Basin is cleaner now than it was 40 years ago and with many more people and cars (the major source of emissions that dwarfs all others.). Nevertheless, when cities and local governments are suffering through the reduced revenue results of the great recession, now is not the time to "tinker at the edges." Developing a cost per ton of pollutants removed measure would go a long way to providing clarity in rule making and long term planning.

KK-4

KK-5

Local governments are in a unique position to understand the dynamic and difficult task the AQMD has with the preparation of the AQMP, and we can appreciate your challenge. Building consensus around regional public policy is a difficult endeavor. Therefore, we believe that several steps could be taken to mitigate potential issues with the draft plan including an **unrelenting focus on economic impacts and the adoption of a "do no fiscal harm" philosophy.** Thank you again for the chance to provide comments and please feel free to contact us any time.

Sincerely,

Fred R. Bockmiller, Jr., P.E.

Responses to Comment Letter KK
Mesa Consolidated Water District

Response to Comment KK-1:

The socioeconomic report on the 2012 AQMP has been released on September 28, 2012 and provides an extensive analysis, including the cost of the control measures (e.g., capital, installation, operation and maintenance), benefits of clean air (e.g., health, visibility, congestion relief and material) and job impacts. The report is available online at <http://www.aqmd.gov/aqmp/2012aqmp/index.htm> and the public comment and review period is for 45 days.

Response to Comment KK-2:

As noted in Response to Comment KK-1, the socioeconomic analysis on the 2012 AQMP has been released on September 28, 2012, for a 45-day public comment and review period ending on November 12, 2012. Comments on the Revised Draft 2012 Plan can be received during this time. Commenters are encouraged to send in comments as expeditious as possible to ensure staff will be able to respond in a timely manner. As noted by the commenter, there are federal deadlines imposed on the District in the submittal of the Plan into the State Implementation Plan, however, staff is accommodating the request for an extended comment period.

Response to Comment KK-3:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified and adopted at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the

adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond.

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NOx and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs will need to further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment KK-4:

Although FUG-01 does not currently intend to expressly exempt local governments, including cities, special districts, county governments, and others from this measure, because of their limited emissions contribution, the District does not expect the control measure to have a significant financial impact on them. This control measure is based on Bay Area AQMD Regulation 8, Rule 53: Vacuum Trucks Operations, which is limited to emissions of organic compounds from the use of vacuum trucks to move materials that are typically handled at petroleum refineries, bulk plants, bulk terminals, marine terminals, and organic liquid pipeline facilities. Because local governments, cities, special districts, county governments primarily use vacuum trucks to remove trash from parking lots, clean out sewers and water mains for maintenance work, and remove waste from septic tanks and portable toilets, they would typically be outside the intended scope. The Bay Area AQMD regulation does provide an exemption for emergencies that would be applicable to both private and public agencies under defined

circumstances (e.g., a petroleum product spill) where the delay in acquiring and using equipment to comply with the rule would result in a risk of significant harm to facility equipment, personnel, the public, or the environment, and District staff expects to include similar provisions in any rulemaking efforts. Any other use of vacuum trucks that would otherwise be subject to the proposed control measure would be assessed during the rulemaking process with appropriate stakeholder input, along with an evaluation of cost impact and effectiveness to determine the requisite level of inclusion in the control requirements.

Response to Comment KK-5:

Most of the stationary source control measures in the 2012 AQMP have a cost-effectiveness values assigned in dollars per tons of pollutant reduction (see Appendix IV-A and IV-B). The mobile source control measures also provide a value typically based on the annual cost to fund incentives to encourage advancement of zero and near-zero emission technologies. Staff has released cost and cost-effectiveness data for the AQMP control measures that are available online at

http://www.aqmd.gov/gb_comit/aqmpadvgrp/2012AQMP/meetings/2012/july26/CostSummary.pdf

and

http://www.aqmd.gov/gb_comit/aqmpadvgrp/2012AQMP/meetings/2012/july26/DetailCost.xls. The control measures have been ranked (see Chapter 6) in the order to the cost effectiveness to assist in prioritizing adoption and implementation. Also, the District is proposing to establish a cost effectiveness threshold (see Chapter 4) of \$16,500 per ton of VOC emissions, and \$22,500 per ton of NOx emissions. The threshold would not prohibit rule adoption, but trigger additional analysis of economic impacts. Only one control measure, CTS-01 (Architectural Coatings) on the high range exceed the cost effectiveness threshold. During rule development, staff with input from stakeholders can develop viable alternative controls. Finally, as noted in Response to comment KK-1 and MM-2, the full socioeconomic analysis was released late September and includes discussions on the distribution of costs and benefits to 21 sub-regions within the AQMD and presents the resulting regional employment and competitiveness impacts.

Moreover, the AQMD is obligated to submit an attainment plan for PM2.5 which demonstrates attainment by 2014 or face the possibility of sanctions, which include the possibility of losing federal highway funding for regional transportation projects. Maintaining regional transportation infrastructure is an important element of the region's economic vitality.

LL. Joint Orange County Coalition, September 12, 2012

September 12, 2012

Dr. Barry Wallerstein
Executive Officer
South Coast Air Quality Management District
21865 Copley Dr.
Diamond Bar CA 91765

RE: Comments to the 2012 Draft Air Quality Management Plan

Dear Mr. Wallerstein -

Thank you for this opportunity to comment on the 2012 draft Air Quality Management Plan (AQMP). The Association of California Cities – Orange County (ACC-OC), the Costa Mesa Sanitary District, Independent Special Districts of Orange County, Mesa Consolidated Water District and the Municipal Water District of Orange County, have reviewed the draft AQMP and respectfully submit the following comments.

Combined, the undersigned agencies and organizations represent the interests of Orange County's hundreds of thousands of residents and tens of thousands of businesses across the region. The mission of each agency and organization is unique, but we are strong in our agreement on the issues presented hereafter concerning the draft AQMP and its potential impacts on the local government community and the economy as a whole.

Many of the agencies will prepare individual comment letters. However, the intent of this letter is to articulate the several areas of common concern.

AQMP Comments
ACC-OC, CMSD, ISDOC, Mesa Water, MWDOC

- **An economic analysis must be completed as part of the draft AQMP.** The lack of an economic study to accompany the control and implementation measures of the AQMP is paramount to our concerns. This multi-year, regional plan will cost hundreds of millions of dollars to implement, which will have significant impacts on government agencies. At a time when municipal budgets are being raided by the state and property and sales tax revenue is low, AQMD should make a more concerted effort to identify the potential economic impacts of its plans prior to broad distribution.

} LL-1
- **The comment period should reflect the significant delay of an economic study.** Due to a lack of an economic impact study, AQMD should significantly extend any comment period, official or otherwise following the release of the full economic impact analysis. We understand the constraints imposed by state, federal and other timelines. However, it would be irresponsible of the AQMD to move forward with this plan without a complete economic analysis.

} LL-2
- **Ozone Implementation Measures should be included as an appendix or removed from the draft AQMP.** Ozone targets are more than a decade away and implementation measures are not required as part of the 2012 AQMP. Implementation and control measures dealing with ozone should be removed from this draft or included as an appendix.

} LL-3
- **FUG-01 will unintentionally harm cities and local governments without realizing measurable results.** FUG-01 has a stated purpose of expanding AQMD's regulation of vacuum trucks into the petroleum industry. However, numerous cities, water and sanitation districts operate these trucks on a limited basis to comply with State Water Resources Control Board Order No. R3-2006-0003-DWQ, Statewide General Waste Discharge Requirements for Sanitary Sewer Overflows (SSOs). These trucks are essential to preventing hazardous wastewater from overflowing onto public streets and into homes, businesses, natural habitats and eventually into the ocean. Additional regulation and required retrofits would add considerable cost and achieve limited emission reduction. Therefore, we request that local governments be exempted from FUG-01.

} LL-4
- **The AQMP should focus on a philosophy of "do no fiscal harm."** AQMD and other air quality districts have been tremendously successful over the past decade reducing air pollution. By AQMD's estimates, air pollution has been drastically reduced. We do not dispute the merits of air quality improvement. However, we do question its timing. When cities and local governments are suffering through the worst economic recession since the great depression, now is not the time to "tinker at the edges." This will continue to thrust unworkable mandates on local jurisdictions, while also driving job- and sales-tax producing companies out of our region.

} LL-5

AQMP Comments
ACC-OC, CMSD, ISDOC, Mesa Water, MWDOC

Local governments are in a unique position to understand the dynamic and difficult task the AQMD has with the preparation of the AQMP, and we can appreciate your challenge. Building consensus around regional public policy is a difficult endeavor. However, we believe that several steps could have been taken to mitigate potential issues with staff's draft plan including an **unrelenting focus on economic impacts and the adoption of a "do no fiscal harm" philosophy.**

We look forward to discussing these comments with you in the future. Please do not hesitate to contact us in the meantime.

Sincerely,

Lacy Kelly

Responses to Comment Letter LL
Joint Orange County Alliance

Response to Comment LL-1:

The Draft 2012 AQMP Socioeconomic report was released in late September and is available on <http://www.aqmd.gov/aqmp/2012aqmp/DraftSocioeconomicReport.pdf>. The socioeconomic analysis shows that the Draft 2012 AQMP is not expected to result in dramatic impacts on the region's competitiveness. The estimated benefits of the Plan are projected to exceed its implementation costs, resulting in a modest job gain.

Response to Comment LL-2:

The Socioeconomic Report was released on September 28, 2012 with a 45-day comment period ending on November 12, 2012. Staff recognizes that the 2012 AQMP development schedule has been compressed. The attainment demonstration modeling could not begin until input data from SCAG's 2012 RTP and CARB's emissions inventories were available. AQMD staff has made every effort to provide all data and information to the public as soon as it became available in an open and transparent process. The review period for many of the documents has also been extended, additional workshops and regional public hearings have been added, and the Governing Board adoption hearing date has been delayed to December. The AQMD staff is committed to providing sufficient time for public comment, and continues the enhanced outreach efforts to all stakeholders, while keeping the U.S. EPA submittal deadline in December of 2012 in mind.

Response to Comment LL-3:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified and adopted at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called "black box" emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed,

assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are fully achieved by at least 2015 and beyond.

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NO_x and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment LL-4:

Although FUG-01 does not currently intend to expressly exempt local governments, including cities, special districts, county governments, and others from this measure, because of their limited emissions contribution, the District does not expect the control measure to have a significant financial impact on them. This control measure is based on Bay Area AQMD Regulation 8, Rule 53: Vacuum Trucks Operations, which is limited to emissions of organic compounds from the use of vacuum trucks to move materials that are typically handled at petroleum refineries, bulk plants, bulk terminals, marine terminals, and organic liquid pipeline facilities. Because local governments, cities, special districts, county governments primarily use vacuum trucks to remove trash from parking lots, clean out sewers and water mains for maintenance work, and remove waste from septic tanks and portable toilets, they would typically be outside the

intended scope. The Bay Area AQMD regulation does provide an exemption for emergencies that would be applicable to both private and public agencies under defined circumstances (e.g., a petroleum product spill) where the delay in acquiring and using equipment to comply with the rule would result in a risk of significant harm to facility equipment, personnel, the public, or the environment, and District staff expects to include similar provisions in any rulemaking efforts. Any other use of vacuum trucks that would otherwise be subject to the proposed control measure would be assessed during the rulemaking process with appropriate stakeholder input, along with an evaluation of cost impact and effectiveness to determine the requisite level of inclusion in the control requirements.

Response to Comment LL-5:

Please see the response to Comment LL-1. Moreover, the AQMD is obligated to submit an attainment plan for PM_{2.5} which demonstrates attainment by 2014 or face the possibility of sanctions, which include the possibility of losing federal highway funding for regional transportation projects. Maintaining regional transportation infrastructure is an important element of the region's economic vitality. See also response to comment KK-5.

MM. The Adhesive and Sealant Council (ASC), September 17, 2012

September 17, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
Planning, Rules and Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765-4182

Dear Dr. Chang:

The Adhesive and Sealant Council (ASC) is a North American trade association representing 121 manufacturers of adhesives, sealants and suppliers of raw materials to the industry. As director of government relations for ASC, I appreciate the opportunity to offer comments on the South Coast Air Quality Management District's (SCAQMD) Draft 2012 Air Quality Management Plan (AQMP) which includes an expressed consideration of removing the exemption for low vapor pressure (LVP) solvents.

ASC strongly objects to any consideration of the removal of the LVP exclusion as it would have a significant cost impact to ASC members who have taken the opportunity to reformulate their products when the exemption was first included in SCAQMD Rule 1168.

Removal of the exemption would force companies to reformulate many of their products specifically for the South Coast Basin. One ASC member has estimated that to simply develop packaging artwork for a line of products to be sold in a single air district would cost in the range of \$48,000. Taking into consideration that companies would have to develop unique product formulations as well as the maintain a complicated inventory and distribution system that would market parallel product lines within the State of California, it is clear that the loss of the LVP exemption would result in millions of dollars in additional costs for manufacturers with little or no impact in VOC emissions or ozone formation in the South Coast.

ASC and its members have constructively and cooperatively worked with ARB staff for more than 20 years to assure that our products have the lowest possible VOC content while maintaining the product efficacy that residents of the South Coast have come to expect. We plan to continue to work in a cooperative manner to improve the air quality in California while maintaining our industry's ability to supply effective products that the California consumer can rely upon to contribute positively to their health, safety and quality of life.

If you have any questions, please contact me at 301/986-9700 ext. 112

Respectfully submitted,

A handwritten signature in black ink that reads 'Mark Collatz'.

Mark Collatz
Director of Government Relations

MM-1

Responses to Comment Letter MM
ASC

Response to Comment MM-1:

Staff appreciates the efforts of the Adhesive and Sealant Council's (ASC) efforts to improve the air quality in California. For clarification, the proposed control measure is not intended to establish a separate consumer product regulation for the South Coast Air Basin. The proposed control measure calls for re-evaluation of LVP definition and depending on the outcome of this effort, the CARB LVP-VOC criteria may be revised based on scientific data which may include MIR and similar photochemical reactivity parameters. The purpose of this measure is to ensure anticipated reductions and air quality improvements from the existing consumer product regulations are actually achieved. District staff will work with CARB staff to identify categories where it may be appropriate to revise the LVP-VOC exemption. Staff will also work with CARB staff to review emission inventory data to ensure that the total organic emissions reflected in the inventory, in addition to VOC emissions, accurately capture VOC-exempt solvents and LVP-VOC emissions as well. Any proposed amendments to the Consumer Products Regulations to revise LVP-VOC exemption would be vetted through a full public process. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the rule development process to ensure overall efforts are feasible, productive and cost-effective.

in South Coast Air Quality Management District
Revised Draft 2012 Air Quality Management Plan Appendix I Health Effects
and
Request for California Health and Safety Code Section 40471 (b) Hearing on
Health Impacts of Particulate Matter Air Pollution in South Coast Air Basin**

James E. Enstrom, Ph.D., M.P.H.
UCLA School of Public Health
Los Angeles, CA 90095-1772
jenstrom@ucla.edu
(310) 825-2048

September 20, 2012

1) In spite of my repeated submissions to AQMD since 2008 of overwhelming evidence of no mortality impacts, including the evidence in my August 30, 2012 Criticism of the Draft 2012 AQMP (<http://scientificintegrityinstitute.org/AQMP083012.pdf>), the September 7, 2012 Revised Draft AQMP Appendix I Health Effects continues to seriously misrepresent and exaggerate the mortality impacts of criteria pollutants, like particulate matter, in the South Coast Air Basin (<http://www.aqmd.gov/aqmp/2012aqmp/RevisedDraft/AppI.pdf>).

2) Since 2000, overwhelming epidemiologic evidence that fine particulate matter is not killing Californians has been published by 26 accomplished doctoral level scientists (Ph.D. or M.D.), including myself. Since 2008, extensive written and/or verbal comments by 16 doctoral level critics, including myself, have been submitted to US EPA, CARB, and/or AQMD and these comments strongly criticize the way the California-specific evidence has been characterized by the three regulatory agencies. The names of the scientists and critics are listed on the next page.

3) The 2012 AQMP (<http://www.aqmd.gov/aqmp/2012aqmp/index.htm>) does not comply with California Health and Safety Code (CHSC) Section 40471 (b): "On or before December 31, 2001, and every three years thereafter, as part of the preparation of the air quality management plan revisions, the south coast district board, in conjunction with a public health organization or agency, shall prepare a report on the health impacts of particulate matter air pollution in the South Coast Air Basin. The south coast district board shall submit its report to the advisory council appointed pursuant to Section 40428 for review and comment. The advisory council shall undertake peer review concerning the report prior to its finalization and public release. The south coast district board shall hold public hearings concerning the report and the peer review, and shall append to the report any additional material or information that results from the peer review and public hearings." (<http://www.leginfo.ca.gov/cgi-bin/displaycode?section=hsc&group=40001-41000&file=40460-40471>).

4) Before the 2012 AQMP is finalized and approved, the AQMD Governing Board must hold a public hearing on "the report and the peer review" regarding "the health impacts of particulate matter air pollution in the South Coast Air Basin," as required by CHSC Section 40471 (b).

Responses to Comment Letter NN
James Enstrom

Response to Comment NN-1:

Appendix I discusses a number of health effects studies, and also presents the conclusions of EPA's review of the criteria pollutants health effects. Staff will include additional discussion on the range of effects found in the studies referenced.

Commenter also refers to criticisms of the health effects conclusions of EPA, CARB, and AQMD. Appendix I relies heavily on the conclusions of EPA and CARB in summarizing the health effects of PM2.5 and other criteria pollutants. The AQMD Advisory Committee peer review also supported significant health effects from PM2.5. In staff's view, Appendix I is not an appropriate forum to critique the NAAQS or the federal and state reviews. Such criticisms are best directed to the EPA and CARB. Staff notes that the EPA reviews of air pollution health effects are open to public review, and are also reviewed by the EPA Clean Air Scientific Advisory Committee, which was established pursuant to requirements in the Clean Air Act. Also, the review in Appendix I does not establish the underpinning of the draft 2012 AQMP. The purpose of the AQMP is to provide a plan to attain the NAAQS by statutorily required deadlines.

Response to Comment NN-2:

The purpose of the AQMP is to provide a plan to attain the National Ambient Air Quality Standards as required by the Clean Air Act and amendments. In terms of the California Health and Safety code section 40471(b), Staff believes it is in compliance with all the requirements regarding the report of the health impacts of particulate matter air pollution in the South Coast Air Basin. It is staff's opinion that the purpose of the requirement is to provide a thoughtful overview of health effects on PM2.5, and not to provide a forum to advocate for a waiver of the PM 2.5 standard. See response to comment U-1.

Response to Comment NN-3:

The Governing Board will hold an adoption hearing in December on both the 2012 AQMP and Appendix I.

OO. John Dale Dunn, Darnall Army Medical Center, September 28, 2012

Request for a Comprehensive hearing on the Health Impacts of Particulate Matter in the South Coast Basin area in compliance with Section 40471 (b) of the CA Health and Safety Code.

John Dale Dunn MD JD
Emergency Physician Brownwood TX
Policy advisor Heartland Institute, Chicago
Policy advisor, American Council on Science and Health, New York City.
Civilian Contract Faculty, Emergency Medicine, Carl R Damall Army Medical Center, Fort Hood, TX

Members of the South Coast Air Quality Management District Board of Directors:

The recently released draft for Air Quality Management by the Southern California Air Quality Management District (AQMD) proposes very significant regulatory changes for more than 15 million residents of the area, however the South Coast AQMD proposes these changes without benefit of the prescribed triennial Air quality management plan revisions announcements. In conjunction with an effort to elicit public comments. Draft 2012 is, like so many drafts before, the product of a black box project at the South Coast AQMD, the precautionary principle and acceptance of science that has been effectively challenged in public in the past 4 years.

That is not according to Federal or State Clean Air Act law or the intent of environmental compliance provisions.

The Air Quality Management Plan (AQMP) (<http://www.aqmd.gov/aqmp/2012aqmp/index.htm>) proposes aggressive and draconian provisions that would have major impacts on the residents of the South Coast Basin Area.

I have included previous submissions to CARB on air regulations that were the product of the 2008-2010 activities and proposals and public comments made by prominent experts opposed to the new CARB air pollution measures. The South Coast Air Management Plan process should include close review and evaluations of those public comments that criticize and conflict with the studies relied on by the District planners.

The economic impact of the Management plan will kill or harm business, industry, transportation, and agricultural activity for now good reason, since air pollution is not killing anyone in South Coast. The proposed AQM Plan will cause hardship and shorten lives for the residents of the area in addition to depressing the economy with the well-known effect that can be expected, higher unemployment, stress and hardship, resulting in shortened life expectancies and misery—all for AQMD chasing a phantom menace—small particle pollution, that by evidence of the studies, causes no harm or deaths.

AQMP also should follow the law, that specifically states at Section 40471 of the Health and Safety Code “On or before December 31, 2001, and every three years thereafter, as part of the

OO-1

OO-2

OO-3

preparation of the air quality management plan revisions, the south coast district board, in conjunction with a public health organization or agency, shall prepare a report on the health impacts of particulate matter air pollution in the South Coast Air Basin. The south coast district board shall submit its report to the advisory council appointed pursuant to Section 40428 for review and comment. The advisory council shall undertake peer review concerning the report prior to its finalization and public release. The south coast district board shall hold public hearings concerning the report and the peer review, and shall append to the report any additional material or information that results from the peer review and public hearings.” (<http://www.leginfo.ca.gov/cgi-bin/displaycode?section=hsc&group=40001-41000&file=40460-40471>).

OO-3

The district has failed to comply. Therefore they should correct their failure and stand down from pursuing the Plan proposed until the review and hearing process is complete.

For 4 years 2008-2012, the California Air Resources Board (CARB) has attempted to push through air pollution/small particle control regulations that the CARB claimed were based on evidence of human health effects that included deaths from small particles.

Here are the links, which include my previous submissions protesting the inadequacy of the human health effects science relied on by CARB.

Criticism of June 9, 2011 Draft and October 28, 2011 Final Jarrett Report on PM2.5 Deaths in CA

October 28, 2011 Compilation of All Criticism since June 9, 2011 of Jarrett Report on CA PM2.5 Deaths
(<http://www.scientificintegrityinstitute.org/JarrettCriticism102811.pdf>)

Careful review of the submissions above by previous commenters would justify a stand down from the proposed AQMP outlined by the South Coast MD. Research shows that current ambient air pollution in California is not harmful and doesn't justify aggressive new AQMP plans.

Reputable scientists repeatedly raised important issues and Michael Jarrett's joke of a research project based on his selection of the "conurbation" model data, confirms that the CARB claims of thousands of lives saved by air regs is a house of cards built by CARB on small particle research data dredges to find poorly defined "premature deaths" supposed associated with poorly defined small particle pollution. Such uncertainties certainly cannot justify the extreme elements of the South Coast AMP.

The CARB never was able to properly dispel the objections raised in 2008-2010, and in February of 2010 lost the major face to face debate in a knockout when Dr. Michael Jarrett's project came a cropper and Dr. Jarrett admitted he couldn't find any current air pollution health effects.

Then Dr. Jarrett went back to his computer tricks and decided to redo his research with modeling that is risible, then 9 models showed no effect but one of his ten models finally gave him the results that allowed him to do what CARB asked—support their position that small particles are killers.

Dr. Jarrett's co-authors, an impressive array of fellow travelers in the small particle hunting research community, never excused or explained the decision to rely on the "conurbation" model as more reliable than the 9 models that showed no effect. Although conurbation sounds exotic, it is the game played by researchers called torturing the data, and in this case Dr. Jarrett found a way to dice and chop the geography of California to find populations that had the "associations" of air pollution and deaths he was looking for.

That is called the outcome based research fallacy and is fueled by the fact that Jarrett and his coauthors knew who funded their research, an agency that had a stake in promoting the public perception that small particles are killers.

South Coast Air Management District should comply with California Health and Safety Code Section 40471 (b) and schedule a Hearing for a full vetting of the small particle research issues before implementing the proposed AQMP and then act reasonably and discard the Plan.

There are no impact studies for the past decade, and the AQMD has no reports on health impacts

OO-6

OO-7

OO-8

on record for 2001 through 2010 when there should have been at least 3 reports filed, and at one point an AQMD report said, ignoring its responsibility in reporting. "The purpose of this appendix is to provide an overview of air pollution health effects, rather than to provide estimates of health risk from current ambient levels of pollutants in specific areas of the SCAB." (http://www.aqmd.gov/aqmp/docs/2003AQMP_AppI.pdf).

The health effects studies are the foundation for any management plan and have been discarded in favor of aggressive regulatory proposals based on the precautionary principle or good intentions, but not on the science demanded in the Clean Air Act and its corresponding California Statutes. The research presented to the CARB and the public comments provided make a strong case for no effect from current ambient air pollution. No death effect, no measurable health effect from the criteria air pollutants.

Please consider the comments from 2008 on the proposed CARB Tran report, the submissions made for the debate in February of 2010, and the comments by experts on the final version of the Jerrett study that asserted the "conurbation" model justified the CARB pursuit of new and aggressive small particle regulations.

Many studies have found no PM 2.5 health effect and yet the CARB and the South Coast Management district continue to press forward to the detriment of the California economy. California cohorts have found no relationship between PM2.5 and total mortality. Indeed, detailed analyses of two of these cohorts funded by AQMD and completed in 2011, have found no relationship between any criteria pollutant and total mortality in California (www.scientificintegrityinstitute.org/Enstrom081512.pdf).

The CARB and US EPA human health effects research on small particles and other criteria pollutants have been depended on the questionable methodology of data dredging for "premature deaths. The problem is defining premature deaths, and the studies in fact do not count premature deaths as in a medical investigation, but the noise of variation in death rates. That is an opportunity for irresponsible data torturing to find air pollution and daily variation in death rates to call "premature deaths" that are not. The premature deaths projected by researchers, the USEPA and CARB to thousands in the state or nation are projections of deaths that are more than the daily average, not premature deaths of individuals who have been assessed for confounders and found to die short of life expectancy.

The research is unreliable, and misleading, and projections of hundreds of thousands of lives saved is deceitful nonsense. There are no deaths from small particles, the research is deceptive desk top death certificate data dredging that harvests the noise from day to day death rate variations and calls it signal, then projects the "correlations" the population to make impressive scare numbers of "premature deaths."

These data dredged mortalities are the primary health impact used to justify the NAAQS. So the number is the product of data torturing and deception but even if the AQMD accepts the unreliable counting and methodology, the national standards are not based on health effects or mortality in California or the SCAB. In 2009 the SCAB had an age-adjusted total death rate lower than the death rate in every state in the continental US. (<http://www.scientificintegrityinstitute.org/NCHSRR070811.pdf>).

OO-8

OO-9

The AQMD is obligated to evaluate the reliability of the research and another consideration is the already mentioned Krewski map that shows no California air pollution effects. That alone should give California policy makers pause before initiating another aggressive regulatory regime.

A good faith effort to review the human health effects science should convince the SC AMD policy makers to reconsider the proposed aggressive Management Plan.

Cordially,

John Dale Dunn MD JD

Supplemental submission on the AQMP

Members of the Board of South Coast Air Management District,

I write to supplement my previous submission showing that there is no reliable evidence that human health effects in California and specifically in the South Coast District justify the proposed Management Plan.

I must reemphasize that I also believe that the South Coast District is not in compliance with the CA statutes that require a review of human health effects science on a regular basis and particularly when a new Management Plan is promulgated.

OO-10

It is my understanding that before the Draft 2012 AQMP is finalized and approved, AQMD must hold a public hearing on the health impacts of air pollution in the SCAB, in accordance with CHSC Section 40471 (b).

If the hearing is held, in compliance with statute, I am convinced that the policy makers and board will find overwhelming the lack of evidence to justify any proposed plan, particularly the aggressive plan as proposed by AQMD staff.

OO-11

The AQMP should not propose emission control measures necessary to comply with NAAQS that are not appropriate for California or the SCAB. Instead, AQMD should request a waiver from compliance with the NAAQS using the special waiver status granted to California in Section 209 of the Clean Air Act (<http://www.epa.gov/otaq/cafr.htm>).

To reiterate, and reemphasize, in January of 2007, the Air Resources Board and AQMD approved funding for two studies on the human health effects relationship to particle air pollution and the studies by Lipsett, and by Jarrett and others showed no human health effect, no association or relationship between PM and total mortality in California. The Jarrett Study found that total mortality during 1982-2000 among about 75,000 California adults was not related to either PM10 or PM2.5 in eight of nine models tested. He tortured the data to get one model to show an association, the model he called the conurbation model, which was nothing more than slicing the geographical pieces to find a small increase in deaths associated with Air Pollution. I have made fun of such nonsense and data dredging

OO-12

in my first submission. The Lipsett Study found that total mortality during 2000-2005 among about 75,000 female

California teachers was not related to either PM10 or PM2.5. The studies found some unexplained evidence of increased cardiovascular disease risk and decreased cancer risk, but there was no overall increased risk of death but in these studies there is no effort made to avoid the problem of noise in the small ranges of association. However that is the problem with epidemiology funded by government—the researchers know there will be no funds in the future for a study that fails to find what the government entity wants to justify a new regulatory regime.

These null results by Lipsett and Jarrett agree with the overwhelmingly null results for California that have been published since 2000, which include the study by Enstrom on 50,000 Californians. They also are coherent with the Krewski map mentioned before that shows a null California association of deaths and small particle pollution.

Thus, based on all the evidence described in my first submission and in this supplemental submission, I assert there is no health risk associated with PM in the South Coast regions, including the Coachella Valley. There is no evidence of death association in California as a whole and there will be no health risk from PM that would justify concern about the Sentinal power plant.

I urge that the AQMD Board and Staff review carefully review the evidence and consider the negative economic effects from draconian air management regulatory proposals. It is time to focus on the welfare of the public and the California economy is critical to people's well-being.

No human health effects research would justify more damage to the economy of the South Coast region or California as a whole.

Cordially,

OO-12

Responses to Comment Letter OO
John Dale Dunn, MD, JD

Response to Comment OO-1:

The purpose of the 2012 AQMP is to develop a plan to attain the National Ambient Air Quality Standards for particulate matter, as required by the Clean Air Act. The AQMD has held advisory group meetings, and announced public hearings, regarding the draft 2012 AQMP. Commenter indicates the provisions proposed in the Draft 2012 AQMP would have major impacts on the residents of the South Coast Air Basin. However, the large majority of costs associated with the PM2.5 plan derives from transportation control measures. The plan represents staff's best proposals to attain the NAAQS for PM2.5. Staff would always welcome other proposals to evaluate that would result in meeting the standards by the statutorily required deadlines. Failure to submit a plan to attain the standards could also result in penalties that would result in economic impacts in the regions. These could include restrictions on federal transit and highway funds, additional emissions offset requirements, and imposition of a Federal Implementation Plan to attain the standards.

Response to Comment OO-2:

The economic and health impacts of the proposed draft AQMP have been estimated and are contained in the draft Socioeconomic Analysis released in September 28, 2012. As noted above, failure to timely attain the standards can also result in significant economic impacts to the region.

Response to Comment OO-3:

A draft Appendix I, which contains a summary of particulate matter health effects, is being prepared to comply with California Health & Safety Code 40471(b), and not the federal Clean Air Act. The provisions noted in the H&S Code require the report preparation as part of the AQMP updates. However, the DRAFT 2012 AQMP and its proposed provisions are designed to provide the plan for attaining the NAAQS for PM2.5, as required by the Clean Air Act.

Response to Comment OO-4:

Thank you for the links.

Response to Comment OO-5:

Thank you for the links.

Response to Comment OO-6:

The 2012 AQMD is being developed to provide a plan to demonstrate attainment of the National Ambient Air Quality Standard for Particulate Matter, as required by California and federal law. The research described by commenter is discussed in the draft Appendix I of the draft 2012 AQMP. Commenter also states that the AQMD should

“stand down” from the current draft AQMP. However, the purpose of the draft 2012 AQMP is to provide the plan to attain the NAAQS for PM2.5, as noted above.

Response to Comment OO-7:

The AQMD is holding public hearings on the draft AQMP and its Appendix I.

Response to Comment OO-8:

The draft Appendix I provide a summary of particulate matter health effects, which are generally applicable to the South Coast Air Basin. Based on relatively recent studies, additional discussion of health impacts of PM2.5 specifically looking at the South Coast Air Basin population have been added to the discussion. As noted previously, however, the main purpose of the Air Quality Management Plan is to provide a pathway to attain the National Ambient Air Quality Standards by statutory deadlines, as required by the Clean Air Act.

Response to Comment OO-9:

The study referenced in the commenter discussion is included in the Draft Appendix I of the Draft 2012 AQMP. Regarding the discussion of the commenter on whether the health effects of particulate matter justify the National Ambient Air Quality Standards, staff notes that under the Clean Air Act, the EPA Administrator adopts national air quality standards, not states or local districts. The District has no authority to adopt an air quality standard, nor is there any provision under the Clean Air Act to request a waiver from meeting the established NAAQs. The AQMD Draft 2012 AQMP is designed to attain these standards. It is staff’s opinion that the appropriate forum to review the NAAQS is during the EPA review of the standards, not in the development of the updated AQMP.

Response to Comment OO-10:

The Air Quality Management Plan updates have the required report on health effects of particulate matter in the South Coast Air Basin, which is included as Appendix I.

Response to Comment OO-11:

The Clean Air Act requires compliance with the National Ambient Air Quality Standards. The Clean Air Act also calls for severe economic penalties to the region for failure to comply with the National Ambient Air Quality Standards by statutory deadlines. There is no provision in the Clean Air Act to waive compliance with the National Ambient Air Quality Standards. The section 209 waiver that commenter refers to applies to mobile source emission controls, and provides procedures in which California may seek waiver from federal motor vehicle standards if they are replaced with at least equally protective standards. The section 209 waiver clearly does not apply to the NAAQS.

Response to Comment OO-12:

Staff appreciates the references. The two studies mentioned are included in the Appendix I discussion of particulate matter health effects.

PP. Personal Care Products Council, September 28, 2012

September 28, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
echang@aqmd.gov

Re: 2012 Air Quality Management Plan

Dear Dr. Chang:

The Personal Care Products Council (Council) appreciates the opportunity to provide comments to the South Coast Air Quality Management District's (SCAQMD) *revised* 2012 Air Quality Management Plan (AQMP), which was issued for comment on September 8, 2012. Our comments focus on the Stationary Source Control Measures for Coatings and Solvents, and specifically CTS-4 that would "revise" the low vapor pressure volatile organic compounds (LVP-VOC) exemption for certain categories of consumer products.

The Council strongly opposes revising the LVP-VOC exemption.

Introduction

Based in Washington, D.C., the Council is the leading national trade association representing the \$250 billion global cosmetic and personal care products industry. Founded in 1894, the Council's more than 600 member companies manufacture, distribute, and supply the vast majority of finished personal care products marketed in the United States. These include many products that have been reformulated – some multiple times – in order to foster the goals of SCAQMD and the California Air Resources Board (ARB) to reduce emissions from consumer products. Reformulated products include antiperspirants, deodorants, hairsprays, numerous other hair care products, nail polish removers, shaving creams, and personal fragrance products.

While the Council's member companies do not manufacture products that fall under the category of "coatings and solvents", and thus will not be directly impacted by the proposed control measure CTS-4, we have serious concerns that any revision of the LVP-VOC exemption for one category of consumer products could eventually lead to its revision, or possibly even elimination, for *all* consumer products – as one stakeholder verbally suggested at the September 12, 2012, ARB public hearing. Such a move would be

} PP - 1
} PP - 2

Dr. Elaine Chang
September 28, 2012
Page 2 of 3

devastating to industry generally, and to our members particularly, while doing almost nothing to significantly reduce VOCs or improve air quality in the South Coast region.

Our member companies continue to innovate and develop personal care products while considering efficacy, consumer acceptance, cost, and a host of other factors. Most importantly, however, our companies focus on safety – both human health and environmental safety – and the products they make are recognized as the safest products regulated by the U.S. Food and Drug Administration. As our members continue to test and reformulate to improve personal care products, it is vitally important that they continue to have the flexibility to utilize the limited exemptions allowed under law; particularly, the current LVP-VOC exemption.

Our Objections

If SCAQMD decides to revise the LVP-VOC exemption for certain consumer product categories, as proposed in its revised 2012 AQMP, our members fear that it will lead to the revision or elimination of the exemption altogether. This fear is based on the following:

- Our member companies have invested significant resources over the years reformulating personal care products in reliance on the LVP-VOC exemption;
- Many personal care products have been optimally formulated to meet both consumer needs and VOC standards;
- Revising or eliminating the LVP-VOC exemption would potentially reduce product efficacy, causing consumers to use more of the product, and thus resulting in more emissions;
- Revising or eliminating the LVP-VOC exemption could result in the potential loss of products or entire product categories; and
- Unintended consequences are likely to occur, as companies are forced to quickly reformulate their products.

Our fear seems further justified in light of the recently proposed rule¹ by the U.S. Environmental Protection Agency, finding that California’s State Implementation Plan (SIP) for the South Coast Air Basin is “substantially inadequate” to comply with the federal one-hour ozone standard. If EPA finalizes this proposed rule, or “SIP call”, a new attainment demonstration for the one-hour ozone standard in the South Coast area will be required within 12 months.

PP - 2

PP - 3

¹ 77 Fed. Reg. 58072-76 (Sept. 19, 2012).

Dr. Elaine Chang
September 28, 2012
Page 3 of 3

Even so, SCAQMD appears to believe that the proposed control measures for consumer products – CTS 1, 2, 3 and 4 – will somehow help with attaining the one-hour ozone standard. Yet, air modeling shows that further VOC reductions from consumer products will *not* significantly reduce ozone. In particular, LVPs have only the most minimal impact on VOC emissions, and thus ozone formation; as such, revising or eliminating the LVP-VOC exemption will not help SCAQMD meet its ozone attainment goals.

It would be illogical for SCAQMD to devastate an entire sector of the economy to achieve only incremental VOC reductions, which would be the result of implementing the proposed control measures. Instead, SCAQMD should focus on efforts that will result in substantial NOx and ozone reductions so that it can meet its attainment goals.

The consumer products industry in general has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions would result in even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products technologically and commercially infeasible. To that end, the Council asks that you consider our comments in the following context: while extraordinary progress has already been achieved in the reduction of emissions from personal care products, there is *not* an endless pool of VOCs in these products that can be eliminated. We are now at the point where the VOCs remaining in previously-regulated and unregulated products are essential to the function of the products, and/or present in such small amounts that reduction is not cost-effective for either the California or the industry.

Conclusion

The Council appreciates the opportunity to comment on the revised 2012 AQMP. We urge SCAQMD to seriously consider the impact of these control measures – and the revision or elimination of the LVP-VOC exemption in particular – on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the revised 2012 AQMP should not be included in the final 2012 AQMP.

Thank you, and please call me with any questions or concerns by phone at 202-466-0495 or email at mverst@personalcarecouncil.org.

Sincerely,

Thomas Myers

Responses to Comment Letter PP
Personal Care Products Council

Response to Comment PP-1:

Staff appreciates the efforts of the Council's more than 600 member companies to reformulate their products to foster the goals of AQMD and CARB.

Response to Comment PP-2:

The proposed control measure seeks to re-evaluate the LVP-VOC exemption in the Consumer Products Regulation that may lead to potential changes for applicable consumer product categories including personal care products.

CARB will conduct a technical and cost effectiveness feasibility analysis to demonstrate that products available to the consumer provide maximum ozone benefits, are cost-effective and are safe for the consumer. AQMD staff is also interested in reviewing any empirical comparative (side-by-side) studies conducted to assess efficacy of products with and without the use of LVP-VOCs. AQMD staff requests copies of any such studies conducted by members of the Personal Care Products Council or third parties to evaluate effectiveness and safety considering that some of the LVP-VOCs are not only highly reactive, but have some known health impacts.

Response to Comment PP-3:

The long term strategy achieves attainment of the ozone standards at all the air quality monitoring stations throughout the Basin by 2023. Modeling analysis shows that significant NO_x emissions reductions are the only viable path to attain the 8-hour ozone standards in the Basin. Therefore, the ozone strategy focuses primarily on NO_x reductions. However, VOC emissions reductions are also necessary in progressing towards attainment of the ozone standards, especially in the western portions of the Basin. Furthermore, there is a significant health benefit to meeting the ozone standards as soon as possible in as many areas of the Basin as possible. While the current 8-hour ozone design value site is at Crestline in the San Bernardino Mountains, projections in 2023 show that the design value site will be at Glendora in the San Gabriel Valley to the west. As shown in the 2023 baseline 8-hour ozone NO_x/VOC isopleths for Glendora and other western sites presented in the attachment to Appendix V, VOC reductions will help to lower ozone concentrations in the San Gabriel Valley and Western portions of the Basin. This is true near the level of the 8-hour ozone standards, but is even more significant along the path to attainment. This is due to the higher VOC/NO_x ratios projected to occur in future years, especially in the western Basin.

To this end, short-term VOC controls (through 2020) will help offset the impact of the increased VOC/NO_x ratio in the impacted areas of the Basin, such as the San Gabriel

Valley, that are immediately downwind of the primary emissions source areas. As such, a nominal amount of VOC reductions are proposed in the Draft 2012 AQMP. The proposed VOC control measures in the Plan are based on implementing all feasible control measures through the application of available technologies and best management practices, while seeking a fair share reduction from both mobile and stationary sources. As zero and near-zero technologies are implemented for mobile sources to reduce NO_x emissions, concurrent VOC reductions from mobile sources are expected. Thus, stationary sources must continue to achieve their fair share of VOC reductions in the future. This plan proposes a modest 6 tpd of VOC emissions reductions out of a total 21 tpd of VOC reductions needed for basin-wide attainment in 2023.

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NO_x emissions reductions, beyond already adopted rules and measures, will be needed to meet the 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond.

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “black box” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious

attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NO_x and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs should further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

RE: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The International Fragrance Association North America (IFRA North America) appreciates the opportunity to offer comments on the South Coast Air Quality Management District's (AQMD's) Revised Draft 2012 Air Quality Management Plan (AQMP). These comments focus on Section CTS-04 of that proposal. IFRANA strongly objects to the inclusion of this measure in the draft AQMP, and urges that CTS-04 *not be included* in the final 2012 AQMP. In addition to the comments outlined below, we fully support those submitted by the Consumer Specialty Products Association on this issue on behalf of the consumer product companies it represents.

Overview

IFRA North America represents the fragrance industry in the United States. Our member companies create and manufacture fragrances and scents for personal care, home care, industrial and institutional use as well as home design products all of which are manufactured by consumer goods companies. IFRA North America also represents companies that supply individual fragrance ingredients, such as essential oils and other raw materials, which are used in perfumes and fragrance mixtures. Our member companies are responsible for over ninety percent of the fragrance market throughout the world and directly employ hundreds of California residents. This is in addition to innumerable indirect jobs and fragrance related economic activity through the sale and production of goods that utilize fragrance and fragrance technologies.

Indisputably, functional fragrance components are essential to achieving consumer-desired product performance across all categories of consumer products. While AQMD has before it a document with admirable objectives to create a workable, science-based program that benefits consumers and the environment, it would do so to the detriment of innovation, investment and functionality. IFRA North America has grave concerns that the proposed reductions in VOCs, and methods of achievement, are neither necessary nor cost effective in addition to being technologically infeasible. Further, we have misgivings that the proposed changes will ultimately harm California consumers and businesses in addition to the welfare of the fragrance industry as a whole.

We have outlined our specific concerns in the subsequent sections.

INTERNATIONAL FRAGRANCE ASSOCIATION
NORTH AMERICA
1001 19th Street North, Suite 1200
Arlington, VA 22209

Unnecessary and Infeasible Reductions

IFRA North America is principally concerned with the proposal to include further reductions in VOCs from consumer products that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts overall on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

Over the past 20 years, the fragrance industry, as well as the consumer products industry, has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions would come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products unnecessary.

Proposal to Remove LVP Exemption Would be Devastating to Consumer Products Industry

Removal of the existing exemption for low vapor pressure "solvents" threatens the existence of entire classes of consumer products, well beyond the coatings and cleaner product categories that are suggested for attention by SCAQMD. The end result would be a disregard for differential contributions to VOC burden. In particular, those consumer product categories that may contain fragrance as an ingredient are not the main focus of the SCAQMD initiative, which appears to concentrate on cleaning and related products having a defined 'solvent' component and effect.

As suppliers of fragrance to major consumer product companies across the country, IFRA North America has worked diligently with California regulators since the inception of CARB. Our representatives have collaborated directly with CARB staff to provide background information on our products, our business practices, and the technical criteria that must be fulfilled for fragrances in order to achieve consumer expectations for marketplace products containing fragrance. Those consumer products, particularly in the air care category, have been carefully constructed in order to comply with air quality regulations and also to deliver the consumer benefit stated by the manufacturer. While the SCAQMD proposal seems to focus on a narrow product segment (i.e., solvent-based cleaners) IFRA North America's concern is for the potential of a broad sweeping impact across many consumer product categories, and this gravely damaging whole industry segments.

Review of SCAQMD Technical Report Warrants Further Examination

Treatment of Chemical Boiling Points

IFRA North America has obtained the SCAQMD technical report dated August 31, 2012 titled "Non-Volatile, Semi-Volatile or Volatile: Redefining Volatile for Volatile Organic Compounds". We believe that a closer examination of some of the hypotheses presented in this report is warranted. In particular, the treatment of chemical boiling points for establishing qualification for Low Vapor Pressure (LVP) status seems at odds with the statement that "[b]oiling point and number of carbon atoms do not appear to be a reliable indicator of volatility." Along these lines, the technical report addresses the role of boiling point in the determination of whether or not a material qualifies as a LVP material. While acknowledging that boiling point is one of the criteria cited by CARB for consideration in the definition of an LVP, the point must be made that potential atmospheric reactivity of a material is much more important than boiling point alone. Thus, the discussion of alternative boiling point criteria (e.g., Canada, Green Seal) is misplaced as it does not address the much more fundamental concern of ozone reactivity. In addition, the focus on mass calculations to achieve reductions in

QQ - 1

QQ - 2

QQ - 3

ozone-reactive components ignores a much more relevant factor which is Maximum Incremental Reactivity considerations.

QQ - 3

Concerns with Room Temperature Evaporation Study

In the SCAQMD study, a room temperature evaporation study is described for a number of individual materials. It must be recognized that the consumer products that SCAQMD is seeking to address are not single chemical entities, but rather complex formulas of multiple components. While the individual components undoubtedly possess their own boiling points, vapor pressures, etc., in isolation, it is well known that these individual materials behave much differently when present in a mixture, and evaporative loss to air, water and soil compartments is heavily influenced by interactions among these materials in the mixture.

QQ - 4

Justification Behind New Categorization

In the SCAQMD report, the authors propose a new scheme for categorization of materials as "Volatile", "Semi-Volatile" and "Non-Volatile" and they have assigned materials to these categories, apparently by arbitrary criteria (e.g., a material classed as "volatile" is said to evaporate to the extent of 95% within 6 months under ambient conditions). It is not clear what the precedent is for this new assignment scheme, and we must question the relevance of evaporation of single substances from a Petri dish to the evaporations of the same substances when present in a mixture (i.e., consumer product) that may be used for minutes (or less) at a time.

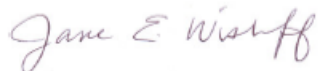

QQ - 5

Conclusion

IFRA North America appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP) and looks forward to collaborating to achieve an agreeable path forward. We point to the SCAQMD goal statement: "[w]e are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the Revised Draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

If you should have any questions regarding these comments, please do not hesitate to contact me at jwishneff@ifrana.org or 571-346-7584.

Sincerely,

Jane E. Wishneff
Director, Government Affairs & Counsel

Responses to Comment Letter QQ
IFRANA

Response to Comment QQ-1:

The long term strategy achieves attainment of the ozone standards at all the air quality monitoring stations throughout the Basin by 2023. Modeling analysis shows that significant NO_x emissions reductions are the only viable path to attain the 8-hour ozone standards in the Basin. Therefore, the ozone strategy focuses primarily on NO_x reductions. However, VOC emissions reductions can also be cost-effective in progressing towards attainment of the ozone standards, especially in the western portions of the Basin. Furthermore, there is a significant health benefit to meeting the ozone standards as soon as possible in as many areas of the Basin as possible. While the current 8-hour ozone design value site is at Crestline in the San Bernardino Mountains, projections in 2023 show that the design value site will be at Glendora in the San Gabriel Valley to the west. As shown in the 2023 baseline 8-hour ozone NO_x/VOC isopleths for Glendora and other western sites presented in the attachment to Appendix V, VOC reductions will help to lower ozone concentrations in the San Gabriel Valley and Western portions of the Basin. This is true near the level of the 8-hour ozone standards, but is even more significant along the path to attainment. This is due to the higher VOC/NO_x ratios projected to occur in future years, especially in the western Basin.

To this end, short-term VOC controls (through 2020) will help offset the impact of the increased VOC/NO_x ratio in the impacted areas of the Basin, such as the San Gabriel Valley, that are immediately downwind of the primary emissions source areas. As such, a nominal amount of VOC reductions are proposed in the Draft 2012 AQMP. The proposed VOC control measures in the Plan are based on implementing all feasible control measures through the application of available technologies and best management practices, while seeking a fair share reduction from both mobile and stationary sources. As zero and near-zero technologies are implemented for mobile sources to reduce NO_x emissions, concurrent VOC reductions from mobile sources are expected. Thus, stationary sources must continue to achieve their fair share of VOC reductions in the future. This plan proposes a modest 6 tpd of VOC emissions reductions out of a total 21 tpd of VOC reductions needed for basin-wide attainment in 2023.

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NO_x emissions reductions, beyond already adopted rules and measures, will be needed to meet the 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This

CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond.

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “black box” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NO_x and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA’s recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs will need to further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment QQ-2:

Based on comments received, the Proposed Control Measure CTS-04 (CTS-04) has been revised to reevaluate the existing exemption for LVP-VOC solvents and does not include complete removal of the LVP-VOC exemption, unless technologically feasible. Further, the measure suggests incorporating additional parameters, such as maximum incremental reactivity (MIR) or volatility, to the existing exemption criteria. The proposed control measure aims to recognize the contribution of some LVP-VOC solvents, considering that over the past decade, consumer product manufacturers have increased the use of LVP-VOCs to meet the lower VOC requirements of the regulation. Reformulation of products by substituting fast-evaporating LVP-VOC solvents for other solvents considered to be VOCs may not achieve the ozone reduction benefits anticipated by reducing the VOC content limits. While staff appreciates the efforts made by your industry to carefully construct products that meet the current definition of LVP-VOC, AQMD studies (“Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds”, U. Vö and M. Morris, August 2012) indicate that the ozone reduction benefits sought during rule development may not be realized based on the evaporation rates exhibited by many of the LVP-VOCs. In addition to reevaluating the exemption for LVP-VOC solvents, it may also be necessary to reconsider the current limits in the consumer product category, especially if alternative products are unavailable. The proposed control measure would not necessarily impact the provisions in the current Consumer Products Regulation for products with 2% percent or less fragrance added. However, it is acknowledged that the proposal may impact products, excluding personal fragrance, that contain more than 2% fragrance. While there are many products that do not rely on LVP-VOC solvents to meet the current limits, there may be niche applications where changes to the rule limits are warranted. It is not the intention of the proposed control measure to gravely damage California consumer products industry but to accurately determine the VOC contribution made by consumer products. The proposed control measure further calls for CARB to collect speciated LVP-VOCs data by category in future surveys. This data will greatly assist CARB staff in further identifying overall potential additional VOC contribution from LVP-VOCs, as well as calculating the emission and ozone benefits. Lastly, the control approach calls for implementation in phases, beginning with products with the most reactive compounds that have the greatest emission impacts, such as multi-purpose solvents and institutional cleaners.

Response to Comment QQ-3:

Chemical boiling points are currently utilized by regulatory agencies and some certification programs to define volatility. The paper included an examination of currently used boiling points and compared the regulatory classification to various VOC test methods and ambient evaporation. Staff agrees that potential atmospheric reactivity coupled with volatility is a much better indicator of ozone contribution than boiling point alone. While the paper only compares the results, the control measure

seeks to reevaluate the LVP-VOC definition with scientifically supported criteria including MIR and ambient evaporation considerations.

Response to Comment QQ-4:

The AQMD study acknowledges that the study is a comparative review of pure analytes and may not reflect analyte behavior in complex blends or mixtures. Staff agrees that individual components may behave differently, including being less or even more volatile, when present in a mixture. The comparative review provides evidence for the need to reevaluate the current LVP-VOC definition. The conclusion of the paper describes VOC test method strategies (such as thermogravimetric analysis (TGA) or Gas Chromatography (GC) methods with a general accepted non-volatile endpoint) that could be further considered to better measure VOC content from complex mixtures. However, as indicated in the proposed control measure and response to comment #2, there are some categories that contain 100% LVPs and are not part of a complex mixture that may inhibit or accelerate the evaporation of LVP-VOCs, and therefore the proposed control measure calls for implementation in stages.

Response to Comment QQ-5:

As noted in the previous response, staff acknowledges that the study is a comparative review and may not reflect analyte behavior in complex mixtures. Staff plans to conduct further studies to analyze the volatility of complex mixtures. The categorization scheme presented in the paper is to illustrate the significant differences in volatility for compounds categorized under a single regulatory category (i.e. LVP-VOC). The overall time frame of the study is consistent with other efforts to determine volatility. The assertion by the commenter that consumer products “may be used for minutes (or less) at a time” is inconsistent with the actual use of most consumer products. While a consumer product such as a multi-purpose lubricant, contact adhesive, hairspray or brake cleaner may be discharged from the product container for minutes (or less), the product is likely to remain on an open surface and available to evaporate for an extended period of time. Even in the limited situations where the product is disposed soon after use, the methods of disposal, waste container or drain, are uncontrolled and evaporation into the atmosphere is still a likely possibility.

Re: *Draft 2012 Air Quality Management Plan, The Integra Report*

To Whom It May Concern:

This letter is submitted on behalf of the County of Orange ("County") in its capacity as the owner and operator of John Wayne Airport, Orange County ("JWA" or "Airport"). This letter contains additional written comments from the Airport on the Draft 2012 Air Quality Management Plan ("2012 AQMP"), initially issued by the South Coast Air Quality Management District ("SCAQMD" or "District") in July 2012, with a Revised Draft 2012 AQMP issued in September 2012. Specifically, the Airport's additional comments concern the Aircraft Emissions Inventory For 2008 and 2035 (August 2012) prepared by Integra Environmental Consulting, Inc. ("Integra Report"), which provides the assumptions utilized in preparing the 2012 AQMP's emissions inventories relative to the aviation sector.

As indicated in our August 31 comment letter, it initially was difficult to discern whether the airport-specific data provided by JWA was utilized when preparing the aviation forecasts presented in the 2012 AQMP because (i) there is little information provided in the 2012 AQMP on the aviation forecasts, and (ii) JWA is not broken out in the forecasts as all aviation sector emissions are reported on a combined basis. As a result of the ambiguities concerning what aircraft activity data specific to JWA was utilized in preparing the emissions inventories presented in the 2012 AQMP, Fred Greve of Landrum & Brown (one of the Airport's consultants) contacted SCAQMD in order to request additional information regarding the emissions inventories' data inputs. On August 28, Mr. Greve received a copy of the Integra Report from District staff. Because Mr. Greve did not receive the Integra Report until three days before the close of the public comment period on the 2012 AQMP, JWA was not able to provide detailed comments on the assumptions utilized in preparing the 2012 AQMP's emissions inventories at that time. We have now had an opportunity to review the Integra Report and have the following additional comments.

3160 Airway Avenue
Costa Mesa, CA
92626-4608
949.252.5171
949.252.5178 fax

South Coast Air Quality Management District
September 28, 2012
Page 2

A. Existing Operations at JWA

Table 3.2.1 of the Integra Report presents the existing operations at JWA. The number of air carrier, air taxi and general aviation (GA) operations appears to be fairly consistent with the data previously provided to SCAQMD; however, the split between GA piston and jet aircraft at the Airport that is provided in Appendix B of the Report overestimates the percentage of GA jet aircraft at JWA. It appears that the split provided in the Report is based upon an FAA generic value of 27.5 percent jet aircraft and 72.5 percent piston aircraft. These percentages are not representative of the GA aircraft mix at JWA. Based on historical data from JWA operations for the period 2007-2009, the approximate split should reflect jet aircraft at 15 percent of operations and piston aircraft at 85 percent of operations. Appendix B should be revised to accurately reflect the enclosed information.

RR - 1

B. Aircraft Specific Data at JWA (2035)

The Integra Report also provides data and analysis regarding the current and projected future fleet mix at JWA. There are a number of inaccuracies in this data/analysis, as provided below.

- (1) The B737-600 aircraft does not currently operate at the Airport and we do not anticipate that it will operate at the Airport at any time in the future;
- (2) FedEx is the only operator of the A300/310 aircraft type at the Airport and they currently operate with only one Average Daily Departure (ADD). Therefore, the total projected A300/A310 operations should not exceed 2 operations/day;
- (3) The F100 and F70 aircraft do not operate at the Airport;
- (4) The B737-900 aircraft is too long to operate at the Airport;
- (5) The MD80, MD90 and RJ200 aircraft no longer operate at the Airport; and
- (6) The B737-700 aircraft is the most common aircraft type currently operating at the Airport – forecasts suggest that the B737-700 aircraft will likely be phased out and replaced with the new generation aircraft coming on line such as the 737-MAX aircraft. The introduction of the A320 neo should also be considered.

RR - 2

It is important for SCAQMD's forecasts to accurately reflect the current and projected future fleet mix at the Airport in order for the 2012 AQMP to contain reasonably accurate emissions inventories for 2035.

South Coast Air Quality Management District
September 28, 2012
Page 3

C. Number of Aircraft Operations by Airport (2035)

Table 3.3 in the Integra Report presents the projected future operations by the Airport in 2035. This table indicates that there will be a forty-two (42) percent increase in the annual air carrier operations, an eighteen (18) percent increase in the annual air taxi operations, and a five (5) percent decrease in annual GA aircraft operations from 2008 through 2035. It is unclear from the Report whether the FAA's annual percentage growth factor of 2.08% or some other growth factor was used for purposes of determining the projected number of aircraft operations by airport in the Basin. Please confirm whether the FAA annual percentage growth factor was used for purposes of calculating the projected future aircraft operations.

RR - 3

In addition, it is important to note that the Airport has a currently authorized million annual passenger (MAP) capacity of 10.8 MAP. Any assumptions regarding a capacity increase at JWA beyond our currently authorized 10.8 MAP would be speculative in nature.

D. Aircraft Emissions by Airport (2035)

Table 2.4 provides the aircraft emissions by airport for the Basin. This Table indicates that the emissions for total organic gases (TOG) and volatile organic compounds (VOC) will more than double, the emissions for PM2.5 will almost double and the emissions for PM10 will increase by about 45%. In addition, the Table indicates that the emissions for nitrogen oxides (NOx) will decrease slightly (by approximately 12%). This pattern of large emissions increases is not the emission pattern that we would expect to see for JWA given that the Airport has a currently authorized MAP capacity of 10.8 MAP and given that the Airport anticipates that the fleet mix at the Airport will be converting to an aircraft fleet with more efficient, cleaner burning engines; thereby resulting in fewer emissions.

RR - 4

E. CO2 Emissions for Airports with Commercial Air Carrier Operations

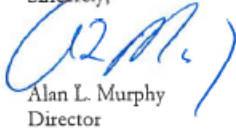

Tables 2.7 and 2.8 provide the 2008 and 2035 CO2 emissions for airports in the Basin with Air Carrier operations. Based on our review of the emissions provided, it is difficult, if not impossible, to discern how the emissions calculations were performed and what data was utilized in connection with the analysis. Could you please provide us with additional information regarding the emissions inventories' data inputs that were utilized in connection with the greenhouse gas emissions calculations? We will not be able to provide additional comments on the assumptions utilized in preparing the 2012 AQMP's greenhouse gas emissions inventories until additional and more complete documentation is provided in connection with this analysis.

RR - 5

South Coast Air Quality Management District
September 28, 2012
Page 4

In closing, JWA thanks the District again for providing the aircraft data specific to JWA that was utilized in preparing the emission inventories presented in the 2012 AQMP. We look forward to continuing to work with the District to ensure that the data utilized in connection with the 2012 AQMP is accurate. If you have any questions regarding the comments set forth in this letter and the additional data provided, please do not hesitate to contact me at your convenience.

Sincerely,

Alan L. Murphy
Director

Responses to Comment Letter RR
John Wayne Airport

Response to Comment RR-1:

AQMD staff has revised the Integra Report to reflect the updated information provided by the airport authority.

Response to Comment RR-2:

The projected 2035 fleet mix was provided by Southern California Association of Governments (SCAG) and is included in their recently adopted Regional Transportation Plan. The estimates were generated by the Regional Airport Demand Allocation Model (RADAM) an approved model used by SCAG staff since 1994 to project growth in aircraft activity in the region. While staff recognizes that operations at the airport do not include some aircraft types today, there is nothing limiting the use of these types in the future and we believe it is appropriate to use information that is consistent with SCAG's 2012 RTP and other growth assumptions used in the AQMP. (The one exception would be a physical characteristic that would not allow operation of an aircraft type at the airport such as the B737-900 craft referenced as too long to operate at John Wayne Airport. However we note that the engine type is the same as the other B737 classes that would likely be used in lieu of the 900 series and we would expect the estimated emissions would be similar).

Response to Comment RR-3:

SCAG's growth information was used to estimate the future airport activity listed in Table 3.3 of the Integra Report and is further described in their Aviation and Ground Access Appendix of the 2012 Regional Transportation Plan – (http://rtpscs.scag.ca.gov/Documents/2012/final/SR/2012fRTP_Aviation.pdf).

Response to Comment RR-4:

The emission estimates for 2035 listed in Table 2.4 of the Integra Report were generated using the airport activity as estimated by SCAG's RADAM model and FAA's Emissions and Dispersion Modeling System (EDMS) airport model. For JWA the activity was capped at the authorized limit of 10.8 MAP. The emission estimates for JWA are not inconsistent with the expected improvement in engine technology and growth in airport activity in that increased activity resulted in increased emissions with the exception of NO_x, which has been and will continue to be the main focus of emissions improvements from aircraft engines.

Response to Comment RR-5:

The CO2 emissions listed in Tables 2-7 and 2-8 are generated using the airport specific data either provided by the airports or estimated from SCAG's RADAM model as inputs for FAA's EDMS model. The default CO2 emission rates in the EDMS model by aircraft type were used. More information about FAA's EDMS model can be found at:

www.faa.gov/about/office_org/headquarters_offices/apl/research/models/edms_model/.

2012aqmpcomments@aqmd.gov

Subject: Revised Draft 2012 Air Quality Management Plan (AQMP)¹

Dear Dr. Fine:

The Consumer Specialty Products Association (CSPA)² appreciates the opportunity to offer additional comments on the South Coast Air Quality Management District's (South Coast's or AQMD's) draft 2012 Air Quality Management Plan (AQMP). CSPA filed initial comments on the AQMD's draft Program Environmental Impact Report (Program EIR) for the 2012 AQMP on July 19, 2012. See Attachment 1. This document is hereby incorporated by express reference in comments that CSPA files today.

CSPA reiterates our strong objection to the inclusion of the proposed Stationary Source Control Measures for Coatings and Solvents numbered CTS-01, CTS-02, CTS-03, and CTS-04 and urges the AQMD to withdraw these four measures when it issues the final 2012 AQMP³ that will be included in further revisions to the California State Implementation Plan (SIP). CSPA remains extremely concerned to see that the AQMD is proposing to include further reductions in volatile organic compounds (VOCs) in the 2012 AQMP that are neither necessary nor cost effective. The AQMD's own data and overwhelming weight of credible scientific evidence demonstrates the South Coast Air Basin is NOx-limited and that further VOC reductions are not effective in reducing ground-level ozone.

SS-1

¹ The AQMD's revised draft 2012 AQMP was issued on September 7, 2012. The initial draft 2012 AQMP was issued on July 18, 2012. Both the initial and revised draft 2012 AQMPs are posted on the AQMD's website at: <http://www.aqmd.gov/aqmp/2012aqmp/RevisedDraft/index.html>.

² CSPA is a voluntary, non-profit national trade association representing approximately 230 companies engaged in the manufacture, formulation, distribution, and sale of products for household, institutional, commercial and industrial use. CSPA member companies' wide range of products includes home, lawn and garden pesticides, antimicrobial products, air care products, automotive specialty products, detergents and cleaning products, polishes and floor maintenance products, and various types of aerosol products. Through its product stewardship program Product Care[®], and scientific and business-to-business endeavors, CSPA provides its members a platform to effectively address issues regarding the health, safety, sustainability and environmental impacts of their products.

³ CTS-01 Further VOC Reductions from Architectural Coatings (Rule 1113); CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants; CTS-03 Further VOC Reductions from Mold Release Products; and CTS-04 Further VOC Reductions from Consumer Products. See Revised Draft 2012 AQMP at pp. 4-24 and 4-25 and Appendix IV-A at pp. 49-59.

CSPA Comments on the Revised Draft 2012 AQMP
October 9, 2012
Page 2 of 5

In particular, CSPA strongly objects to the proposed CTS-04 measure that targets low vapor pressure compounds (LVPs), since scientific data indicate that these substances are likely to have insignificant contributions to ozone formation. Since CTS-04 is neither technologically and commercially feasible nor necessary as required by applicable California law,⁴ it should not be included in the final 2012 AQMP and any future revisions to the California SIP.

In the following sections, we will outline our major concerns regarding the draft AQMP and strongly urge that various changes be made to this AQMP before it is adopted by the AQMD Board of Governors and considered by the ARB for adoption as the 2012 update to the California State Implementation Plan (SIP).

1. The Consumer Product VOC Control Measures are Unnecessary for Ozone Attainment and Therefore Are Not Required by EPA to Be Included in This or Any Future AQMP and SIP Updates.

As discussed more fully in CSPA's initial comments on the draft Program EIR, Sierra Research, Inc., conducted a modeling study demonstrating that the ozone attainment status of the region would be unchanged if the portion of the VOC reductions in the Section 182(e)(5)⁵ "black box" were foregone.⁶ This re-modeling of AQMD's ozone attainment study showed that the region remained in ozone attainment even if the low-reactivity VOCs from consumer products were added back into the emissions inventory. This clearly shows that these VOC reductions for consumer products are not necessary for ozone attainment, and therefore not required to be included in either the 2012 AQMP or future SIP revisions. A copy of the Sierra Research study report is attached. See Attachment 2.

SS - 1

Applicable California law requires that state implementation plan for the air basin "...shall only include those provisions necessary to meet the requirements of the [federal] Clean Air Act (42 U.S.C. Sec. 7401 et seq.)."⁷ Since consumer product VOC control measures would not materially impact ozone formation, they are not necessary for demonstrating compliance with the federal ozone in the South Coast Air Basin, these measures should not be included in the final 2012 AQMP.

2. In Addition to Being Unnecessary, the Proposed Consumer Product LVP Measure Is Counterproductive.

As articulated in our initial comments on the draft Program EIR, scientific data studies demonstrate that the LVP compounds used in consumer products have minimal impacts on ozone formation, and have been part of the solution to lowering the impacts of consumer products on ozone formation for nearly 25 years. Since Control Measure CTS-04 is unwarranted and counterproductive, it should be removed from the 2012 AQMP and any future AQMPs. As support for the need for Control Measure CTS-04, a draft paper has been released by two South Coast AQMD scientists that showed that some LVP compounds could evaporate and concluded that therefore these LVP compounds contribute to ambient tropospheric ozone

CSPA Comments on the Revised Draft 2012 AQMP
October 9, 2012
Page 3 of 5

formation.⁸ CSPA strongly disagrees with this conclusion. A broad coalition of industry scientists was brought together to assess this draft paper. Those scientists, who include numerous experts in chemistry and environmental science, developed a Scientific Critique of that draft paper that is attached to these comments. (See Attachment 3)

This consumer products industry Scientific Critique provides scientific evidence that the LVP compounds evaluated by SCAQMD do not contribute significantly to VOC emissions, and do not contribute significantly to tropospheric ozone formation. The exemption of LVPs in the ARB Consumer Product Regulation therefore contributes to VOC emission reductions and ozone attainment. Factors causing LVP use to contribute to lower potential ozone impact include:

- LVP compounds are predominantly partitioned into other environmental media (soil, water, etc.) where they are biodegraded.
- LVP compounds have limited vapor-phase availability which limits their atmospheric concentrations and limits their potential ability to be involved in tropospheric photochemistry.
- LVP compounds in consumer products used indoors are often not emitted into the ambient air due to alternative fates indoors (water, solid waste, etc.).
- Lower volatility is an effective tool in reducing emissions in various product uses due to the lower rate of evaporation that allows lower volume of product use.

Indeed, the data developed as part of the Scientific Critique shows that many compounds regulated as VOCs in consumer products may also have alternative environmental fates that limit their actual contribution to the VOC emissions that can contribute to ozone formation. For instance, the environmental fate modeling for isopropyl alcohol (isopropanol) shows that only a small percent of that compound introduced into ambient air can be expected to remain in the ambient air where it can contribute to tropospheric photochemistry, with the balance partitioned into water and soil where it readily biodegrades. This finding has broad ramifications, since isopropanol is typical of the types of VOCs that represent the majority of the "VOC emissions inventory" for consumer products.

This result strongly suggests that much of the current VOC emissions inventory for consumer products should be reevaluated, since they are not actually available for involvement in tropospheric ozone formation. The statements made throughout this South Coast AQMP that consumer products are becoming the largest source of VOC emissions in the South Coast may therefore not be accurate, and should be further evaluated in light of environmental fate and partitioning data. CSPA believes that environmental fate modeling results must be taken into account in determining the VOC inventory used for ozone attainment modeling, and the control measures proposed for ozone attainment. We believe this is a compelling reason why VOCs and ozone should not be included in the final 2012 AQMP, and work on ozone attainment should be deferred.

SS - 2

CSPA Comments on the Revised Draft 2012 AQMP
October 9, 2012
Page 4 of 5

3. It Is Neither Reasonable Nor Necessary for CARB and South Coast to Consider Additional Ozone Emission Reduction Measures Until the Parameters of EPA's Final SIP Call Are Known. Therefore, the AQMP Should Withdraw All Proposed Ozone Measures in the Final 2012 AQMP and the SIP Revision for Fine Particulate Matter (PM 2.5).

On September 19, 2012, the U.S. Environmental Protection Agency's (EPA or Agency) issued a proposed rule finding that the California SIP for the South Coast Air Basin is substantially inadequate to comply with the one-hour ozone standard.⁹ In summary, "EPA is proposing to issue a SIP call under [the federal Clean Air Act] section 110(k)(5) to require California to submit a new attainment demonstration for the 1-hour ozone standard in the South Coast."¹⁰ At the end of the 30-day comment period, EPA will need to consider and respond to comments filed on the proposed SIP call before the Agency can issue a final (*i.e.*, enforceable) rule. California will then have 12 months to comply by submitting a SIP revision for ozone.¹¹

SS - 3

Since the parameters of EPA's final rule are not know, it would be premature for the AQMD to anticipate future requirements by including ozone reduction measures in the SIP revision for fine particulate matter (PM 2.5). Therefore, CSPA urges the AQMD to defer consideration of any proposed ozone emission reduction measures until EPA promulgates its final rule on the recently proposed SIP call.

4. Further VOC Control Measures for Consumer Products are Not Necessary Even If EPA's SIP Call Is Finalized as Proposed.

The AQMD's own modeling data for the AQMP demonstrates that the South Coast Air Basin is NOx-limited and insensitive to additional VOC reductions.¹² The numerous ozone isopleth graphs plainly show which combinations of nitrogen oxides (NOx) and VOC reductions are needed to attain various ozone standards, throughout the area and in various locations in the South Coast air basin. In every sector, the isopleths for attaining a 75 ppb ozone standard were "flatlined" and show essentially the same NOx reduction being needed for attainment no matter what reductions are made in VOCs. The isopleths are consistently flat at further VOC reduction levels between 0% and 50%. For all lower ozone isopleths, the "flatline" extends all the way to 100% VOC reduction; in other words, no amount of VOC reductions will have any significant impact on ozone levels. Thus, additional VOC reduction measures are unlikely to be needed for demonstrating ozone attainment of the federal one-hour ozone standard.

SS - 4

It is extremely important that SCAQMD take appropriate time to consider these factors, and not move ahead with VOC reduction measures for consumer products in this 2012 AQMP. Even if EPA includes the provisions of the proposed SIP call in the Agency's final rule, the AQMD's own data points to a conclusion that it is not necessary to include VOC control measures for consumer products in any required SIP revision. In conjunction with the evidence that we have

See Agenda Item #3 "Update on Technical Analysis and 2008 Ozone Modeling Performance/Carrying Capacity" by Joe Cassmassi, and Sang Mi Lee. The document is posted on South Coast's website at: http://www.aqmd.gov/gb_comit/stmpradvgrp/2012AQMP/meetings/2012/jun14/Item3.pdf.

CSPA Comments on the Revised Draft 2012 AQMP
October 9, 2012
Page 5 of 5

provided that shows that question the accuracy and relevancy of emissions sought to be controlled from consumer products, we believe that it would be inappropriate for AQMD to move ahead with any modifications to the ozone portions included in this AQMP. In addition, as we noted in our July comments, any new control measures should be evaluated for effectiveness through sensitivity modeling to assure that they would actually contribute to ozone attainment.

SS - 4

SUMMARY AND CONCLUSIONS

CSPA has presented in these comments a compelling case that the control measures relating to consumer product VOCs and LVPs should not be included in this AQMP, and that no modifications to the AQMP relating to ozone attainment should be made until EPA finalizes its proposed SIP Call, and SCAQMD and ARB can fully consider the accuracy and relevance of the current VOC inventory and its need to be corrected to account for alternative fates and availability.

Responses to Comment Letter SS
CSPA

Response to Comment SS-1:

The long term strategy achieves attainment of the ozone standards at all the air quality monitoring stations throughout the Basin by 2023. Modeling analysis shows that significant NO_x emissions reductions are the only viable path to attain the 8-hour ozone standards in the Basin. Therefore, the ozone strategy focuses primarily on NO_x reductions. However, VOC emissions reductions can also be cost-effective in progressing towards attainment of the ozone standards, especially in the western portions of the Basin. Furthermore, there is a significant health benefit to meeting the ozone standards as soon as possible in as many areas of the Basin as possible. While the current 8-hour ozone design value site is at Crestline in the San Bernardino Mountains, projections in 2023 show that the design value site will be at Glendora in the San Gabriel Valley to the west. As shown in the 2023 baseline 8-hour ozone NO_x/VOC isopleths for Glendora and other western sites presented in the attachment to Appendix V, VOC reductions will help to lower ozone concentrations in the San Gabriel Valley and Western portions of the Basin. This is true near the level of the 8-hour ozone standards, but is even more significant along the path to attainment. This is due to the higher VOC/NO_x ratios projected to occur in future years, especially in the western Basin.

To this end, short-term VOC controls (through 2020) will help offset the impact of the increased VOC/NO_x ratio in the impacted areas of the Basin, such as the San Gabriel Valley, that are immediately downwind of the primary emissions source areas. As such, a nominal amount of VOC reductions are proposed in the Draft 2012 AQMP. The proposed VOC control measures in the Plan are based on implementing all feasible control measures through the application of available technologies and best management practices, while seeking a fair share reduction from both mobile and stationary sources. As zero and near-zero technologies are implemented for mobile sources to reduce NO_x emissions, concurrent VOC reductions from mobile sources are expected. Thus, stationary sources must continue to achieve their fair share of VOC reductions in the future. This plan proposes a modest 6 tpd of VOC emissions reductions out of a total 21 tpd of VOC reductions needed for basin-wide attainment in 2023.

Current U.S. EPA, CARB and AQMD emissions inventory and photochemical air quality models include speciation profiles that account for total organic gases (TOGs), including reactive compounds, unreactive and exempt compounds, as well as LVP-VOC compounds. Staff reviewed the Sierra Research Report cited in the comment letter and found that LVP-VOCs were purposely excluded when determining relative photochemical reactivity and the overall inventory of consumer product VOC emissions (Assessment of the Need for Long-Term Reduction in Consumer Product Emissions in

the Basin, Sierra Research Report SR2007-09-03, September 2007 and Impact of Consumer Products on California's Air Quality, Sierra Research Report SR97-07-01, July 1997). Model results for ozone non-attainment areas have demonstrated that even compounds with low photochemical reactivity or LVP-VOCs contribute to photochemical ozone formation and not including these would compromise the ozone attainment demonstrations. Staff recognizes that some multi-media models that incorporate partitioning concepts such as "Atmospheric Availability" or "Environmental Fate" may have been recently developed; however, current peer-reviewed ambient ozone models used by CARB and AQMD do not include such partitioning concepts. District staff will continue to work with U.S. EPA and CARB staff on ozone model improvements, especially if additional peer-reviewed environmental fate and atmospheric availability studies justify incorporation into these predictive models.

Because substitution of traditional VOC containing materials indicates an increasing use of LVP-VOCs, a review of the extent of LVP-VOCs utilized and the associated applications is required to ensure that VOC emission reductions and ozone reduction benefits are maintained as originally intended. Please note that CTS-04 does not include an emission reduction commitment nor does it necessarily require complete elimination of the LVP exemption. Rather, it advocates the re-evaluation of the necessity, scope of the existing exemption LVP-VOCs are currently enjoying, and the efficacy of such an exemption, starting first with the consumer product categories where use of LVP-VOCs is registering high penetration rates and proceeding in subsequent phases with other product categories. Following a study, "Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds", U. Vö and M. Morris, August 2012

(<http://www.aqmd.gov/prdas/Coatings/VOCs/RedefiningVOCs.pdf>) that indicates that some LVP-VOCs can evaporate nearly as rapidly as other VOC materials, District staff believes that additional review of specific materials and applications and the associated LVP-VOC qualification criteria may help identify air quality improvement opportunities. The table below illustrates the contribution of LVP-VOC solvents from traditional (non-environmentally preferable) institutional and industrial (I&I) products. The average LVP-VOC contribution is greater than 50% of the overall VOC content with many products (41% in the products tested below), having more than 70% of the VOC coming from LVP-VOC solvents.

LVP Contribution to VOC Content

Product Category	VOC (undiluted) g/l	LVP (undiluted) g/l	% VOC Attributable to LVP
Household Dishwashing Soap	36.58	24.76	67.7%
Household General Purpose Cleaner	4.83	3.81	78.9%
Household Laundry Detergent	14.77	10.87	73.6%
I&I Bathroom Cleaner	19.81	1.62	8.2%
I&I Bathroom Cleaner	113.77	112.41	98.8%
I&I Bathroom Cleaner	49.83	17.70	35.5%
I&I Carpet Cleaner	30.26	0.47	1.6%
I&I General Purpose Cleaner	3.00	2.41	80.3%
I&I General Purpose Cleaner	8.79	8.11	92.3%
I&I General Purpose Cleaner	67.66	16.84	24.9%
I&I General Purpose Cleaner	20.69	17.79	86.0%
I&I General Purpose Cleaner	31.17	0.02	0.1%
I&I Glass and General Purpose Cleaner	13.54	3.76	27.8%
I&I Glass and General Purpose Cleaner	33.70	10.17	30.2%
I&I Glass and General Purpose Cleaner	0.45	0.30	66.7%
I&I Glass Cleaner	1.06	0.44	41.5%
I&I Glass Cleaner	4.14	3.58	86.5%
Total VOC Attributable to LVP			51.8%

Source: SCAQMD test results from selected I&I products

The proposed control measure is intended to study the air quality improvement potential for replacing LVP-VOC containing compositions with alternative low VOC formulations. The District, through the implementation of the Certified Clean Air Cleaners Program and Rule 1143 – Consumer Paint Thinners and Multi-Purpose Solvents, has identified alternative low-VOC, cost-effective technologies that are currently commercially available and used that do not rely upon the LVP-VOC exemption. The proposed control measure may involve eliminating or amending the CARB LVP-VOC criteria based on scientific data which may include MIR and similar photochemical reactivity parameters. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the rule development process to ensure overall efforts are feasible, productive and cost-effective. Further, the control measure includes requirements for CARB to collect speciated LVP-VOC data by category as a part of future surveys. This information will assist CARB and AQMD, as well as industry, in identifying additional categories that have the types and greatest LVP-VOC penetration, and result in more focused changes to the LVP-VOC exemption.

The Certified Clean Air Choices Cleaner program has nearly 50 institutional and industrial (I&I) cleaners that do not rely upon the LVP-VOC exemption. These products consist of full I&I product lines to cover nearly all cleaning and maintenance needs. Other certification programs have several hundred I&I cleaners, most of which do not rely upon the LVP-VOC exemption. As indicated, except for very few niche applications where efficacy of certain products may be impacted from a complete exclusion of a LVP-VOC, for the great majority of operations, environmentally preferable cleaners have equal or superior performance at equal or lower costs. Many cities and school districts have completely switched to environmentally preferable janitorial products and have found no degradation in performance at no extra cost. In some cases, lower overall costs have been seen and included in the cost-effectiveness section of the control measure. The City of Santa Monica reported spending 5% less on its cleaning products costs when it switched from conventional cleaners to less-toxic brands a decade ago. An article entitled, “The Benefits of Green Cleaning” by Dr. Robert W. Powitz on the ISSA website (November 2008), states, “We’ve heard the excuses, most of which can be grouped into one sentence: Eco-friendly products do not work and are more expensive. But this is simply not so.” The Green Seal and EcoLogo certification programs include efficacy performance standards to address claims in deterioration of performance. Again, Green Seal and EcoLogo have certified hundreds of I&I products most of which do not rely upon the LVP-VOC exemption.

Response to Comment SS-2:

Staff appreciates the efforts by CSPA to bring together a broad coalition of industry scientists to review the AQMD Paper “Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds”, U. Vö and M. Morris, August 2012. The proposed control measure seeks to reevaluate the criteria established for LVP-VOCs by relying on scientific data and therefore the information provided in the critique supplements the scientific data available for consideration.

Staff agrees that lower volatility compounds have limited vapor-phase availability. The study cited indicates that many LVP-VOC compounds are indeed non-volatile or semi-volatile limiting their ability to contribute to ozone formation. However, the paper also demonstrates that many compounds that qualify as LVP-VOC under the existing criteria are volatile and available to participate in ozone formation.

Current USEPA, CARB and AQMD emissions inventory and photochemical air quality models include speciation profiles that account for total organic gases (TOGs), including reactive compounds, unreactive and exempt compounds, as well as LVP-VOC compounds. Model results for ozone non-attainment areas have demonstrated that even compounds with low photochemical reactivity or LVP-VOCs contribute to photochemical ozone formation and not including these would compromise the ozone attainment demonstrations. Staff recognizes that some multi-media models that

incorporate partitioning concepts such as “Atmospheric Availability” or “Environmental Fate” may have been recently developed; however, current peer-reviewed ambient ozone models used by CARB and AQMD do not include such partitioning concepts. District staff will continue to work with USEPA and CARB staff on ozone model improvements, especially if additional peer-reviewed environmental fate and atmospheric availability studies justify incorporation into these predictive models.

The commenter attempts to justify the LVP-VOC exemption by noting that LVP-VOC compounds are predominantly partitioned into other environmental media (soil, water, etc.). The conclusion being that these products do not go into the air but instead are biodegraded. Yet this observation is true for nearly every chemical (LVP-VOC and non-LVP-VOC). Despite this partitioning, some fraction of the chemical enters the atmosphere and contributes to ozone formation. Contrary to the assertions made by the commenter, the critique does not provide evidence that LVP-VOC compounds are any different than traditional VOC compounds with respect to environmental partitioning. In fact, of the compounds studied (LVP-VOC and non-LVP-VOC) the highest predicted partitioning ratios into air are for some LVP-VOCs (22% for Light Distillate). It appears that there is no correlation between partitioning to air and LVP-VOC status. Furthermore, it is concerning that the current regulatory methodology may be requiring the transition from traditional VOC compounds (such as isopropanol) to LVP-VOCs (such as Light Distillate) with similar evaporation profiles, higher MIR values and more than four times higher predicted air partitioning factors.

Staff concurs that the current VOC emissions inventory for consumer products should be reevaluated to more accurately and precisely determine their contribution to ozone formation using the best available scientific data and methodologies, including environmental chamber studies and evaporation studies using fully formulated products. However, because consumer products represent the largest single source of VOC emissions (under current methodologies), uncertainty about the inventory because of the LVP-VOC exemption, and the current regulatory structure may be limiting the environmental benefits sought after in the regulation, staff believes that it is imperative that CTS-04 be included in the 2012 AQMP. Furthermore, draft CTS-04 has been revised to include the commenter’s suggestions pertaining to additional studies and refined emissions inventory.

Response to Comment SS-3:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the

development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond.

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “black box” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NO_x and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA’s recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs will need to further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment SS-4:

The set of isopleths provided in the June 2012 STMPR meeting was based on the initial 2023 baseline inventory and preliminary modeling. Subsequent modeling sensitivity simulations that varied the VOC emissions by approximately 12 TPD (across the board reductions) resulted in a 1 ppb movement in the 8-hour future design projection with lower VOC resulting in lower ozone. The current draft 2012 update to the 2007 AQMP 8-hour ozone projected 2023 future year design value placed several Basin sites within 1-2 ppb of the U.S. EPA threshold for demonstrating attainment. (EPA's threshold was set at 84.4 ppb with rounding). Far from being insignificant, a 1ppb change in the 8-hour ozone would jeopardize attainment demonstration.

SS-1. American Cleaning Institute, August 31, 2012

August 31, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
via e-mail - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The American Cleaning Institute® (ACI®) appreciates the opportunity to offer initial comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. ACI strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, ACI supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

ACI is the trade association representing the \$30 billion U.S. cleaning products market. ACI members include the formulators of soaps, detergents, and general cleaning products used in household, commercial, industrial and institutional settings; companies that supply ingredients and finished packaging for these products; and oleochemical producers. ACI and its members are dedicated to improving health and the quality of life through sustainable cleaning products and practices. ACI's mission is to support the sustainability of the cleaning product and oleochemical industries through research, education, outreach and science-based advocacy.

ACI is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. As

SS-1 - 1

NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation.

ACI is particularly concerned with the removal of the LVP exemption. The loss of this exemption for any consumer product category conflicts with the California Air Resources Board's (ARB) Consumer Product Regulation. The exemption exists because, in addition to allowing industries to innovate technically and commercially feasible consumer products for Californians, elimination of the exemption would not result in VOC emission reductions.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

Summary and Conclusions

ACI appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Sincerely,

Kathleen Stanton

SS-2. Shield Packaging of CA, September 28, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules, and Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Subject: 212 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Shield Packaging of California appreciates the opportunity to offer comments on the South Coast Air Quality Management District's Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-2, CTS-3, and CTS-4. Shield Packaging of California strongly objects to the inclusion of these measures in the draft AQMP and is requesting that these measures are not included in the final 2012 AQMP. Shield Packaging of California supports comments submitted by the Consumer Specialty Products and American Coatings Association on the AQMP.

Shield Packaging of California is a custom formulator and packager of consumer products. We have been in business in Southern California for over forty years. We have been supportive of consumer products regulations and development of more environmentally responsible products. It has been an ongoing challenge for us to provide both "compliant" and "efficacious" products for our customers. But, like others, we have persisted and our business has survived despite losing some customer to competitors outside of California.

The SCAQMD's proposal to eliminate an exemption for Low Vapor Pressure Solvents (LVP's) as part of the AQMP present unique problems to us because we do not see formulation options. Reformulation of some consumer categories may not be attainable, economical, effective, or all of the above. Elimination of some or all of the LVP chemicals will be hugely detrimental to our business.

Respectfully submitted,

A handwritten signature in black ink, appearing to read 'Roger R. Vanderlaan', is written over a horizontal line.

Roger R. Vanderlaan

Re: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:
Betco Corporation appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Betco Corporation strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. Betco Corporation supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Betco Corporation is a small business that promotes "green low VOC" products. We continue to stand with AQMD in providing these quality products at a reasonable cost. The proposed control measures will increase the cost of these products significantly, reduce their effectiveness, and raise other costs beyond that of the product itself. Some products will have to be eliminated.

For example, we sell a prewash laundry product for the institutional/commercial laundry sector. The product contains LVP-VOC solvents. The solvents are the agents that break down stains such as lipstick, grease, and fat to be lifted away by surfactant. If LVP-VOC solvents are counted as VOC, the product will not meet the current VOC regulation. Without the LVP-VOC solvents in the formula, the cleaning efficacy is reduced by 75%. The cost of replacement is high. Costs to reformulate include the price of the replacement, raw material identification, chemical product development, product suitability testing, health testing, and field testing of the product.

Without the solvents the product will not work as well. Substitutes for the solvents such as enzymes and bacteria take longer, are temperature sensitive and cost significantly more. Chemical additives such as sodium hydroxide are hazardous to handle, affect color in fabric, and damage fabric over time, creating indirect cost to the user. Having to soak laundry increases the time to complete one load and the man-hours to operate or oversee the process.

There will be additional costs and a reduction in number of "green" third party (Green Seal, DFE, Ecologo) certified products because we will have to recertify them after the formulas are changed. If LVP-VOCs are now to be counted as VOC, the number of certified products will be reduced because some cannot achieve the required cleaning efficacy in the timeframe required.

SS-3 - 1

Betco Corporation

www.betco.com

Betco Corporation is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

Institutional products meant for the public sector, schools, government buildings and health care facilities must perform well and within a short time frame. An extended timeframe for cleaning translates into extended man-hours for crews to be working in buildings. These sectors (governmental agencies, schools and public health care facilities) are the least able to absorb additional costs.

Betco Corporation appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Sincerely,

Lynn Morsch

Responses to Comment Letter SS-3
Betco Innovative Cleaning Technologies

Response to Comment SS-3-1:

Staff appreciates Betco Corporations efforts to reformulate its products to reduce VOCs and the promotion of “green low VOC” products. It is possible that some of Betco’s products, such as the prewash laundry product provided in the letter as an example, may be impacted by the proposed control measure because the LVP-VOC solvents used may be contributing to ozone formation. There may be other solvents that break down stains and do not readily evaporate that could be true low-VOC replacements. The proposed control measure may involve eliminating or amending the CARB LVP-VOC criteria based on scientific data which may include MIR and similar photochemical reactivity parameters. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the rule development process to ensure overall efforts are feasible, productive and cost-effective. The commenter supports, and provides similar comments, to comments submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS).

SS-4. Air-Scent International, October 1, 2012

October 1, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
via e-mail - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Air-Scent International. appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Association/company name strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP.

As such, Air-Scent International supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Our company has been forced to re-formulate and discontinue many of its core products to conform with CARB/EPA regulations which has greatly impacted our business and caused a loss of its valued products. Another mandatory change can devastating to us and thus create loss of employees, etc.

Air-Scent International is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

SS-4 - 1

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective. These product categories have been unfairly targeted – especially when CARB has been unable to reduce the daily pollution caused by automotive exhausts. The so-called improvement to the environmental, in regulating these products – is negligible!

Summary and Conclusions

Air-Scent International appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: “We are committed to protecting the health of residents, while remaining sensitive to businesses” when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Alpha Aromatics appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Association/company name strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP.

As such, Alpha Aromatics supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Our firm has been burdened with the task of trying to create effective formulations for our customers -- based upon the limited available options; since regulations have been imposed. New changes forcing re-formulations with even more stringent regulations and less options for compliant alternatives will affect our company as well as our customers -- thus severely impacting employment -- when many current products are once again affected -- and a major loss is created; including employee reduction!

Alpha Aromatics is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce

ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective. These product categories have been unfairly targeted – especially when CARB has been unable to reduce the daily pollution caused by automotive exhausts. The so-called improvement to the environmental, in regulating these products – is negligible!

Summary and Conclusions

Alpha Aromatics appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: “We are committed to protecting the health of residents, while remaining sensitive to businesses” when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Sincerely,

Roger Howell, General Manager

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Surco Products appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Association/company name strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP.

As such, Surco Products supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Our company has been forced to re-formulate and discontinue some of its core products to conform with CARB/EPA regulations which has greatly impacted our business and caused a loss of its valued products. Another mandatory change can devastating to us and thus create loss of employees, etc.

Surco Products is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

SS-6 - 1

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Sunshine Makers, Inc. appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Sunshine Makers, Inc. strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, Sunshine Makers, Inc. supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Sunshine Makers, Inc. is the maker of Simple Green brand products. We are located in Southern California and employ 46 California residents, as well as conduct significant multi-million-dollar business with other California businesses. We have undergone no less than four General Purpose Cleaner formula and label modifications to meet California's Consumer Product Regulation since its inception. The combined cost of doing this has been in the multiple millions of dollars in man-hours, materials costs, inventory component loss, and testing fees. We have worked extremely hard to comply with California's VOC regulations.

Sunshine Makers, Inc. is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

SS-8 - 1

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective. Our latest work has been a 3.5-year search for replacement chemistry for our general purpose cleaners, the category of which drops from 4% to 0.5% maximum VOC level at the end of 2012. This project could not be successful without the lawful use of LVP-VOCs. Further, we would not be able to continue marketing greener chemistry without the use of LVP-VOC chemistry, as the alternatives to LVP-VOCs in cleaning products are certainly less preferable in many other aspects such as mammalian and aquatic toxicity, acute dermal and ocular toxicity, etc. Our company has invested over one million dollars in the cost of man-hours, materials, and testing fees for this latest reformulation in order to reach a formulation that will enable our company to continue offering products that the retail, industrial and institutional consumers will purchase and appreciate, while meeting our commitment to safer, greener chemistry. Without the LVP-VOC exemption, our company would lose virtually all of its current product line and likely not survive such a regulation.

SS-8 - 1

Summary and Conclusions

Sunshine Makers, Inc. appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Sincerely,

Carol Chapin
Vice President, Research & Development

SS-9. Eastern Aerosol Association, October 4, 2012

October 4, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
via e-mail - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The Eastern Aerosol Association (EAA) appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. The EAA strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, the EAA supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

The EAA is a proactive organization that influences action affecting the aerosol industry within our region. Although our region is the eastern United States, many of the regulations imposed in other parts of the country, and the world, eventually make their way to our region. This issue, therefore, is extremely important to this association and to our members.

The EAA is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment.

SS-9 - 1

Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution, not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

Summary and Conclusions

The EAA appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Diamond Bar, CA 91765
via email - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Losorea Packaging Inc. appreciates the opportunity to offer comments on the South Coast Air Quality management District's Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Losorea Packaging Inc. strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, Losorea Packaging Inc. supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Losorea Packaging Inc. is an aerosol contract packager, we are located in Woodstock, GA. We are a small family owned business with 26 employees. We have products that are sold into California indirectly through our customers. The cost to reformulate would be devastating to a small company like ourselves.

Losorea Packaging Inc. is principally concerned with the proposal to include further reductions in VOC's for consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially having an impact on consumer products: (CTS-01 Further VOC Reductions from Miscellaneous Coating, Adhesives, Solvents and Lubricants [VOC]; CTS -03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impact on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

SS-10 - 1

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

Summary and Conclusions

Losorea Packaging Inc. appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to business" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures affecting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Sincerely,

Ryan Dailey
President

SS-11. WAiB, October 5, 2012

Western Aerosol Information Bureau

October 5th, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
via e-mail - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The Western Aerosol Information Bureau (WAIB) appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. Our concerns focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-01, CTS-02, CTS-03, and CTS-04. WAIB strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, WAIB supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

The Western Aerosol Information Bureau is a regional association of companies involved with the production or marketing of aerosol products. The membership consists of approximately 55 companies, some small and independently owned, others nationally and internationally recognized. A fundamental component of our organizational charter is providing objective information predicated upon scientific data to the public, our members, the media, regulatory and government bodies regarding aerosol products.

The WAIB represents industry in California and the rest of the western United States, and we are here to be part of a solution. WAIB members frequently attend and speak at meetings of the California Air Resources Board, Air Quality Management Districts, and Federal Environmental Protection Agency. Our volunteer 12-member board of directors represents all segments of the aerosol products industry: fillers, marketers, component and chemical suppliers.

The Western Aerosol Information Bureau is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are not technologically and commercially feasible. The control measures-potentially impacting consumer products include:

CTS-04 proposes the elimination or modification of the LVP provision in the CARB Consumer Product Regulation. This measure is particularly troublesome given that the SCAQMD does not have authority over Consumer Products. CARB has sole authority over Consumer Products in California. WAIB has participated in the CARB process for two decades. CARB has encouraged the use of LVP's in Consumer

Products. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

The consumer products industry has invested heavily in reducing VOC through product reformulation. Continued reformulation of these products will lead to minimal if any realized reductions in reducing ozone. Reformulation will negatively change the performance and consumer experience with these products.

The Western Aerosol Information Bureau appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP is not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Sincerely,

**Roger Vanderlaan,
WAIB President**

SS-12. IAN GECKER & ASSOCIATES, LLC, October 5, 2012

October 5, 2012

Dr. Elaine Chang
Deputy Executive Officer,
Planning Rules & Area Sources
South Coast Air quality Management District
21865 Copley Dr.
Diamond Bar, CA 91765

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

I am a consultant to the Aerosol Industry with 50 years of involvement in product development, executive management and company ownerships. As such I have spent the past 20 some years reformulating hundreds of aerosol products for Fortune 1000 companies in order to meet the ever tightening VOC standards for consumer products.

I strongly disagree with the SCAQMD's plan to change the status of LVP's currently used in a variety of products that currently meet the CARB VOC standards. Further reductions in VOC content through the removal of LVPs will devastate entire categories of consumer products in that there are no suitable non-voc replacements that would yield the same quality, efficacy and safety in these products and still allow them to meet the standards.

The consumer products industry, and in particular the aerosol industry, have spent tens of millions of dollars through research, product development and manufacturing changes in order to meet current and future VOC standards. Further reductions of VOC content in aerosol consumer products are not technologically feasible and will result in these products being commercially inadequate for their intended purposes. At a time of economic stress, job losses and business bankruptcies in California, as well as the rest of the country, these proposals are not only technologically infeasible but will further add to our economic problems via job losses and lost business opportunities. When I arrived in California in 1971 there were over 12 aerosol manufacturing companies in the state. Today there are 4! The loss of these businesses, jobs and income to the state was due in large part to their strangulation by continuous and expanding regulations.

One final point is that current air modeling shows that further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are reduced VOC regulations become less effective in reducing ozone. Indeed, LVPs have minimal impacts on VOC emission's and ozone formation and their change in exempt status will reverse the aerosol industries achievements in VOC reductions.

The aerosol industry has been a partner with CARB and SCAQMD in its commitment to protecting the health and safety of the populace and we remain committed to this endeavor but do not believe this

Mailing Address: 10300 W. Charleston Blvd., 13-183, Las Vegas, NV 89135

latest proposal to de-qualify LVPs is the right approach and ultimately will do more commercial harm than environmental good aside from the changes being technologically feasible.

Thank you for the opportunity to comment and respond to the proposals in the draft 2012 AQMP.

Sincerely,

Ian R. Gecker,
President and Owner

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The Roof Coatings Manufacturers Association (RCMA) appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. RCMA strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, RCMA supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

RCMA is the national trade association representing the manufacturers of bituminous and non-bituminous roof coatings and the suppliers to the roof coatings industry. Our association and its member companies have collaborated with the SCAQMD for many years to help establish the rules that are currently in place for stationary sources and do not believe that further VOC emission reductions from this category are neither cost effective nor necessary. Specifically, we object to the inclusion of the aforementioned Stationary Source Control Measures for Coatings and Solvents in the AQMP for the following reasons:

- Changing formulation may decrease product's performance, resulting in worsened air quality
- Further VOC reductions might result in loss of products, meaning fewer product choices available to the California consumer
- Costs associated with reformulating products
- Further VOC reductions from Coatings and Solvents are not likely to result in significant air quality improvements

RCMA is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products, CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC], are particularly troublesome given the proposals are neither effective nor necessary for ozone

SS-13 - 1

attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution, not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

Summary and Conclusions

RCMA appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary, or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Sincerely,

John Ferraro

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The Dow Chemical Company (Dow) appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-01, CTS-02, CTS-03, and CTS-04. Dow strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, Dow supports comments submitted by the American Coatings Association and the Consumer Specialty Products Association on the AQMP.

Raw material suppliers, such as Dow, provide a diverse array of innovative products of significant commercial and economic value to California. The innovation of greener solvents to consumer products will be greatly impacted by the proposal. Specifically, the Dow Chemical Company has committed substantial resources in implementing a multi-generational program to develop VOC-free solvents – reflecting the considerable technical, practical and commercial challenges and realities posed by this objective. A repeal or significant modification of the LVP exemption will cause substantial delays in the marketing of new, biobased solvents with an overall improved environmental profile. More explicitly, the proposal represents a departure from the broader trend toward the marketing of consumer products that are more sustainable across the entire product lifecycle. The proposal is also not compatible with the global trend toward harmonization in chemicals regulations; this is likely to have important competitive impacts, including the higher costs of complying with technical requirements of the proposal.

SS-14 - 1

Dow is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment.

SS-14 - 2

Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution, not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

Summary and Conclusions

Dow appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

About Dow

Dow has four manufacturing facilities in California with over 600 employees and contractors. Globally, Dow's more than 5,000 products are manufactured at 197 sites in 36 countries. The Company connects chemistry and innovation with the principles of sustainability to help address many of the world's most challenging problems such as the need for clean water, renewable energy generation and conservation, and increasing agricultural productivity. Dow's diversified industry-leading portfolio of specialty chemical, advanced materials, agrosiences and plastics businesses delivers a broad range of technology-based products and solutions to customers in approximately 160 countries and in high growth sectors such as electronics, water, energy, coatings and agriculture. In 2011, Dow had annual sales of \$60 billion and employed approximately 52,000 people worldwide.

Responses to Comment Letter SS-14
Dow Chemical Company

Response to Comment SS-14-1:

The proposed control measure seeks to reconsider the exemption for LVP-VOC solvents that readily evaporate under ambient conditions. These types of products tend to be less sustainable because of their loss into the air through evaporation. Studies have demonstrated that bio-based solvents do not readily evaporate. Any reevaluation of the LVP-VOC criteria would retain the exemption for products that are clearly non-volatile. The global harmonization in consumer product regulations is inconsistent with chemical regulations. Coating and solvent regulations utilize much more stringent criteria than consumer products when determining VOC exemption status. Determination of VOC contribution to ozone formation should be based on scientific criteria.

Response to Comment SS-14-2:

The commenter supports, and provides similar comments, to comments submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS).

SS-15. Nexreg Compliance Inc, October 5, 2012

Dear Dr. Chang:

Nexreg Compliance Inc. appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04.

Nexreg Compliance, Inc. represents roughly 400 companies in the chemical industry in the United States and Canada. After discussing this issue with dozens of our clients, we have very serious concerns about these measures. Nexreg strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such we support comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Nexreg and their clients are principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

SS-15 - 1

Nexreg appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

Sincerely,

Mike P. Moffatt

Re: The South Coast Air Quality Management District's Draft 2012 Air Quality Management Plan

Dear Dr. Chang:

The American Coatings Association¹ (ACA) appreciates the opportunity to offer additional comments on the revised South Coast Air Quality Management District's (South Coast or AQMD) Draft 2012 Air Quality Management Plan (AQMP), which the District released in September. These comments supplement ACA's previous comments on the draft 2012 AQMP, focusing on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. ACA continues to strongly object to the inclusion of these measures in the draft AQMP. As such, ACA also supports comments submitted by the Consumer Specialty Products Association on the AQMP, including the attached Scientific Critique of South Coast Air Quality Management District Paper entitled "Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds".

ACA is principally concerned with the proposal to include further reductions in VOCs from coatings and solvents products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting architectural coatings, solvents, and consumer products are CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC]. These control measures are particularly troublesome given that the proposals are neither effective nor necessary for ozone attainment. The District's air modeling and explanation in the draft 2012 AQMP demonstrates that further VOC reductions from coatings and solvents will not significantly reduce ozone. As NOx levels and ozone levels are

SS-16 - 1

¹ The American Coatings Association (ACA) is a voluntary, nonprofit trade association working to advance the needs of the paint and coatings industry and the professionals who work in it. The organization represents paint and coatings manufacturers, raw materials suppliers, distributors, and technical professionals. ACA serves as an advocate and ally for members on legislative, regulatory and judicial issues, and provides forums for the advancement and promotion of the industry through educational and professional development services.

ACA Comments – South Coast Draft 2012 AQMP

October 5, 2012

further reduced by the District, VOC reductions become less and less effective in reducing ozone. In particular, LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high cost and low effectiveness makes further VOC reductions from coatings, solvents, and consumer products prohibitively expensive.

In sum, ACA appreciates the opportunity to comment on the 2012 Air Quality Management Plan. We point to the SCAQMD's stated goal – "We are committed to protecting the health of residents, while remaining sensitive to businesses" – when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting coatings and solvents included in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP. ACA will submit additional comments upon receiving individual responses to our August 31, 2012 comments.

Thank you, and please do not hesitate to contact us know if you have any questions regarding these comments.

Sincerely,

/s/

RE: 2012 South Coast Air Quality Management District Consumer Air Quality Management Plan (AQMP)

Dear Dr. Fine:

The Solvents Industry Group ("SIG")¹ and the Glycol Ethers Panel² of the American Chemistry Council appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-01, CTS-02, CTS-03, and CTS-04. We strongly object to the inclusion of these measures in the draft AQMP, and urge that the measures not be included in the final 2012 AQMP. As such, we support comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

We are principally concerned with the proposal to include further reductions in volatile organic compounds (VOCs) from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01) Further VOC Reductions from Architectural Coatings (R1113) [VOC]; (CTS-02) Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; (CTS-03) Further VOC Reductions from Mold Release Products [VOC]; and (CTS-04) Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Furthermore, air modeling projects that further VOC

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Armored AutoGroup Inc. appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Armored AutoGroup Inc. strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, Armored AutoGroup supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Armored AutoGroup Inc., headquartered in Danbury, Conn., and a Global Research and Development Center in Northern California is engaged in development, manufacture and sale of ARMOR ALL®, STP® and other brands of consumer car care products. The current ARMOR ALL product line of protectants, waxes, tire and wheel care products, glass cleaners, leather care products and washes is designed to clean, shine and protect interior and exterior automobile surfaces. The STP product line of oil and fuel additives, functional fluids and automotive appearance products has a broad customer base ranging from professional racers to car enthusiasts and "Do-it-Yourselfers". Our company has a diversified geographic footprint with operations in the United States, Canada, Mexico, the United Kingdom, Australia and China and distributors in more than 50 countries.

The proposed measures, if included in the final 2012 AQMP, would have a direct and negative impact on our business in terms of costs, resources required and complexity of reformulation of our products. In addition, it is not at all clear there will be acceptable substitute chemicals available for new formulations. There may be some products where chemical substitutes are not available and the result would be discontinuation of car care products that consumers demand.

Armored AutoGroup Inc. is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures

via e-mail - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan

Dear Dr. Chang:

Radiator Specialty Company appreciates the opportunity to offer comments on the South Coast Air Quality Management District's (SCAQMD) draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25th of this year. We have reviewed the proposed Stationary Source Control Measures numbered CTS-01, CTS-02, CTS-03, and CTS-04. Radiator Specialty Company strongly objects to the inclusion of these four measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. Radiator Specialty Company supports comments submitted by the American Coatings Association, the Alliance for Responsible Regulation, and the Consumer Specialty Products Association (CSPA) regarding these control measures in the AQMP.

Radiator Specialty Company is a family-owned, North Carolina manufacturer and marketer of household, industrial, and automotive specialty chemical products sold both in the USA and worldwide. Through our division, RSC Chemical Solutions, and our affiliated company, RSC Bio Solutions, we manufacture and market a variety of consumer and industrial products under the GUNK[®], Liquid Wrench[®], Motormedic[®], SAFE CARE[®], and Envirologic[®] brands. Our products range from SAFE CARE[®] cleaners and GUNK[®] degreasers to Liquid Wrench[®] lubricants, Envirologic[®] hydraulic fluids, and Motormedic[®] fuel and oil additives. We currently offer both conventional chemistries and next-generation, readily biodegradable, sustainable alternatives to our customers in both the cleaner/degreaser and lubricant/hydraulic fluid product categories. Our products are sold through distributors as well as national chains such as Walmart[®], O' Reilly, Autozone[®], Advance Auto, Pep Boys, Lowe's[®], and Home Depot[®], to name just a few.

Radiator Specialty Company has a long history of not only meeting, but exceeding the environmental, health, and safety needs of our customers. We are, however, gravely concerned that the proposed Stationary Source Control Measures will drive industry toward ineffective product chemistries or will force some products out of the California market entirely. Radiator Specialty Company and its affiliates are principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures impacting consumer products (CTS-01, CTS-02, CTS-03, and CTS-04) are neither effective nor necessary for ozone attainment. Air modeling shows

RADIATOR SPECIALTY COMPANY • 600 Radiator Road • Indian Trail, NC 28079 • (704) 684-1802 • FAX (704) 684-1865

SS-19 - 1

further VOC reductions from consumer products will not significantly reduce ozone. As NO_x levels and ozone levels are lowered, VOC reductions become practically ineffective in reducing ozone. The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

SS-19 - 1

I will be focusing the remainder of our comments on CTS-04, which concerns the role of LVPs and the potential modification or elimination of the LVP-VOC exclusion currently included in the California Consumer Products Regulations. We strongly oppose CTS-04. We fully support the conclusions of the Scientific Critique of South Coast Air Quality Management District Paper "Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds" October 2012 prepared by the Alliance for Responsible Regulation and CSPA (see attached). LVPs, and particularly those defined as "LVP-VOC" in the regulations, have minimal impact on VOC emissions and ozone formation. Simply put, LVP-VOCs have been, and should continue to be, part of the solution and NOT part of the problem.

Radiator Specialty Company's single most effective tool to meet current VOC limits has been by the use of LVP-VOC technologies. Modifications to, or elimination of, the current regulatory definition of "LVP-VOC" would have far-reaching consequences not originally intended by the staff at SCAQMD:

- **Increase in apparent emissions:** Products currently VOC-compliant with California law would become non-compliant, resulting in an apparent (although inaccurate) calculated increase in emissions within their particular category. We have evaluated our products and found that, of our top-ten VOC-regulated consumer products, over half would become non-compliant. Some would move from only a few percent VOC up to over 90% "apparent VOC" were the LVP-VOC components to be considered 100% VOC. An unintended consequence would be the resulting non-compliance of clean solvent technologies already reviewed and approved by SCAQMD. Many of these products rely upon butyl cellosolve replacements that would not pass muster as zero-VOC when subjected to the test conditions of EPA Method 24.
- **Cost of reformulation:** Reformulating impacted products would be at significant cost, tying up research resources that would be better used to identify more sustainable ingredients and evaluating other "green" chemistries. Cost to recreate and re-label each product would be substantial, potentially costing Radiator Specialty Company hundreds of thousands of dollars.
- **Potential loss of products:** In some cases, non-LVP options may not be either cost effective or the resulting loss of performance would be so substantial that products would be removed from the marketplace.
- **Environmental and exposure impact:** Many of our aerosol products (9 of our top 10, in fact) rely upon low viscosity LVP-VOCs to ensure correct evacuation and proper atomization of the product. Our experience with the solvents considered zero-VOC by EPA Method 24 is that they are not acceptable alternatives to LVP-VOCs in that they create a thick, not atomizing stream that actually increases product use to cover a specified area. This leads to overuse of the product with resulting waste with the potential for causing more environmental and human exposure.
- **Impact to California industry:** Impact to industry and agriculture in California should be considered, particularly in light of our concerns regarding overuse cited above. California agriculture and vintners who use our products to clean, lubricate, and otherwise maintain their equipment would be faced with using poorly-performing alternatives that would require more of each product to be used per application and would be expected to result in overuse, waste, and increased potential for soil and water contamination resulting from that overuse.

SS-19 - 2

RADIATOR SPECIALTY COMPANY • 600 Radiator Road • Indian Trail, NC 28079 • (704) 684-1802 • FAX (704) 684-1865

MANUFACTURERS OF AUTOMOTIVE, INDUSTRIAL, AND SPECIALTY CHEMICAL PRODUCTS

Radiator Specialty Company appreciates the opportunity to comment on the 2012 Air Quality Management Plan. We have kept in mind the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on our company's ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary, or cost-effective, and should not even be considered for inclusion in the final 2012 AQMP. We would also point out that the responsibility for regulating consumer product VOCs and the definition of "LVP-VOC" is the sole responsibility of the California Air Resources Board. The attempt to change the role of LVP-VOCs in consumer products falls outside the authority of SCAQMD.

Sincerely,

Larry G. Beaver, Ph.D.
Vice President, Technology
Radiator Specialty Company

Responses to Comment Letter SS-19
Radiator Specialty Company

Response to Comment SS-19-1:

The commenter supports, and provides similar comments, to comments submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS).

Response to Comment SS-19-2:

From a limited review of consumer product formulations, it appears that a significant portion of traditional solvent replacement utilized LVP-VOC technology. The paper cited by the commenter indicates that some LVP-VOCs do not evaporate and should remain exempt. On the other hand, some LVP-VOCs readily evaporate and are available to participate in ozone formation. While the commenter describes any modification as an “apparent” increase in emissions, it should be more accurately described as an acknowledgement of a decrease in emission reductions. Products that reformulate away from traditional solvents (such as butyl cellosolve) to LVP-VOCs (such as Light Distillate) with similar evaporation rates may not have the anticipated emission reduction benefits, especially for ozone. As the commenter notes, Radiator Specialty Company has reformulated products with up to 90% LVP-VOCs in some of their products. Depending on what specific LVP-VOCs used with consideration for their volatility characteristic and maximum incremental reactivity (MIR), the 90% replacement may not have ozone benefits or may further exacerbate the ozone formation from the reformulated product. This very trend truly justifies the need for the draft control measure, which calls for CARB to collect additional data on the types and quantity of LVP-VOC usage by category to truly understand the potential benefits or drawbacks of such an approach.

Furthermore, the paper cited recognizes the issues with respect to the results from EPA Method 24 and does not recommend that method as a replacement for CARB Method 310. EPA Method 24 has limitations for products with high water content and/or semi-volatile compounds, especially certain mineral oils used for metal working fluids and lubricant. Instead, staff is recommending only that the LVP-VOC criteria be reevaluated by relying on scientific data. Products certified by the AQMD as Clean Air Solvents or Clean Air Choices Cleaners do not rely on fast-evaporating LVP-VOC solvents and VOC content is measured using AQMD Method 313 with a methyl palmitate endpoint. This is consistent with measuring VOC content of architectural paints and coatings that use similar solvents (i.e. ethylene glycol, propylene glycol, 2,2,4-trimethylpentanediol diisobutyrate, and 2,2,4-trimethyl-1,3-pentanediol monoisobutyrate). It is not clear why switching from butyl cellosolve to propylene glycol in a consumer product designed to remain on a surface for an indefinite period of

time would “reduce” emissions, while the same reformulation in an architectural coating would have no emission impact whatsoever. The inconsistency between the two VOC determination methodologies makes it apparent that the consumer product regulation is not achieving the environmental benefits anticipated.

SS-20. Automotive Specialty Products Alliance, October 12, 2012

October 12, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
via e-mail - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The Automotive Specialty Products Alliance (ASPA) appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. ASPA strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures be withdrawn when the final 2012 AQMP is issued. As such, ASPA supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

ASPA is an alliance of three non-profit, national trade associations representing companies engaged in the manufacture, formulation, distribution, and sale of automotive specialty products. This alliance combines the efforts of Automotive Aftermarket Industry Association (AAIA), the Consumer Specialty Products Association (CSPA), and the Motor & Equipment Manufacturers Association (MEMA) to form a unified industry voice for their members engaged in the automotive chemical and vehicle appearance products markets. ASPA's members market products on a national and regional basis.

ASPA is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and

SS-20-1

less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. Additionally, it is not known whether acceptable alternative ingredients would be available – and commercially feasible – if the aforementioned measures are adopted. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

The Automotive Specialty Products Alliance appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the AQMD goal statement: “We are committed to protecting the health of residents, while remaining sensitive to businesses” when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective, and should not be considered for inclusion in the final 2012 AQMP.

SS-20-1

Respectfully,

Sean R. Moore

On behalf of the ASPA Operating Committee and Board of Directors

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Mothers® appreciates the opportunity to offer comments on the South Coast Air Quality Management District's Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Mothers® strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, Mothers® supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

VOC reductions in both existing and new formulations are a continual focus. We understand the trend of reducing VOC limits in Consumer Products and have been proactive in working to identify new raw materials and options that further reduce its use. Reducing limits continue to be a concern and while LVPs do not provide an adequate drop-in replacement in formulations, they do provide some characteristics that help to reduce the overall VOC content. The objective is to reduce the presence of these compounds to meet federal requirements; to eliminate the use of LVPs hinders the primary goal while compromising product quality and eventual business stability.

Mothers® is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]); CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products [VOC] are particularly

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Quality Car Care, Inc. appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. Quality Car Care, Inc. strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, Quality Car Care, Inc. supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Quality Car Care, Inc. manufactures a complete line of automotive car care products sold worldwide under the brand name Justice Brothers. We have spent, and continue to spend a lot of time, effort, and money reformulating our products to make them more "green". Your proposed control measures will result in our taking a giant step backwards by forcing us to reverse our formulations to make them less "green" again. This will have a negative effect on our customers, the environment, and our reputation in the industry. In addition, there are substantial research and development costs associated with reformulating our product line.

Quality Car Care, Inc. is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]) CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]; CTS-03 Further VOC Reductions from Mold Release Products [VOC]; and CTS-04 Further VOC Reductions from Consumer Products

SS-22 - 1

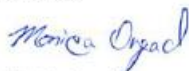

[VOC] are particularly troublesome given the proposals are neither effective nor necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less and less effective in reducing ozone. LVPs have minimal impacts on VOC emissions and ozone formation, and have been part of the solution not part of the problem.

The consumer products industry has spent hundreds of millions of dollars to reformulate its products to reduce VOCs, and further reductions come at even higher costs. This combination of high costs and low effectiveness makes further VOC reductions from consumer products not cost effective.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

American Jetway Corporation appreciates the opportunity to comment on the South Coast Air Quality Management Plan. Our comments focus on the CTS-02 further emission reduction from miscellaneous adhesives, solvents, and lubricants, and CTS-04 further VOC reduction from Consumer Products.

Both of the above categories have a major impact on our business. We have spent tens of thousands of dollars over the past twenty years developing products to meet the provisions of the CARB regulations. Changing this long standing rule will have a serious adverse impact on our industry and American Jetway Corporation specifically.

The LVP exempt solvents found in CARB inventory are less likely to create ozone and their substitution into formulations has been an important part of the effective ozone reduction strategy implemented by CARB.

SCAQMD does not have the jurisdiction on consumer products specifically. CARB has the authority over consumer products.

LVP's have been a part of the solution to VOC emissions and not part of the problem. Removing the LVP's will be a huge step backward to our industry and American Jetway specifically. The products being submitted to our customers are more costly and less effective.

We appreciate the opportunity to comment on the 2012 Air Quality Management Plan.

Sincerely,

A handwritten signature in blue ink that reads 'Gordon Jones'.

Diamond Bar, CA 91765

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Cobra Plastics Inc. appreciates the opportunity to offer comments on the AQMD Draft 2012, which was issued for comment on July 25, 2012. Our comments on this draft focus on CTS-1, CTS-02, CTS-03, and CTS-04. Cobra Plastics Inc. strongly urges that these measures NOT be included in the final 2012 AQMP. Our Company, Cobra Plastics Inc., strongly supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Cobra Plastics Inc., a small Ohio company, is the second largest supplier of aerosol over caps in the United States. This is the only product that we manufacture and these measures would negatively impact our company of 85 loyal, dedicated employees. Our customer base includes several California companies that utilize our product in their manufacturing process. If these measures were included in the AQMP, then we would have to downsize our operation and eliminate employees by the mere fact that our demand for our products would be significantly reduced. A worse scenario of going out of business is not unfathomable. This not the direction that this company wants or the US economy can afford.

Our concern that further reductions in VOCs from consumer products will yield a poor performing product at a cost that is prohibitive. We do not feel that this AQMP is technologically and commercially feasible and, more importantly, it is unnecessary. Air modeling shows further VOC reductions from consumer products will NOT significantly reduce ozone. LVPs have minimal impact on VOC emissions and ozone formation, and have been part of the solution and not part of the problem.

Cobra Plastics Inc. appreciates the opportunity to comment on the Draft 2012 Air Quality Management Plan. While we look at the goal of SCAQMD of "We are committed to protecting the health of residents, while remaining sensitive to businesses", we must understand the purpose for this 2012 AQMP. It does not significantly improve the protection of health of residents, but it does negatively impact businesses. Therefore, we strongly urge that these specific measures NOT be included in the final 21012 AQMP.

Best Regards,

A handwritten signature in black ink that reads "Kent A. Houser".

“BLASTER”

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Blaster Chemical Company appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

For over 50 years, Blaster Corporation has manufactured penetrants, lubricants, rust inhibitors and a full line of specialty, highly concentrated formulas for the automotive, industrial and hardware industries. Blaster has a full-line of specialty lubricant, performance enhancement and cleaning products to serve professionals and DIYers.

The Blaster Company strongly opposes the inclusion of CTS-04 in the AQMP for the following reasons:

- 1) The California Air Resources Board (CARB) is required to ensure that the Consumer Products regulations are technologically and commercially feasible. CARB has used the LVP-VOC option for reformulation to justify the stringent new VOC levels adopted. For our Penetrant product PB, there are no other options for reformulation for our product other than LVP's for the 12/31/2013 future effective limit. In addition, several of our other products have been reformulated using LVP-VOC. Without the option of LVP-VOC, our products would be ineffective. If the LVP-VOC option is removed, then CARB will need to re-review these categories and propose different limits to ensure technological and commercial feasibility.
- 2) Our Company is a small business. Continually reformulating our products is expensive and time consuming. In addition, as stated above, there are no known commercially viable alternatives for our product to utilize, except LVP-VOC. Blaster in good faith is reformulating our products to meet the stringent VOC limits. Imposing CTS-04 would be fundamentally unfair to our company. Use of LVP-VOC has reduced our use of more reactive VOC compounds and has benefited the states air quality.
- 3) CARB has sole jurisdiction over Consumer Products in California. SCAQMD should remove CTS-04 from the AQMP.

**8500 Sweet Valley Drive
Valley View, Ohio 44125**

Doug Raymond, Raymond Regulatory Resources (3R), LLC

Responses to Comment Letter SS-25
Blaster Chemical Company

Response to Comment SS-25-1:

The commenter provides similar comments to comments submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS).

Response to Comment SS-25-2:

The proposed control measure is intended to study the air quality improvement potential for replacing LVP-VOC containing compositions with alternative low VOC formulations. Staff recognizes that changing the LVP-VOC provisions of existing CARB rules is with the authority of CARB but has provided this measure as a recommendation to CARB. The proposed control measure may involve amending the CARB LVP-VOC criteria based on scientific data which may include MIR and similar photochemical reactivity parameters. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the CARB rule development process to ensure overall efforts are feasible, productive and cost-effective. The control approach would revise the LVP-VOC exemption if speciated LVP-VOC survey data and research results show an opportunity to further reduce ozone from use of consumer products. Any proposed amendments to the Consumer Products Regulations to revise the LVP-VOC exemption would be vetted through a full public process.

SS-26. PLZ Aeroscience Corp., October 30, 2012

October 30, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
via e-mail - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

PLZ Aeroscience appreciates the opportunity to offer comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-1, CTS-02, CTS-03, and CTS-04. PLZ Aeroscience strongly objects to the inclusion of these measures in the draft AQMP, and urges that these measures not be included in the final 2012 AQMP. As such, PLZ Aeroscience supports comments submitted by the American Coatings Association and the Consumer Specialty Products Association on the AQMP.

PLZ Aeroscience is comprised of seven companies (Assured, Camie, Claire, CPC, K-G-Spraypak, Plaze, & Sprayway) and employs approximately 800 people throughout North America. PLZ Aeroscience is a co-packer, formulator, manufacturer, marketer and distributor of products (primarily aerosol) in a wide variety of sectors of the retail and industrial/institutional markets.

In particular PLZ Aeroscience strongly objects to the proposed CTS-04 measure that would eliminate the LVP-VOC exemption in consumer products. For more than a decade, most Research and Development resources have been allocated to reformulating products to comply with ever more stringent VOC regulations. This has inhibited organic growth by limiting resources that could have been allocated to developing new, innovative products. Elimination of the LVP-VOC exemption will invalidate over a decade's worth of reformulation work because in many cases, LVP-VOC's were the only viable option to meet new VOC limits. The elimination of the LVP-VOC exemption will be devastating to the business because at best, hundreds of thousands of dollars will be required to reformulate approximately 900 products or product lines, and at worst, will cause these same products to be eliminated due to technical infeasibility.

PLZ Aeroscience is principally concerned with the proposal to include further reductions in VOCs from consumer products in this AQMP that are neither necessary nor cost effective, as well as being technologically and commercially infeasible. The four control measures potentially impacting consumer products: (CTS-01 Further VOC Reductions from Architectural Coatings (R1113) [VOC]1 CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and

SS-27. AEROPRES Corporation, November 12, 2012

November 12, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
Via email – echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Aeropres Corporation appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

Aeropres Corporation is a major supplier to the Consumer Products Industry and distributes many products helping formulators achieve current regulations. Aeropres has been in business since 1973 and has a facility in the South Coast Air Quality Management District. Aeropres Corporation strongly opposes the inclusion of CTS-04 in the AQMP for the following reasons:

- Aeropres has been actively involved with the California Air Resources Board (CARB) since the inception of Consumer Product Regulation. Members of our company actively worked with CARB to develop the current VOC category limits. CARB is required to ensure that the category VOC limits are technologically and commercially feasible. Modification to the LVP-VOC provision in the CARB Consumer Product regulation will negate the current VOC category limits, because for the last decade LVP-VOC compounds are one of the options for reformulations. In addition, LVP-VOC compounds are the main justification for setting the limits. Without the use of LVP-VOC compounds, numerous product categories will cease to exist or have significantly inferior products.
- SCAQMD by their own data show that the basin is NO_x limited. Thus, further reductions in VOC's will have little to no effect on ozone levels. LVP-VOC compound do not produce any measurable amount of ozone. Especially in a NO_x limited environment.
- Using LVP-VOC compounds to replace higher reactive VOC compounds is a sound science approach to reducing VOC emissions. This approach has been utilized by CARB

SS-27-1

for over a decade. A significant amount of VOC emissions reduction has been achieved from Consumer Products using CARB's approach.

} SS-27-1

In closing, SCAQMD should remove CTS-04 from the AQMP for the reasons stated above.

Thank you for your consideration to these comments. Any questions or comments feel free to call at 318-213-1206 or email at mrivers@aeropres.com.

Sincerely,

Mark Rivers
Vice President of Technical Services

Responses to Comment Letter SS-27
AEROPRES Corporation

Response to Comment SS-27-1:

The commenter provides similar comments to those submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS). Staff supports the commenter's suggestion to use sound science in its approach to reducing VOC emissions. The proposed control measure seeks to use the best available science to review and potentially revise the LVP-VOC exemption criteria.

The commenter asserts that numerous product categories will cease to exist or have significantly inferior products. The commenter should provide all data or studies demonstrating the infeasibility of products that do not rely upon the LVP-VOC exemption. To the contrary, significant evidence exists that there are numerous product categories that already have competitive products that do not rely on the LVP-VOC exemption. A number of major companies now provide multi-purpose lubricants utilizing low-VOC bio-based technologies. The Certified Clean Air Choices Cleaner program has nearly 50 institutional and industrial (I&I) cleaners that do not rely upon the LVP-VOC exemption. These products consist of full I&I product lines to cover nearly all cleaning and maintenance needs. Other certification programs have several hundred I&I cleaners, most of which do not rely upon the LVP-VOC exemption. As indicated, except for very few niche applications where efficacy of certain products may be impacted from a complete exclusion of a LVP-VOC, for the great majority of operations, environmentally preferable cleaners have equal or superior performance at equal or lower costs. Many cities and school districts have completely switched to environmentally preferable janitorial products and have found no degradation in performance at no extra cost. In some cases, lower overall costs have been seen and included in the cost-effectiveness section of the control measure. The City of Santa Monica reported spending 5% less on its cleaning products costs when it switched from conventional cleaners to less-toxic brands a decade ago. An article entitled, "The Benefits of Green Cleaning" by Dr. Robert W. Powitz on the ISSA website (November 2008), states, "We've heard the excuses, most of which can be grouped into one sentence: Eco-friendly products do not work and are more expensive. But this is simply not so." The Green Seal and EcoLogo certification programs include efficacy performance standards to address claims in deterioration of performance. Again, Green Seal and EcoLogo have certified hundreds of I&I products most of which do not rely upon the LVP-VOC exemption.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Chicago Aerosol, a private label aerosol formulator and packager, appreciates the opportunity to offer comments on the South Coast Air Quality Management District's Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measures for Coatings and Solvents.

We believe that Provision CTS-04, Further VOC Reductions from Consumer Products by modifying or removing the LVP exemption, is unfair, counter-productive to VOC reduction strategies, and unscientific.

Chicago Aerosol also supports comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP which have included the following points:

- This provision has served as a model for air quality management regulatory policy for nearly twenty years.
- The LVP exempt solvents found in the CARB inventory are even less likely to create ozone and their substitution for more volatile analogs has been an important part of the effective ozone reduction strategy implemented by CARB.
- The consumer products industry has in good faith spent hundreds of millions of dollars in complying with the CARB Consumer Products Rule. Changing this long-standing rule will have a serious adverse impact on industry, especially small and medium sized companies, with no justifying benefit.

SS-28-1

- Science reviews demonstrate that these materials are very unlikely to exhaust to air and very likely to deposit on water, vegetation or other surfaces where they degrade without air quality impact.
- SCAQMD does not have jurisdiction of consumer products, only CARB does.
- LVP's have minimal impacts on VOC emission and ozone formation and have been part of the solution not the problem.

SS-28-1

In closing, we definitely appreciate having the opportunity to comment on this proposed control measure. However, it is our belief that it is not feasible or cost effective thus SCAQMD should remove CTS-04 from the AQMP.

Sincerely,

Edward S. Piszyski
Vice President
Laboratory Services

Chicago Aerosol

Response to Comment SS-28-1:

The commenter provides similar comments to those submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS). Staff supports the commenter's conclusion that The California Air Resources Board's Consumer Products Regulation is the model for air quality management policy for the past twenty years. While there are partitioning effects for all chemicals, LVP-VOCs, as currently defined, are not by nature any more or less likely to degrade without any air impact. The control measure seeks to utilize the best scientific data available in the review of the LVP-VOC exemption criteria.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

CRC Industries Inc. appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

CRC Industries Inc. is a manufacturer and marketer of a full line of automotive and commercial products.

CRC strongly opposes the inclusion of CTS-04 in the AQMP for the following reasons:

- CRC Industries has been an active participant in the development of the California Air Resources Board (CARB) Consumer Products Regulation. CARB is required to ensure that VOC category limits are technologically and commercially feasible. CARB has used the LVP-VOC provision as a way to achieve this feasibility. If CTS-04 is implemented and the LVP-VOC provision is in anyway modified, then the existing VOC category limits would be rendered infeasible and CARB would need to develop new VOC category limits for the majority of Consumer Product categories in the regulation.
- Removal of the LVP-VOC provision would have significant adverse effect on our product line. We have used LVP-VOC compounds to replace more reactive VOC compounds, thus benefiting the Air Quality in California.

SS-29-1

885 Louis Drive • Warminster, PA 18974-0586 • (215) 674-4300 • FAX (215) 674-2196

AMERICAS GROUP

- Without LVP-VOC compounds, we could not formulate viable products in some categories. LVP-VOC compounds provide the only known substitutes for certain categories, such as lubricants. Our lubricant line is highly dependent on LVP-VOC compounds.
- CARB has sole authority over Consumer Product regulations, not SCAQMD. The LVP-VOC provision is in the CARB regulation.

SS-29-1

In closing, SCAQMD should remove CTS-04 from the AQMP for the reasons stated above. CARB has sole authority of Consumer Products in California. Statewide consistency is needed for our company to compete in California.

Thank you for your consideration to these comments. Any questions or comments feel free to call at (215) 442-6223 or email at aselisker@crcindustries.com

Responses to Comment Letter SS-29
CRC Industries

Response to Comment SS-29-1:

The commenter provides similar comments to those submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS). The proposed control measure is intended to study the appropriateness of the LVP-VOC exemption in its current form, in an effort to ensure that the ozone reduction benefit of the Consumer Products Regulation is fully materialized. Alternative lubricant technology, such as bio-based products that do not volatilize compared to other LVP-VOCs, are already in the marketplace and may be considered in future amendments to the CARB Consumer Products Regulation. The proposed control measure may involve eliminating or amending the CARB LVP-VOC criteria based on scientific data which may include MIR and similar photochemical reactivity parameters. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the CARB rule development process to ensure overall efforts are feasible, productive and cost-effective. The control approach would revise the LVP-VOC exemption if speciated LVP-VOC survey data and research results show an opportunity to further reduce emissions from consumer products. Any proposed amendments to the Consumer Products Regulations to revise the LVP-VOC exemption would be vetted through a full public process.

SS-30. Diversified CPC International, Inc., November 12, 2012

Diversified CPC International, Incorporated

24338 West Durkee Road | Channahon, IL 60410 | 815-424-2000

November 12, 2012

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Diversified CPC International, Inc. appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

Diversified CPC International, Inc. is a supplier to the Consumer Products Industry. Our company operates an aerosol propellant purification facility in the South Coast Air Quality Management District. This facility, located in Anaheim, CA purifies natural gas liquids in the manufacture of low relative reactivity liquefied gas propellants and also distributes VOC exempt propellants such as R-152a. We have worked (and continue to work) closely with Kennard Ellis of SCAQMD with the draft review process and implementation of the new Rule 1177 for LPG facilities.

Diversified CPC International, Inc. strongly opposes the inclusion of CTS-04 in the AQMP for the following reasons:

- 1) The Provision CTS-04 proposes to modify the LVP-VOC definition in The California Air Resources Board (CARB) Consumer Product Regulation. The South Coast Air Quality Management District (SCAQMD) has no authority over the CARB Consumer Product Regulation, or over Consumer Products that are currently regulated by CARB. State law provides that CARB has sole authority over currently regulated Consumer Products. Thus, SCAQMD cannot force CARB to change the LVP-VOC definition. The provision CTS-04 should be eliminated from the AQMP.
- 2) CARB is required by state law to adopt Consumer Product VOC regulations that are technically and commercially feasible. CARB has used the LVP-VOC provision as an option for reformulation and justification to adopt the VOC limits. If the LVP-VOC definition is modified, then the justification for adopting the VOC limits is removed. CARB would need to review all the category VOC limits.

SS-30-1

Diversified CPC International, Incorporated

24338 West Durkee Road | Channahon, IL 60410 | 815-424-2000

- 3) Using LVP-VOC compounds to replace more reactive VOC solvents is a VOC emission reduction strategy that CARB has been utilizing for over two decades. Through this strategy CARB has produced significant VOC reductions from Consumer Products.

In closing, SCAQMD should remove CTS-04 from the AQMP for the reasons stated above. CARB has sole authority of Consumer Products in California.

Thank you for your consideration to these comments. Any questions or comments feel free to call at 815-424-2003 or by email to bfrauenheim@diversifiedcpc.com.

SS-30-1

Sincerely,

Bill Frauenheim
Vice President, Operations
Diversified CPC International, Inc.

Responses to Comment Letter SS-30
Diversified CPC International

Response to Comment SS-30-1:

The commenter provides similar comments to those submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS). The proposed control measure may involve eliminating or amending the CARB LVP-VOC criteria based on scientific data which may include MIR and similar photochemical reactivity parameters. Notably, the MIR value for natural gas (methane) and propane is higher than ethane. Alternative non-VOC propellants, including carbon dioxide and exempt solvents with MIR values below ethane are available and in use. However, the key focus of the proposed control measure is the use of ingredients in the product formulation and not necessarily the composition of the propellant. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the CARB rule development process to ensure overall efforts are feasible, productive and cost-effective. The control approach would revise the LVP-VOC exemption if speciated LVP-VOC survey data and research results show an opportunity to further reduce emissions from consumer products. Any proposed amendments to the Consumer Products Regulations to revise the LVP-VOC exemption would be vetted through a full public process.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

IKI Manufacturing appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

IKI Manufacturing is a manufacturer of Consumer Products many of which include sales in California.

IKI strongly opposes the inclusion of CTS-04 in the AQMP for the following reasons:

- LVP-VOC compounds are the only viable substitutes for more reactive VOC compounds used in Consumer Products. Our reformulation efforts have removed the more reactive VOC's and substituted LVP-VOC compounds. With this reformulation effort and by removing the more reactive compounds, it has reduced the ozone being produced. LVP-VOC compounds are part of California Air Resources Board (CARB) strategy to reduce ozone from Consumer Products. LVP-VOC's are some of the only substitutes to VOC's in some categories where water or exempt compounds will not work.
- CARB LVP-VOC provisions has been adopted in the Ozone Transport Commission (OTC), the Lake Michigan Air Directors Coalition (LADCO) and the U.S. Environmental Protection Agency (EPA) as sound science for strategy to reduce ozone produced by Consumer Products.
- CARB has sole jurisdiction over Consumer Products. SCAQMD does not have authority over the Consumer Products regulation that includes the LVP-VOC provision.

SS-31-1

In closing, SCAQMD should remove CTS-04 from the AQMP for the reasons stated above. CARB has sole authority of Consumer Products in California. Statewide consistency is needed for our company to compete in California.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Motsenbocker's Lift Off appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

Motsenbocker's Lift Off is a California company that markets consumer products. The products are patented using unique formulas. These formulas utilize LVP-VOC compounds.

Motsenbocker's Lift Off urges SCAQMD to remove CTS-04 in the AQMP for the following reasons:

- A. Industry has utilized the LVP-VOC provision for decades to reduce the use of higher reactive compounds and to formulate effective products. Motsenbocker's Lift Off products provide effective products for Consumers to perform every day tasks. Our products utilize the LVP-VOC provision and have significantly reduced the use of reactive VOC's.
- B. As a California company, Motsenbocker's Lift Off has been in the forefront of reformulating Consumer Products. These reformulations have cost a significant amount of time and resources to perfect. The loss of LVP-VOC's would severely effect our reformulations to date and provide little in way of substitutions in the future to provide unique and effective products.
- C. Last, our company is a small business. Loss of the LVP-VOC provision would significantly affect my product line and my company's financial future. The economical repercussion of this provision would devastate my company.

SS-33. NAA, November 12, 2012

November 12, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
Via email – echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The National Aerosol Association (NAA) appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

The NAA is an association that represents the suppliers, fillers, manufacturers and marketers of aerosol products and their components. The NAA has been an active participant in the California Air Resources Board (CARB) Consumer Products regulations since the beginning of these regulations.

NAA strongly opposes the inclusion of CTS-04 into the AQMP for the following reasons.

Authority for Consumer Products

The California Air Resources Board (CARB) has sole jurisdiction over Consumer Product regulation. The LVP-VOC definition is incorporated into the Consumer Product Regulation, thus changing this definition is not under the SCAQMD authority. CTS-04 should be removed from the AQMP.

LVP-VOC reformulation

For decades, the Consumer Products Industry has reformulated products to remove reactive VOC's. LVP-VOC has been used as the replacement. This reformulation has been to the benefit of California for cleaner air. Science reviews on LVP-VOC demonstrate that these compounds have ultimate fates where the compound degrades without air quality impacts. LVP-VOC has been part of the solution not part of the problem with air quality.

SS-33-1

Economical Reasons

The Consumer Products Industry in good faith has spent significant resources in time and money to reformulate their products to meet CARB regulation stringent limits using LVP-VOC's. Changing this long-standing provision will have serious adverse economical impact on the Industry, especially small and medium sized companies with no justifying benefits.

LVP-VOC basis for regulation

The LVP-VOC provision has been incorporated into the CARB Consumer Products Regulation since the first regulation was adopted. CARB is bound by state law to develop regulation on Consumer Products, which are Technically and Commercially feasible. For the last decade and a half CARB has used the availability of LVP-VOC as the main option for reformulation of the majority of the Consumer Product categories. In addition, CARB has used the LVP-VOC provision to justify setting the strict limits in its regulation. Any modification to the LVP-VOC definition could negate the Technical and Commercial feasibility of the current limits. The Consumer Product categories affected will need to go through a complete review to ensure that the VOC limits are Technologically and Commercially feasible per state law.

CARB Regulation Model for other Jurisdictions

The CARB Consumer Products regulation has been the model regulation for other jurisdictions. Including the national EPA consumer products regulation. All the other jurisdictions have adopted the regulations with the inclusion of the LVP definition. The LVP-VOC definition is scientifically sound and an important part of the Consumer Products VOC emission reduction process.

Summary

For the reasons explained in detail above, CARB Authority, Reformulation, Economical Reasons, LVP-VOC basis for Reformulation and Model regulation, we respectfully request that the SCAQMD remove CTS-04 from the AQMP.

Thank you for your consideration to this issue and we look forward to working with you. Any comments or questions feel free to contact me at djraymond@reg-resources.com or by phone at 440-474-4999.

On behalf of the NAA,

Douglas Raymond

Any proposed amendments to the Consumer Products Regulations to revise the LVP-VOC exemption would be vetted through a full public process. Staff supports the commenter's conclusion that The California Air Resources Board's Consumer Products Regulation is the model for air quality management policy nationwide.

The commenter provides similar comments to those submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS).

SS-34. Stoner, November 12, 2012

November 12, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
Via email - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Stoner Incorporated appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Stoner manufactures specialized cleaners including car care products, lubricants, and coatings for industrial, commercial, and consumer applications. For over 70 years, Stoner has been committed to manufacturing and marketing safe and effective products to our customers. We operate two facilities in Lancaster County, Pennsylvania. Stoner is a 2003 recipient of the Malcolm Baldrige National Quality Award. Stoner is continually improving our manufacturing processes and our products to better serve the consumer. Included in these improvements are the protection of human health and the environment. Stoner pursues a mission of helping our customers save time, increase their productivity, and improve the quality of their work. Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-03 and CTS-04.

Stoner Incorporated opposes the inclusion of CTS-03 and CTS-04 into the AQMP for the reasons below.

- Recent Science data from SCAQMD shows that the South Coast Basin is NO_x limited. Thus any new VOC emissions will not have an impact on ozone reduction.

SS-34-1

- SCAQMD should remove CTS-04 from the AQMP because CARB has sole authority over Consumer Products in California. The LVP-VOC definition is in the CARB regulation thus SCAQMD has no authority over its removal or modification.
- CARB is required to ensure any limits imposed on Consumer Products are technically and commercially feasible. The majority of the limits imposed on our products were adopted using the justification that LVP-VOC's were an option for reformulation. Modification or removal of the LVP-VOC option would render the Consumer Products regulation technically infeasible. For the majority of our products the use of LVP-VOC is the only substitute to ensuring that our products remain effective for the Consumer to use. Our reformulations to LVP-VOC have replaced more reactive VOC compounds, for the improvement of Air Quality in California.
- Stoner is a small company with limited resources. Reformulation is expensive and requires valuable use of our technical departments time. In good faith Stoner either reformulated or are in the process of reformulating products using LVP-VOC compounds. To impose the CTS-04 provision now would be unfair to our company.

SS-34-1

In conclusion, for the reasons set forth above, the SCAQMD should remove CTS-03 and CTS-04 from the AQMP.

Stoner Incorporated has worked with CARB to ensure the technical and commercial feasibility on the Consumer Products regulation. The provision CTS-04 would significantly impact this regulation.

Thank you for your consideration to this issue.

Any questions feel free to contact me.

Sincerely,

Robert W. Sweger, Ph.D.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Spray Products Corporation appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

Spray Products Corporation is a custom filler and marketer of Aerosol Consumer products. We fill for marketers that do business around the globe including California. The inclusion of CTS-04 will significantly affect the Consumer Product market.

Spray Products strongly opposes the inclusion of CTS-04 in the AQMP for the following reasons:

- The California Air Resources Board (CARB) has sole authority over Consumer Products in the state of California. SCAQMD does not have authority to change the CARB Consumer Products regulation. The LVP-VOC provision is in the CARB regulation. The AQMP and CTS-04 cannot force CARB to change the Consumer Product regulations, thus the CTS-04 provision should be removed.
- Reformulation of Consumer Products without the use of LVP-VOC's will render a majority of Consumer Product ineffective. Currently there are no suitable substitute compounds for the LVP-VOC's.
- LVP-VOC's have replaced more reactive VOC compounds and are part of the solution to reducing ozone in California.

In closing, SCAQMD should remove CTS-04 from the AQMP for the reasons stated above. CARB has sole authority of Consumer Products in California.

Responses to Comment Letter SS-35
Spray Products

Response to Comment SS-35-1:

The commenter provides similar comments to those submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS).

The proposed control measure is intended to study the appropriateness of the LVP-VOC exemption in its current form, in an effort to ensure that the ozone reduction benefit of the Consumer Products Regulation is fully materialized. The proposed control measure may involve eliminating or amending the CARB LVP-VOC criteria based on scientific data which may include MIR and similar photochemical reactivity parameters. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the CARB rule development process to ensure overall efforts are feasible, productive and cost-effective. The control approach would revise the LVP-VOC exemption if speciated LVP-VOC survey data and research results show an opportunity to further reduce emissions from consumer products. Any proposed amendments to the Consumer Products Regulations to revise the LVP-VOC exemption would be vetted through a full public process.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Turtle Wax, Inc. appreciates the opportunity to offer comments on the South Coast Air Quality Management District's Provision CTS-04 for Further VOC Reductions from Consumer Products. Removing the LVP exemption is based on unscientific test methods and offers no correlation to air quality improvements. The consumer products industry has spent hundreds of millions of dollars in complying with the CARB Consumer Products Rule. Science reviews demonstrate that LVP materials are very unlikely to exhaust into the air and very likely to deposit on water, vegetation or other surfaces where they degrade without air quality impact. LVP's have minimal impacts on VOC emission and ozone formation and have been part of the solution not the problem.

Changing this long-standing rule will have a serious adverse impact on industry, especially small and medium sized companies such as Turtle Wax, Inc. with no justifying benefit. We are very concerned that additional limits and controls will result in poor "product performance" as well as lost consumer sales, production, revenue and LOST JOBS within the industry.

Turtle Wax, Inc. appreciates the opportunity to comment. This control measure is not feasible or cost effective, thus SCAQMD should remove CTS-04 from the AQMP.

Sincerely,

Turtle Wax, Inc.

Michael A. Schultz
Senior Vice President
Product Development

Responses to Comment Letter SS-36
Turtle Wax

Response to Comment SS-36-1:

The commenter provides similar comments to those submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS).

The commenter asserts that numerous product categories will have poor performing products. The commenter should provide all data or studies demonstrating the infeasibility of products that do not rely upon the LVP-VOC exemption. To the contrary, significant evidence exists that there are numerous product categories that already have competitive products that do not rely on the LVP-VOC exemption. A number of major companies now provide multi-purpose lubricants utilizing low-VOC bio-based technologies. The Certified Clean Air Choices Cleaner program has nearly 50 institutional and industrial (I&I) cleaners that do not rely upon the LVP-VOC exemption. These products consist of full I&I product lines to cover nearly all cleaning and maintenance needs. Other certification programs have several hundred I&I cleaners, most of which do not rely upon the LVP-VOC exemption. As indicated, except for very few niche applications where efficacy of certain products may be impacted from a complete exclusion of a LVP-VOC, for the great majority of operations, environmentally preferable cleaners have equal or superior performance at equal or lower costs. Many cities and school districts have completely switched to environmentally preferable janitorial products and have found no degradation in performance at no extra cost. In some cases, lower overall costs have been seen and included in the cost-effectiveness section of the control measure. The City of Santa Monica reported spending 5% less on its cleaning products costs when it switched from conventional cleaners to less-toxic brands a decade ago. An article entitled, "The Benefits of Green Cleaning" by Dr. Robert W. Powitz on the ISSA website (November 2008), states, "We've heard the excuses, most of which can be grouped into one sentence: Eco-friendly products do not work and are more expensive. But this is simply not so." The Green Seal and EcoLogo certification programs include efficacy performance standards to address claims in deterioration of performance. Again, Green Seal and EcoLogo have certified hundreds of I&I products most of which do not rely upon the LVP-VOC exemption.

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

Four Star Chemical appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD's) Draft 2012 Air Quality Management Plan (AQMP). Our comments focus on the Stationary Source Control Measure for Coatings and Solvents, in particular CTS-04.

Four Star Chemical is a Private Label Filler of commercial products in the state of California. We provide our customers with a wide variety of products for the specialty consumer market place.

Four Star strongly opposes the inclusion of CTS-04 in the AQMP for the following reasons:

- 1) The California Air Resources Board (CARB) has sole authority over Consumer Products in the state of California. Four Star has worked to maintain compliance with the CARB regulation through reformulation. Four Star products use LVP-VOC to maintain compliance with the stringent limits imposed by CARB on Consumer Products. If CTS-04 is implemented then our product reformulations will have been a waste of time and money.
- 2) As a small California business we cannot afford to constantly reformulate products. Also, SCAQMD does not have authority over Consumer Products thus CTS-04 should be removed from the AQMP.
- 3) Lastly, the SCAQMD's own data shows that the basin is NO_x limited. Future VOC reductions will have a little to no effect on ozone levels.

TT. Bear Valley Electric Service, October 9, 2012

October 9, 2012

Dr. Elaine Chang
Deputy Executive Officer
Planning, Rule Development, and Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

SUBJECT: Bear Valley Electric Service Comments on AQMD Revised Draft 2012 Air Quality Management Plan

Dear Dr. Chang:

Bear Valley Electric Service (BVES) appreciates the opportunity to submit the below comment on the South Coast Air Quality Management District (AQMD) Revised Draft Air Quality Management Plan (AQMP) that was released in September 2012.

BVES is a division of Golden State Water Company (GSWC), an investor owned utility (IOU). BVES provides electric distribution service to approximately 23,000 residential customers in a resort community with a mix of approximately 40 percent full-time and 60 percent part-time residents. Its service area also includes about 2,500 commercial, industrial and public-authority customers, including two ski resorts.

BVES purchases wholesale power to meet the majority of its energy requirements. To aid in meeting peak demand for electric energy, BVES installed and now operates the Bear Valley Power Plant (BVPP), a natural gas-fired, 8.4 MW generation plant in its service area. The BVPP became commercially operational on January 1, 2005.

BVES has only one comment on the September 2012 Revised Draft AQMP. We previously submitted this comment on the Draft AQMP in a letter dated August 31, 2012. We are re-submitting it as it was not addressed in the September 2012 Revised Draft AQMP. Below are the chapter and section relevant to the comment, as well as background information and the comment itself.

Chapter 4, Reductions from District's Stationary Source Control Measures (page 4-41)

Background: Appendix A-IV includes proposed measures for the reduction of pollutants from stationary sources that contribute to ozone, including VOC, NOx, and PM. In reviewing the appendix, it appears (Table IV-A-2) that measure MCS-03 applies to all stationary sources that involve start-up, shutdown, and related operations where emissions are not currently well understood. However, the corresponding discussion section for MCS-03 later in the appendix seems to apply only to refinery flares and similar operations.

Page 1 of 2 P.O. Box 1547, 42020 Garstin Drive, Big Bear Lake, California 92315
Tel: (909) 866-4678 Fax: (909) 866-5056

Comment: BVES requests that the AQMD clarify that measure MCS-03 applies only to refinery and similar processes, and does not more generally apply to all stationary sources that have start-up and shutdown operations. BVES' Bear Valley Power Plant is a natural gas-fired peaking plant, and energy generation from its operations is not similar to refinery operations. BVES believes it is possible that the AQMD did not intend to include all stationary sources as part of MCS-03. If the AQMD did intend to include all stationary sources, then BVES requests that it become a member of the working group(s) that inventory, assess, and develop recommended control measures for start-up and shutdown operations.

TT-1

If you have any questions or comments regarding the above, please feel free to contact me at (909) 866-4678.

Sincerely,

Karuna Warren
Operations and Planning Manager

Responses to Comment Letter TT
Bear Valley Electric Services

Response to Comment TT-1:

Control measure MCS-03 is carried over from the 2007 AQMP. Although the initial scope of review for startup, shutdown and turnaround activities is likely to focus on the minimization of potential flaring emissions at refineries, staff believes that it is possible to develop procedures that can lead to optimization, operational efficiency and emission minimization opportunities applicable to other industries.

The District approach under MCS-03 would be to initially focus on better quantifying emission impacts from startup, shutdown and turnaround activities at refineries, as well as analyzing emission reduction potential. Should the results of these analyses and emission assessments warrant further investigation, a review of potential emission reduction efforts would follow, including a determination of the applicability to other industries. Any subsequent rulemaking efforts would include technical feasibility, socioeconomic impact, and environmental impact assessments, including safety considerations, and certainly involve outreach to affected stakeholders.

UU. WD-40 Company, October 11, 2012

P.O. Box 80607, San Diego, CA 92138-0607

October 11, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Dear Dr. Chang,

The purpose of this letter is to reiterate points we have made verbally in recent meetings with SCAQMD leadership and staff regarding SCAQMD's Draft 2012 Air Quality Management Plan (AQMP). Our comments are focused primarily on the Stationary Source Control Measure for Coating and Solvents numbered:

- CTS-03 Further VOC Reductions From Mold Release Products.
- CTS-04 Further VOC Reductions from Consumer Products.

We appreciate this opportunity and look forward to finding win/win situations for all of us to achieve California and SCAQMD's clean air goals.

WD-40 Company is a California born company located in San Diego that does business in over 180 countries around the world. We have spent millions of dollars over the past 15 years or so developing and launching products that meet or beat CARB VOC regulatory standards. Historically, we have taken these same products to all 50 of the United States at a higher cost due to our belief of doing all we can to achieve clean air everywhere.

We do not meet CARB's definition of an "industrial product" which are "products used exclusively in the manufacture or construction of goods," We do meet CARB Consumer Products definition which includes household and Industrial & Institutional (I&I) products. I & I products include products used in factories. This means that 100% of all WD-40 made and sold in California has been under CARB regulations for about a decade.

Unfortunately, Rule 1144 passed a few years ago by SCAQMD prevents WD-40 from being used on metal working fluid type uses (but it is allowed on other type uses in same location). We think this is regulatory overlap between CARB and SCAQMD since the same formula and product is hitting two sets of regulations in the same place that have different VOC measurement methods and success criteria and are administered in completely different ways. SCAQMD does not currently agree with our view and we are working together to resolve as you witnessed in our last meeting with Barry Wallerstein. We fully support Rule 1144 for all other products regulated since none of them have been under CARB VOC regulations, are sold at retail and are only available through industrial distribution. They do meet CARB's "industrial product" definition.

Our USA marketing research shows WD-40 is in over 90% of households and 85% of workplaces and used in over 2,000 ways. All this done with the one brand, the same formula, a handful of package sizes across numerous trade channels including retail and industrial. This broad reach and strength of WD-40

UU - 1

UU - 2

UU - 3

can result in getting entangled in various type regulations from different agencies. Our concern is that CST-03 dealing with mold releases will impact WD-40 like Rule 1144 has with metal working fluids and we seek to avoid that.

UU - 3

Regarding CTS -04, WD-40 Company strongly objects to any modification or elimination of existing regulations allowing WD-40 Company and other consumer product companies to use Low Vapor Pressure (LVP) compounds as part of our current and future regulatory compliance efforts.

Our concern with any changes to existing CARB LVP definitions, test methods or regulations is that they could compromise the work and progress we achieved so far towards clean air. All of our impacted company products in several categories use LVP technology and solutions to achieve current regulatory compliance. That includes WD-40, WD-40 Specialist, 3-In-One, Spot Shot, Carpet Fresh and X-14 brands. We plan on doing the same for upcoming CARB VOC regulations. Any changes to LVP use in these efforts; whether in our existing categories or adjacent ones, is not supported by our company. We do not see the scientific basis for it, the regulatory need or benefit.

UU - 4

We do not believe that any of the four control measures (CTS-01 through CTS-04) are effective or necessary for ozone attainment. Air modeling shows further VOC reductions from consumer products will not significantly reduce ozone. LVP's have minimal impacts on VOC emissions and ozone formation and have been part of the solution and not the problem.

As an active member of the Consumer Specialty Products Association (CSPA), we fully support their comments and positions. To save paper and respect everyone's time, talent and treasure, we refer to their more detailed comments which we believe are solid and fact based recommendations and insights. We also fully support the California state requirement that all product regulations adopted be technologically and commercially feasible and not eliminate any product forms.

Thank you for your consideration.

Sincerely,

Michael L. Freeman
Division President - The Americas

Cc: Barry Wallerstein, SCAQMD
Mike Morris, SCAQMD
Carla Takemoto, CARB

Responses to Comment Letter UU
WD-40 Company

Response to Comment UU-1:

Staff appreciates WD-40's efforts to meet or beat CARB VOC regulatory standards and wishes to continue working with WD-40 to achieve California and AQMD's clean air goals.

Response to Comment UU-2:

Staff agrees that WD-40 is primarily a consumer product and Rule 1144 includes provisions limiting the applicability to only industrial uses. Repair and maintenance operations, the primary uses of WD-40 at industrial facilities, are not subject to Rule 1144. However, any product used by an industrial facility during the manufacture of goods is subject to the limits of Rule 1144, regardless if it is an "industrial" product or a "consumer" product. CARB and AQMD agree that the purpose of the Consumer Product Regulations is not "to deprive the districts of their long-standing authority to regulate pollution-generating activities occurring at stationary sources, just because these activities may involve the use of consumer products." (Letter from Kathleen Walsh, CARB General Counsel to William Wong, AQMD Senior Deputy District Council 2/20/01). Further, as discussed in the August 8, 2012 meeting with WD-40, AQMD and CARB, WD-40 should only report and pay CARB fees on volume of sales that fall under the Consumer Products Regulation, which does not include volume sold for "manufacturing" use at stationary sources.

Response to Comment UU-3:

The proposed control measure CTS-03 seeks to limit VOC emissions from mold release fluids used in industrial applications. Assuming that cost-effective, low-VOC alternatives are available, it would not be sensible to avoid establishing lower VOC limits just because some shops may be using consumer products as mold release agents. Nor would it be prudent to exempt consumer products, creating an incentive to use higher-VOC consumer products and diminishing the potential emission reductions realized from the control measure.

Response to Comment UU-4:

While some WD-40 products may use fast-evaporating LVP-VOC solvents potentially impacted by the proposed control measure, the Blue Works All Purpose Lubricant made by WD-40 is an excellent example of a product that truly maximizes ozone benefits and reduces VOC well beyond current requirements. The product utilizes carbon dioxide propellant technology and methyl soyate lubricants that have been shown in evaporation studies (Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds, U. Vö and M. Morris, August 2012) and

ASTM E 1868-10 to be non-volatile. Clearly WD-40 has the vision and technical capability to formulate technologically and commercially feasible products that do not rely on the LVP-VOC exemption as currently defined.

The commenter supports comments submitted by The Consumer Products Association. Please refer to the responses to comments for The Consumer Products Association (comment letter SS).

VV. John R. Froines, October 26, 2012

To: Jean Ospital

From: John R. Froines, Ph.D.

Date: October 26, 2012

Subject: Chapter 9, Near roadway exposure and ultrafine particles

The purpose of this memorandum is to offer brief comments on afore named section of the AQMP.

At the outset I want to compliment AQMD for its efforts at addressing the ultrafine particle issue. I believe the document is thorough and thoughtful. This is a difficult topic because the literature is limited and that raises a number of issues which are difficult to address. I think your efforts help clarify the issues that must be addressed in considering the policy and scientific issues raised by ultrafines.

My remarks will be brief, but the three papers I sent earlier contain up-to-date information that should prove helpful.

Comments:

1. This first comment derives from an AQMD funded application which we are now working on. It illustrates our mechanistic understanding of the pathway leading to illness and disease from air pollutants and while not directly related to ultrafines we believe the key particulate matter responsible for adverse health effects is ultrafines. See attachment to this document.
2. Humic acids: we believe that humic acids may be important PM constituents. Their chemical structure creates the possibility for prooxidant and electrophilic activity and they are likely water soluble which suggests they may dissolve off the ultrafine PM and exert toxicity in the cell. See attached paper.

} VV - 1
}

} VV - 2
}

- 3. This section of the report emphasizes ultrafine particles to the exclusion of consideration of vapors. In the Los Angeles basin the most prevalent PAH is naphthalene and it is between 1,000 and 10,000 times greater in concentration than benzo(a)pyrene which is particle bound. Naphthalene is in the vapor state. It has been identified as a carcinogen by NTP albeit with lower potency. We have demonstrated quite clearly that naphthalene is oxidized to naphthoquinone via atmospheric chemistry as we go from east to west in the LAB. Naphthoquinone is capable of both prooxidant and electrophilic activity. The same is true for other PAHs. Greater attention needs to be given to vapors and especially their oxidation products. Acrolein is another example of a highly toxic vapor. There are a very large number of compounds that fit these categories. VV - 3
- 4. It was very important to identify the relative organic compound load in different particles. Ultrafines have organics that are in the 60% range and this is considerably greater than PM2.5. Over time we believe the organic load may be a basis for regulatory activity. VV - 4
- 5. There should be discussion of nasopharyngeal deposition of ultrafines since that is the route for translocation to the central nervous system. Dr. Kleinman and others have published in this area and it is apparent from in vivo studies that there are persistent inflammatory responses. VV - 5
- 6. There should be discussion of inflammatory responses to deposition of ultrafines in the lung. This deposition activates immunological responses and the products may translocate to other sites namely the heart. See the papers by Jesus Arujo and Andre Nel on cardiovascular issues. At least one is cited, but Jesus could be contacted at UCLA for additional references. His work is VV - 6

outstanding. I don't have the references as I write this and your follow up is needed.

VV - 6

7. A key issue that must be addressed over time is the nucleation/condensation of vapors as they cool following emission from vehicles. This source of PM is not addressed by filters and while I did not focus my reading on controls want to emphasize this as an important source of PM.

VV - 7

8. Our Caldecott study demonstrated that as PM 2.5 decreased particle number increases and we confirmed this with an ARB study on new technology, that is, new diesel engines. The issue of the increase in particle number as mass declines is a continuing problem as we consider controls. I thought the conclusion in the document could have been more extensively addressed. It seemed to simplify the issue and was basically one sentence on page 9.2. More work needs to be done on the organic content in the context of this issue.

VV - 8

Since time is limited I will stop here and hope these brief comments are useful. I will be pleased to discuss the paper further over time.

Thank you.

Responses to Comment Letter VV
John Froines

We would like to thank you for your valuable comments to Chapter 9 and Appendix 1 of the AQMP. The work conducted by the Southern California Particle Center (SCPS) in past 10 years contributed to improve our understanding of the mechanisms responsible for the health effects associated with exposure to ultrafine particles (UFPs). Several of the key scientific papers resulting from the research activities of the SCPC have been referenced in Chapter 9 to emphasize the fact that UFPs and some of their chemical components may promote allergic inflammation in the lungs, the progression of atherosclerosis, and other adverse health effects.

Response to Comment VV-1:

AQMD staff believes it is possible that UFP may be the main PM fraction responsible for the adverse health effects caused by particle exposure. As noted in Chapter 9 (page 9-8 through 9-22), this is in line with the results of several research studies conducted by the SCPC and research groups in other parts of the world.

Response to Comment VV-2:

Although this is an important issue, the contribution of Humic Acids to the overall UFP toxicity has not been discussed in Chapter 9 because this topic is too specific for the scope of this document.

Response to Comment VV-3:

As stated on page 9-19 of Chapter 9, work conducted by the SCPC has demonstrated that because of their high organic carbon (OC) and polycyclic aromatic hydrocarbon (PAH) content, UFPs have the highest potential to induce oxidative stress in macrophages and epithelial cells (Li et al., 2003). We also noted that this, in turn, may promote allergic inflammation in the lungs, the progression of atherosclerosis, and precipitation of acute cardiovascular responses ranging from increased blood pressure to myocardial infarction (Delfino et al., 2005; Araujo et al., 2008). The semi-volatile component of quasi-ultrafine urban aerosols (mostly OC and PAHs) seems to be responsible for most of the oxidative potential of PM (Verma et al., 2011).

Response to Comment VV-4:

On Page 9-8 of Chapter 9 we stated that the UFPs collected in urban environments across the United States are mostly comprised of organic matter (up to around 70% by weight). Research conducted as part of the SCPC (also referenced on page 9-8) clearly demonstrated that the organic content of UFPs is larger in the summer, when photochemical formation of organic aerosol is higher (Kuhn et al., 2005; Sardar et al., 2005).

Response to Comment VV-5:

We thank the commenter for his input on this topic, but we think that a detailed discussion on the nasopharyngeal deposition of UFPs as a route for translocation to the central nervous system is beyond the scope of this document

Response to Comment VV-6:

This important issue has been mentioned on page 9-19, where we noted that the potential of UFPs to generate ROS and to induce oxidative stress in macrophages and epithelial cells and may promote allergic inflammation in the lungs and the occurrence of various cardiovascular problems (Delfino et al., 2005; Araujo et al., 2008).

Response to Comment VV-7:

On page 9-22 of Chapter 9 we have noted that more work is needed to better characterize the mechanisms that lead to UFP formation right after emission and in the atmosphere. Developing a clearer picture of particle formation dynamics in different environments, including those which are influenced by traffic, would greatly assist control measures to regulate emissions of UFPs.

Response to Comment VV-8:

This issue has been described in detail in the “Emission Control Technologies” section of Chapter 9 (see pages 9-28 and 9-29).

October 30, 2012

Dr. William A. Burke, Chairman and
Other Members of the Governing Board
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
2012aqmpcomments@aqmd.gov

Dear Board Members:

I am writing to convey my emphatic support a 2012 Air Quality Management Plan (AQMP) Appendix I Health Effects that focuses on "the health impacts of particulate matter air pollution in the South Coast Air Basin," in accord with California Health and Safety Code Section 40471(b). In addition, I urge you to hold a Board hearing on the health impacts report and its peer review, in accord with this Code Section.

In particular, please address the September 25 public comments of Jonathan M. Samet, M.D., and the August 30 and September 20 public comments of James E. Enstrom, Ph.D. I have been a cancer epidemiologist for over 30 years, and I have been aware of the important research of these outstanding epidemiologists during this entire period. In addition, I have personally worked with Dr. Enstrom on environmental epidemiology issues. You need to take their criticism of Appendix I very seriously.

My own examination of the PM2.5 epidemiologic findings of Dr. Samet, Dr. Enstrom, and two dozen other highly qualified scientists, convincingly shows that there is no relationship between PM2.5 and total mortality in California and that the current US EPA National Ambient Air Quality Standard (NAAQS) for PM2.5 is not applicable to California or the South Coast Air Basin (SCAB). Therefore, the AQMP should request a waiver from this NAAQS, rather than proposing stricter emission controls.

In conclusion, the final 2012 AQMP must be based on the actual health impacts of particulate matter in the SCAB. Otherwise, I believe that it can be vigorously challenged on scientific, economic, and legal grounds. I am following this issue from New York because the PM2.5 NAAQS has national epidemiologic and regulatory significance and because the exaggeration of PM2.5 risks fits the pattern of examples described in my 2008 book "Hyping Health Risks."

Thank you for your attention to my comments.

Sincerely yours,

Geoffrey C. Kabat, Ph.D.

WW - 1

Responses to Comment Letter WW
Dr. Geoffrey Kabat

Response to Comment WW-1:

The Draft AQMP is designed to provide a pathway to attain the National Ambient Air Quality Standard for Particulate Matter, which is required to be timely attained under the Clean Air Act. This standard was established by the US EPA Administrator, as set forth in the Clean Air Act, to protect public health based on a substantial body of health studies. The EPA has concluded that there are serious adverse health effects associated with exposure to PM_{2.5}, including an increased risk for mortality.

There is no provision in the Clean Air Act that would allow a local district to receive a waiver from meeting the NAAQS by the statutory deadline. Indeed, there are significant penalties for not adopting a plan timely for attaining the standard, which could include restrictions on transportation and highway funds to the region, increases in required emissions offset ratios, and imposition of a Federal Implementation Plan to attain the standard.

The Governing Board will hold an adoption hearing on the 2012 AQMP and Appendix I before it takes action to approve the 2012 AQMP. In the meantime, there will also be regional public hearings to obtain public comment on the 2012 AQMP and Appendix I.

Re: Comments on Revised Draft 2012 Air Quality Management Plan

Dear Mr. Fine:

This letter is submitted on behalf of the County of Orange ("County") in its capacity as the owner and operator of John Wayne Airport, Orange County ("JWA"). This letter contains the County's written comments on the Proposed Modifications to the Draft 2012 Air Quality Management Plan ("Revised AQMP"), issued by the South Coast Air Quality Management District ("SCAQMD" or "District") in September, 2012. The County appreciates the opportunity to provide these additional comments on the Revised Draft AQMP.¹

XX - 1

Our comments on the Revised AQMP are intended to serve the following principal objectives:

- 1. First, we appreciate the opportunity to continue to work constructively and cooperatively with the District in evaluating and developing realistic airport emissions inventories and aviation forecasts for the Revised AQMP.
2. Second, we are concerned with a number of the responses that the District provided to our July 27, 2012, comment letter on the Notice of Preparation and Initial Study ("NOP/IS") for the proposed 2012 AQMP. These responses warrant further comment and discussion because many of our previous comments relate to revisions that are required to the Draft 2012 AQMP, including, but not limited to, revisions to the baseline emissions inventory for JWA. Without careful attention and response to these important issues during the comment/response period for the Revised AQMP, the District will be unable to structure appropriate and effective air quality regulations which might affect the

XX - 2

1 The County has previously submitted comment letters on the Notice of Preparation of a Draft Program EIR, the draft 2012 AQMP, The Integra Report and the Draft Program Environmental Impact Report for the 2012 AQMP. Please see the enclosed comment letters to Mr. Steve Smith from Ms. Lori Ballance, dated July 27, 2012, to SCAQMD from Mr. Alan Murphy, dated August 31, 2012, to SCAQMD from Mr. Alan Murphy, dated September 28, 2012, and to Mr. Jeff Inabinet from Ms. Lori Ballance, dated October 23, 2012.

Mr. Phillip Fine, Planning and Rules Manager
October 30, 2012
Page 2

operations of the air carrier airports in the Basin while minimizing the environmental impacts of those regulations.

XX - 2

- 3. Third, and finally, we continue to have a number of concerns and questions regarding Control Measures MCS-03 and ADV-07 as well as the long term black box measures and the proposed regulation of ultrafine particles that require further comment and discussion at this time.

XX - 3

GENERAL COMMENTS

EMISSION INVENTORY

The Revised Draft AQMP continues to provide an emission inventory using 2008 as the baseline year and it appears that no revisions have been made to the July draft of the 2012 AQMP to include the airport-specific data provided by JWA. This may be simply a matter of timing with respect to when the District received the additional airport specific data from JWA; nevertheless, and as noted in our previous written comments to the District, JWA remains very concerned about the accuracy of the baseline emissions inventory assumptions utilized in the Revised 2012 AQMP.² By this letter, we would like to request confirmation that staff will include in the Final 2012 AQMP baseline emissions inventory assumptions all of the information provided by JWA to the District with respect to the aircraft activity data and airport specific data for JWA. This data includes, but is not limited to, the recent information the JWA provided after reviewing the Integra Environmental Consulting, Inc. Report which provides the assumptions utilized in preparing the Draft 2012 AQMP's emissions inventories relative to the aviation sector.

XX - 4

We continue to be particularly concerned with this issue because the baseline year is not only used to determine future year air quality emissions projections, but also appears to be used in the development of AQMP control measures. As we have stated in our previous comments to the District, the District needs to be seriously concerned about both the accuracy and completeness of the existing data that it relied upon for the emission inventory. Revision is required to accurately reflect the baseline and projected future activity levels at JWA. These revisions should be included in the Final 2012 AQMP that is presented to the District's Board for consideration and approval.

² In order to help ensure the accuracy of the baseline emissions inventory assumptions for JWA, JWA provided the District with aircraft activity data and airport specific data for JWA for incorporation into the 2012 AQMP and requested that the baseline emissions inventory be updated and modified to incorporate this new information. In response to the County's request, the District indicated that staff "... will consider the request ... and determine the magnitude of the change from the information provided in the Draft 2012 AQMP."

Mr. Phillip Fine, Planning and Rules Manager
October 30, 2012
Page 3

DISTRICT'S LACK OF REGULATORY AUTHORITY RELATIVE TO AIRCRAFT EMISSIONS

In our previous comment letters, we requested that the District clearly inform the public and decision makers of the District's lack of regulatory purview relative to aircraft emissions. Although the District's response to our NOP/IS comment letter acknowledges that "the Clean Air Act expressly preempts state and local agencies from adopting or enforcing any standard respecting emissions of any air pollutant from any aircraft or engine thereof unless such standard is identical to a standard [adopted by EPA and FAA] applicable to aircraft ...", the District's response also indicates that "...the term standard ... does not include in-use or operational requirements [and that] whether any individual measure, which does not constitute a standard preempted under the CAA, would be preempted by any other law would need to be decided on the facts of each case."

As indicated in our comment letter on the Draft EIR for the 2012 AQMP, we continue to have a fundamental disagreement with the District regarding the extent of the District's authority to regulate aircraft emissions. Specifically, we continue to believe that, to the extent the District attempts to regulate aircraft related emissions, directly or indirectly (through in-use or operational requirements), any such regulation would constitute a constitutionally impermissible local intrusion into a federally preempted field of regulation. *People of State of Cal., v. Dept. of Navy* (1977) 431 F.Supp. 1271, 1281; *Washington v. General Motors Corp.* (1972) 405 U.S. 109, 92 S.Ct. 1396, 31 L.Ed.2d 727. The District's attempted indirect regulation of airport related emissions through in-use or operational requirements would be an impermissible and unconstitutional intrusion into an area which is pervasively and exclusively controlled by federal law and federal authority. *City of Burbank v. Lockheed Air Terminal, Inc.* (1973) 411 U.S. 624, 633.

XX - 5

SPECIFIC COMMENTS ON PROPOSED CONTROL MEASURES

CONTROL MEASURE MCS-03

With respect to Control Measure MCS-03, although we appreciate the District's response to our comment letter on the NOP/IS which acknowledges that "operational, technological and economic variables will be among the key variables to be consider[ed] ..." during the second phase of implementation, there have been no modifications to this proposed Control Measure in the Revised 2012 AQMP that reflect these constraints and that indicate how they will be taken into account when designing the measure's parameters and predicting associated emission reductions. Therefore, we continue to find it difficult, if not impossible, to assess the measure itself without further information on its proposed parameters. The Revised 2012 AQMP should be modified to include a discussion relative to the fact that controlling emissions during start-up

XX - 6

Mr. Phillip Fine, Planning and Rules Manager
October 30, 2012
Page 4

and shutdown is constrained by operational, technological and economic limitations and provide an analysis of how these limitations may impact the projected emission reductions for this Measure.

XX - 6

CONTROL MEASURE ADV-07

Relative to Control Measure ADV-07, again, there appears to have been no modifications to this proposed Control Measure in the Revised 2012 AQMP. Rather, this Control Measure is identical to the Measure provided in the July draft of the 2012 AQMP. Therefore, as indicated in our previous comments, we continue to be concerned about the extent to which ADV-07 is intended to impose affirmative obligations on the District or local airport authorities to regulate the aircraft fleet mix serving the South Coast Air Basin. Although we continue to have no immediate objection to the District providing support for FAA's Continuous Lower Energy, Emissions and Noise ("CLEEN") Program, JWA objects to any measure that requires local airport authorities to regulate the aircraft fleet mix serving the South Coast Air Basin on the grounds that such affirmative obligation would be incompatible with the jurisdictional authorities and powers of airport owners/operators. The 2012 AQMP should be revised to provide additional information on the ultimate intent of ADV-07 before it is presented to the District's Board later this year.

XX - 7

The proposed Control Measure also includes working with the airlines and local airport authorities to develop mechanisms to route the cleanest aircraft to serve the South Coast Air Basin. As we have discussed with the District on many occasions in the past, and in our most recent comment letter to the District on the Draft EIR for the 2012 AQMP, neither the District nor airport operators can ensure that only the "cleanest aircraft" operated by commercial airlines serve the Basin; such a requirement would trigger federal preemption and interstate commerce implications. In addition, we have serious doubt, particularly after adoption of the Airport Noise and Capacity Act of 1990 (49 USCA 2151, et seq.), as to whether airport proprietors generally have sufficient residual authority to act effectively as the agencies working with the District and the airlines in developing, implementing and enforcing a program that requires the cleanest aircraft to serve the Basin. At a minimum, the District should receive adequate assurances from the Federal Aviation Administration, the Department of Transportation, and any other relevant federal authorities that airport proprietors do, in fact, have sufficient regulatory authority to allow them to make meaningful implementation choices which would allow them to enforce local regulations to achieve whatever mandates are imposed on them by the District.

LONG-TERM (BLACK BOX) CONTROL MEASURES

Table 6-2 in the Draft Program EIR for the 2012 AQMP shows the black box measure strategies from the 2007 AQMP and also shows the proposed control measures from the 2012 AQMP that affect the same emissions sources. It is unclear from this Table and the discussion provided

XX - 8

Mr. Phillip Fine, Planning and Rules Manager
October 30, 2012
Page 5

whether the methods of emissions control from the 2007 AQMP are still being considered for implementation in connection with the 2012 AQMP. Specifically, the method of emissions control for aircraft from the 2007 AQMP is as follows: "More stringent emission standards for jet aircraft (engine standards, clean fuels, retrofit controls); Airport bubble."

Is the District still considering implementation of an "airport bubble" concept in connection with the proposed 2012 AQMP control measures? The 2012 AQMP must be revised to clarify whether this method of emission control is still being considered and whether this concept will be translated into specific control measures for the airport and airline industry.

We have discussed at length with the District our concern regarding the role of the airport proprietor relative to the administration of air quality emission strategies at airports in the Basin. As you know, we have expressed strong opposition to the "airport bubble" concept previously proposed by the District and will continue to oppose any measure that requires an airport to become the air quality "enforcer" for airport users.

REGULATION OF ULTRAFINE PARTICLES

According to the District's response to the JWA's comment letter on the NOP/IS for the 2012 AQMP, we understand that the District is continuing to include a discussion of the evaluation of ultrafine particles as a "subset of PM2.5." This is neither necessary nor appropriate for the following reasons. First, while the federal Clean Air Act requires submittal of a plan by December 14, 2012 outlining how the District will achieve the National Ambient Air Quality Standards (NAAQS) for PM2.5 in the South Coast Air Basin, there is no such deadline for ultrafine particles which are not regulated by NAAQS. Second, by including control measures specific to ultrafine particles in connection with their status as a subset of PM2.5, the District is addressing issues beyond the current regulatory framework established by the U.S. Environmental Protection Agency via the NAAQS program. Third, and finally, it is impossible to determine how the PM2.5 control measures may regulate ultrafine particles as a "subset of PM2.5."

As indicated in our comment letter on the Draft 2012 AQMP, the County/JWA continues to support a bifurcated approach to the 2012 AQMP which focuses attention on NAAQS achievement; other air quality related issues relating to ultrafine particles can, and should, be addressed via a separate and subsequent process.

CONCLUSION

In closing, the County/JWA thanks the District again for this opportunity to comment on the Revised 2012 AQMP. We look forward to continuing to engage in an open, thorough and responsive public process on the 2012 AQMP and assisting the District with its efforts to improve air quality in the South Coast Air Basin. If you have any questions regarding the issues addressed in this letter, please do not hesitate to contact us at your convenience.

Responses to Comment Letter XX
Gatzke Dillon & Ballance LLP

Response to Comment XX-1:

The comment requests that past comments, current comments, and continued cooperation in this process will allow the County to continue contributing to complex airport regulatory issues associated with air quality in the Basin. The AQMD welcomes participation in AQMP development from all stakeholders including, but not limited to, public agencies, affected industries, environmental organizations, and other interested parties. To the extent that AQMP control measures affect a specific stakeholder group, it is important that the group affected participate in crafting control measures, as well as any resulting rules or regulations. Currently, the 2012 AQMP contains ozone Measure ADV-07 – Actions for the Deployment of Cleaner Aircraft Engines. This control measure describes the actions needed to develop, demonstrate, and commercialize advanced technologies, procedures, and sustainable alternative jet fuels that could be deployed in the 2020 to 2030 timeframe, so no emission reductions are associated with it as part of this AQMP process. The control measure recognizes that state and local aircraft emission standards are preempted by the Clean Air Act, which gives that responsibility to U.S. EPA in consultation with the Federal Aviation Administration (FAA). However, emission reductions are needed from all emissions sources, including those regulated by the federal government. Therefore, it is important that the County participate in any future control measure development relative to emission reductions from aircraft to ensure the most effective and cost-effective measures are identified.

Response to Comment XX-2:

This comment expresses general concern regarding unspecified AQMD responses to unspecified comments regarding the NOP/IS for the 2012 AQMP. While responses to the NOP/IS are not required, the AQMD provided responses to all comments received relative to the NOP/IS. However, it is important to keep in mind that responses to comments made at the NOP/IS stage often results in changes that get incorporated into the Draft Program EIR. Further, at the NOP/IS stage, the environmental analysis is not complete at the time, so detailed responses were not always possible.

Response to Comment XX-3:

See Response to Comment XX-6 regarding a discussion of control measure MCS-03 and see Response to Comment XX-7 regarding a discussion of control measure ADV-07.

Response to Comment XX-4:

The JWA inventory was developed incorporating all information submitted by JWA and further updated as described in our response to comment letter RR (JWA's September 28th comment letter on the 2012 draft AQMP), which is described below.

The John Wayne Airport inventory was developed incorporating all information submitted by John Wayne Airport and AQMD staff has revised the Integra Report to reflect the updated information provided by the airport authority. SCAG's growth information was used to estimate the future airport activity listed in Table 3.3 of the Integra Report and is further described in their Aviation and Ground Access Appendix of the 2012 Regional Transportation Plan – (http://rtpscs.scag.ca.gov/Documents/2012/final/SR/2012fRTP_Aviation.pdf).

The emission estimates for 2035 listed in Table 2.4 of the Integra Report were generated using the airport activity as estimated by SCAG's RADAM model and FAA's Emissions and Dispersion Modeling System (EDMS) airport model. For John Wayne Airport the activity was capped at the authorized limit of 10.8 MAP. The emission estimates for John Wayne Airport are not inconsistent with the expected improvement in engine technology and growth in airport activity in that increased activity resulted in increased emissions with the exception of NO_x, which has been and will continue to be the main focus of emissions improvements from aircraft engines.

The projected 2035 fleet mix was provided by SCAG and is included in their recently adopted 2012 – 2035 RTP/SCS. The estimates were generated by the Regional Airport Demand Allocation Model (RADAM) an approved model used by SCAG staff since 1994 to project growth in aircraft activity in the region. While staff recognizes that operations at the airport do not include some aircraft types today, there is nothing limiting the use of these types in the future and we believe it is appropriate to use information that is consistent with SCAG's 2012 – 2035 RTP/SCS and other growth assumptions used in the AQMP. (The one exception would be a physical characteristic that would not allow operation of an aircraft type at the airport such as the B737-900 craft referenced as too long to operate at John Wayne Airport. However the engine type is the same as the other B737 classes that would likely be used in lieu of the 900 series and we would expect the estimated emissions would be similar).

Response to Comment XX-5:

The comment repeats a concern that an attempt by the AQMD to regulate airport related emissions, even through in-use or operational requirements, would be federally preempted. As identified in NOP/IS response 4-7 (see Appendix B of the Program Environmental Impact Report), the Clean Air Act generally preempts state and local agencies from adopting or enforcing any standard respecting emissions of any air pollutant from any aircraft or engine. 42 U.S.C. §7573. The term "standard", however, does not include in-use or operational requirements. *Engine Manufacturers' Association v. EPA*, 88 F.3d 1075 (D.C. Cir. 1996).

In any event, control measure ADV-07 does not purport to seek regulation of aircraft emissions. The control measure does not take credit for emissions reductions, does not identify cost effectiveness and recognizes that the implementing agencies are the AQMD, U.S. FAA, U.S. EPA, and CARB (see AQMP Appendix IV-B, page IV-B-86). Rather, ADV-07 is intended to develop and demonstrate new technologies for improved

efficiency and reduced emissions through the FAA initiated Continuous Lower Energy, Emissions and Noise (CLEEN) program and through other incentive-based or demonstration-based projects (see AQMP Appendix IV-B, page IV-B-86). If, through the development of these projects, it is determined that feasible regulatory action exists, the AQMD may elect to pursue that path after determining whether such action, while not preempted under the CAA, would be preempted by any other law.

Response to Comment XX-6:

There will be constraints in implementing a proposed control strategy with all the proposed control measures, including MCS-03. Determining those operational, technical and economic constraints will take place during the rule development process when the source category is further evaluated and affected industry and public participation provide valuable insight. Once those constraints are determined, the rule can be best developed to consider necessary relief such as tiered compliance dates, requirement exemptions, and program incentives.

Response to Comment XX-7:

Control measure ADV-07 recognizes the efforts with the CLEEN Program to develop cleaner aircraft engines. However, in order to route cleaner aircraft to region, there is a need to determine if there are mechanisms such as incentives that will bring cleaner aircraft to the region. We recognize that this effort will involve local airport authorities, state and federal agencies and the airlines. It is premature at this point to determine the “performance target” for this measure since specific mechanisms have not been developed. The measure will be further developed as part of the next AQMP development.

The commenter asserts that a control measure which would have the AQMD work with the airports and airlines to develop mechanisms to route the cleanest aircraft to serve the South Coast Air Basin would necessarily be federally preempted., particularly in light of the Airport Noise and Capacity Act of 1990 (49 U.S.C. §2151 et seq.). We disagree. The measure involves working together with the affected parties. We note that the relevant preemption provision, 49 U.S.C. §41713, preempts regulations that “have the force and effect of law related to a price, route, or service of an air carrier...” Thus, it would not include, for example, incentive programs not having the force and effect of law. Moreover, the statute expressly provides that it does not limit a state or political subdivision of a state “from carrying out its proprietary powers and rights.”49 U.S.C. §41713(b)(3). Thus the airports may be able to exercise their authority as “municipal proprietors” in this area. The Airport Noise and Capacity Act (now reorganized at 49 U.S.C. §47521 et seq.) does not seem to be relevant since it deals with noise restrictions, and should not be interpreted to apply to air pollution issues. But even if it applied, it still allows restrictions on noisier aircraft in certain cases. 49 U.S.C. §47524. The AQMD will work with the airports and other stakeholders to implement this measure to the extent legally feasible and not preempted.

Response to Comment XX-8:

The black box control measures in the 2007 AQMP are concepts that require further development. These concepts will be further developed with input from all affected stakeholders. Concepts included in the 2007 AQMP black box measures but not discussed in ADV-07 should not be interpreted as being removed from further consideration. Ultimately, some concepts may require actions on the federal level to implement, while other actions may potentially be implemented at the local level, such as incentives.

Response to Comment XX-9:

By definition, ultrafine particles are less than 0.1 micron, so are less than 2.5 microns, thus, a subset of “PM2.5.” We agree with the commenter that no national ambient air quality standards have been established for ultrafine particles, so they are not part of demonstration of attainment of the 24-hour PM2.5 standard as analyzed in Chapter 5 and Appendix V of the 2012 AQMP. In addition, ultrafine particulates are not characterized in the emissions inventory data and were not considered in the development of the control strategy. Thus, no commitments to reduce ultrafine particles are submitted in the 2012 AQMP. Finally, the PM2.5 control measures in the 2012 AQMP are not specifically aimed at ultrafine particles, but in some cases could have the effect of reducing ultrafines as they reduce PM2.5. That is what we meant by saying ultrafines could be regulated as a “subset“ of PM2.5. As discussed in Chapter 9 of the 2012 AQMP, in most urban environments, vehicular fossil fuel combustion constitutes the major contributing sources of ultrafine particles. The PM2.5 control strategy in the 2012 AQMP is the curtailment of wood burning, thus targeting PM2.5 emissions and not ultrafine particles.

Response to Comment XX-10:

The comment reiterates the County’s desire to continue working with the AQMD with its efforts to improve air quality in the Basin. No further response is necessary.

First, there was concern that oil/gas exploitation of maritime methane hydrate deposits could dangerously destabilize them. Now, there is reason for concern that warming seas are --already, right now -- causing destabilization that is potentially far worse.

Maybe it is no longer so far-fetched to consider the possibility that humanity's impotence to control and reduce an emerging, self-reinforcing feedback loop of methane emissions and global heating could be -- or already is -- triggering the granddaddy of all planetary extinction events that will spare neither oblivious Republicans nor feckless Democrats nor anyone else?

Coming soon? Guys in long beards and robes wearing sandwich boards outside the California Public Utilities Commission warning: "Repent: the end of the anthropocene era is at hand"!

Date: Wednesday, October 31, 2012 4:39:34 PM

Howdy Michael Krause et. al.SCAQMP/D, 10/31/12

This is Part 3 of Third Comments on AQMP of Harvey Eder & PSPC Public Solar Power Coalition 10/31/12 (First Comments where authored and sent July 17 &18,2012,

Second Comments were authored and sent October 23, 2012 and this third comments were authored and sent October 30,&31, 2012 on AQMP and DEIR and SocioEconomic Document (Dr. Sue Lue -sp-)

Correction section 3 of Part 3 on funding of Marin CCA MEA was funded by ICLEI (International Council For Local Environmental Initative) but it could and should be funded for the Counties and Cities in the SCAQMD by the SCAQMD. This should be part of the 2012 Plan but funding should happen now as cited in Section 3 of Third Comments and herein. (HE PSPC) as well as funding with SCD and CARB for Statewide SolarCal in 1st Comments July 17&18 etc..

YY - 5

Part 5 of Third Comments AQMP ETC 10/31/12. Solar Renewables was in the Texas SIP

for Solar/ Renewables in 2005 and muct be included in the SCD AQMP and in the SIP (State Implimentation Plan. Etc. Also Connecitute cited solar energy in their documents contact vis Robyn DeYioung document supplied yesterday, etc.

YY - 6

Part 6 of Third Comments AQMP ETC 10/31/12 SCAQMD sstaff like in BAAQMD in CEQA Documents should comment on Climate Action Plans for all Counties and Cities in the SCAQMD as Solar as BACT/RACT/LAER and Best Practicesworking with Local Planners etc and with JPL NAS Lab in the District (Jet Proplusion Labratory). BAAQMD has LBL Lawerence Berkeley Lab and we have ours but should also work wityh LBL and BAAQMD can work with JPL etc and UC CSUs. Up north much of this is voluntary but should be mandatory in SCD to meet or beat 2050 less co2 e 80% reductions from 1990 levels or more sooner ! We must bring back good ole command and control ! ITSCP Now !!!

YY - 7

This covers best practices ie solar conversion nowfor commercial ,industrial, and residential BARACT when installing any new or backup heating system or HVAC. on transfer of title etc or sooner for retrofits. Tone up nortyh to a great degree including the Cities of SF Berkeley, Pleasanton Peadmont and Albany etc.....

Part 7 of Third Comments PACE (Property Assesed Clean Energy should be used to finance ee/solar RE converions including like in Sonoma a new Health Spa Gym withSolar Hot Water) and in new developments in the City of Petaluma etc As cited in July comments interest rates are the lowest they have been ever or since the Great Depression of the 1930s . Putting in energy efficiency/conservation with solar rewneables conversion the total system is more cost effective. The same is true when financing with low interest plus as cited in July the cost of PV has been reduced considerably making solar /ee/ec cost effective now using life cycle cost analysis etc...

Responses to Comment Letter YY
Harvey Eder

Response to Comment Letter YY-1:

We are familiar with the EPA document *Incorporating EE/RE Policies and Programs into State and Tribal Implementation Plans*. Appreciate the set of comments for the 2012 AQMP and we still have the file containing the comments submitted during the AQMPs in 1988 and 1991.

Response to Comment Letter YY-2:

Could not find this control measure for Washington DC area, appreciate any reference that can be provided to locate. Also see response AAA-1 on achieving reductions from implementing renewable energy sources.

Response to Comment Letter YY-3:

We will look further into the Marin Energy Authority and also speak with BAAQMD on this organization.

Response to Comment Letter YY-4:

Feedback loops are a big concern with climate change. However, they are not directly associated with reducing fine particulate matter.

We recognize the larger GWP potentials of climate forcers with shorter atmospheric lifetimes, such as methane, when looking at a 20 or 10 year time horizon. Referencing these larger GWPs on a shorter timeframe have no impact on the Basin achieving PM2.5 standards. We are working on also working on identifying ways to assess the forcing impacts of other components such as the black carbon emitted within the Basin.

Response to Comment Letter YY-5:

We have received previous comments which are included in previous sections and have taken note of the correction.

Response to Comment Letter YY-6:

The primary purpose of the 2012 AQMP is to develop control strategies that bring the Basin into compliance with the federal fine particulate standard. We are working with the State in helping achieve the goals of S-3-05. The jointly developed document between SCAQMD, San Joaquin APCD, and the ARB “Vision for Clean Air: A Framework for Air Quality and Climate Planning” shows pathways on how we can achieve 2050 GHG reduction levels. As shown in the document there is not a single

pathway that can be taken to meet the GHG goals and further development and implementation of transportation technologies is needed.

Mandating the requirement that no new natural gas powered power plants greater than 50MWs be built might not make the implementation of renewable energy sources possible. The discussion below describes the intermittency that renewable energy sources add into the grid. There is a need to develop technologies at a faster rate that can help provide a more reliable grid with renewables without relying upon fossil generating sources.

Response to Comment Letter YY-7:

We have and will continue to work with local governments in developing their climate action plans. We also frequently collaborate with JPL and LBL.

Response to Comment Letter YY-8:

Chapter 10: Climate and Energy of the AQMP discusses financing programs such as PACE for RE and EE purposes.

ZZ. Pacific Merchant Shipping Association (PMSA), October 31, 2012

October 31, 2012

Executive Officer
South Coast Air Quality Management District
21865 E. Copley Drive
Diamond Bar, CA 91765

Subject: Comment Letter – 2012 Air Quality Management Plan for PM 2.5

The Pacific Merchant Shipping Association (PMSA), which represents ocean-carriers and terminal operators at ports throughout the state of California, appreciates this opportunity to comment on the South Coast Air Quality Management District's (SCAQMD) 2012 Air Quality Management Plan (AQMP) for PM 2.5. PMSA and our individual members have proactively worked with the local port authorities to develop a systematic approach to the reduction of air quality emissions through the implementation of the voluntary measures of the San Pedro Bay Ports Clean Air Action Plan (CAAP)". In addition, PMSA members have taken a leadership role in developing and implementing most of the measures included in the CAAP and by supporting the development of international standards and regulations. While PMSA and our members are proud of our contributions to air quality in and around the Ports of Los Angeles and Long Beach (Ports), we cannot support some of the measures of the 2012 Air Quality Management Plan because they are unnecessary, infeasible, and outside the authority of the SCAQMD.

ZZ - 1

First and foremost, we want to congratulate the SCAQMD on demonstrating in the 2012 AQMP that the Annual PM 2.5 National Ambient Air Quality Standard (NAAQS) of $15 \mu\text{g}/\text{m}^3$ will be met by the attainment deadline of 2014. It is because of that success that the proposed Stationary Source Measure, IND-01, "Backstop Measures for Indirect Sources of Emissions from Ports and Port-Related Sources" is unnecessary. Besides the simple fact that the measure applies to both on-road and off-road mobile sources, and therefore it makes no sense to categorize it as a stationary or an area source, it also implies that the Ports somehow have legal authority to impose controls. The measures of the CAAP are by definition voluntary in nature as they must be since the Ports neither own nor operate the equipment.

Further, for either the SCAQMD or the Ports to regulate the equipment under this Port Backstop Measure the United States Environmental Protection Agency (EPA) would have to grant a waiver under the Clean Air Act. Even then it is difficult to envision how EPA could grant such a wide sweeping waiver since the regulation of locomotive equipment is specifically pre-empted under Section 209 of the act rendering the measure infeasible.

ZZ - 2

Even without the federal pre-emption issue the Port Backstop Control measure still fails to demonstrate feasibility since the 2012 AQMP fails to quantify the emissions benefits of the measure

ZZ - 3

Pacific Merchant Shipping Association
300 OceanGate, 12th Floor, Long Beach, CA 90802

(562) 432-4042 fax (562) 432-4048

and further fails to disclose the cost of implementing the measure. Without any gauge of the cost or the benefit of the Port Backstop control it is not possible to determine if the measure is feasible and if feasibility cannot be clearly demonstrated then the control measure has no place in the current AQMP. It certainly makes no sense to imply if the region for some reason fails to achieve attainment of the PM 2.5 NAAQS that the Ports are somehow solely responsible for bringing the entire region back into attainment. Clearly, if the 2012 AQMP is wrong about achieving or maintaining attainment of the PM 2.5 NAAQS then the entire region, and all sources with the district must be re-evaluated to demonstrate attainment, not just the port sources.

ZZ - 3

For the same reasons listed above the Off-Road measures, OFFRD-04, "Further Emission Reductions from Ocean-Going Marine Vessels While at Berth" and OFFRD-05, "Emission Reductions from Ocean-Going Marine Vessels" should also be removed from the 2012 AQMP. Since these measures are clearly included under the umbrella of the Ports CAAP their listing here constitutes a double counting of the elements already included in IND-01. That is it would be a double counting if these measures were quantified and the costs of implantation estimated. Just as the measures for IND-01 fail to demonstrate need and feasibility so do these measures and they should be removed from the 2012 AQMP.

ZZ - 4

Regardless of whether these measures are included in the 2012 AQMP they will continue to provide air quality benefits to the regions. The Ports and their industry partners have developed an effect mechanism through the CAAP, that is now backstopped by state, federal, and international regulations that ensures that the fair share goal, and hence, the emission reductions alluded to by this AQMP, will be met. PMSA and our members are committed to the goals of the voluntary CAAP and therefore request that the SCAQMD remove the infeasible and unnecessary measures, IND-01, OFFRD-04, and OFFRD-05, from this AQMP.

Respectfully submitted,

Vice President

Responses to Comment Letter ZZ
PMSA

Response to Comment Letter ZZ-1:

The comment asserts that PMSA has worked with the Ports on the Clean Air Action Plan, but that PMSA believes the Port Backstop Measure (IND-01) is not necessary, and should not be classified as a stationary source measure. Also the Ports lack legal authority over equipment they do not own or operate.

The AQMD staff appreciates the efforts of all parties in implementing the Clean Air Action Plan (CCAP). However, Measure IND-01 is still necessary because it serves to ensure that the emissions from port-related sources for future years will in fact be at or below the emissions included in the future year baseline emission inventories. These reductions are part of the emission reductions used to demonstrate attainment with the PM_{2.5} standard and thus this measure is a necessary part of the PM_{2.5} SIP. This measure is most appropriately categorized as an indirect source measure, rather than a stationary source measure, because it is directed at the ports based on the fact that the ports attract mobile sources of pollution. See 42 U.S.C. 7410(a)(5)(C). Indirect sources are considered a type of “nonvehicular” source, so that is why the measure appears under the stationary source category. 76 Ops. Cal. Atty. Gen. 11, 14 (1993). However, there should not be any confusion on this issue since the measure is entitled “IND-01”, standing for “indirect source.” Finally, it is the nature of many indirect source measures that the source does not own or operate the mobile sources which it attracts. For example, the AQMD’s Rule 2202 applies to employers of 250 or more, but the employer does not own or operate the commuter vehicles.

Response to Comment Letter ZZ-2:

The comment asserts that any regulation of port sources would require a waiver from U.S. EPA, under Clean Air Act Section 209, and that even EPA cannot grant a waiver for locomotive sources.

An indirect source regulation is not preempted by Clean Air Act Section 209 and may be valid even though it affects sources for which the Clean Air Act would require a waiver in order to establish an “emission standard.” *National Ass’n. of Home Builders v. San Joaquin Valley APCD*, 627 F. 3d 730 (9th Cir. 2010). Moreover, if any measures are later determined to require a waiver, AQMD would work with CARB to seek such a waiver. Updates to the AQMP and state SIP routinely include control measures that would require a waiver, even though the waiver has not yet been granted.

Response to Comment Letter ZZ-3:

The comment asserts that the AQMP fails to demonstrate feasibility for IND-01 because it fails to disclose the cost of implementing the measure. Further, the measure

should not imply that the ports are solely responsible for bringing the region into attainment if the region fails to timely attain the PM_{2.5} standard.

IND-01 does not place the entire burden of attaining the standard on port-related sources but will evaluate the feasibility of further emission reductions from these sources using a “fair-share” methodology. This means the AQMD will seek reductions from all types of sources contributing to any nonattainment. This feasibility analysis would include all affected stakeholders. The costs of implementing the measure will depend on the amount of emission reductions needed to reach the targets of the measure, and so cannot be determined now.

Response to Comment Letter ZZ-4:

The comment asserts that the two off-road measures OFFRD-04 “Further Emission Reductions from Ocean-Going Marine Vessels While at Berth” and OFFRD-05, Emission Reductions from Ocean-Going Marine Vessels” should be removed from the AQMP because they are incorporated in measure IND-01, and are “double-counted” with the Port CAAP. Also, the measures fail to demonstrate need and feasibility.

Staff disagrees with this statement. First, OFFRD-04 and OFFRD-05 measures are designed to be implemented after IND-01, ensuring that the reductions are not included with those from measure IND-01. Second, both OFFRD-04 and OFFRD-05 target emission reductions that go beyond what is required in IND-01. In general IND-01 reductions are consistent with reductions expected from the state, federal, and international rules applicable to mobile sources operating at the ports. Reductions from both off-road measures would be realized by achieving compliance rates above those required by the applicable regulations. For example, OFFRD-04 targets emission reductions from vessels that are not subject to CARB’s shorepower regulation such as bulk cargo vessels and tankers, resulting in emission reductions not included in IND-01. Therefore, any emission reduction credit claimed in the SIP for these two measures would only be for reductions going beyond what is already assumed in the future year baseline inventories. Therefore, there would not be double-counting. As explained in Response to Comment ZZ-2, indirect source measures are not preempted by Section 209. Similarly, operational requirements or fuel requirements are not preempted by the Clean Air Act. *Engine Mfr’s Ass’n. v. EPA*, 88 F. 3d 1075 (D.C. Cir. 1996). To the extent the measures would require a waiver from U.S. EPA, the AQMD would work with CARB to obtain a waiver.

Comments by Sierra Club Angeles Chapter on
Draft South Coast Air Quality Management Plan (AQMP)

October 31, 2012, sent to: 2012aqmpcomments@aqmd.gov

Dear South Coast Air Quality Management District,

For over a decade, the top priority of the Sierra Club has been stopping global warming to protect life on this planet. We are pleased with the emphasis placed in both the AQMP and PEIR on analyzing and reducing GHG emissions.

As the PEIR correctly reports, "Executive Order S-3-05, . . . established emission reduction . . . goals to . . . reduce GHG emissions . . . to 80 percent below 1990 levels by 2050." The SCAQMD is legally bound to comply with Executive Order S-3-05. Therefore the AQMP must show how it supports reduction of "GHG emissions . . . to 1990 levels by 2020, and to 80 percent below 1990 levels by 2050."

Since there are many sources of GHG emissions in addition to fossil fuels, such as industrial processes, to achieve 80 percent below 1990 levels by 2050 means that essentially all use of fossil fuels for combustion (such as natural gas for electricity and hot water) must end by 2050. Since most large natural gas power plants have life expectancies of 40 years, it is past time for AQMP to state its policy is not to issue permits for any new large natural gas plants (peakers less than 50 MW to support renewables are acceptable if need is proven). This would support reductions of both NOx and GHG emissions.

A simple straight line extrapolation from 1990 levels by 2020 to 80 percent below 1990 levels by 2050 yields 40% percent below 1990 levels by 2035. Thus this AQMP must show how it is on track to reduce GHG emissions to 40% percent below 1990 levels by 2035, the final target date in this plan (and the SCAG RTP).

Thus it is time for SCAQMD to end support for natural gas, whether it is for large natural gas power plants, hot water heaters, or even some industrial uses, which could be supplied by solar hot water, especially concentrating solar. State goals are zero net energy new buildings (residential by 2020 and commercial by 2030). SCAQMD should support this by all feasible control measures, plus investigate how to require this on sales.

We also call to SCAQMD's attention Sierra Club California's formal opposition to new licensing of all new natural gas-fired electrical generation power plants (larger than 50 MW). The only exceptions are permitting of certain technologies using natural gas fuel (such as cogeneration plants, renewables with natural gas backup, large fuel cell facilities, biogas wheeling) only if they significantly reduce fossil fuel consumption and carbon emissions and protect air quality.

AAA - 1

This discussion has important implications for control measures, especially those that must begin now, because of the extremely slow turnover of residential, commercial, and government buildings. Some examples of such control measures would be as follows:

- Requiring solar PV electricity generation for new, major remodels, and sales of residences, commercial, industrial, and government buildings.
- Requiring solar thermal hot water generation for new and major remodels of residences, commercial, industrial and government buildings.
- Requiring solar thermal hot water generation for new swimming pools.
- Requiring industrial processes to install energy efficiency measures and convert as rapidly as possible to solar thermal hot water generation wherever feasible.
- Requiring all new and major remodels of all large commercial, industrial and government buildings to install additional solar thermal generation to supply heat in the winter and operate absorption chillers for cooling in the summer.
- Requiring district heating and cooling wherever feasible.
- Requiring use of waste heat and co-generation where feasible from fuel cells or other sources of heat in large commercial, industrial and government buildings.
- Requiring fleets to go to zero emission vehicles, such as battery electric vehicles charged by solar panels, or fuel cells fueled by hydrogen produced by solar electricity.
- Requiring electric vehicles charging stations to be installed in all businesses and commercial buildings above a minimum size.

AAA - 2

Mitigations for GHG effects of the use of natural gas need to be expanded. For example, Control Measure INC-01 must be amended to include efficiency and solar thermal for hot water and industrial processes. There also need to be additional control measures mandating implementation of the above requirements.

We oppose any fossil natural gas used in relation to Control measures IND-01, ONRD-01, ONRD-02, ONRD-03, ONRD-04, ONRD-05, OFFRD-01, OFFRD-02, OFFRD-04, ADV-01, ADV-02, ADV-03, ADV-06, and ADV-07, which have the potential to require the use of alternative fuels. If natural gas is involved, it is erroneous to state in PEIR 4.2-47 that: "Alternative fuels generate less GHG emissions when combusted compared to gasoline and diesel and generate less GHG emissions from production when compared to petroleum products. Therefore, no increase in GHG emissions is expected from the use of alternative fuels and no significant impacts are expected."

The reason for the Club's opposition is the latest science: "Using all available information and the latest climate science, we conclude that for most uses, the GHG footprint of shale gas is greater than that of other fossil fuels on time scales of up to 100 years. When used to generate electricity, the shale-gas footprint is still significantly greater than that of coal at decadal time scales but is less at the century scale. We reiterate our conclusion from our April 2011 paper that shale gas is not a suitable bridge fuel for the 21st Century." – from "Venting and leaking of methane from shale gas development," by Robert W. Howarth, Renee Santoro & Anthony Ingraffea, *Climatic Change* (2012) 113:537–549.

In addition, we suggest that the urgency of reducing climate change and GHG emissions be added to: EDU-01: FURTHER CRITERIA POLLUTANT REDUCTIONS FROM EDUCATION, OUTREACH AND INCENTIVES:

AAA - 3

The scientific consensus is that humanity has only a few years to divert from the fossil fuel path before irreversible tipping points are passed and climate change becomes runaway climate chaos. We are grateful AQMD has recognized this challenge and we call for redoubling of GHG reduction efforts.

Thank you for the opportunity to comment.

Jim Stewart, PhD, Chair

Responses to Comment Letter AAA
Sierra Club Angeles Chapter

Response to Comment Letter AAA-1:

The primary purpose of the 2012 AQMP is to develop control strategies that bring the Basin into compliance with the federal fine particulate standard. We are working with the State in helping achieve the goals of S-3-05. The jointly developed document between SCAQMD, San Joaquin APCD, and the ARB “Vision for Clean Air: A Framework for Air Quality and Climate Planning” shows pathways on how we can achieve 2050 GHG reduction levels. As shown in the document there is not a single pathway that can be taken to meet the GHG goals and further development and implementation of transportation technologies is needed.

Mandating the requirement that no new natural gas powered power plants greater than 50MWs be built might not make the implementation of renewable energy sources possible. In addition, it is proven that natural gas provides cleaner combustion than gasoline and diesel combustion. The discussion below describes the intermittency that renewable energy sources add into the grid. There is a need to develop technologies at a faster rate that can help provide a more reliable grid with renewables without relying upon fossil generating sources.

Response to Comment Letter AAA-2:

The AQMD recognizes the clean air benefits renewable energy provides to both the electric power grid and other services such as hot water heating. Chapter 10 of the AQMP addresses the implementation of the States 33% renewable portfolio standard along with the benefits increased efficiency provides on reducing fuel and energy demands. This chapter shows the total energy consumption in Sothern California was near 2.1 quads in 2008 and is expected to show a slight 0.1 quad increase by 2023. However, the slight increase in projected energy use in Southern California will be met with an increase in energy prices; in 2008 close to \$54 billion was spent on energy and the projected cost of energy consumption in 2023 is \$74 billion. Overall the projected 5% increase in energy consumption is going to be met with a 27% increase in energy prices. As mentioned within this chapter, significant implementation of renewable energy coupled with the transportation system will help lower emissions, reduce impacts from volatile energy prices, help localize dollars spent on energy, and provide some isolation from increasing energy costs.

The AQMD endorses solar power as a clean air solution to help provide emission free electricity to residences and businesses whenever feasible. We have been an early supporter of implementing new solar technologies. At the AQMD headquarters, we currently have over 180kW of solar panels installed that are demonstrating three different solar technologies. Additionally, we are funding and undertaking several

technology demonstration projects that help address the limitations of solar, such as, coupling solar power production with energy storage to help with intermittency. We also promote the benefits electrification technologies provide to clean the air such as electric vehicles, and as mentioned earlier, advocate for the electrical supply to be from clean air sources such as renewables.

The prices of solar panels has come down nearly a third in the past couple of years due to less expensive ways to manufacture polysilicon, an increase in solar manufacturers, and expiring solar incentives in other countries. Resulting price declines have made PV solar very competitive with conventional generating technologies. This decline in prices has helped implement this technology in Southern California as there are now many solar installation companies that employ thousands in this sector. The recent increase in rooftop solar PV installations does not show any indication of slowing down in the near future since financing mechanisms have become available along with local incentives and federal tax credits. Additional incentives for solar installations are also likely in the near future as a portion of the revenues utilities start to receive from the CARB GHG Cap and Trade program under AB 32.

Unfortunately, solar power does not currently provide a standalone solution to providing all the electrical generation needs for Southern California. Until the intermittency problem is addressed, large storage technologies, and increased panel efficiencies become more cost effective, existing natural-gas fired power generating technologies are required to provide base loads, ramp rates, and other ancillary services such as frequency regulation to ensure a stable and reliable grid. Additionally, the clean air benefits renewable energy sources such as solar power provides in Southern California will be best realized as transportation technologies such as electrification are implemented at a faster rate.

In a Vision for Clean Air: A Framework for Air Quality and Climate Planning biofuels was presented as a one component among several to meet the GHG goals of the State. The use of biofuels does not typically provide an advantage in reducing criteria pollutants if they are combusted in standard IC engines such as diesels. Therefore in the document it was stated “In the longer-term, to meet the greenhouse gas targets, any combustion-based heavy-duty trucks would rely predominantly on efficiency and renewable and biofuel solutions. However, to achieve the air quality standards in the South Coast, a technology transition to zero- and near-zero emission trucks (e.g., electric, fuel cell, or hybrid with all electric range) to reduce NOx emissions is also needed.” In summary, staff supports the development and implementation of solar energy technologies to the maximum extent feasible and cost-effective. These technologies are not needed to attain the PM2.5 standards, but staff will continue to support solar technologies for attaining the ozone standards in the future

The primary objective of INC-01 is to develop programs that promote and encourage adoption and installation of cleaner, more-efficient combustion equipment with a focus on zero and near-zero emission technologies. The commenter's request to include "efficiency and solar thermal for hot water and industrial processes" in INC-01 is not necessary as those example are in concert with the goals of INC-01.

Some of the alternative technologies stated included using natural gas in cogeneration, using biogas, and large fuel cells. Currently the AQMD is funding demonstration projects with many of these technologies and alternative sources of fuel. Biogas can provide a good replacement for natural gas and has GHG benefits but currently has limited supply sources with high upfront costs to develop new sources. Generation sources using natural gas for fuel cells have many applications to provide a generation source and waste heat recovery for a building. The AQMD is currently installing a demonstration unit to further investigate these benefits. However, large fuel cells are currently very costly and the efficiency of the system with waste heat recovery is similar to a combined cycle power plant. As the costs of these systems come down they can be more widely implemented and have criteria pollutant emission benefits over large power generating facilities.

Some of the proposed control measures are covered under the Title 24 building standards. Many of the other proposed measures we support. However, as stated earlier many of these measures are costly to implement, some are broadly covered in the control measures, some are covered under the regulations or market programs in AB32, and many listed do not directly help bring the Basin into compliance with PM-2.5.

Response to Comment Letter AAA-3:

Many of the components of this educational control measure will reduce both criteria and GHG pollutants.

BBB. RadTech, October 31, 2012

October 31, 2012

Ms. Elaine Change
South Coast Air Quality Management District

Diamond Bar, California 91765

Re: Public comments 2012 Draft Air Quality Management Plan

Dear Elaine:

RadTech International is pleased to comment on the draft AQMP. RadTech supports the district's efforts to improve air quality in the Basin without sacrificing a healthy business climate and believes that the implementation of UV/EB technology can help accomplish both goals.

As you know, I am also a member of the district's AQMP advisory committee and have been making comments during those meetings as well. I would like to encourage the district to consider UV/EB technology as one of the many alternatives to achieve clean air standards. The table below gives a picture of the categories where our technology can play a role. A notation is included to differentiate between areas where the technology is currently being used versus areas where the technology is under development but not necessarily commercially available.

- [Rule 1103](#) Pharmaceuticals and Cosmetics Manufacturing Operations **CURRENT UV MARKET**
(Amended March 12, 1999)
- [Rule 1104](#) Wood Flat Stock Coating Operations **CURRENT UV MARKET**
(Amended August 13, 1999)
- [Rule 1106](#) Marine Coating Operations **Some UV and developing applications for UV**
(Amended January 13, 1995)
- [Rule 1106.1](#) Pleasure Craft Coating Operations **Some UV and developing applications for UV**

BBB - 1

We commend district staff for proposing incentive programs such as INC-01 and INC-02, that encourage voluntary emission reductions. Unfortunately the current proposal does not make these programs available to stationary sources of VOCs. We urge the district to extend the incentives program to VOC stationary sources.

We have seen voluntary conversions to UV/EB technology, even without regulatory drivers. Typical UV/EB materials have VOC contents of less than 50 grams per liter. In contrast, the typical VOC limits in district rules are in the neighborhood of 300 grams per liter. The sources that have voluntarily converted and are achieving emission reductions above and beyond those required by district rules, get little if any, rewards for going the extra mile. Instead, we see incentive programs focusing on mobile sources while stationary sources are impacted by command and control approaches.

BBB - 2

We urge the staff to investigate an alternative approach that is less reliant on NOx reductions and which, may turn out to be more cost effective for industry.

We appreciate your attention to these issues and look forward to a productive rulemaking effort.

Sincerely

Rita M. Loof
Director, Environmental Affairs

Responses to Comment Letter BBB
RadTech

Response to Comment BBB-1:

The District appreciates the hard work that RadTech has invested in promoting cleaner coating technology and continues to support all companies that manufacture and use zero- and near-zero emission technologies. Control measure CTS-02 will focus on select coating, adhesive, solvent and lubricant categories, such as some of the rules listed by commenter, to further limit the allowable VOC content in formulations. Thus, cleaner coating technologies such as UV/EB technology can assist affected industry to comply.

Response to Comment BBB-2:

To meet the ozone standards, it will be important to achieve both NO_x and VOC emission reductions. Based on the carrying capacity developed in the 2007 AQMP and the 2023 emission inventory developed in the 2012 AQMP, there will be a need to reduce NO_x emissions by 65 percent from baseline and 3 percent VOC emissions from 2023 baseline in order to demonstrate attainment of the ozone standards. Thus, INC-01 was developed to target the stationary combustion sources that generate NO_x emissions to assist in the “NO_x heavy” reduction strategy. INC-02, however, does not focus on a particular pollutant or source type so manufacturers of zero- and near-zero emission technology are encouraged to take advantage of the expedited permitting and CEQA preparation benefits from INC-02. Previous incentive programs that have focused on mobile sources generally have done so because the implementing legislation specifies how the money must be spent.

RE: Second Comment Letter – 2012 Draft AQMP

Dear Dr. Chang,

The California Council for Environmental and Economic Balance (CCEEB) is a coalition of California business, labor and public leaders that work together to advance strategies to achieve a sound economy and a healthy environment. Founded in 1973, CCEEB is a non-profit and non-partisan organization.

Our members have great interest in the Air Quality Management Plan (AQMP), as it serves as the basis for virtually all decisions made by the District with regard to its control strategy. Collectively, our members spend hundreds of millions of dollars with their operations in the South Coast Air Basin and provide jobs to thousands of South Coast residents. Our goal is to work with the District and its Governing Board to help develop an AQMP that:

- Meets state and federal obligations,
- Provides a clear path forward to allow our members and all stakeholders to make sound investment decisions,
- Reduces emissions fairly across different emissions sources, recognizing limits in regulatory authority, cost effectiveness and technological feasibility, and
- Achieves needed emission reductions while protecting the economic vitality of the region.

This letter is CCEEB's second set of written comments on this plan. In addition, we have met with you, your staff and Dr. Wallerstein on numerous occasions as well as with several members of your Governing Board. Throughout all of this interaction, we have seen great improvement to the plan, yet there remain three areas of significant concern.

CCC - 1

Elaine Chang, Dr. P.H.
October 31, 2012
Page 2

Scope

Since this process has begun, CCEEB has expressed its view that this plan should focus on PM_{2.5}. EPA requires the SCAQMD to submit a 2012 AQMP to show attainment of the 24-hour PM_{2.5} standard by 2014. EPA does not require this plan to address ozone. CCEEB recommends that the 2012 AQMP be limited to PM_{2.5}.

CCC - 1

One-Hour Ozone Attainment Demonstration

CCEEB is well aware of the enormous challenge facing the District with regard to ozone, and staff's desire to begin to identify specific control measures that will reduce the size of the so-called "black box" under Section 182(e)(5). CCEEB is also aware of the proposed action by EPA calling for the submittal of a revised AQMP providing for attainment of the 1-hour ozone standard. The proposed action was published in the Federal Register on September 19, 2012, and the comment deadline was recently extended to November 8, 2012. Following a review period to respond to comments, we expect EPA to finalize the rule in 60 to 90 days. It is our understanding that the District would then have one year to submit the 1-hour attainment plan to EPA.

CCC - 2

Given this time frame, and the fact that we do not even have a final rule, we see no logical reason to include the 1-hour ozone attainment demonstration in the 2012 AQMP. Rather, we see this as an opportunity to gain a full understanding of the technological feasibility and cost effectiveness of measures necessary to meet the 1-hour standard. We recommend submittal of the 1-hour ozone attainment demonstration to EPA at a time much closer to its actual due date.

RECLAIM

CCEEB is highly concerned with the possibility of having multiple rulemakings with multiple shaves in the NOx RECLAIM program over the next few years. We strongly recommend that the District address any shave to the NOx RECLAIM program through one rulemaking based on a control measure in the 1-hour ozone submittal. The Southern California economy is slowly recovering from recession. Particularly in this fragile period, businesses in the RECLAIM program want greater certainty in order to plan for required emission reductions and to assess the market. This District can best address the need for planning certainty through one rulemaking.

CCC - 3

As we understand the current 2012 AQMP proposal, facilities would face a potential 2-3 tpd shave in 2015 as a contingency measure if attainment for PM_{2.5} is not met by end of 2014. In a second phase, staff would determine the amount of the shave through an extensive BARCT analysis to meet the requirements of the proposed SIP call for the 1-hour ozone standard. This shave would include the 2-3 tpd Phase I reductions if PM_{2.5} attainment is met. An additional shave could be included as a control measure in the 2015 AQMP for ozone. Because so little is known about these shaves (e.g., percent reduction, timing, impacted facilities, etc.), a high level of uncertainty results for those in the program, which in turn severely jeopardizes business decisions necessary to establish long-range capital and compliance plans.

Elaine Chang, Dr. P.H.
October 31, 2012
Page 3

With regard to the NOx RECLAIM program, CCEEB recommends the following actions:

- Base any shave on an extensive BARCT analysis.
- Address any shave to the program through one rulemaking.
- Remove RECLAIM as a contingency measure in the 2012 AQMP. The 14 to 1 ratio to achieve credit for PM reductions from NOx makes this control measure cost prohibitive, even as a contingency measure.
- Shift the currently proposed Phase 2 RECLAIM shave from the 2012 AQMP to the 1-hour ozone submittal expected to occur in just over a year. Include a full BARCT analysis to determine the appropriate level of the shave.
- Provide assurance to industry, to the extent possible, that it is the District's intent that the control measure in the 1-hour ozone submittal will satisfy any NOx RECLAIM measure in the 2015 ozone AQMP.

CCC - 3

Thank you for considering our views. We would be pleased to discuss our comments with you and your staff at any time.

Sincerely,

William J. Quinn
Vice President & Chief Operating Officer

cc: Dr. Barry Wallerstein
Dr. Phillip Fine
Mr. Gerald D. Secundy

Responses to Comment Letter CCC
CCEEB

Response to Comment CCC-1:

Staff believes that given the short timeframe and the fact that a significant fraction of the large amount of emission reductions needed to meet the 8-hour ozone standard by 2023 is still from yet to be specified “black box” measures, it is important to identify specific measures to achieve the needed reductions as soon as possible. Comments and potential litigation on U.S. EPA’s approval of the 2007 ozone SIP have called into question the relative size and reliance on “black box” measures to demonstration ozone attainment. Making SIP commitments for reductions when they are identified as feasible demonstrates AQMD’s commitment to reduce reliance on “black box” measures as attainment deadlines approach.

Response to Comment CCC-2:

A requirement for the submittal of an attainment demonstration for the revoked 1-hour ozone standard has been proposed by U.S. EPA, and the submittal will be due by late 2013 or early 2014. As the commenter is aware, the emissions inventory, control strategy and RACT/RACM analysis has already been developed for the 2012 AQMP, and because attainment of the 1-hour standard is based on the same strategy as that proposed for the 8-hour ozone standard (although both Plans rely on “black box” reductions). As such, staff was able to complete an attainment demonstration for the 1-hour ozone standard as an Appendix to the 2012 AQMP. Staff believes that there is no reason to wait until the 1-hour ozone attainment demonstration is due given that no new measures are being proposed and the work has been completed. Utilizing the current 2012 AQMP emissions inventory, modeling framework and public process is the most efficient use of resources and time. Furthermore, there is little current or expected guidance from U.S. EPA on the technical approach to the 1-hour ozone attainment demonstration. Staff believes it has developed the most reasonable approach, and that submitting the 1-hour ozone attainment demonstration with the 2012 AQMP will be the best way to promote and get feedback on this approach from U.S. EPA.

Response to Comment CCC-3:

The NO_x shave (Phase I of CMB-01) will target surplus unused RTC’s currently in the NO_x RECLAIM market as a contingency measure to satisfy CAA requirement to be triggered if the NAAQS is not attained by 2014. This is a necessary contingency measure because the excess of reductions from wood burning curtailment is not enough to meet the EPA requirement of one-year’s worth of emission reductions. The two ton per day target represents approximately 25 percent of the un-used RTC’s in the RECLAIM universe. The two ton per day shave proposed in the 2012 AQMP is expected to have only a minor impact on the program as a whole. As such, staff plans to commence the rule amendment process in late 2012 targeting a midyear 2013

adoption date. While staff acknowledges that the economic turndown post 2008 had an impact on the RECLAIM market. The current RECLAIM market has approximately one third (8 TPD) of the total RTC's not being utilized. Staff recognizes that this is an aggressive timetable; regardless every effort will be made to expedite the rule amendment process. The CAA requires that contingency measures be fully adopted and in place prior to the attainment date. While the contingency measure is targeted for implementation in 2015, U.S. EPA will take into consideration the progress (or completion) of the rule amendment when evaluating the Draft 2012 AQMP for completeness prior to making its recommendation on the plan's approval. Staff believes that as long as the rule making process is well under way with a reasonable date established for the Public Hearing, that U.S. EPA will not consider this as a barrier to the evaluation and approval process.

The two tons per days reduction proposed for the 1st phase of the RECLAIM shave will be incorporated as a contingency emissions reduction measure to satisfy CAA requirement to be triggered if the NAAQS is not attained by 2014. If not triggered, the 2 TPD shave will be rolled into the proposed Phase II BARCT rule amendment process. This process will undergo a full assessment of available technology, costs, affordability, and market impacts to the RECLAIM stakeholder community, as well as a fully transparent public evaluation of the potential for emissions reductions. The BARCT assessment phase of the NOx RECLAIM shave is to be completed in 2015 and fully achieved by 2020.

DDD. The Port of Los Angeles, Port of Long Beach, October 31, 2012

October 31, 2012

Barry Wallerstein, D. Env.
South Coast Air Quality Management District

Re: Supplemental Comments on the Revised Draft 2012 Air Quality Management Plan

Dear Dr. Wallerstein:

The Port of Long Beach and Port of Los Angeles (ports) are submitting this comment letter to add to comments previously submitted on August 30, 2012.

As members of the South Coast Air Quality Management District's (AQMD) 2012 Air Quality Management Plan (AQMP) Advisory Committee, the ports have worked with AQMD staff to provide comments on the draft plan, including the emissions data being used. Included in this effort, ports' staff provided the 2008 base year emissions inventories for the port sources based on the most recent methodologies agreed upon by the Technical Working Group (TWG) in the ports' 2011 air emissions inventories.

As noted in the Draft AQMP, "*An effective AQMP relies on an adequate emission inventory.*" Discrepancies exist between the emissions inventories prepared by the ports and the inventory prepared by the AQMD. The emissions shown in the Draft 2012 AQMP are different from those prepared by the ports in cooperation with the AQMD, California Air Resources Board, and Environmental Protection Agency, during development of the San Pedro Bay Standards. If the AQMD's emissions projections for achieving attainment are incorrect, the concerns expressed in our August 30 comments are greatly increased. The emissions projections drive both the Measure IND-01 analysis and the PM_{2.5} analysis. The basis for the Draft 2012 AQMP emissions projections is impossible to determine, because the assumptions and methodologies (including control factors and growth factors) are not disclosed.

The San Pedro Bay Ports Clean Air Action Plan was developed with the participation and cooperation of the staff of the US Environmental Protection Agency.

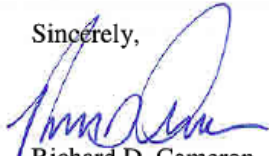

Dr. Wallerstein
October 31, 2012
Page -2-

Additionally, it concerns the ports that the AQMP has made a commitment to Measure IND-01 before AQMD has released details of its intended implementation actions against the ports, or the socioeconomic and other analyses for such actions. Elaine Chang admitted at the AQMD's October 24, 2012, meeting that it is unknown what a port compliance plan would include and that AQMD would develop it during a future rulemaking process. This violates due process, to commit to implement an AQMP measure without disclosing what AQMD's actions against the ports will be under the backstop measure, as it deprives the public and the ports of the opportunity to review and comment to influence the decision, prior to committing to it in the AQMP.

DDD - 2

This further demonstrates that the collaborative process established by the ports and the air quality regulatory agencies remains the most appropriate forum to identify and implement strategies to reduce emissions from port-related sources.

Sincerely,

Richard D. Cameron

Responses to Comment Letter DDD
The Port of Los Angeles, Port of Long Beach

Response to Comment DDD-1:

The commenter states that the Ports' specific emission inventories prepared by the AQMD are different than those prepared by the Ports and the assumptions and methodologies are not disclosed. AQMD staff disagrees with this statement. The inventory development, including the methodologies and assumptions were shared in a September 5th email to Port staff. In the email we explained that the Ports' 2008 inventory (updated by Port staff using 2011 emission inventory methodologies) was used as received as the baseline inventory. All future year projected inventories were generated from the 2008 baseline inventory and were calculated using growth and control assumptions consistent to those in CARB's approved mobile source inventory models. In summary, the Ports' emission inventory shown in the Draft 2012 AQMP was developed using the Ports' official inventory as the foundation for the baseline and forecasted inventories and is appropriate to use in the PM2.5 and Measure IND-01 analyses.

Response to Comment DDD-2:

The AQMD staff disagrees with the comment that the inclusion of Control Measure IND-01 in the 2012 AQMP violates due process. This measure would establish targets for NOx, SOx, and PM2.5 for 2014 that are based on current and projected emission inventories resulting from adopted rules and other measures such as railroad MOUs. In addition, assumptions used in the development of emission inventories for port-related sources such as ocean-going vessel speeds also contribute to the emission targets. Based on current and future emission inventory projections these rules and measures will be sufficient to achieve attainment of the 24-hr federal PM2.5 ambient air quality standard by 2014. Requirements adopted pursuant to this measure will become effective only if emission levels exceed the established targets. Once triggered, the ports will be required to develop and implement a plan to reduce emissions from port-related sources to meet the emission targets over a specified time period. The time period to achieve emission targets and any requirements to maintain attainment will be established during rulemaking.

Actions required by the ports under IND-01, have been furthered outlined in the revised control measure write-up. Additional clarification has also been provided on emission targets, triggers, cost-effectiveness and feasibility. However, it is beyond the scope of the control measure write-up to completely establish every detail that would normally be covered thorough a rule development process spanning a several month process. Specific rule requirements are best developed using a collaborative process where AQMD staff works with all stakeholders such as affected sources, environmental community, other agencies, and interested public members. Through the rule

development process the AQMD staff will establish a working group, hold a series of working group meetings, and hold public workshops. In addition, the emissions inventory and targets will reviewed and may be refined if necessary.

COMMENTS ON THE DRAFT 2012 AQMP

Dear Dr. Chang:

The California Small Business Alliance (Alliance) is a non-partisan coalition of California trade associations committed to providing small businesses with a single constructive voice before air quality management districts and other environmental regulatory agencies. As active participants in the Air Quality Management Plan (AQMP) Advisory Group, Alliance members have been continuously engaged in the development of the plan. Our members were also participants in the review of the report on the health impacts of particulate matter and the effects of other major pollutants in the South Coast Air Basin (SCAB), in conjunction with the preparation of the revised plan. Finally, Alliance members have been actively engaged in the ongoing dialog with other stakeholders representing a broad cross section of business interests, neighborhood community organizations, and local, state and federal agencies. Now, with the last round of public workshops involving the draft plan about to take place, Alliance members want to take this opportunity to offer our comments prior to the plan being presented to the governing board for review and adoption consideration.

A Fair Share Approach to Clean Air

In our comment letter on the 2007 AQMP, we credited the district for their efforts in helping to improve the air quality in the SCAB over the past 30 years. We also noted that these year-over-year improvements were due in large measure to the unwavering commitment by business owners to improve their processes and increase operational efficiency more for competitive reasons than because of increased regulatory burdens. Finally, in our letter we commented on the disturbing inequities in the plan with regard to the inequitable commitments by other agencies - particularly the California Air Resources Board (CARB) and the U. S. Environmental Protection Agency (EPA) - for achieving their portion of future emissions reductions as a condition of meeting targeted air quality standards. Regrettably, we see that these inequities have carried over into the 2012 AQMP.

Elaine C. Chang, Dr. P.H.
South Coast Air Quality Management District

Re: COMMENTS ON THE DRAFT 2012 AQMP
November 12, 2012

With each revision of the AQMP emissions from stationary sources (particularly small businesses) have become less of a factor in solving the overall complex problem of improving air quality in the SCAB. It should be common knowledge that timely attainment of federal standards can be achieved only when all agencies - not just the SCAQMD - assume their fair share of reducing emissions from the sources under their control.

EEE - 1

The 2012 AQMP, whether it is a plan containing specific control measures for only PM_{2.5}, or a plan which also includes explicit control measures for Ozone, is not likely to include similar comprehensive strategies and commitments by state and federal agencies to reduce emissions under their jurisdiction unless action is taken by the staff and governing board to shed light on the reluctance of these two agencies to be more proactive and engaged in reducing emissions. Unless this happens, the plan will contain only CARB's and EPA's *vision for clean air* in future years. And, unfortunately, the vision isn't so clear as to offer businesses, especially small businesses, some idea of how much it will add to the cost of doing business in California.

The Draft Socioeconomic Impact Report, while claiming to be "*...a rigorous application of statistical analysis and computer modeling to assess the potential impacts of the overall suite of control measures*" skillfully sidesteps the basic need for business owners to be able to anticipate the cost of doing business in the foreseeable future. The only explanation which the Staff offers is to write that "*...competitiveness of individual business sectors will be analyzed in detail during ensuing rulemaking processes*" leaving those in the business community questioning just how rigorous, reliable and useful the statistical analysis and computer modeling really is.

EEE - 2

In the Draft Socioeconomic Impact Report, the Staff write, in part, that: "*the total benefit of the Draft Plan is expected to exceed \$10.7 billion annually since not all of the benefits associated with the implementation of the Draft Plan can be quantified.*" Staff asserts that quantified health benefits only account for reduced exposure from PM_{2.5}, while those from decreased exposure to Ozone and nitrogen dioxides are not included. In conclusion, Staff writes that "*further research is needed before these benefits can be quantified.*" Alliance members have maintained in previous AQMPs, as well as in this one, that if agencies are unable or unwilling to quantify the benefits or the costs of the control measures they seek to enforce, it is irresponsible and unconscionable for them to impose such measures on the communities under their jurisdiction.

EEE - 3

The Potential Effects of the AQMP on Employment

In much the same fashion as with the 2007 AQMP, the Draft 2012 AQMP proclaims to be an indispensable ingredient in the recipe for a healthy environment and economy going forward. Then, and now, we believe we have good reason to question the reliability of the data and assumptions used to compile the socioeconomic impact reports of both AQMPs.

Elaine C. Chang, Dr. P.H.
South Coast Air Quality Management District

Re: COMMENTS ON THE DRAFT 2012 AQMP
November 12, 2012

Both AQMPs were proclaimed to be job creators. In fact, the authors of the 2007 AQMP wrote that "... without the 2007 AQMP, jobs in the four-county area are projected to grow at an annual rate of about 0.93 percent between 2007 and 2025, which would be approximately 95,000 jobs per year. Cleaner air from the 2007 AQMP would result in an additional 61,409 jobs created per year." In spite of the optimistic projections of the district's economists, computer modelers and consultants, hindsight and the National Bureau of Economic Research, tells us that December 2007 marked the date of the worst economic downturn in the United States since the Great Depression; a phenomena that was missed completely in the development of the 2007 Socioeconomic Impact Report. Another look back in history tells us that the Great Recession officially ended in June 2009, yet in California the devastation continues with double digit unemployment still existing in all but one of the four counties under the district's jurisdiction. Well over a million people are still unemployed or underemployed in the region. In Southern California, a few small businesses are selectively hiring, but most are still struggling to stay afloat.

EEE - 4

While we were encouraged to read that the district intends to " work closely with businesses and industry groups to identify the most cost-effective and efficient path to meeting clean air goals while being sensitive to their economic concerns," history tells us that whenever rulemaking involves a control measure which has been included in a State Implementation Plan (SIP), it is too late because the Staff seems to lose whatever discretion they might have had to be sensitive to business because the approved AQMP and SIP takes precedence over all else.

With the district acknowledging that while job gains from cleaner air would benefit all wage groups, all groups would nevertheless experience jobs forgone from control measures. Despite Staff's good intentions to evaluate possible negative impacts of certain control measures during individual rule development, we remain convinced that this too late in the game to be sensitive to business. Analysis of this type must begin before control measures are put into the SIP and become binding legal commitments to the federal government, regardless of the cost and administrative burden they impose upon struggling small businesses.

EEE - 5

An AQMP for PM2.5 or for PM2.5 and Ozone

We appreciate Staff's forthrightness in alerting us to the fact that the Draft AQMP for both PM2.5 and Ozone would carry a higher cost than the PM Strategy Only Alternative. Apparently, Staff also believes it would produce greater reductions of both pollutants, as well. Since the Alliance is part of a broader coalition of business interests, we will defer any direct comments on this subject to correspondence from the larger coalition.

Health Impacts and Benefits of the 2012 AQMP

Since a representative of the Alliance was seated on the AQMP Advisory Council, for the purpose of reviewing and commenting on Appendix I, and since a letter was submitted earlier reflecting our views on this subject, we believe we have made our views a matter of public record and will refrain from offering any additional comments.

Elaine C. Chang, Dr. P.H.

South Coast Air Quality Management District

Re: COMMENTS ON THE DRAFT 2012 AQMP
November 12, 2012

Refinements to the Socioeconomic Report

While we appreciate Staff's inference that the Socioeconomic Impact Report in any AQMP is typically a contentious subject. Further, we appreciate that Staff has itemized a number of enhancements that they might consider investigating in future years with a view towards refining future reports. These commitments and good intentions, however, will do nothing for the 2012 AQMP. What is even more disconcerting is that small businesses are hurting TODAY. Sadly, some will not be around for another AQMP because of a variety of factors, including the rulemaking that is certain to result once this AQMP has been approved and incorporated in the new SIP. In past AQMP Advisory Group sessions, the Staff has shown a propensity for acknowledging the concerns expressed by representatives of the business community over cost-effectiveness, affordability, and technical viability of certain control measures, but never really resolving the issues. And this gives us little comfort that things will be different in the future. One recent example of this failing is a recent verbal commitment that was made by a senior staff member at the last public workshop on this very Socioeconomic Impact Report. It was during the proceedings that the staff member committed to involving the U. S. Small Business Administration in the development of the next AQMP. We hope that by not seeing this commitment in the last draft of the AQMP that it is nothing more than an oversight, and not a change of heart.

In closing, I want to express my appreciation, and that of the other members of the Alliance, for inviting us to be represented on the AQMP Advisory Group, and for allowing us to comment.

Sincerely,

Bill La Marr
Executive Officer

cc: Joe Cassmassi, Planning & Rules Manager - SCAQMD

Responses to Comment Letter EEE
California Small Business Alliance

Response to Comment EEE-1:

Fair share is one of the design principles the SCAQMD Governing Board directed the staff to pursue in developing AQMPs. It should also be noted that there are other design principles such as taking the most efficient path to clean air, choosing all feasible measures, and minimizing socioeconomic impacts.

There are also state law requirements to implement all feasible measures. One of the principles is the same as noted by the commenter to promote fair share responsibility. The development of the control measures were guided by a list of criteria located in Chapter 4 of the 2012 AQMP that includes evaluating proposed control measures based on cost effectiveness.

For the PM_{2.5} control strategy, wood burning curtailment was determined to have minimal cost impact (see Chapter 6 of the 2012 AQMP) and is an all feasible measure because wood burning curtailment is successfully implemented elsewhere in California, such as Bay Area and San Joaquin Valley. With wood burning curtailment, the 24-hour PM_{2.5} standard will be achieved by 2014 with an anticipated excess emission reduction that will be applied to contingency requirement compliance. Thus, no other PM_{2.5} reduction from other agencies is necessary. CEQA Alternative 3 also illustrated that if the attainment demonstration relies on mobile source NO_x/PM_{2.5} reductions, the Basin will not meet the PM_{2.5} standard until 2017 and at a much higher cost to the business community, including small business.

With regard to the ozone measures, the 2012 AQMP provides 11 tons per day (tpd) of NO_x emission reductions from stationary (3 tpd) and mobile (8 tpd) sources. This reduction is five percent of the estimated NO_x emission reductions of 200 tpd needed to achieve attainment of the 8-hour ozone standard (80 ppb) by 2023 and the stationary source contribution is less than 30 percent of total proposed reductions. Even more NO_x reductions will be necessary to meet the lower 8-hour ozone standard of 75 ppb by 2032. Therefore, in order to demonstrate attainment of the 8-hour ozone standard, a substantial amount of NO_x emission reductions will be necessary. In any case, since mobile sources contribute 80 percent of the total NO_x emissions, we do agree that it is imperative that reducing NO_x emission from mobile sources thru agencies who have primary authority over regulating mobile source emissions, such as CARB and U.S. EPA, need to do their fair share of reductions.

Response to Comment EEE-2:

Table 3-1 of the Draft socioeconomic report shows the cost that each industry would experience in order to implement control measures in the 2012 AQMP. The entire Chapter 6 is devoted to competitiveness issues in terms of region's share of national

jobs, cost of doing business, delivered prices, imports, and exports. As each measure goes through rulemaking, more detailed data will be developed. Thus, more detailed analyses can be rendered.

Response to Comment EEE-3:

Quantifiable clean air benefits accrued to ozone and nitrogen dioxides are not analyzed in the 2012 AQMP due to resource constraints. Unquantifiable benefits (known, suspected, or unknown effects), as denoted in Figure 3-4, will be the focus of future research.

Response to Comment EEE-4:

Socioeconomic analyses of the AQMPs examine the impact of an AQMP relative to the baseline projection of the underlying economy. The impact reflects changes from the baseline, but is not part of the baseline. Historical events, such as the Great Recession, were considered in constructing the baseline. The AQMD is cognizant of the lingering unemployment due to the Great Recession and wants to make sure that implementation of the 2012 AQMP not render adverse impacts on the local economy, as evidenced in the Socioeconomic Report.

Response to Comment EEE-5:

The benefit of cleaner air exceeds the cost of control measures, as shown in the socioeconomic report. When considering the total impact of cost and benefit on the local economy, the socioeconomic report shows that all wage groups would experience job gains.

FFF. SASOL, November 12, 2012

November 12, 2012, 2012

Dr. Elaine Chang
Air Resource Board
Sacramento, CA 95811

Dear Dr. Elaine Chang,

Subject: Air Resource Board Plan

Sasol North America appreciates the opportunity to comment on the proposed rulemaking considered for the LVP-VOC solvents discussed during the California Air Resource Board workshop on September 12, 2012.

As you know, Sasol North America produces surfactants, surfactant intermediates, long chain alcohols as well as some highly refined hydrocarbon solvents and paraffins. These products are used in many consumer products and as a result we have been actively involved in past California Air Resource Board consumer product workshops. We hope our efforts have proved helpful to CARB staff in crafting mutually acceptable regulations that help reduce air pollution in the state. This letter provides Sasol North America's comments on the proposal to change the consumer product's LVP-VOC exemption.

Sasol North America strongly urges CARB not to remove the LVP-VOC exemption from Consumer Products. We believe that the enforcement concern on multi-purpose solvents and paint thinner products that introduced the LVP-VOC issue can be easily handled by the other proposed solutions presented by CARB during the workshop. These solutions; product definition changes or most restrictive limit provisions changes, are the preferred solution since they clarify the regulation requirements, resolve the issue with the category in question, and have minimal regulatory ramifications for other consumer products. Sasol is in favor of using these approaches rather than changing the LVP-VOC exemption.

The proposal by SCAQMD to change or remove the LVP-VOC exemption is strongly opposed by Sasol North America for the following reasons.

1. Changing the statewide LVP-VOC exemption for the purpose of resolving an issue with one or two consumer product categories is a needlessly severe response with wide ranging repercussions. Changing the LVP-VOC criteria would eventually affect other consumer products and result in a wholesale re-evaluation of all consumer product categories that use LVP-VOCs. The argument that the LVP-VOC change would only affect the multi-purpose solvents and paint thinner products is ultimately untenable in today's environmental and litigious society.
2. One of the comments during the workshop was that the existing vapor pressure requirement for LVP-VOCs is "arbitrary" and thus should be reviewed (and changed). The argument that a regulatory requirement is arbitrary is misleading. SCAQMD's paperⁱ lists differences in VOC regulations between the United States, European Union and

FFF-1

FFF-2

Sasol North America Inc.
2201 Old Spanish Trail

Telephone: (+1) 337 494 5140 Facsimile: (+1) 337 494 5172
www.sasolswla.com

- Canada, and Green Seal. What was not noted is that these regulatory differences reflect the different requirements and goals put on the regulatory bodies by the individual governments or sponsors. For the California Air Resource Board, there is a requirement for regulations to be both technological and commercially feasible. The LVP-VOC exemption was a result regulatory staff working with industry input. The claim that CARB's LVP-VOC regulations, including the LVP-VOC vapor pressure cut-off, are "arbitrary" unfairly and wrongly dismisses the significant efforts of CARB staff and industry that resulted in these regulations and does not seem to us as a valid argument.
3. An associated argument is that the LVP-VOC materials have been demonstrated to be volatile by SCAQMD. This is not new information. The argument that these materials were not known to volatilize is refuted by the material designation in the existing regulations as "low vapor pressure *volatile* organic compounds" (LVP-VOCs). SCAQMD desires that "volatile" be redefined by whether a material evaporates within a six month period in a non-climate controlled area with a significant temperature and humidity range (or by a quicker laboratory test that mimics these results). We disagree with this approach for the following reasons
- a. The main issue is whether the "volatile" materials are available for ozone formation. SCAQMD assumes that available means the same as volatile. However, many LVP-VOC materials have been tested for biodegradability and are considered readily biodegradable. This means within 28 days they undergo significant decomposition, converting to CO₂, water, or biomass. This is certainly the case for most materials that go down the drain, but also the case for some products that are used and absorbed into substrates. The 180 day "volatility" period proposed by SCAQMD exceeds this period by a factor of six and appears to be set up to exclude substrate or biodegradability issues. This unfairly assumes LVP-VOC availability to make ozone when it is not.
 - b. In order to obtain reproducible results, the ASTM D-3539 test method for determining evaporation rates specifically sets limits on the liquid amount, surface area of the fluid, temperature, humidity, air flow, and specifies repeat determinations. This was not done in the SCAQMD study or at least was not apparent from the paper. In fact, SCAQMD gives ranges some of the important physical variables. This is not conducive to obtaining reproducible results.
 - c. We note that this approach will raise severe issues for the MIR regulations as well, since MIR testing does not look at availability. For example, it is claimed in the SCAQMD paper that glycerol is "clearly non-volatile" and is "not available to contribute to ozone formation". This is in opposition to the reported MIR value for glycerol of 3.15, a significant discrepancy since an MIR value of 3.15 is considered high and tends to discourage its use by formulators. Thus a change in the LVP-VOC regulations to a volatility range may affect the MIR regulations as well.
4. We note in passing a discrepancy in the proposed VOC method change; to "consider specifying that VOC content is defined as total volatile content as determined using U.S. EPA Method 24..." (see slide 32 of the public workshop slides). EPA method 24 however is described in the SCAQMD paper "unable to yield reproducible VOC content results...". In fact the associated ASTM method D-2369 referenced by EPA method 24

FFF-2

FFF-3

FFF-4

- refers to several other test methods for determining VOCs for different types of materials.
5. It is uncertain whether removing the LVP-VOC exemption would result in significant VOC emission reductions. Re-evaluation of the technological and commercial feasibility of affected products may actually result in higher ozone production potential previously demonstrated as an argument for the MIR regulations. Additionally, there are fewer options and production capability for the less volatile materials, especially hydrocarbon based materials. A review of the various hydrocarbons produced by a barrel of oil show a progressively smaller amount of high molecular weight materials available from a typical refinery. Purposely isolating some of these materials for use in consumer products will increase costs. Price conscious consumers have already demonstrated that they are willing to compound their own products when commercial products are too costly or do not function as well due to reformulations as seen by recipes available on the internet for various consumer product categories.

FFF-4

FFF-5

Sasol North America is particularly concerned with the fact that there is not enough research conducted to justify the proposed changes in the LVP-VOC regulations and we strongly urge the California Air Resource Board not to change these regulations. We look forward to working with CARB to make sure that future regulations and VOC limits are feasible, based on good science, and can improve California's air quality in a meaningful way.

Sincerely,

Wayne Sorensen and Nomihla Valashiya-Mdleleni
Product Steward

Responses to Comment Letter FFF
SASOL

Response to Comment FFF-1:

AQMD recognizes that the California Air Resources Board (CARB) has already initiated regulatory action on paint thinners and multi-purpose solvents and AQMD staff supports CARB's efforts to rectify the situation with respect to paint thinners and multi-purpose solvents through revisions to the definitions and further clarification of the most restrictive limit clause. However, during the investigation of this use of the LVP-VOC exemption, studies have shown that common LVP-VOC solvents used in numerous categories aside from paint thinners and multi-purpose solvents are widely utilized and have evaporation and reactivity profiles similar to the traditional solvent they are meant to replace. The studies further provide a clear indication that additional examination of the LVP-VOC exemption criteria is warranted and necessary to ensure that ozone benefits anticipated by amendments to the CARB Consumer Products are indeed achieved. While the issue has been unmistakably apparent for consumer product categories studied in detail by AQMD, such as paint thinners, multi-purpose solvents, and industrial and institutional cleaners, the same chemicals utilized in those categories are also widely present in many of the other consumer product categories. Many of the comment letters received regarding this proposed control measure, represented by the gamut of consumer products manufacturers, specifically state that much of their reformulation efforts have been to increase the usage of LVP-VOC solvents. Therefore, AQMD staff respectfully disagrees with the commenter and believes it is imperative to assess the LVP-VOC exemption parameters for all consumer products categories. The draft control measure emphasizes, as a first step, additional data collection through CARB surveys for not only the VOCs used in consumer product formulations, but also accurately capture the usage of LVP-VOCs and exempt solvents. AQMD staff believes that a more precise inventory of total organic gases used for ozone modeling purposes will allow a better reflection of ozone impacts from the use of consumer products. Subsequently, depending on the type and quantity of LVP-VOCs in different categories, additional review and modification of the LVP-VOC exemption must be considered.

Response to Comment FFF-2:

Staff agrees that CARB must make a determination that their regulations are both technologically and commercially feasible. Additionally, it is accurate to note that some of the limits in the Consumer Products Regulation are based on the availability of exempt LVP-VOC solvents as they are currently defined. While it should be acknowledged that this is a long standing exemption and that at the time of its adoption CARB used "more than 12 carbon atoms" as a dividing line between evaporative solvents and non-volatile surfactants and resins, recent scientific evidence show that many of the so-called LVP-VOC products exert evaporative and reactivity

characteristics that are similar to those of traditional solvents that are meant to replace. The proposed control measure seeks to utilize available scientific data to review the LVP-VOC exemption and potentially revise certain parameters for those categories where speciated LVP-VOC survey data by category and research results show an opportunity to further reduce emissions from consumer products. Revised LVP-VOC criteria should continue to provide an exemption to products that do not contribute to the photochemical ozone formation. If an opportunity exists, any proposed amendments to the Consumer Products Regulations to revise the LVP-VOC exemption would be vetted through a full public process.

Response to Comment FFF-3:

Staff agrees with the commenter that the main issue is whether the “volatile” materials are available for ozone formation. The reference paper’s purpose is to highlight that the regulatory definitions and test methods used to determine volatility are at variance with real world observations for certain types of products, including LVP-VOC solvents. This is true for both “volatile” and “non-volatile” chemicals. The observation that widely used LVP-VOC solvents completely evaporate in two days is far from the discussion of whether the volatility test should be 28 days, as the commenter suggests, or 180 days, as the paper suggests.

Several alternative concepts of determining volatility have been suggested including environmental chamber studies, partitioning, and as the commenter suggests, biodegradability and controlled evaporation rate tests (ASTM D-3539). These may be reasonable considerations that should be incorporated into future efforts to evaluate revisions to the LVP-VOC exemption. It should be noted that partitioning and biodegradability have little to do with whether the chemical is an LVP-VOC or a non-LVP-VOC. Despite this partitioning and biodegradability, some fraction of the chemical enters the atmosphere and contributes to ozone formation. Of the compounds studied (LVP-VOC and non-LVP-VOC) the highest predicted partitioning ratios into air are for some LVP-VOCs (22% for Light Distillate). It appears that there is no correlation between partitioning to air and LVP-VOC status. Additionally, it is evident that none of these concepts are built into the current criteria for the LVP-VOC definition. It is also inconsistent to point out these alternative methods of determining volatility while requesting that the LVP-VOC exemption remain unchanged.

Response to Comment FFF-4:

U.S. EPA Method 24 is a well established VOC test method for paints and coatings. The description in the paper refers to testing semi-volatile chemicals, such as metalworking fluids and other categories that are not paints and coatings. The paper illustrated that U.S. EPA Method 24 tends to have VOC content measurements higher than what was observed from evaporation data. Staff is not asserting that CARB should adopt U.S. EPA Method 24 for the Consumer Products Regulation, but rather consider

an alternative endpoint for CARB Method 310 or alternative test methods such as gas chromatography approaches included in SCAQMD Test Method 313 or ASTM D6886.

Response to Comment FFF-5:

The proposed control measure is intended to study the appropriateness of the LVP-VOC exemption in its current form, in an effort to ensure that the ozone reduction benefit of the Consumer Products Regulation is fully materialized. The proposed control measure may involve eliminating or amending the CARB LVP-VOC criteria based on scientific data which may include MIR and similar photochemical reactivity parameters. If the re-evaluation indicates that there are niche products that are infeasible, additional considerations would be made. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the CARB rule development process to ensure overall efforts are feasible, productive and cost-effective.

Diamond Bar, CA 91765-4182

Coalition Members

via email: bwallerstein@aqmd.gov

Dear Mr. Wallerstein:

The Construction Industry Air Quality Coalition (CIAQC) appreciates for the opportunity to provide these comments on the Revised Draft 2012 Air Quality Management Plan (AQMP). The 2012 AQMP will have a broad impact on the region's residents, businesses, local and state economy. For these reasons CIAQC recognizes that it is vitally important that the 2012 AQMP achieves a balanced strategy to address the federal air quality requirements.

Associated General Contractors America-San Diego Chapter, Inc.

Building Industry Association of Southern California

California Dump Truck Owners Association

Engineering Contractors Association

Engineering & General Contractors Association

Engineering & Utility Contractors Association

Southern California Contractors Association

As CIAQC and other leaders in the business community articulate in the November 2012 letter to Chairman Burke on the Draft 2012 AQMP and Socioeconomic Report, this is best achieved by including only those control measures that are actually necessary to meet legal obligations at this time. The South Coast Air Quality Management District must demonstrate achievement of the PM2.5 standards by 2014. A plan to meet the eight-hour ozone and the revoked one-hour ozone standards is not due at this time and should be developed at a later date.

The District has demonstrated in its Revised Draft 2012 AQMP that it can meet its air quality requirements with just two control measures; Reductions from Residential Wood Burning (BCM-01) and Reductions from Open Burning (BCM-02). The estimated costs of these measures is \$123,000 per year. The estimated costs of for the elective ozone portion of the Revised Draft 2012 AQMP is \$40 million per year. Including only the PM2.5 portion of the plan is the best path way forward at this time.

Included in the ozone portion of the Revised Draft 2012 AQMP is control measure OFFRD-01: Extension of the SOON Provisions for Construction/Industrial Equipment. This proposed control measure would promote the faster turnover of older in-use construction diesel engines utilizing annual incentive funding from 2014 to 2023. SCAQMD began implementing the Surplus Off-road Opt-in for NOx (SOON) Program in 2008. CIAQC supports incentive funding to achieve cost-effective emission reductions and continues to maintain that incentive programs should be voluntary, including the SOON. The SOON program however is mandatory for fleets that meet certain thresholds; they must apply for funding that covers some of the total costs to repower or replace a piece of equipment, but not all of it. CIAQC recommends that if the SOON program were to continue beyond 2014 it should be voluntary for equipment owners that want

GGG-1

GGG-2

GGG-3

Mr. Barry Wallerstein
November 8, 2012
Page Two

to participate in the program.

Originally, the SOON Program was conceptualized as a voluntary program that would assist contractors in the long run with their CARB base rule compliance. It was voluntary in 2008 and then became a mandatory program. However, due to the application of the Carl Moyer requirements to the SOON program, contractors are expected to contribute from 15% – 50% of the cost of the repower. This is simply impossible for many equipment owners when added to the cost to comply with the statewide Off-Road Regulation. Making the program voluntary in 2008 was the proper step at that time. CIAQC recommends that the SOON Program be made voluntary and that incentive funding cover 100% of the repower costs, certainly so if it is extended beyond 2014.

GGG-3

Please do not hesitate to contact me if you have any questions or would like additional information.

Sincerely,

Michael W. Lewis,
Senior Vice-President

Responses to Comment Letter GGG
CIAQC

Response to Comment GGG-1:

Consistent with the previous AQMP, the current analysis shows that approximately 65% of additional NOX emissions reductions, beyond already adopted rules and measures, will be needed to meet the existing 1997 8-hour ozone standard of 80 ppb in 2023. The Basin can only demonstrate attainment of the 8-hour standard by using the CAA Section 182(e)(5) provision allowing for long-term measures that anticipate the development of new technologies or improving of existing control technologies. This CAA provision requires that these long-term measures be specifically identified at least three years prior to the attainment year (2020).

With less than 8 years remaining to identify these so-called “black box” emissions reductions, it is imperative to move forward with the identification and development of all feasible specific measures to achieve these reductions as soon as possible. If progress is delayed, there will be even less time to develop and implement strategies before the looming deadlines, and thus the resulting necessary measures could be more burdensome and disruptive. Delaying progress will also provide less certainty and lead time to the regulated community for planning compliance with potential new regulatory requirements. The considerable time it takes for new technologies to be developed, assessed and implemented widely, especially in the mobile source sector, also underscores the need to begin immediately. Note that while this Plan commits to the adoption of several ozone measures in the near-term, the implementation date and emissions reduction commitments are at least 2015 and beyond. While the District will need to adopt another ozone plan in 2015 to attain the 75 ppb standard by 2032, we cannot afford to delay implementation of the large “black box” in the existing 2007 AQMP (241 tpd NOx & 40 tpd VOC).

Recent litigation regarding U.S. EPA approvals of previous SIPs has focused on the reliance on a relatively large “commitments” to demonstrate attainment and the short time frame available to develop and deploy potential new technologies. The District believes it is important to demonstrate progress towards ozone attainment by making commitments for additional emissions reductions that reduce the size of the “black box” commitments. In U.S. EPA’s comment letter on the Draft 2012 AQMP (August 30, 2012), they state that they “fully support the District’s inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NOx and VOC emission reduction commitments contained

in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.”

Furthermore, U.S. EPA’s recently proposed to require a new 1-hour ozone SIP for the South Coast Air Basin. In order to demonstrate attainment with this revoked standard by 2022, all feasible measures must be included in the SIP. Because the emission inventory, control strategy and RACT/RACM analysis has already been developed, the attainment demonstration for the 1-hour ozone standard has been completed (see Appendix VII). It was decided to submit the 1-hour attainment demonstration in the 2012 AQMP because it is a most efficient use of resources and early action will establish a technical approach since there is no formal technical guidance yet developed. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. Future AQMPs will need to further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment GGG-2:

Staff agrees with the commenter that wood burning curtailment and its corresponding costs is the “best path way forward” in complying with the 24-hour PM2.5 standards. However, the ozone portion of the 2012 AQMP, as discussed in response to comment GGG-1, is intended to update the previous 8-hour ozone plan with new emission reduction commitments from a set of new control measures, which further implement the 2007 AQMP commitments. Chapter 4 of the 2012 AQMP provides thresholds for cost effectiveness (dollars per ton reduced) for VOC and NOx emissions.

Response to Comment GGG-3:

The SOON program is part of the approved 8-hour SIP for the South Coast (*Federal Register, Vol. 77, No. 41, March 1, 2012*), however affected operators have been provided flexibility in the past and despite mandatory requirements, staff will continue to evaluate the implementation of the program.

Diamond Bar, California 91765-4182
slieu@aqmd.gov

Re: *Comments on the Socioeconomic Report for the Draft 2012 AQMP*

Dear Dr. Lieu:

This letter is submitted on behalf of the County of Orange (“County”) in its capacity as the owner and operator of John Wayne Airport, Orange County (“JWA”). This letter contains the County’s written comments on the Socioeconomic Report (“Report”) for the Draft 2012 Air Quality Management Plan (“AQMP”), issued by the South Coast Air Quality Management District (“SCAQMD” or “District”) in September 2012. The County appreciates the opportunity to provide its comments.¹

GENERAL COMMENTS

We are very concerned with the District’s statements in the first Chapter of the Report which indicate that socioeconomic impacts are somehow not required to be considered in connection with the preparation and adoption of the 2012 AQMP. Specifically, at Page 1-2, the Report indicates that the District is not required to “actively consider any socioeconomic impacts” in connection with the preparation and adoption of the 2012 AQMP.

HHH - 1

We respectfully disagree with this legal position for the following reasons. The California Clean Air Act specifically requires the District Governing Board to determine that the 2012 AQMP is a cost-effective strategy that will achieve attainment of the state standards by the earliest practicable date. CAL.HEALTH & SAFETY CODE §§40440(e), 40703, and 40913(b). In addition, the AQMP must include an assessment of the cost-effectiveness of available and proposed measures and a list of the measures ranked from the least cost-effective to the most cost-effective. *Id.* at §40922. Specifically, Section 40922 provides: “[i]n developing an adoption and implementation schedule for a specific control measure, the District shall consider the relative cost effectiveness of the measure, as determined under subdivision (a), as well as other factors

HHH - 2

¹ The County has previously submitted comment letters on the Notice of Preparation of a Draft Program EIR, the Draft 2012 AQMP, The Integra Report, the Draft EIR, and the Revised 2012 AQMP. Please see enclosed comment letters to Mr. Steve Smith from Ms. Lori Ballance, dated July 27, 2012, to SCAQMD from Mr. Alan Murphy, dated August 31, 2012, to SCAQMD from Mr. Alan Murphy, dated September 28, 2012, to Mr. Inabinet from Ms. Lori Ballance, dated October 23, 2012, and to Mr. Fine from Ms. Lori Ballance, dated October 30, 2012.

Dr. Sue Lieu
South Coast Air Quality Management District
November 9, 2012
Page 2

including, but not limited to, technological feasibility, total emission reduction potential, the rate of reduction, public acceptability, and enforceability.”

Consistent with these requirements, by this letter, we request that the Socioeconomic Report be significantly revised, prior to being issued in its final form, to include consideration of the full costs of any possible regulatory program and/or proposed control measures that may have an impact on the airports and airline industry. We also request that the cost effectiveness analysis take into account the effect any emission reduction strategies may have on existing and new entrant air carriers in the Basin (particularly proposed Control Measure ADV-07), and the importance of maintaining a competitive airline environment in the Basin. A regulatory scheme that would inhibit competition would most likely result in significantly higher airfares to and from the Basin than other parts of the Country, which could in turn have a seriously negative effect on the local economy.

HHH - 3

Careful attention and response to these issues is critical in order to ensure that the District will be able to structure appropriate and effective air quality regulations which might affect the operations of the air carrier airports in the Basin while minimizing the environmental impacts of those regulations.

SPECIFIC COMMENTS

EXPANSION OF REGULATORY AUTHORITY AND COST EFFECTIVE ANALYSIS

The Draft Socioeconomic Report states, “[a]s with the previous AQMPs, the District has proposed to expand its control program for mobile sources by proposing additional mobile source control strategies to supplement CARB’s existing mobile source regulations.” Report, pg. 1-1. The Report defines off-road mobile sources to include: “[m]obile sources of air pollution (vehicles) which are not authorized to operate on streets and highways. Examples include trains, boats, aircraft, farm equipment, and earthmoving equipment.” Report, pg. G-4. The proposed 2012 AQMP off-road mobile source measures include Control Measure ADV-07 that calls for the District to work with the airlines and local airport authorities to develop mechanisms to route the cleanest aircraft to serve the South Coast Air Basin. 2012 AQMP, p. 4-40.

We continue to have a fundamental disagreement with the District regarding the extent of the District’s authority to regulate airports and aircraft. Specifically, we continue to believe that, to the extent the District attempts to regulate aircraft related emissions, directly or indirectly, any such regulation would constitute a constitutionally impermissible local intrusion into a federally preempted field of regulation. *People of State of Cal., v. Dept. of Navy* (1977) 431 F.Supp. 1271, 1281; *Washington v. General Motors Corp.* (1972) 405 U.S. 109, 92 S.Ct. 1396, 31 L.Ed.2d 727. The District’s attempted indirect regulation of airport related emissions is an impermissible and unconstitutional intrusion into an area which is pervasively and exclusively controlled by federal law and federal authority. *City of Burbank v. Lockheed Air Terminal, Inc.* (1973) 411 U.S. 624, 633.

Dr. Sue Lieu

November 9, 2012
Page 3

In addition to this fundamental legal disagreement with the District regarding the District's regulatory authority over airports and aircraft, the cost-effectiveness of proposed Control Measures MCS-03 and ADV-07 have not been quantified at this time. In fact, it appears that the District has simply deferred quantifying the costs until a later date. The District has also acknowledged the following: "[a]s with any complex analysis, some uncertainty is inherent in the methodology employed. . . . The key areas of uncertainty and caveats in this socioeconomic assessment are in estimating emission reductions, costs, air quality changes, and health benefits, among others." Report, p. 8-2. Unless or until information is obtained and provided relating to the cost-effectiveness of Control Measures MCS-03 and ADV-07, discussion of these proposed Measures should not be considered further.

CONCLUSION

In summary, before any further analysis is conducted regarding any of the measures provided in the 2012 AQMP directed toward airports and airlines, the District must complete appropriate and complete analyses of the cost-effectiveness of all of the proposed measures as mandated by California law. It is important for the District to take a "hard look" at these issues and to provide airports in the Basin with information which measures the full costs of any and all possible regulatory programs in terms of the increase in emission reduction costs versus program and improvement costs.

We look forward to continuing to work closely with the District on the draft 2012 AQMP and related documents. If you have any questions regarding the issues addressed in this letter, please do not hesitate to contact us at your convenience.

Very truly yours,

A handwritten signature in cursive script that reads "Lori D. Ballance".

Responses to Comment Letter HHH
Gatzke Dillon & Balance

Response to Comment HHH-1:

Information presented in the Socioeconomic Report is designed to help the District's Governing Board in its deliberation process of the 2012 AQMP. Details of legal requirements for socioeconomic impact assessments are provided in Chapter 1 of the Draft Socioeconomic Report.

Response to Comment HHH-2:

The District has calculated cost-effectiveness of all control measures with SIP commitments except for one. Cost effectiveness values for each control measures can be found in Appendix IV to the 2012 AQMP. Cost effectiveness of other control measures cannot be quantified due to the following reasons: the nature of the control measure (e.g., educational or incentive program); emission inventory or control approach needs to be identified; or further studies such as a technical assessment needs to take place. Tables 6-3, 6-4, and 6-5 in Chapter 6 of the Final Draft 2012 AQMP rank proposed control measures by cost-effectiveness

Response to Comment HHH-3:

There are no control measures in the 2012 AQMP that directly affect airports or the airline industry except for Phase I RECLAIM and Control Measure CMB-03 (Reductions from Commercial Space Heating). For impacts of the 2012 AQMP on airports or the airline industry, please see Table 3-1 in Chapter 3 for cost impact, Tables 4-2, 4-3, and 4-4 in chapter 4 for job impact, and Tables 6-2 and 6-3 in Chapter 6 for competitiveness impact.

Subject: Question from Workshop

Ms Chang,

I attended the Socioeconomic Workshop this past Wednesday. Please confirm for me that I heard correctly that the Socioeconomic Analysis and Report is not legally required but was accomplished under your Board's direction.

III - 1

Thank you very much for clarification.

Respectfully,

Leroy Mills

Responses to Comment Letter III
Leroy Mills

Response to Comment III-1:

Legal requirements that are for socioeconomic analyses during rulemaking are not applicable to the preparation of the AQMP. Please see the discussion on page 1 in Chapter 1 of the Draft Socioeconomic Report.

Howdy Folks,SCAQMD etc.

apx 3:10 PM November 10, 2012

First questions how do I get the comments submitted of the AQMP and tge DEIR to date as of November 2012 ? Please send a hard copy of everything asap. Mike...

To Sue Lue sp sorry on Socio Economic Study for comments due on Monday Nov 12, 2012. comments are submitted herein by Harvey Eder and PSPC Public Solar Power Coalition, and for AQMP and DEIR since your still accepting comments.

Part 1

#1 There is nothing about the submitted comments timely submitted now being answered this is illegal for the AQMP and the DEIR ! There is nothing in the Public Participation section about this at all. This must be remedied at once !@&

#2 As published in Forbes this month "Solar: America's Fastest Growing Job-creation Engine ? SOLAR JOBS GREW OVER 13 % THIS YEAR in the nation usa which is most probably from 50-100% in the South Coast District ! since much of the growth is in california the report of The Solar Foundation will be out on Nov 14,2012 and info for SCD will be sent in then.

#3 With \$50 plus Billion spent in the district on energy (Chapter 10 AQMP there should be a graph breaking this down and over \$70 billion to be stent in 10 or 20 years (this is a low number with whats happened and is on deck for the middle east IE Iran firing on the US's military property this past week etc. and the Straights of Hormuse under threat to be mined by Iran and the Isreali Iranian tensions etc ie threat of Irna that will soon have the nuc bomb etc and 4 years ago oil hitting \$147 a barrel etc.

And the Soc/Economic Plan air pollutioin costing over \$50 billion per year in the district on mobidity and mortality Ie as District Chair says 10 people die from air pollution each day in the district comment at a board meeting over the past year or so.

The cost to the district for the dirty fossel fueled energy systme that exists in the SCDistrict is from \$100 to \$200 billion dollars per year in cost to the people of the district or from \$1 to \$2 trillion dollars over the next ten years or from \$2 to \$4 trillion dollars over the next 20 years which this plan is mistakenly limited to to 2032, when we must use the 2050 green house as well as other emissions (including ultrafine espacially in natural gas being pushed like a dealer on the District for Transportation of our kids to school ie the Moyers Program using natural gas as cited in previous testimony comments on this AQMP/DEIR/ Soc/Econ Study etc ... or the correct but very conservative figure of from \$5 to \$10 trillion dollars being spent by people inb thedistrict/cost.. over the next 40 yearsfor dirty fossel fuel aqnd health and death costs in the district etcccc...

The obvious solution is convert to total solar clean renewable energy sources at once... The savings to the community is \$trillios of dollars.

#4 And the jobs that will be created are tens 10's to 100's of thousands or more in the district. And they will be spent on the low income now or the poor saving billions to trillions on unemployment and subsidies food stamps etc and contributing to tax paying jobs and people instead to the 20-40 plus percent unemployed small businesses employed people now in construction in the SC District.

#5 This will mean environmental justice which was cited in last months Socio Economic Study meeting at the District that was attended by me . Harvey Eder and PSPC the Public Solar Power Coalition and cited as necessary that a study of this be done and at least on of the economic consultants cited environmental justice as needing to be empathized by SCDistrict Soc/Econ study and the District Plan this is all on take which is herein incorporated into the record in these proceedings and a transcript of and the tape is entered into the record as well as meetings of the board where testimony on the immediate total solar conversion plan etc was cited by me Eder and for PSPC etc

JJJ - 1

#6 Millions and billions and trillions of dollars will be saved in the district by implementing the immediate total solar conversion plan cited in testimony/ comments on the record before the SCD in these proceedings ...

#7 as well as doing the right thing !!! Environmental Justice because the low middle income that will be put to work on the Immediate Total Solar Conversion Plan being implemented at once by the end of 5 years in 2016-17 not only will the federal government pay for half of it in tax credits and right offs (remember this was put on the record during the conversation that the Board had a month or so ago when they were talking about Solar... and public solar solves the problem of companies going out of business - local cities many go belly up ie in the inland empire but the regional gov /state gov will endure

In the last economic giant problem we had in the 1930s some localities even had their own money/script etc..

Thanks for the opportunity to put his all on the record in these proceedings etc

Harvey Eder and PSPC the Public Solar Power Coalition
1218 12th Street #25

Subject: Part 2 Comments/Questions To AQMP Nov 2012 DRAFT/ DEIR/Soc Ecom Plan ETC Nov 10/12 H Eder & PSPC

Howdy Again Folks @ SCDist Etc. ET Al.

after 3:20 pm Nov 10,2012

Part 2 of Comments/ Testimony/ On The Record in AQMP DRAFT/DEIR/ Soc/Economic Study etc Independent and or part of the DEIR EIS Etc and submitted to CARB California Air Resources Board (also cited before the Board both .. on the record in the past) and to both State EPA and Federal EPA and the Governor, his Office Of Planning and Research, the the State of California SGC Strategic Growth Council (and AB/SB 375 and AB?SB 32 Scoping Plan for 2012 review at CARB including lcls low carbon fuel standards etc SB1x 33% by 2020 plan now 100% by 2020 or before by 2016/7

etc and CEC/CPUC, and Cal ISO etc everything submitted in the record in this these proceedings submitted hereing and before on the record (Resources Agency and Dept of Conservation and to Doggr (Division-Department of Oil Gas and Geothermal Resources) in record all submittals made in the past to all of those cited in this proceeding and in the past record to those cited past present future on in the record (example OII 42 on Solar Finance Models before the CPUC on public solar in late 1970's early 80s etc and record on deregulation in the early 90 etc

All covered in July 17/18 2012 etc all in the past and since in on the record SCD.

Part 2 12/10/12

#8 kThe Socio economic study with the AQMP and DEIR ETC cited "Green Jobs" and is incorporated herein by reference and the solar and energy efficiency and energy conservation jobs referred to today and otherwise in the record are reference into the record

etc including Nov 8 1 pm 2012 " Solar Among the Fastest Growing Job Markets in America /Department of

Energy (US Federal Government DOE Office of Energy Efficiency and Renewable Energy)

"LI-currently the largest solar photovoltaic power plant in the Eastern United States ISF generated enough renewable energy to power approximately 4,500 homes . LISF is located at Brookhaven National Lab." etc Long Island Solar Farm "

#9 Solar as BACT Best available control technology / RACT reasonably available control technology and or LAER lowest achievable emissions reductions cited and incorporates by reference EPA information on the 200 acre solar concentrating apx 50 MW of apx 500 MW of combined cycle gas turbine to bottom cycle steam turbine electric generation plant approved by region 9 EPA in Palmdale California PDPP Palm dale Power pLANT owned by the city of Palmdale in the desert about 50 miles from los angeles ca, using line focus concentrated collectors like the 354 mw SOLAR POWER PLANTS WITHIN 50 TO 100 MILES OF THE PLANNED hybrid solar power plant in the SC District. All existing power plants in the District if land is available should be retrofit with solar at gas plants and when gas is outlawed it will be a solar only power plant. Solar is not only BACT/RACT/LAER it saves money and has no cost per ton or pound of emission but rather saves money per ton or pound etc of emissions reduced. This is especially true now as cited in these proceedings since interest on a

10 year bond is as low as 1.6% now and bonds are being proposed at 30 years which as also at or near record lows vs what happened 30 years ago after the Iranian revolution when interest rates were as high as 10-20% or higher. There is considerable activity to have a solar infrastructure bank /entity set up for the US especially since Obama won the elections and global warming /climate change is now much more accepted because of tens to hundreds of thousands of users without power still on the east coast after the hurricane Sandy etc a couple of weeks ago (people are still buying gas for vehicles on odd and even days like during the 73/74 opec oil embargo following the yom kippur war in the middle east and oil tripling /quadrupling in cost at once (now to mention the thought of nucs being used then)

I first saw solar in Israel in 1968 visiting my family there who had it on their roofs who were survivors...over 44years ago... and it started over 100 years ago solar thermal and electric right here in the South Coast District where in 1910 30% of the new homes in 1910 had solar hot water (looking at old building permits)

Thanks for taking and responding quickly to these comments

Subject: One For The Road FIFO Writ of Mand.Before Nov HE/PSPC S/Econ, DEIR,AQMP

Howdy Mike Krause scaqmd folks et. al., Nov 11,2012 2:20 PM

Comments timely submitted for Soc/Econ study and if accepted for DEIR & AQMP after others have been answered including those made yesterday but it is on time for Soc/Econ to Dr. Sue Lu. Nov 11.2012 Part 2

1. Soc/Economic Chicago has passed and is forming a CCA see earlier comments public solar power etc he. But they will use dirty fossil fuels unless solar renewables are included and with 1 million people they may have to have more than one company serving them Marin went with Shell etc and may use RECs Renewable Energy Credits vs Solar Buildout etc renewables

2. Solar average pre incentive cost of going solar decreased 17% in 2010 alone plus before , the most significant annual reductions since the data has been tracked. Costs declined another 11%

in the first half of 2011 (Source Lawrence Berkeley National Lab's Tracking the Sun IV. and has continued to go down etc now source For PV solar Energy USA

3. State Ca. Plan for the District is illegal because it's due ever 3 years cited my comments to the Board SCD on the record at least once or more over the past 3 years, and now it's been 5 yerars for the Fed EPA Plan. Answer the comments that were timely submitted first then deal with late comments later. Board member Lyou commented on this ...

4. I fell like T.S. Elliost poem the Wasteland We are the thin men the hollow men head piece filled with straw allas like rats feet over broken glass in an empty field... We are in the 5th or 6th great extinction on earth the most significant since like was taken to oxygen emitting life forms eons ago. And we can't get an answer to timely legally filed comments now 1` responce for 4 or 5 months

5. We should also look at direct hydrogen storage even on an individual or more practical level neighborhood and or community block level from solar electric pv or thermal with district heating and cooling combined cycle with absorption chillers etc

6. Hydro Power sho9uld be used for storage with pumped storage in the Sierras , Cascades in Ore and Washington and BC during peak in the day or when solar best matches the use to serve peaks that don't match solar perk like the early evening or early am off peak base line etc

7. Ground storage has proven itself and as of 2010 is law for Wind Turbines in Kansas using st. domes etc which have been intregated into the system s of Germany and in Alabama. Using high pressure airturbine generators stored in the off beak and off off peaaak base load time when it's windeist to serve peak and other loads. Fracking will contaminate the air in these areas with toxins and cancerigians etc. The District as well as CARB etc CE#C CPUC should weigh in on this with Fed EPA Gov Office of Planning and Reserch and SGC Strategic Growth Coincuil etc fopr all issues and comments cited and Fed DOE and Health and Housing state and Fed as well as CSA Community Service3s agencys etd and are herein by incor[pporated to such in the record . Much of this natural gas stuff 100times co2 e over 20 years Howarth etal was brought with the DOE NREL NG study in the Scoping Plan for AB32 which is being re done now and is hereby herein submitted to them as well.

8. In answer to Dr. Phil Fines comments to my comments last mionth on the meeting on the soc econ submittal studythat soplar won't help get us in complianc with the mandated fed etc by 2014for PM it depends. and probably an extention is needed and will be asked for for 5 years more to 2019 think the plan says. Solar will eliminated with other co benefits pm 10 , pm 2.5 to 10 and pm 2.5 and under pm.1 or the ultra fines which natural gas has plenty of and must be copunted in this plan etc. According to the Nov 7 draft of the Plan the District doesn;t test for this and the only data is from Europe . Lets get with it now. and get the date for mortality and morbidity etc off paint etc.

9. This and all comments from June - NOv etc is submitted for AQMP, DEIR and Soc/Economic Study required for the state eir as well etc and fed and should be expanded to socio economic

JJJ - 2

political , or political socio econ study as well cause Mike Krause (draft was written before see about 40 min agon MKrause3 email to me us that on the NOv7 he had recieved comments on that day or the day before the 6th of Nov and was waiting to answerthem . this issue has already been addressed herein FIFO first in first out is not timely submitted ??? it's more important to provide responce to timely filed comments to fit the scheduled hearings next 13,14,15,16 as well as the 27th deading to get copies to the Board for their Dec 7 Hearing/ Board meeting so these comments/ reso[ponses could be addressed or what the hexck is the purpose of the comment and responce process anyway ...The Process is the Product . sorry these submittals have been so casual... and the Advisory groups meeting on Nov 29th. Its the substance that cvcounts !!!

JJJ - 2

Thanks, take care

Howdy Mike Krause and folks SCD ET. EL., Nov 11,2012 4:18 PM

This is part 2 of Nov 11 One for the road comments on Soc/Econ Study plus anything that can get in for DEIR and AQMP ref previous comments today One For The Road conditional etc..Cont

10. Israel fired in Syria today in return of mortar fire .. Syria is an ally to Iran that we US had fired on last few days. Middle east is a hot spot --theyre threatening to mine the straights of Hormutz where about 1/5 of the porlds oil + passes each day (to our allys etc Europe which is an Economic Hot Spot with financial problems in Greece, and Spain and Italy etc and the US facing the Fiscal Cliff in about 50 days of cutting trillions of dollars from our budget etc. If the US had adopted an ITSCP 5 -10 years ago we wouldn't be in this shape and the world etc. But the SCAQMD can once again lead the way visa vie air quality and the economic multiplier and externalities herein hereby Oh ya Iran threatened to "wipe Israel off the map. Never Again.

11. I first saw solar on the roofs of my relatives , who are survivors, in 1969 at 18 in Israel. and haven't been the same since, over 44 years ago. Israelis also built the worlds first solar

thermal electric power plants in the 1980s. many said it couldn't be done... 354 MW operating within less than 100 miles of the District head quarters in Dimond Bar.

12 Soc Political Economics if we go over the fiscal maybe nothing will happen like Nobel L Krugman suggests. Or maybe unemployment will go to 9%plus and start a another world wide recession with China Choppy and Europe and the Middle east and all. or...maaaaaybe well buytime to implement the ITSCP the Immediate Total Solar Conversion Plan for the District or the District and S. J. District like the Vision with CARB could suggest or the hole State of CA and then the Nation and the World like comments submitted in July 17&18 2012 stated visa vie Jacobson and Delucci 2009 Nov cover Sci Am converting the world to solar renewables in 29 yrs by 2030, also Dec 2001 Energy Ploicy...Which would take an effort like we did in WW2 which got us out of the last RE/Depression in the 1930s???

13. Which brings us to Green jobs and Environmental Justice of which well have plenty if we ithe ITSCP for Sout Coast District Now.

14. The district had all agencies of the state and fed energfy environmental and economic equity muct lobby state and federal gov and powers that be to do it now ITSC

15. Bloom berg gave the Sierra Club \$50 million dollars toi fight coal and some of that money is being spent right here in LA River City County SCD to convert to Solar and Energy Eff/ Con. with staff on the ground working.. etc Not the district needs to implement the green jobs cited in the S/Econ Study and hiring low income and middle income workers (this costs much less and is more procuctive then 99 weeks of unemployment fed state payments etc... Which brings us to

16 Environmental Justice and Solar Equity Green Solar Conversion Jobs will help the Econ and EJ and Solar Equity.

17 the solar tax credits must (the wright offs acrs) must be refundable progressively etc. and made avialable to other than the upper income

18 30 plus year ago we did a K withthe CPUC and Mayors off on this

Thanks take caree H., Eddeer Pspc sonver (Part 2) For The Roa

Responses to Comment Letter JJJ
Harvey Eder

Response to Comment JJJ-1:

Figure 5-1 in Chapter 5 shows the impact of 2014 PM2.5 concentration changes on Environmental Justice Areas. This is also one of the subject areas that the District is considering expanding in the future, as shown in Chapter 8.

Response to Comment JJJ-2:

The commentor needs to define what the Political economy issues are. Specific suggestions on how to further expand contents of the report are welcome and will be reviewed by staff for inclusion in the analysis of future AQMPs.

PREFACE

Numerous comments have been received during the Plan development. Specific responses to 99 written comment letters on the 2012 AQMP are addressed in “Draft Final 2012 AQMP Responses to Comments to the 2012 AQMP” publicly released on November 21, 2012 (Attachment C of the Board Letter). Additional responses to comment letters not included in the “Draft Final 2012 AQMP Responses to Comments to the 2012 AQMP” are included in this Addendum to Attachment C.

For some comments similar remarks have been previously made in previous comment letters so the response indicates where the reader can locate the appropriate response in Attachment C (Draft Final 2012 AQMP Responses to Comments to the 2012 AQMP). Other comments have been addressed in the Board Letter or Resolution (Attachment A to the Board Letter) and the response notes if that is the case. Finally, there are some comments that have not been provided specifically in the past so a written response is provided.

AQMP Response to Comments

KKK. Port of Los Angeles / Port of Long Beach, November 8, 2012

RECEIVED

12 NOV 13 AIO :44

November 8, 2012

Barry Wallerstein, D. Env.
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Dear Dr. Wallerstein:

SUBJECT: COMMENTS ON THE DRAFT SOCIOECONOMIC REPORT FOR THE DRAFT 2012 AIR QUALITY MANAGEMENT PLAN

The ports of Los Angeles and Long Beach (Ports) appreciate the opportunity to comment on the South Coast Air Quality Management District's (AQMD) Draft Socioeconomic Report for the Draft 2012 Air Quality Management Plan (AQMP).

The Draft Socioeconomic Report states that "District staff performs a socioeconomic analysis of the Draft Plan in order to further inform public discussions and the decision making process of the Draft Plan." However, the Draft Socioeconomic Report shows that no cost data have been developed for Measure IND-01 – Backstop Measures for Indirect Sources of Emissions from the Ports and Port-Related Sources, despite the fact that there are real and significant costs to the Port industry to implement the emission controls that could result from the proposed Backstop Measure. Presentation of this measure to AQMD's Board, as well as the public, is incomplete without an associated socioeconomic analysis. Potential regulation of the Port could have a very significant economic effect on the region that AQMD does not address, and therefore the Ports believe that it is inappropriate to move forward with inclusion of this measure in the Draft AQMP without a full socioeconomic analysis.

By not including a socioeconomic analysis of Measure IND-01, the AQMD is completely ignoring the economic importance of the Ports. The Ports are a major economic engine for the region and nation, and port-related industry generates \$5.1 billion and \$21.5 billion in state and federal tax revenue, respectively. The Ports account for over 1.1 million jobs in California and 3.3 million jobs in the United States. Additionally, for every one job created by a Port customer, nearly 1.7 additional jobs are created elsewhere in the region.

Even just the potential of additional regulation of the Ports brings with it a significant uncertainty for the Port industry that may result in the diversion of goods to other ports outside of this region. There are more environmental requirements on the Port industry operating in this region than anywhere else in the world. The threat of additional regulatory requirements, especially when no details have been provided as to what those requirements would be, results in significant concerns for these operators and a significant potential for loss of regional economic benefits due to diversion. The Draft Socioeconomic Report fails to analyze this potential impact.

Port of Los Angeles • Environmental Management
425 S. Palos Verdes Street • San Pedro • CA 90731 • 310-732-3675

Port of Long Beach • Environmental Planning
925 Harbor Plaza • Long Beach • CA 90802 • 562-590-4160

The San Pedro Bay Ports Clean Air Action Plan was developed with the participation and cooperation of the staff of the US Environmental Protection Agency, California Air Resources Board and the South Coast Air Quality Management District.

KKK-1

Dr. Wallerstein

Page 2

Additionally, AQMD has indicated that Measure IND-01 does not have a socioeconomic analysis associated with it because there are no emission reductions associated/committed with this measure. As noted in our comment letter on the Draft AQMP dated August 30, 2012, Section 39602 of the California Health and Safety Code states that, the State Implementation Plan (SIP) shall only include those provisions necessary to meet the requirements of the Clean Air Act. Hence, there is no identified need or legal basis for implementing Measure IND-01. AQMD's proposed measure will not result in any additional benefit for the region beyond what is currently being achieved and expected to be achieved in the near future, and is therefore unnecessary.

KKK-2

Finally, as stated in our letter dated October 31, 2012, Measure IND-01 should not move forward because the AQMP makes a commitment to implement it before AQMD has developed or released details of its intended compliance actions against the Ports, or the socioeconomic and other analyses for such actions. Failing to disclose the AQMD's intended actions against the Ports violates due process, depriving the public and the Ports of the opportunity to adequately review and comment on this measure prior to finalizing the AQMP.

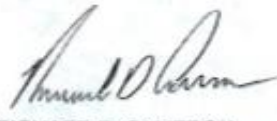

KKK-3

For the reasons listed above and those presented in our previous letters, the Ports reiterate our consistent position that Measure IND-01 should be eliminated from the AQMP. Further, we continue to believe that the successful, collaborative approach established by the Ports and the regulatory agencies remains the best mechanism for identifying and implementing strategies to reduce emissions from Port-related sources.

Sincerely,

CHRISTOPHER CANNON

RE: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

The Riverside County Waste Management Department (RCWMD) operates all public landfills in Riverside County. The RCWMD is also responsible for implementation of the Countywide Integrated Waste Management Plan ensuring that the County will continue to meet the 50% waste diversion mandate of AB 939 via various source reduction, recycling, and composting programs. The RCWMD is familiar with the air quality and climate change issues associated with solid waste management in the South Coast Air Basin (SCAB) and is particularly concerned about how new air quality regulations might impact our landfills, as well as our ability to meet current and anticipated waste diversion mandates of the State. In this light, the RCWMD offers the following comments on the draft 2012 AQMP:

Emission Inventory:

- The baseline emissions from landfill source category in the 2012 AQMP has drastically increased as compared with the 2002 baseline used in the 2007 AQMP. It is stated in the 2012 AQMP that this was due to erroneous activity data reported by the point sources in 2002, as well as to the revision of landfill emission estimation methodology incorporating CARB's greenhouse gas (GHG) emission inventory data. However, the 2012 AQMP falls short of explaining what exactly the erred data was, the relevance of using point source data for landfill emissions, which are an area source, and how the 2008 baseline emissions data reflects the true landfill emissions. The new landfill source emission numbers make landfills a greater contributor to regional air pollution than they were assessed in the 2007 AQMP. We are concerned that the actual landfill contribution to the region's air quality problem is overestimated. We have contacted your planning managers for clarification but to no avail. Given the compressed schedule of the 2012 AQMP and last minute release of the complete emission inventory data, there is not enough time for the stakeholders to fully review, analyze, and provide thoughtful inputs on the CARB input and the 2012 AQMP emissions inventory.

LLL-1

Implementation Measures for Ozone:

- While the 2012 AQMP is supposed to demonstrate the attainment of the PM2.5 standard, it also attempts to further Clean Air Act §182(e)(5) implementation measures for ozone. We acknowledge the difficulty of attaining the ozone standards in 2023 and 2032 that the SCAQMD faces. However, as indicated above, the 2012 AQMP process has not provided stakeholders sufficient time to fully study the proposed ozone measures and their implications. We believe more research and technical and feasibility

LLL-2

Dr. Elaine Chang
November 9, 2012
Page 2

studies are necessary before committing to these reductions with new rules and regulations. The RCWMD is in agreement with the view of many other stakeholders that the ozone reduction commitments are better left for the 2015 AQMP. This will give the SCAQMD and stakeholders more time to develop a comprehensive and realistic ozone attainment plan.

LLL-2

- **CMB-02, NOx Reductions from Biogas Flares:** This Section 182(e)(5) implementation measure proposes that all biogas flares, including older flares, meet current BACT and/or implement flaring minimization strategies. As proposed, the SCAQMD is committed to rule adoption by 2015 and implementation in 2017. The RCWMD is concerned that many of its closed small landfills don't generate enough LFG to sustain the current flares, let alone contribute significant NO_x emissions. Since the landfill gas quality and quantity is steadily declining naturally, the already small amount of NO_x from these flares is also declining. Annual emissions source tests from most of the existing flares at our eight older landfills show that they are at or near the BACT limit of 0.025 lb/MM Btu. Most of the closed landfills' gas production cycle will cease before the AQMP end date of 2035.

In addition, the 2012 AQMP estimates that the average cost effectiveness for meeting the BACT emission limit of 0.025 lb/MM Btu of biogas is less than \$20,000 per ton of NO_x reduced. The RCWMD is concerned that the cost effectiveness estimate of \$20,000 per ton of NO_x is too low because of the low LFG generation and quality at old landfills. As an example, the closed Corona Landfill flare 2012 Source Test emissions was 0.028 lb/MM Btu. The flare operates at a heat input of 4.4 MMBtu/hr. If an ULE flare was installed to replace the existing flare to reduce NO_x by 0.003 (0.028-0.025) lb/MM BTU, the tons of NO_x reduced per year would be 0.058. We estimate the ULE flare to cost \$600,000 to be installed and cost an additional \$10,000 per year to operate when compared to the existing flare. Over the 22 year duration of the AQMP (2013-2035) the overall cost of the ULE BACT flare would be \$820,000. The reduction of NO_x during this duration would be 1.28 tons (22 years x .058 tons/yr). The cost to reduce 1 ton of NO_x would be \$640,625 (\$820,000/1.28), hardly "cost effective".

LLL-3

This cost estimate is conservative since we believe the landfill gas generation phase of this landfill that closed in 1988 will end within 15 years. Also, the heat input rate which is now 4.4 MMBtu/hr, is also declining. A more accurate cost to reduce one ton of NO_x emissions by installing the ULE flare at this closed site is \$942,000, based on an estimated remaining 15 year gas generation cycle, to \$1,271,000 based on an estimate remaining 15 years gas generation cycle and a 50% heat input rate drop. It is not cost-effective to install ULE BACT flares at old closed landfills. Also, as shown in the example above, the NO_x emission reduction potential from the replacement of existing flares with ULE flares at older closed landfills is diminutive, **only 1.28 tons of NO_x removed over a twenty-two year span.** In order to avoid high capital expenditures for extremely small NO_x emission reductions as described above, we recommend that the AQMP include exemption protocol for inactive landfills.

Furthermore, there has been no proof to date that ULE BACT flares can be designed and built for closed landfills with low gas generation and declining methane content. Some of the RCWMD's older landfills have gas generation heat rates at or below one MM Btu/hr. The technological feasibility for the design and operation of low flow, low Btu

Dr. Elaine Chang
November 9, 2012
Page 3

ULE BACT flares still needs to be proven. CMB-02 states, "Strategies that minimize flaring and associated emissions can also be considered as alternative control options". There are very limited opportunities for landfill gas-to-energy or landfill gas to pipeline projects available for small closed landfills with poor declining gas quality and quantity. The RCWMD has volunteered our landfills at no cost for various demonstration projects such as a zero emission micro-turbine and a gas separation project. Neither project, to date, has developed beyond the pilot stage. The landfill operators should not be penalized for flaring the LFG, particularly when that is the only viable option.

LLL-3

As demonstrated, this measure will have significant financial implications to the RCWMD, as we may have to replace eight old flares at closed landfills and/or implement flaring minimization strategies at flares at active landfills, both of which would be costly and perhaps even technically challenging. It is recommended that implementation of the expedited ozone measure be accompanied with financial incentives for small landfill operators as well as public agencies.

- **MCS-02, Further Emission Reductions from Greenwaste Processing (Chipping and Grinding not Associated with Composting):** This Section 182(e)(5) implementation measure would seek to establish additional BMPs for handling processed or unprocessed greenwaste material by greenwaste processors, haulers, and operators who inappropriately stockpile material or directly apply the material to land. The 2012 AQMP proposes that the primary control method would be by covering chipped and ground greenwaste material by an impermeable tarp or a layer of finished compost: (1) as early as operationally possible after chipping and grinding; and (2) until the processed greenwaste material is removed from the site within 48 hours. It is also anticipated that seasonal covering of chipped and ground greenwaste may be considered for the summer months, when ozone and secondary particulate formation potential is greatest. It is unclear as to how physical covering of the processed greenwaste by an impermeable tarp could reduce VOC emissions; the most it could do is to delay the fugitive emissions of VOC from the covered piles to the time when the cover is removed. Covering by finished compost is via a different mechanism, whereby VOCs are subject to microbial actions within the compost that break down the pollutants into non-polluting elementary gases, such as H₂O and CO₂. The option of a compost cover will be too costly for most greenwaste processors and unpractical for mobile operators and haulers.

LLL-4

Existing Rule 1133.1 already established maximum stockpile holding time at chipping and grinding facilities, and when actively enforced, the rule should be able to prevent or reduce VOC emissions from inadvertent anaerobic decomposition of chipped and ground greenwaste. As proposed, the SCAQMD is committed to rule adoption by 2015 and implementation in 2016. The imminence of this control measure could adversely impact the volatile greenwaste recycling industry and market in today's economic climate and run counter to recycling efforts underway at CalRecycle.

Dr. Elaine Chang

Responses to Comment Letter LLL
Riverside County Waste Management Department

Response to Comment LLL-1:

Please refer to Response to comment M-16.

Response to Comment LLL-2:

Please refer to Response to comments R-1, S-1, T-2, W-1, Z-2, BB-1, DD-8, KK-3, LL-3, CCC-1, and GGG-1.

Response to Comment LLL-3:

The intent of the control measure is not to eliminate all flaring at landfill facilities, but rather to minimize flaring emissions through equipment upgrades and flare minimization techniques when feasible. During the rule development phase, staff will focus on identifying the emission reduction opportunities that are feasible and cost effective. Staff is fully aware that as landfills enter their inactive phase, landfill gas production rates and gas quality diminish. These issues will be considered during the rulemaking process. Also, please refer to Response to comment M-10.

Response to Comment LLL-4:

The use of impermeable tarps upon freshly chipped or ground green waste material will retain the moisture released by the material. This allow the VOCs (generally of a light alcohol nature) to be retained by the water vapor, thus allowing for further decomposition of the VOCs by microbes in the first 48 hours.

MMM. BizFed, November 9, 2012

November 9, 2012

Dr. William A. Burke, Chairman
Members of the SCAQMD Governing Board
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

RE: Draft 2012 Air Quality Management Plan and Socioeconomic Report

Dear Chairman Burke and Governing Board Members:

As representatives of Southern California's broader business community, we appreciate the opportunity to provide these comments on the Revised Draft 2012 Air Quality Management Plan (AQMP)¹.

Our group is comprised of leaders from many of Southern California's largest regional business entities and associations. The Final 2012 AQMP, and the rule making that will eventually stem from it, will directly affect these businesses. Consequently, our highest priority is to work with the District to develop a balanced strategy that addresses federal requirements through an economically feasible compliance program. To that end, we offer the following comments on the Revised Draft AQMP:

The Final AQMP as adopted by the Board should include only those control measures that are actually necessary to meet current legal requirements.

The District is required by law to submit a Plan demonstrating that the PM2.5 standards will be attained by 2014. However, there are no current requirements whatsoever regarding attainment of the ozone standards - either for the (revoked) one-hour standard or for the eight-hour standard. Attainment of the eight-hour ozone standard will be addressed in the 2015 AQMP update, which, of course, is only three years away (we offer our comments on the [revoked] one-hour standard below).

An attainment demonstration for the PM-2.5 standards would require, literally, just two control measures - Reductions from Residential Wood Burning and Reductions from Open Burning, BCM-01 and -02, respectively. The estimated average annual cost attributable to these two measures is a relatively modest \$123,000². In other words, attainment of the PM-2.5 standards can be achieved at a total estimated cost of \$123,000, per year.

MMM-1

¹ Revised Draft AQMP released on September 8, 2012. These comments do not reflect any changes that might be made for the Final Draft AQMP which is expected to be released between November 4th and 7th.

² Draft Socioeconomic Report for the Draft 2012 AQMP (Socioeconomic report), September 2012, Table A-1, Appendix A.

- Ambient levels of PM-2.5 have been steadily decreasing.
- Both the annual and 24-hour standards for PM-2.5 were exceeded at only one monitoring site (Mira Loma) in the entire basin in 2011.
- Ambient PM-2.5 levels at Mira Loma are only marginally above the air quality standards, and it would not be unreasonable to assume that, given the trend, attainment of the standards would occur by 2014 even without further regulatory action.
- The fact that slightly over one-half of the emission reductions from BCM-01 and -02 are now specified as contingencies means that only half of the reductions are actually needed for the attainment demonstration.
- The District's air quality model over-predicts ambient levels of PM based on projected emissions inventories; this is another reason why there would be an adequate contingency built into an attainment demonstration consisting of just two measures.
- Notwithstanding the fact that no control measures beyond BCM-01 and -02 are truly necessary for this SIP submittal, the Revised AQMP includes a total of forty-one proposed control measures having an estimated annual cost of \$40 million³.

Now is not the time to propose costly elective control measures, which, regrettably, is exactly what the Revised AQMP would do.

This economy is not a healthy one. The Federal Reserve, in reporting on the October meeting of its Federal Open Market Committee, stated its concerns that, "... without sufficient policy accommodation, economic growth might not be strong enough to generate sustained improvement in labor market conditions", and that "... strains in global financial markets continue to pose significant downside risks to the economy"⁴. Thus, it is inappropriate and, frankly, incomprehensible that the District would seek to impose compliance costs estimated at \$40 million annually on the business community when such requirements have no legal support or justification, and when attainment can be demonstrated with just two control measures at a cost of \$123,000 annually.

We appreciate the fact that, in response to our request, the District included a PM2.5-only alternative, "Alternative 4", in its CEQA evaluation. We want to highlight several conclusions regarding Alternative 4 in the Draft Program Environmental Impact Report (DPEIR). These are findings that our group strongly supports:

- A PM2.5-only Plan was not among the alternatives that were rejected as infeasible⁵.
- A PM2.5-only Plan "... is considered to be a legally viable alternative ..." because, with this 2012 Plan submission, the District is only required to demonstrate attainment of the 24-hour PM-2.5 standard⁶.
- A PM2.5-only Plan - would generate fewer adverse environmental impacts or less severe impacts than the Project (i.e., the draft AQMP)⁷.

³ Socioeconomic Report, page ES-2. "The projected cost for all the ozone measures is approximately \$122 million annually, of which \$40 million is attributable to stationary source controls."

⁴ Federal Reserve press release, October 24, 2012.

⁶ DPEIR Section 6.4.4.

⁷ DPEIR Section 6.8.

MMM-1

District staff might suggest that the proposed control measures related to ozone attainment are necessary to fulfill EPA's SIP-call regarding the (revoked) one-hour ozone standard. However, as a practical matter, there is no SIP-call; one has not yet been issued. When a SIP-call is formally made, possibly by late-January 2013, the District will have twelve months to respond. Then, the required Plan will only have to show attainment of the (revoked) one-hour standard by 2022-23, which is both a full decade away and approximately coincident with the 2023 attainment demonstration date for the 8-hour ozone standard.

There is simply no valid reason for including a one-hour ozone attainment demonstration as part of this AQMP. There are, however, a number of valid reasons for taking the full twelve months, after a SIP-call is made, to prepare a Plan in response:

- Including ozone measures in the current AQMP risks "piece-mealing" the requirements and creating significant inefficiencies with respect to the capital intensive compliance effort that will ultimately be required.
- The 2015 AQMP for ozone is expected to be a very challenging endeavor, and it should be built from the ground up. It should constitute a complete, internally consistent, and economically efficient approach to attainment of the 8-hour ozone standard.
- The closer the timing of the one-hour Plan is to the timing of the 2015 AQMP, the greater the opportunity for coordinating the two Plans and, thus, minimize conflicting or overlapping requirements.
- Mention has been made of the need to identify CAA Section 182(e)(5) measures (i.e., the so-called "black box"). However, this AQMP has only to demonstrate attainment for PM-2.5, while the black box is related solely to ozone. Furthermore, there is a risk that including some Section 182(e)(5) measures in this PM-2.5 SIP may create an unintended commitment. At the very least, the black box measures would defeat the legislative intent of adopting a Plan for which all of the impacts can be fully analyzed.

MMM-2

Our group strongly urges the Board to adopt a PM2.5-only Plan consisting of two control measures, BCM-01 and -02, inclusive, which would be legally viable and fully adequate.

The Draft Socioeconomic Report presents an unrealistically optimistic assessment.

As described in the Executive Summary, the theory behind the Socioeconomic Report is that it is supposed to assist decision-makers, "... arrive at a clean air blueprint that lays out a strong path toward reduced public health damages (sic) while at the same time maintaining economic strength, social fairness, and long-term sustainability."⁸ Although the theory behind the report may be all well and good, the report itself is a misleading attempt to justify the proposed AQMP, which, as explained in the discussion above, goes far beyond what is required at this time. At least two of the stated goals of the Socioeconomic Report need to be discussed here:

MMM-3

⁸ Socioeconomic Report, page ES-1.

- Reduced public health damage. Public health is not a trivial issue. However, given the current state of PM air quality within the Basin (i.e., already very close to attainment, as discussed above), the health benefits attributable to the proposed AQMP are truly minimal.

MMM-3

The Socioeconomic Report recognizes that the draft AQMP has a higher cost than a PM-2.5 only strategy but claims, for example, "... higher PM-2.5 air quality benefits due to the co-benefit from ozone measures."⁹ We strongly disagree. The goal is to demonstrate attainment of the standards, and a two-measure, PM-2.5 only AQMP will do that. Attainment is attainment. Any so-called "co-benefits" from the proposed ozone measures (or, from measures beyond just BCM-01 and -02) are superfluous.

A minor portion (21 percent) of the \$10.7 B in estimated benefits, which the District claims is attributable to the Revised AQMP, is due to health related benefits. However, we note that approximately ninety percent of the total claimed average annual health benefits are in sub-regions¹⁰ that are already in attainment of the PM-2.5 standards. Once the standards are achieved, it is unreasonable to take any credit for any possible further improvements. Thus, the true health benefits, if any (again, current ambient air quality is already very close to the standards), are a small fraction of what is being claimed.

MMM-4

Chapter 2 of the Revised AQMP discusses the public health effects of ambient pollution levels. However, recognition also needs to be given to the adverse public health and environmental justice impacts of unemployment, and to regulatory requirements that negatively affect key job sectors.

MMM-5

- Maintaining economic strength. As noted above, the current US economic situation cannot reasonably be considered either strong or healthy. Unfortunately, the Socioeconomic Report is insensitive to the poor state of the economy, and presents outdated and/or unreliable cost estimates.

MMM-6

Although the socioeconomic report suggests that the "clean air benefits are projected to result in a gain of 42,174 jobs annually over the period of 2014-2035"¹¹, a careful reading of the report confirms that this number (and even the estimated *net* jobs of 37,043 jobs annually) is very misleading. The report itself offers numerous caveats. Among them are the following three: First, the jobs are not necessarily permanent, and there is no indication that the jobs created or forgone will be sustained from year to year¹². Second, the bulk of the predicted new jobs (32,986) result from decreased congestion attributable to SCAG's transportation measures, and not the District's proposed control measures¹³. Third, the report notes that because the values being presented are extremely small, "... neither the quantified benefits nor the quantified measures are expected to result in discernible differences ..."¹⁴

MMM-7

⁹ Socioeconomic Report, page ES-5.

¹⁰ Socioeconomic Report, Appendix G, Table 5-2.

¹¹ Socioeconomic Report, page ES-3.

¹² Socioeconomic Report, page 4-2.

¹³ Socioeconomic Report, page 4-3.

¹⁴ Socioeconomic Report, page 6-2.

- The District has estimated annual compliance costs for the control measures in the Revised AQMP, but also notes that actual costs could be higher than projected costs. Costs greater than those that were projected are circumstances that the District's stakeholders have found to be true on a great many occasions.

- Projected costs are not accurate, and appear to have little, if any, basis in fact. For example, a number of proposed control measures have an evaluation step as Phase I. Clearly, none of these evaluations have been conducted; therefore, it is impossible to predict what a Phase II implementation step might require. In spite of the fact that none of the necessary information for developing cost estimates is available, Table A-1 in Appendix A purports to show average annual costs and presents them with three and four significant figures of accuracy. These costs should, at the very minimum, be shown as a range and we would guess that such a range is plus/minus fifty or one hundred percent.

- Control costs, on a year-by-year basis from 2013 through 2035, are presented in Figure 3-2 in the Report, but there are at least two significant problems with the information. First, although the calculation can be done mathematically, it is misleading to develop an average cost for projected expenditures that vary by a factor as great as nine to one (from approximately \$200 million per year to as high as approximately \$1.8 billion). Second, the chart purports to depict the cost of the ozone strategy but the chart is misleading because it fails to comprehend the significant costs that are expected to be incurred with the 2015 AQMP for ozone.

- Lastly, we note that much of the report relies on studies of one sort or another that were performed decades ago and which are of doubtful relevance today. For example, an audit by Massachusetts Institute of Technology of the District's socioeconomic analysis program goes back to 1992. The visibility aesthetic benefit is based on a study conducted in 2001 and which obviously does not reflect the effect of the subprime real estate crisis that began in roughly 2008. Similarly, the avoided-damage materials benefit is based on a study in 1985 when very different paints and architectural coatings were being used.

MMM-8

MMM-9

Thus, the Socioeconomic report appears to have serious weaknesses that are quite apparent from nothing more than a reading from a common-sense perspective.

In summary, there is no justification for including proposed control measures in this Plan that go beyond the two that are actually required to demonstrate attainment of the PM-2.5 standards by 2014. This is particularly true given the fragile state of the economic recovery and the fact that the 2015 AQMP will fully address ozone attainment in just three years. We urge the Board to adopt a PM-2.5 only plan consisting of control measures BCM-0-1 and -02, which it is free to do because such an alternative was adequately considered by the Draft Program EIR.

As the AQMP process moves forward, we look forward to our continued partnership with SCAQMD. Please know that the business community remains committed to helping develop a balanced, workable 2012 AQMP that provides for both environmental and economic success. Further, we are committed to working with the District on developing the 2015 AQMP for ozone, which, we believe, will be a significant undertaking.

We welcome further discussion of these comments; please contact Tracy Rafter, CEO of BizFed (Tracy.rafter@bizfed.org) or Matt Petteruto, Vice President of Economic Development for the Orange County Business Council (mpetteruto@ocbc.org).

Responses to Comment Letter MMM
BizFed

Response to Comment MMM-1:

Please refer to Response to comments R-1, S-1, T-2, W-1, Z-2, BB-1, DD-8, KK-3, LL-3, CCC-1, and GGG-1.

Response to Comment MMM-2:

Please refer to Response to comments W-9, and CCC-2.

Response to Comment MMM-3:

NO_x and VOC reductions from ozone measures will lower PM_{2.5} because NO_x and VOC are also precursors to PM_{2.5}.

Response to Comment MMM-4:

There is no clear PM_{2.5} exposure threshold below which no adverse health effects are observed. In fact, California has lower PM_{2.5} standards than the federal standards. Furthermore, the U.S. EPA is in the process of proposing a more stringent annual PM_{2.5} standard based on several health studies (See Appendix I to the Draft Final 2012 AQMP for more details).

Response to Comment MMM-5:

The local economy is projected to experience a net modest positive job impact of clean air benefits and control measures. As our economy transitions to a new phase of better air quality, there will be new job opportunities and some sectors may decline due to the overall efficiency gain in our economy. This phenomenon is consistent with any other transition in our economy. The sectors that are forecasted to decline due to the Plan were truck transportation and auto repair which result from less demand for their services due to improvements in traffic. The rise in job opportunities in other sectors will help offset the negative impacts in these two sectors.

Response to Comment MMM-6:

Chapter 2 of the Report presents the current state of the economy and the analysis in the Report shows deviations from the current state of the economy. The commentor needs to elaborate on why cost estimates are outdated and/or unreliable and staff has solicited comments on cost assumptions for the measures since July 2012 and will continue to incorporate new information as the AQMD further studies the measures of begins the rulemaking process.

Response to Comment MMM-7:

The Socioeconomic Report clarifies that no job in our economy is permanent. Therefore, any job statistics for any given year reflects a count of jobs and does not address the length of employment. Even without TCMs, the positive job impact of clean air benefits outweighs the negative job impact of control measures by a 5 to 1 margin. Compared to the total number of jobs in the four-county area, job impacts in the Socioeconomic Report represent less than 0.4 percent of the total jobs in our economy. Based on comments on TCMs, staff has included an additional cost benefit scenario without TCMs.

Response to Comment MMM-8:

Detail cost assumptions and data for each measure has been posted online (http://www.aqmd.gov/gb_comit/aqmpadvgrp/2012AQMP/meetings/2012/july26/agenda.html) since late July per the commentor's request. Typically, a two-phase control measure requires additional technology assessment to refine the technology and control potential. Therefore, Phase II is contingent upon the findings from Phase I. In those cases, no SIP reductions are committed. Wherever appropriate, the AQMD has also provided costs for Phase I requirements. Appendix IV to the AQMP shows a range of cost effectiveness estimates for measures, when applicable. Differences in costs from year to year reflect variations in implementation dates of measures. The cost for the 2015 AQMP cannot be calculated at this time since the attainment strategy has yet to be developed.

Response to Comment MMM-9:

One of the future enhancements as indicated in Chapter 8 of the Report is to update methods, underlying technical studies, and approaches, as appropriate.

NNN. Association of California Cities Orange County (ACCOC), November 10, 2012

November 10, 2012

Dr. Barry Wallerstein
Executive Officer
South Coast Air Quality Management District
21865 Copley Dr.
Diamond Bar CA 91765

RE: Comments to the draft Socioeconomic Report for the 2012 AQMP

Dr. Wallerstein -

Thank you for the opportunity to review and comment on the draft Socioeconomic Report (Report) for the 2012 Air Quality Management Plan (AQMP). As the Hub for Good Public Policy in Orange County, the Association of California Cities – Orange County (ACC-OC) takes extraordinary interest in the costs associated with regional public policy. Thus, we reviewed this Report through the lens of how local governments and taxpayers would be impacted and how it can be improved to mitigate these impacts, now and in the future.

After careful and thorough review of the Report, as well as a November 1 meeting with AQMD staff, we remain concerned with several elements of the Report, including its timing, “cost benefit” assumptions and the science used to arrive at its conclusions. These concerns are outlined below:

AQMD Must Prioritize Economic Impacts as Part of its Plan

The ACC-OC is very concerned that this Report was not prioritized as part of the public comment period of the AQMP. In fact, the Report was issued nearly one full month *after the proposed comment period deadline for the draft AQMP*.

This de-prioritization is both concerning and confusing. We understand that the Report is shaped by the Plan’s control measures.

But to review the AQMP without any economic impact study is to review incomplete and inaccurate policy. Therefore, AQMD staff should prepare economic alternatives that account for the various alternatives of the Plan itself. Studying alternative scenarios is common in environmental analysis – in fact, it is required by the California Environmental Quality Act. The local government community is concerned that AQMD staff does not place equal emphasis on economic impacts.

Thus, we request that the following be added to ES-6 of the Report:

NNN-1

ASSOCIATION OF CALIFORNIA CITIES ORANGE COUNTY
600 S. MAIN ST. SUITE 940, ORANGE, CA 92868 | (714) 953-1300

AQMP Socioeconomic Report Comments
November 10, 2012

- *The Socioeconomic Report is a critical document to the draft AQMP and shall be included in the initial release of the Plan itself, either as an Appendix or Chapter, to ensure that stakeholders can review a comprehensive Plan and comment on the entirety of its economic and environmental impacts.*

NNN-1

Transportation Control Measures are “Double Counted” as Benefits

Composing more than 70 percent of the overall “cost benefit,” the Report states that TCMs would provide nearly \$8 billion in benefits. Yet the vast majority – if not the entire amount – is calculated from projects already identified in the Federal Transportation Implementation Plan – a document prepared by SCAG, regional transportation authorities and cities.

The ACC-OC realizes and appreciates that Appendix H later revised the total amount downward to \$519 million, accounting only for TCMs through 2014. *However, this does not address the issue of TCMs already being independently designed, approved and funded by local agencies and taxpayers.*

NNN-2

In fact, costs associated with the development of TCMs – engineering, design, construction, etc. – are included in both the “expense” and “benefit” calculations. It therefore is “double-counting” the economic benefits that are already being put forward by local agencies. Therefore we request the AQMD calculate the costs and benefits associated with the specific Control Measures proposed in the AQMP, rather than assign the benefits of infrastructure projects that have already been designed, approved and funded by other agencies to the implementation of the AQMP.

Visual Aesthetic Benefits - \$700 million

The Report’s attribution of nearly three-quarters of a billion dollars of increased property values to the implementation of this plan seems to over-estimate the benefits of the plan’s implementation. In fact, the leading study on this issue – the University of Chicago’s 2005 *Does Air Quality Matter? Evidence from the Housing Market* – concludes that:

“After over 30 years of research, the cross-sectional correlation between housing prices and particulates pollution appears weak. ... As a result, many conclude that either individuals place a small value on air quality or the hedonic approach cannot produce reliable estimates of the marginal willingness-to-pay (MWTP) for environmental amenities¹.”

NNN-3

Clarification on how AQMD staff arrived at this conclusion that is counter to leading studies is necessary to more fully understand the impacts of the AQMP on local real estate prices.

Additionally, the California Environmental Protection Agency (Cal/EPA) is currently processing a draft environmental health screening tool that is not included in this Report’s analysis. The health screening tool would “rate” a region’s air quality (by ZIP) as either healthy or unhealthy. The significance of this tool cannot be understated. A negative rating by this tool would decimate local property values and therefore property tax revenue, effectively wiping out any perceived Visual Aesthetic Benefit accounted for in this plan.

NNN-4

The ACC-OC requests that the AQMD address Cal/EPA’s health screening tool in its final Socioeconomic Report.

¹ Chay, Kenneth and Greenstone, Allan. *Journal of Political Economy*. “Does Air Quality Matter? Evidence from the Housing Market. University of Chicago, 2005.

AQMP Socioeconomic Report Comments
November 10, 2012

Summary of Requests

The following summarizes the ACC-OC's requested revisions and additions to the Report:

Timing: Add the following to the suggested refinements currently listed on ES-6 of the Report: *"The Socioeconomic Report is a critical document to the draft AQMP and shall be included in the initial release of the Plan itself, either as an Appendix or Chapter, to ensure that stakeholders can review a comprehensive Plan and comment on the entirety of its economic and environmental impacts."*

Control Measure Cost Benefit Analysis: The Report should calculate costs associated with each Control Measure proposed in the AQMP, rather than calculate the costs and benefits of infrastructure projects that have been designed, approved and funded by other agencies and that are outside of AQMP's discretionary authority.

Visual Aesthetic Benefits: AQMD staff should study the potential impacts of Cal/EPA's proposed Health Screening Tool. This policy has a direct impact on the AQMP, its Socioeconomic Report and its conclusions. Studying these impacts are necessary to have a complete picture of the proposed Visual Aesthetic Benefits.

Again we appreciate the opportunity to review this Report and provide our recommendations. These requests are intended to provide greater credibility to this process and protect local taxpayers. We appreciate your sincere consideration.

Please do not hesitate to contact me or my staff at (714) 953-1300.

Sincerely,

Lacy Kelly
Chief Executive Officer
Association of California Cities – Orange County

Responses to Comment Letter NNN
ACCOC

Response to Comment NNN-1:

Staff strives to release information as it becomes available so as to engage stakeholders early and throughout the process. In addition, upon the release of the Socioeconomic Report, a public review period of 45 days was provided. Also, please refer to Response to comments T-1, W-11, W-12, Z-1, and LL-2.

Response to Comment NNN-2:

Appendix G to the Socioeconomic Report has results derived from excluding TCMs. Exclusion of TCMs from the analysis does not change the conclusion of the analysis.

Response to Comment NNN-3:

The AQMD will examine this study as part of future enhancements. Also, please refer to the 2012 AQMP Board Letter and the Resolution.

Response to Comment NNN-4:

Cal/EPA's environmental health screening tool is still under development. Zip code level data was used by Cal/EPA for illustration in the draft screening tool document. In the Socioeconomic Report air quality data is based on a 4 by 4 kilometer grid and economic data is modeled at the census tract level, both of which are finer than zip code level data. The Cal/EPA's screening tool is a qualitative tool that ranks environmental exposure data (e.g., pesticide use, air quality, toxic release, and traffic congestion), community health data (e.g., asthma, cancer, heart disease, and birth weight), and demographic data (e.g., population age profile, educational attainment, and income) in a snapshot of time to construct a weighted score for various communities. The Socioeconomic Report links air quality, epidemiological, and economic models to produce quantitative results across time and space. While the screening tool is useful for some other purposes, it provides less information than the framework that the Socioeconomic Report uses for the AQMP analysis. Also, please refer to the 2012 AQMP Board Letter and the Resolution.

**Re: Comments on the Draft Socioeconomic Report for the
Revised Draft 2012 Air Quality Management Plan (AQMP)**

Dear Dr. Wallerstein:

The Western States Petroleum Association (WSPA) is a non-profit trade association that represents twenty-seven companies that explore, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California and five other western states. WSPA has been an active participant in air quality planning issues for over 30 years. WSPA member companies operate petroleum refineries and other facilities in the South Coast Air Basin and thus have a major stake in the Air Quality Management Plan (AQMP) being prepared by the South Coast Air Quality Management District (SCAQMD or District), and any rule developments that might stem from the final AQMP as adopted by the District's Governing Board.

WSPA appreciates the opportunity to submit these comments on the Draft Socioeconomic Report for the Revised Draft 2012 AQMP. We have also delivered comments on Revised Draft AQMP under separate cover.

WSPA believes the 2012 AQMP must be scientifically-based and technically accurate and the District's Governing Board needs to have a thorough assessment of the air quality benefits, environmental impacts, and economic costs associated with that plan. To be successful, the AQMP must be both technically and economically viable because "economic growth is needed

Page 1

970 W. 190th Street, Suite 770, Torrance, California 90502
PHONE: (310) 678-7782 • FAX: (310) 324-9063 • PSenecal@wspa.org • www.wspa.org

to support investment in cleaning the air.”¹ For this reason, decision makers need access to the best possible estimates of the economic impacts of the control measures contained in the proposed AQMP.

According to the Socioeconomic Report, the socioeconomic impact assessment was “designed to help decision-makers and stakeholders arrive at a clean air blueprint that lays out a strong path toward reduced public health damages while at the same time maintaining economic strength, social fairness, and long-term sustainability.”² The design of the assessment is advertised as “a rigorous application of statistical analysis and computer modeling” to assess the aggregate potential impacts of the overall suite of control measures. But while the methodology may reflect the state-of-the-art, this Socioeconomic Report falls short of delivering a meaningful assessment for decision-makers and stakeholders for several reasons.

1. The cost inputs and public health benefits for the control measures proposed in the 2012 Draft AQMP are too often lacking. Where estimated costs are presented, they often do not appear to have a basis in fact. These shortcomings seriously compromise the quality of the assessment output and findings.

The Revised Draft AQMP proposes eight control measures for the 24-hour PM_{2.5} attainment demonstration, twenty-six control measures as an update to the 8-hour ozone strategy, and seven advanced technology measures. For the PM_{2.5} strategy, the District reports costs for four of the proposed measures as \$0, and reports “No Cost Data” available for another three measures. So only BCM-01 has any costs assigned to it. In the case of the proposed update to the 8-hour ozone strategy (i.e., the 182(e)(5) measures), no cost data was reported for eight of the measures.³

In some cases where cost estimates are provided, they lack a factual basis. Several proposed control measures involve a Phase I effort that is an evaluation phase. These evaluations have not been conducted and, as a result, there are no proposals for rule development or for compliance with any regulatory requirement. Without this information, it is impossible to develop realistic assessments of the potential cost of compliance. Nevertheless, the District manages to present cost estimates with an implied accuracy.

The net result is that about half of these AQMP measures have no estimated expense, and nearly the entire reported cost for this AQMP is actually the cost of Transportation Control Measures which came from the Regional Transportation Plan (RTP).⁴ Often the AQMP and the Socioeconomic Report simply defer the development of control measure cost estimates to some future rulemaking. So while the socioeconomic assessment has a very complicated modeling

OOO-1

¹ SCAQMD, Draft Socioeconomic Report for the Draft 2012 AQMP, September 2012, p. 2-10.

² Ibid, p. ES-1.

³ In some cases the Revised Draft AQMP actually presents representations about control measure costs which conflict with values reported in the socioeconomic report.

⁴ Ibid, Table A-1.

methodology, its conclusions are suspect because it is based on materially incomplete cost inputs.

If SCAG can provide planning-level costs for each of the transit projects and TCMs in the RTP, surely the District can at least provide planning-level cost estimates for thirty or forty emission control measures. These estimates should include all potential cost items, and not omit major line items (e.g., stationary source construction costs) simply because they are uncertain. The District can confer with industry representatives where needed to help develop the estimates and in many cases they may best be reported as cost ranges to reflect uncertainty in the estimates. These estimates will be subject to further refinement (as with all forecasts), but they will at least provide a starting point for technical analysis and decision making.

OOO-1

Socioeconomic analysis should include at least planning-level cost estimates for all proposed measures.

2. The socioeconomic assessment contains mismatched costs and benefits, which could mislead decision makers and other stakeholders.

In the case of control costs, the socioeconomic assessment includes costs for both PM_{2.5} and ozone control measures in the Revised Draft AQMP (to the extent it reports any costs). But the plan only includes health benefits for PM_{2.5} measures and explicitly excludes health benefits associated with NO₂ and ozone.

OOO-2

“The proposed PM_{2.5} strategy is also projected to result in co-benefits from reductions in exposure to NO₂, which is not included in the analysis due to resource constraints. Nor are co-benefits from ozone reductions because the ozone strategy in the Draft Plan represents a partial implementation of the Black Box whose full implementation is needed for the ozone attainment.”⁵

Thus, all the available costs are purported to have been considered but only some of the benefits are analyzed. This type of mismatching of costs and benefits is confusing, and makes it difficult for decision makers and stakeholders to relate program benefits to costs.

3. The estimated control costs for measures CMB-01 Phase I and Phase II are fundamentally flawed; the District should complete a comprehensive market analysis that considers the potential impacts to the regional economy of reducing RECLAIM market supplies (i.e., RTCs).

OOO-3

As explained in our comments on the Revised Draft AQMP, the various representations for cost effectiveness of proposed measures CMB-01 Phase I and Phase II are fundamentally flawed in their assumptions and derivation. The potential costs for these control measures are likely much higher than suggested in the socioeconomic assessment or the Draft AQMP.

⁵ Ibid, p. 3-6.

Any remaining discussion of CMB-01 Phase I or Phase II and associated cost effectiveness needs to be based on a comprehensive market analysis that considers the potential impacts to the regional economy of reducing RECLAIM market supplies (i.e., RTCs). Such analysis needs to consider economic growth factors and use an appropriate forecasting methodology as was done for the broader regional emissions inventory.

OOO-3

4. Cumulative costs for regional air quality policy should be presented in the socioeconomic assessment.

As the District knows well, air quality attainment planning in Southern California is an ongoing process that is not limited to any single air quality management plan. For Southern Californians, this planning effort has now been underway for over sixty years. Yet the Socioeconomic Report considers the 2012 AQMP as though it is a stand-alone planning event. The assessment of the AQMP costs and benefits should not be piecemealed.

OOO-4

WSPA recognizes and wishes to emphasize the importance of the socioeconomic impact assessment in helping inform decision-makers and stakeholders as we work to meet the region's clean air challenges while maintaining economic strength. Southern Californians recognize that clean air is not going to be achieved without cost, but the many missing cost inputs to this socioeconomic analysis render the Draft Socioeconomic Report less than useful.

WSPA appreciates the opportunity to submit these comments. Please contact me with any questions at (310) 678-7782 or psenecal@wspa.org.

Sincerely,

Patty Senecal
Manager, Southern California Region and Infrastructure Issues

Responses to Comment Letter 000
WSPA

Response to Comment 000-1:

Detail cost assumptions and data for each measure has been posted online (http://www.aqmd.gov/gb_comit/aqmpadvgrp/2012AQMP/meetings/2012/july26/agenda.html) since late July. Except Control Measure ONRD-05 (Further Emission Reductions from Heavy-Duty Vehicles Serving Near-Dock Railyards), no emission reductions are claimed for control measures without costs. Table 6-4 in the 2012 AQMP and respective measures in Appendices IV (A) and IV (B) to the 2012 AQMP has additional information on measures without cost data. Construction costs associated with the re-design of a facility vary by facility and will be assessed during rulemaking when specific requirements are laid out. Also, please refer to Response to comments C-1, M-1, KK-5, EEE-2, and HHH-2.

Response to Comment 000-2:

Please refer to Response to comment EEE-3.

Response to Comment 000-3:

Staff does not agree with the commenter's assumption that available RTC supplies would necessarily be reduced. Currently, there are substantial excess RTCs available in the market and still NOx reduction potential among RECLAIM facilities. Staff believes that CMB-01 Phase I can be implemented through market transactions as there is an excess of RTCs currently. The socioeconomic analysis assumes that the Phase II shave would be achieved through the use of BARCT, which is more conservative than if some facilities elect to purchase RTCs.

Response to Comment 000-4:

All the costs of implemented control measures and their associated air quality benefits of the past AQMPs are reflected in the economic baseline against which the 2012 AQMP is evaluated. Performing a cumulative assessment of all the past and current AQMPs would not be practical as past events have already occurred and become part of the baseline. It would be difficult to isolate air quality regulations out of the entire regional economy. Also, as pointed out by another commenter, many businesses reduce emissions to be more efficient and competitive (please see Response to comment EEE-1). Nevertheless, staff welcomes suggestions on methodologies for such analysis.

Re: Comments on the Revised Draft 2012 Air Quality Management Plan (AQMP)

Dear Dr. Wallerstein:

The Western States Petroleum Association (WSPA) is a non-profit trade association that represents twenty-seven companies that explore, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California and five other western states. WSPA has been an active participant in air quality planning issues for over 30 years. WSPA member companies operate petroleum refineries and other facilities in the South Coast Air Basin and thus have a major stake in the Air Quality Management Plan (AQMP) being prepared by the South Coast Air Quality Management District (SCAQMD or District), and any rule developments that might stem from the final AQMP as adopted by the District's Governing Board.

WSPA appreciates the opportunity to submit these comments on the Revised Draft 2012 AQMP. This letter presents WSPA's general comments on the Revised Draft AQMP and builds on our Draft AQMP comment letter dated 31 August 2012. We are also delivering detailed comments on specific AQMP measures which are attached hereto, and will submit a separate comment letter on the Draft Socioeconomic Report for the AQMP.

Page 1

970 W. 190th Street, Suite 770, Torrance, California 90502
PHONE: (310) 678-7782 • FAX: (310) 324-9063 • PSenecal@wspa.org • www.wspa.org

1. The State Implementation Plan (SIP) submittal for the 2012 AQMP should be limited to the legally-required 24-hour PM_{2.5} NAAQS attainment demonstration.

The District's Clean Air Act obligation for this 2012 AQMP is to demonstrate attainment with the 24-hour PM_{2.5} National Ambient Air Quality Standard (NAAQS) by 2014. In fact, the Draft Programmatic Environmental Impact Report for the 2012 AQMP (Draft PEIR) considers this option as Alternative 4 and concludes:

"Alternative 4, PM_{2.5} Emissions Reduction Strategies Only: This alternative is considered to be a legally viable alternative because the SCAQMD is only required to submit a PM_{2.5} plan demonstrating attainment of the 2006 24-hour PM_{2.5} National Ambient Air Quality Standard no later than three years from December 14, 2012.... there is no federal requirement to submit an ozone plan by the same date as the PM_{2.5} plan"¹
(Emphasis added)

The District should wait and develop the revised 8-hour ozone attainment strategy when it is required as part of the 2015 AQMP. At that time, we will all have a better understanding of the needed emission reductions and better information on the economic factors and technologies required to meet the region's air quality challenge.

The ozone measures which were proposed in the Draft AQMP, while numerous, are immaterial when compared to the "Black Box" in terms of quantifiable emission reductions. The region needs an ozone strategy that is comprehensive, coordinated and efficient. The ozone measures outlined in the Draft AQMP fail to meet this standard and would only serve to unnecessarily constrain the options available to the District and Southern California businesses when the real ozone planning effort is undertaken for the 2015 AQMP.

The 2012 AQMP control strategy and the associated SIP submittal should be limited exclusively to the PM_{2.5} attainment demonstration consistent with EPA requirements.

2. CMB-01 Phase I is not needed nor appropriate for the PM_{2.5} contingency plan. It should be removed from the 2012 AQMP.

WSPA appreciates the District's recognition that CMB-01 Phase I was unnecessary for attainment of the 24-hour PM_{2.5} standard, and the re-categorization as a contingency measure in the Revised Draft AQMP. However, we submit that CMB-01 Phase I does not represent a reasonable contingency measure and should be completely removed from the PM_{2.5} control measures.

Using the District's "NO_x equivalent" weighting system it is reasonably deduced that CMB-01 Phase I does not meaningfully contribute to the PM_{2.5} contingency plan. BCM-01 and BCM-02 would provide at least 144 tpd of "NO_x equivalent" emission reductions during control

¹ SCAQMD, Draft PEIR for the 2012 AQMP (September 2012), p. 1-34.

PPP-1

PPP-2

episodes.² By comparison, measure CMB-01 Phase I as proposed would only provide 2 tpd NO_x. The Draft AQMP succeeds in showing that BCM-01 and BCM-02 can provide all of the air quality improvement needed for the District to demonstrate attainment of the 24-hour PM_{2.5} NAAQS by 2014, including the contingency plan. We also question whether the measure even meets the EPA requirements³ for a contingency measure.

CMB-01 Phase I should be completely removed from the PM_{2.5} Control Measures in the 2012 AQMP.

3. CMB-01 Phase II should be removed from the 2012 AQMP and reconsidered in the 2015 AQMP as part of a comprehensive strategy for ozone attainment.

Last year, the Governing Board adopted the *AQMD Air Quality Related Energy Policy* which proposed to “integrate air quality, energy issues, and climate policy in a coordinated holistic manner.”⁴ This is a good objective given that Southern California’s economy and future air quality conditions are inextricably tied to our use of energy. Unfortunately, this AQMP fails to even roughly address the economic, environmental or technology implications of the measures proposed in the plan. For example the AQMP talks at length about zero and near-zero technologies for the transportation sector, but instead of providing even a planning-level discussion of the energy sector implications of such a policy trajectory the plan instead pushes the analysis to the Draft Programmatic Environmental Impact Report (Draft PEIR).

“Energy projections made in this chapter reflect past energy usage in the South Coast Basin and energy projections made from utility and other agencies’ planning documents. These projections reflect existing policies and regulations. This review does not include an analysis of energy implications from the control measures within this AQMP; this analysis is conducted within the EIR review.”⁵ (Emphasis added)

But the Draft PEIR does not provide that analysis. Despite a programmatic scope, the Draft PEIR only considers project-level impacts from the immediately foreseeable deployment of 33,000 zero and near-zero technology vehicles under ONRD-1, ONRD-2, ONRD-4 and ONRD-5 over the next decade (i.e., by 2023).⁶ Not surprisingly, the economic and environmental impact of the measures doesn’t look significant because it isn’t in the region expected to house 12 million motor vehicles by 2023.

Solving the region’s ozone challenge, including the Black Box commitment, requires a comprehensive, coordinated and efficient compliance strategy and any future changes to the RECLAIM program need to be considered in that context. The 2012 AQMP control strategy

² The benefits for BCM-01 and BCM-02 would actually be higher than this because these measures will have NO_x, SO_x, and VOC co-benefits which are not accounted in the Revised Draft AQMP.

³ Clean Air Act Section 172(c)(9)

⁴ SCAQMD, Revised Draft AQMP, p. 10-1.

⁵ SCAQMD, Revised Draft AQMP, Section 10, p. 10-1.

⁶ SCAQMD, Draft PEIR for the 2012 AQMP, September 2012, Table 4.3-2.

PPP-2

and SIP submittal should be limited to the PM_{2.5} attainment demonstration. The 2015 AQMP should provide a comprehensive strategy for compliance with the 8-hour ozone standard.

- **The District needs to consider electricity sector impacts associated with a broad-scale electrification initiative for transportation before proposing any new NO_x RECLAIM shave. Failure to plan for such a structural change would challenge the feasibility of the District's zero/near-zero technologies strategy, negatively impact the Southern California economy, and may be contrary to Assembly Bill 1318.**

Broad-scale transportation electrification will mean significant new demand for electricity. As we noted in our 31 August 2012 comment letter, CARB is preparing a much needed evaluation of the long-term electrical system reliability needs of the South Coast Air Basin. This study is being prepared as required under California Assembly Bill (AB) 1318 in consultation with the California Energy Commission (CEC), California Public Utilities Commission (CPUC), California Independent System Operator (CAISO), and the State Water Resources Control Board (SWRCB). That report will include recommendations for meeting those reliability needs while ensuring compliance with state and federal law requirements for emission offsets (i.e., ERCs and RTCs). The release of the draft AB 1318 report is now expected in "early 2013."⁷

The results of the AB 1318 study are critical to understanding the baseline forecast against which the District would consider the additional electricity sector impacts associated with a broad-scale electrification initiative for transportation. That is needed to understand the long-term supply requirements for the NO_x RECLAIM market and it would be premature to consider any new shaves to the NO_x RECLAIM market that could constrain future power loads prior to the completion of that needs analysis. The District should avoid accidentally creating a crisis similar to 2000-2001 when the electricity sector caused a major RECLAIM market disruption that seriously impacted the regional economy and forced the District to temporarily exclude the electricity sector from RECLAIM.

Decisions on the ozone strategy are not legally required at this time, so CMB-01 Phase II should be removed from the 2012 AQMP and excluded from the associated SIP submittal.

- **Any future RECLAIM shave should be limited to those required under BARCT authority.**

Any proposed NO_x RECLAIM shave should be limited to those required under the BARCT authority in the California Health and Safety Code (H&SC). The size of any such shave cannot be specified until the required BARCT evaluation has been completed including an evaluation of the maximum degree of reduction reasonably achievable with advanced control technologies taking into account the environmental, energy, and economic impacts for each class or category of source.

⁷ Michael Tollstrup, California Air Resources Board.

PPP-3

- Any NO_x RECLAIM shave would impose significant costs on the Southern California economy. The AQMP must include a proper cost effectiveness analysis for CMB-01.

RECLAIM is the oldest locally designed and implemented air emissions “cap and trade” program. The cost of RTCs is dictated by both the market’s view of the current supply-demand balance and the market’s view of the future supply-demand balance. Any reduction in market supply (e.g., a shave), will cause the market to reassess the supply-demand relationship and the RTC market price will adjust accordingly. Past market prices cannot be used to forecast future prices when a major structural change is being proposed, such as a nearly 20% supply reduction. And if RECLAIM is unable to support key industrial sectors, the economic consequences could be enormous.

PPP-4

As we noted in our letter dated 31 August 2012, the AQMP makes several conflicting and inappropriate representations concerning the cost effectiveness of Control Measure CMB-01 Phase I and Phase II, and these were carried over into the Draft Socioeconomic Report. Decision makers and stakeholders need to be presented with an economic analysis that is based on appropriate economic principles and information. The Revised Draft 2012 AQMP and the Draft Socioeconomic Report fail to do that for proposed Control Measure CMB-01 Phase I or Phase II.

In summary, proposed measure CMB-01 Phase II is not well considered. Since ozone measures are not legally required at this time, CMB-01 Phase II and the other ozone measures should be removed from the 2012 AQMP and excluded from the associated SIP submittal.

4. **The 1-Hour Ozone Attainment Demonstration should be handled in a stand-alone plan. EPA has not issued a final SIP-call, so action on such a demonstration is procedurally premature.**

On September 19, 2012, EPA published its proposed action calling for a new 1-hour ozone attainment demonstration for the South Coast air basin in the Federal Register. As of this writing, EPA is not expected to issue a final rule until January 2013 or possibly later. Under the Clean Air Act, the District will then have a full year after the final rule is published to submit the 1-hour ozone plan to EPA. Given that the federal agency’s action is not yet final, it would be premature for the Governing Board to consider a new attainment demonstration for the 1-hour ozone NAAQS at this time.

PPP-5

Besides being premature, the draft 1-hour ozone demonstration may be inadequate. EPA has reportedly not released the modeling guidance needed for these 1-hour ozone NAAQS demonstrations, so the District’s initial work is not based on an EPA-approved protocol.

For this reason and others described in our letter dated 31 August 2012, the District should take advantage of the full 12 months allowed under the Clean Air Act to develop a standalone 1-hour ozone plan which we strongly believe should be based on the 2007 AQMP control strategy since the compliance milestones are both circa 2023, and the carrying capacity for the 1-hour ozone

plan is similar to the 8-hour ozone plan. The 1-hour ozone plan would not be due to EPA until early 2014.

In addition to the above comments, we are submitting additional detailed comments on specific control measures proposed in the Revised Draft AQMP as Attachment 1.

WSPA appreciates the opportunity to submit these comments. Please contact me with any questions at (310) 678-7782 or psenecal@wspa.org.

Sincerely,

Patty Senecal
Manager, Southern California Region and Infrastructure Issues

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

Western States Petroleum Association (WSPA) submits these detailed comments on select emission control measures proposed in Appendix IV of the Revised Draft Air Quality Management Plan (AQMP) for the South Coast Air Basin. Our comments below are organized to parallel the order of the proposed measures as presented in Appendix IV.

Appendix IV-A: District's Stationary Source Control Measures
Attachment 1: Short-Term PM_{2.5} Control Measures

1. CMB-01: FURTHER NOX REDUCTIONS FROM RECLAIM - PHASE I [NOX]

Control measure CMB-01 is presented in the Revised Draft AQMP as having two phases. As was done in Appendix IV, our comments here are presented separately for Phase I and Phase II even though WSPA's comments on the two phases have some common points.

CMB-01 Phase I is now proposed as a contingency measure for the 24-hour PM_{2.5} attainment demonstration and would shave 2 tons per day (tpd) of NO_x Reclaim Trading Credits (RTCs) from the RECLAIM market. As noted in our cover letter, it is WSPA's recommendation that CMB-01 Phase I is unnecessary and inappropriate for the PM_{2.5} contingency plan and thus should be completely removed from the PM_{2.5} Control Measures in the 2012 AQMP. With that said, we are providing additional comments on the proposed measure presented in Appendix IV of the Revised Draft AQMP.

The Revised Draft AQMP states that: "currently there are approximately 8 tpd of excess RTCs in the market." This statement is actually not based on "current" conditions but rather is based on a staff conclusion drawn from RECLAIM trading data from the period 2008-2010. WSPA notes that 2008-2010 represented a period of severe economic recession and is not an appropriate basis for characterizing current or future market demand. The document goes on to state: "a shave of 2 tpd of NO_x RTCs should not cause a significant impact to the market." Because the baseline (i.e., 2008-2010 data) is inappropriate, this statement is a conclusion offered by SCAQMD that is lacking valid foundation.

We recommend that the CMB-01 Phase I discussion should be revised to include an analysis of future market demand based on, in part, economic growth factors similar to what was done for the mobile source emissions inventory. It is not clear why the forecasting methodology applied to the broader regional emissions inventory is not applied to stationary sources covered by the RECLAIM market.

Attachment 1
WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

This shortcoming is particularly problematic for the electricity sector and the impacts that future growth of load demand will have on natural gas-fueled generation in the South Coast Air Basin. Concerns about the availability of emissions reduction credits (ERCs) for needed power generation recently prompted the California Legislature to pass Assembly Bill (AB) 1318. That statute required the California Air Resources Board (CARB) to consult with the California Energy Commission (CEC), California Public Utilities Commission (CPUC), California Independent System Operator (CAISO), and the State Water Resources Control Board (SWRCB) and local utilities to prepare a report for the Governor and Legislature that evaluates the electrical system reliability needs of the South Coast Air Basin with specific recommendations for meeting those reliability needs while ensuring compliance with state and federal air pollution control requirements for emission offsets (i.e., ERCs and RTCs). The results of this study, which is the first of its kind for Southern California, are critical to developing the baseline emission inventory for the electricity sector covered under RECLAIM. WSPA contends it would be premature to consider any new NO_x RECLAIM shave that could constrain future electricity generation prior to the review of this report and additional needs analysis. This is especially important given that much of the District's strategy for reducing transportation sector emissions with zero/near-zero technologies would seem to require the availability of significant new electricity loads.

The document states: "Phase I reductions target a range of 2-3 TPD NO_x" while in other places the document suggests that the measure only targets 2 tpd. Because the size of the proposed shave is entirely arbitrary, it is misleading and inappropriate to state the targeted reductions as a range in some places and suggest it is a definite number in others.

The document also states: "During the rule development phase, staff may refine the emission reductions to include growth and other unforeseen issues." It is unclear what this is intended to mean; the intent should be clarified.

The document states: "Phase I is expected to be adopted in 2013 and the shave will be implemented/triggered for compliance year 2015, if the attainment of 24-hr PM_{2.5} standard is not met by 2014." This is simply not a reasonable or realistic expectation. First, a rulemaking of this type would be difficult to complete in 12 months especially because the proposed measure includes a number of controversial issues. Key among those issues would be the shaving methodology. The Draft AQMP states "staff will work with stakeholders to evaluate various shaving methodology (e.g., sector-specific or across-the-board)."¹ That analysis alone will take time to negotiate. Depending on the outcome of that evaluation, certain stationary sources may need to evaluate installation of new emission controls. But given the uncertainties as to whether

PPP-2

¹ SCAQMD, Draft 2012 AQMP, Appendix IV, p. IV-A-14.

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

the contingency measure would even be triggered, we expect that most/all sources would not start that process unless/until the measure was actually triggered. So stationary sources would need no less than 2-4 years after trigger to design, construct, and operationalize new emissions controls necessitated by a reduction of NO_x RTC allocations (assuming that control technology options are available). Given these practicalities, the implementation schedule for proposed measure CMB-01 Phase I is simply not reasonable or achievable.

The document states: "It is expected that the cost effectiveness for this control measure would be in the neighborhood of \$7950 per ton for Phase I based on the most recent RTC trading prices." This statement is unfounded because there is little precedent for forecasting future costs for a capped market like RECLAIM. RTC prices are dictated by both the market's view of the current supply-demand balance and the market's view of the future supply-demand balance. Any reduction in market supply (e.g., a shave), will cause the market to reassess the supply-demand relationship with RTC market prices adjusting accordingly. Past market prices cannot be used to forecast future prices when a major structural change is being proposed, such as a nearly 20% supply reduction. Such a shave would certainly cause an escalation in RTC pricing into the future. So the overall economic impact from such a measure would have to include the added capital and operating expenses for sources installing new emission control equipment or basic equipment, as well as higher RTC prices for all RECLAIM market participants. Conversely, if the RECLAIM market was unable to support key industrial sectors, the economic consequences could be much broader and significant to the regional economy.

The District should conduct a comprehensive market analysis to understand the potential impacts on the regional economy of reducing RECLAIM market supplies. Furthermore, any future reductions to the RECLAIM market should be based on technologies which have been demonstrated to be technologically and economically feasible (i.e., BARCT); not haircuts based on arbitrary assumptions.

Recommendations:

1. CMB-01 Phase I should be completely removed from the PM_{2.5} Control Measures in the 2012 AQMP.
2. Any future reductions to the RECLAIM market should be based on technologies which have been demonstrated to be technologically and economically feasible (i.e., BARCT).
3. Any remaining discussion of CMB-01 Phase I and associated cost effectiveness should be based on a comprehensive market analysis that considers the potential impacts to the regional economy of reducing RECLAIM market supplies (i.e., RTCs). Such analysis should consider economic growth factors and use a forecasting methodology as was done for the broader regional emissions inventory. Special consideration should be applied to

PPP-2

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

the electricity sector including consideration of the CARB AB 1318 report on future electricity sector demands for natural gas-fueled generation in the South Coast Air Basin as well as other policy drivers (e.g., zero/near-zero emissions technology).

2. BCM-01: FURTHER REDUCTIONS FROM RESIDENTIAL WOOD BURNING DEVICES [PM2.5]

WSPA supports the proposal for BCM-01. Most of the basin is already in attainment of the PM_{2.5} NAAQS, and the District's modeling forecast suggests that the area around the Mira Loma monitoring station will be very close to achieving the standard by 2014. Based on the information provided in the Draft AQMP, measures BCM-01 and BCM-02 together are clearly sufficient to demonstrate PM_{2.5} attainment in 2014. Similar measures have been successfully implemented in other jurisdictions and are technologically feasible and cost effective.

The Revised Draft AQMP reports that BCM-01 will reduce direct PM_{2.5} emissions, but this control measure will also yield reductions in NO_x, SO_x and VOC emissions during control episodes which are not presented in the plan. NO_x, SO_x and VOC co-benefits should be quantified and credited in the AQMP.

Recommendations:

1. The BCM-01 discussions in the AQMP should be revised to acknowledge the NO_x, SO_x and VOC co-benefits associated with this measure.

3. BCM-02: FURTHER REDUCTIONS FROM OPEN BURNING [PM2.5]

WSPA supports the proposal for BCM-02 for the same reasons stated for BCM-01. BCM-01 and BCM-02 together are clearly sufficient to demonstrate PM_{2.5} attainment in 2014 and represent the most efficient and most cost effective path to attainment of the PM_{2.5} standard by 2014.

As with BCM-01, the Draft AQMP reports that BCM-02 will reduce direct PM_{2.5} emissions but this measure will also yield reductions in NO_x, SO_x and VOC emissions during control episodes which are not presented in the plan. NO_x, SO_x and VOC co-benefits should be quantified and credited in the AQMP.

PPP-6

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

Recommendations:

1. The BCM-02 discussions in the AQMP should be revised to acknowledge the NO_x, SO_x and VOC co-benefits associated with this measure.
4. **EDU-01: FURTHER CRITERIA POLLUTANT REDUCTIONS FROM EDUCATION, OUTREACH, AND INCENTIVES [ALL POLLUTANTS]**

The Revised Draft AQMP notes that “this control measure is carried over from the 2007 AQMP/SIP.” We note that EDU-01 was formerly covered (in part) by 2007 AQMP measure MCS-03 which is distinct and different from the current MCS-03 measure. We request that such clarification be added to the AQMP.

Recommendations:

1. Discussion of EDU-01 should include a comment that, while this measure was formerly covered (in part) by 2007 AQMP measure MCS-03, EDU-01 is distinct and different from the 2007 AQMP MCS-03 measure.

Appendix IV-A: District’s Stationary Source Control Measures
Attachment 2: Section 182(e)(5) Implementation Measures for Ozone

1. CMB-01: FURTHER NOX REDUCTIONS FROM RECLAIM – PHASE II [NOX]

Control measure CMB-01 is presented in the Revised Draft AQMP as having two phases. As was done in Appendix IV, our comments here are presented separately for Phase I and Phase II even though WSPA’s comments on the two phases have some common points.

CMB-01 Phase II focuses on: “periodic BARCT evaluation as required under state law. As noted in our cover letter, it is WSPA’s recommendation that CMB-01 Phase II should be removed from the 2012 AQMP and reconsidered in the 2015 AQMP as part of a comprehensive strategy for ozone attainment. With that said, we are providing additional comments on the proposed measure presented in Appendix IV of the Revised Draft AQMP.

The Revised Draft AQMP states: “A review of recently adopted control measures and air regulations in other air pollution control districts, as well as command-and-control rules adopted

PPP-6

PPP-7

PPP-2

Page 5

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

for non-RECLAIM facilities in the District, show that advancements in control technologies are available and can be applied to the top emitting sources. Such control technologies include but are not limited to selective catalytic reduction, low NO_x burners, NO_x reducing catalysts, oxy-fuel furnaces, and non-selective catalytic reduction. Several BARCT levels assessed at the inception of the program in 1993 for top emitting sources such as cement kilns, glass furnaces, and gas turbines were not subject to reduction in the 2005 RECLAIM rule amendment. These sources will be examined for further reductions in this control measure and potential rule making.”²

However, the emission control technologies identified by the District are hardly new; any proposal under the BARCT evaluation authority should be based on demonstrated technologies which have been shown to be both technologically and economically feasible, and that have emerged since the last District BARCT evaluation. The emission reductions justifiable by a BARCT evaluation may be markedly different than proposed under CMB-01 Phase II.

The document goes on to state: “During the rulemaking process, staff may also incorporate the concepts of facility modernization, as well as include other feasible control measures such as increased energy efficiency and zero and near-zero emission technologies.” We believe such concepts are contrary to the RECLAIM market design and may not be supported by current legal authority.

The document states: “Staff’s initial analysis shows that approximately 1-2 tpd additional NO_x RTC reductions are feasible for the second phase from the RECLAIM universe (from the overall 3-5 tpd NO_x RTC reductions discussed in the first phase).” As discussed in our comments on CMB-01 Phase I, this is a conclusion offered by SCAQMD that is wholly lacking valid foundation because the baseline (i.e., 2008-2010 data) is inappropriate. We recommend that the discussion for CMB-01 Phase II needs to be revised to include an comprehensive analysis of future market demand which considers economic growth factors similar to what is done for the mobile source emissions inventory. It is not clear why the forecasting methodology applied to the broader regional emission inventory was not applied to stationary sources covered by the RECLAIM market.

The document also states: “During the rule development phase, staff may refine the emission reductions to include growth and other unforeseen issues at this stage.” It is unclear what this means; the intent should be clarified.

² SCAQMD, Revised Draft AQMP, Appendix IV, p. IV-A-61.

PPP-2

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

The document states: "It is expected that the cost effectiveness for this control measure would be in the neighborhood of \$16,000 per ton NO_x reduced. It is based on the cost effectiveness developed for non-RECLAIM facilities or other command-and-control rules in other air pollution control districts. It should be noted that since RECLAIM facilities have the ability to trade RTCs, it tends to lower the actual cost of compliance. Staff will refine the cost effectiveness during the rule development phase."³

This discussion is fundamentally flawed for a capped market like RECLAIM. RTC prices are dictated by both the market's view of the current supply-demand balance and the market's view of the future supply-demand balance. Any reduction in market supply (e.g., a shave), will cause the market to reassess the supply-demand relationship and the RTC market prices will adjust accordingly. Past market prices cannot be used to forecast future prices when a major structural change is being proposed, such as a nearly 20% supply reduction. Such a shave would certainly cause an escalation in RTC pricing into the future. The economic impact from such a measure would have to include capital and operating expenses for sources installing new emission control equipment or basic equipment, as well as higher RTC prices for all RECLAIM market participants. Conversely, the economic consequences could be broader and more significant for the regional economy if the RECLAIM market was unable to support key industrial sectors.

The District should conduct a comprehensive market analysis to understand the potential impacts of reducing RTC supplies on the regional economy. Furthermore, any future reductions to the RECLAIM market should be based on technologies which have been demonstrated to be technologically and economically feasible (i.e., BARCT).

Recommendations:

1. CMB-01 Phase II should be completely removed from the 2012 AQMP and reconsidered in the 2015 AQMP as part of a comprehensive strategy for ozone attainment.
2. Any future reductions to the RECLAIM market should be based on technologies which have been demonstrated to be technologically and economically feasible (i.e., BARCT).
3. Any remaining discussion of CMB-01 Phase II and associated cost effectiveness should be based on a comprehensive market analysis that considers the potential impacts to the regional economy of reducing RECLAIM market supplies (i.e., RTCs). Such analysis should consider economic growth factors and use a forecasting methodology as was done for the broader regional emissions inventory. Special consideration should be applied to the electricity sector including consideration of the CARB AB 1318 report on future electricity sector demands for natural gas-fueled generation in the South Coast Air Basin.

³ SCAQMD, Revised Draft AQMP, Appendix IV, p. IV-A-62.

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

2. FUG-01: VOC REDUCTIONS FROM VACUUM TRUCKS [VOC]

This control measure would target emission reductions from vacuum trucks through the use of traditional control devices and technologies, including carbon adsorption systems, positive displacement pumps, internal combustion engines, thermal oxidizers, refrigerated condensers and liquid scrubbers.

The proposed control measure does not provide enough specifics to understand all the potential implications but some areas of potential concern would include:

- **Compatibility of vacuum trucks to control equipment:** Not all vacuum trucks can be connected to control equipment for various reasons which can include: (a) lack of connection point on the vacuum truck; or (b) some vacuum trucks are too powerful to be connected to a control device (e.g., carbon canister); the high discharge pressure exerted on the hoses, connectors and control equipment is too high (e.g., gap vacuum trucks). Currently, we know of no control equipment compatible with gap vacuum trucks.
- **Permitting:** Portable carbon canisters are typically permitted for odor control and not for emissions control. The District needs to provide a phase-in period to allow the industry to re-permit their existing control equipment for appropriate use. There may not be ample permitted control equipment available for rental if the vacuum truck control requirements become effective immediately after the rule is promulgated.
- **Training:** Training of vacuum truck operators on Method 21 would take time to accomplish.
- **Costs:** The costs of the monitoring equipment and setup for control equipment will impact maintenance budgets and needs to be fully considered.
- **Emissions Reductions:** WSPA questions the realism of the potential emission reductions cited in the proposed control measure. Those estimates will need to be refined during rule development.

Recommendations:

1. The District staff should continue to work with industry to develop the rules contemplated under FUG-01 to ensure that all engineering, costs and safety considerations are fully understood before proposing any new/modified rule(s).

PPP-8

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

3. FUG-02: EMISSION REDUCTIONS FROM LPG TRANSFER AND DISPENSING [VOC]

The purported purpose of this control measure is to reduce VOC emissions associated with the transfer and dispensing of Liquefied Petroleum Gas (LPG). WSPA recognizes that District Rule 1177 (adopted June 1, 2012) provides an exemption for facilities that are under the purview of Rule 1173 (Fugitive Emissions). The control measure identifies refineries, marine terminals, natural gas processing plants and pipeline transfer stations as being among the types of facilities covered by Rule 1173.

WSPA also recognizes the District's interest in evaluating the potential for further VOC emission reductions from those facilities that are currently exempt from Rule 1177 per 1177(j)(2). We assume that any decision to commence further rule development will be based on the outcome of the evaluations of potential emission reductions and associated cost-effectiveness. However, the language of the proposed control measure states that, "... the proposed control measure will evaluate the potential for further reductions in VOC emissions and expand the applicability of Rule 1177 ... to include ... previously exempted facilities." (Emphasis added)

Recommendations:

1. Revise FUG-02 discussion to clarify that an expansion of Rule 1177 applicability will not be automatic, but rather will be based on the results of the not-yet-conducted evaluations.

4. FUG-03: FURTHER REDUCTIONS OF FUGITIVE VOC EMISSIONS [VOC]

The control measure describes a broad-brush approach to potentially further reducing VOC emissions from fugitive emission components at petroleum industry facilities and chemical plants. The control measure focuses on the potential use of optical gas imaging technology, as did 2007 AQMP control measure FUG-01.

Optical gas imaging (OGI) technology was borne out of a desire to conduct fugitive emission LDAR programs in a more efficient manner (thus, the term "Smart-LDAR"). 2007 AQMP Control Measure FUG-01 specifically recognized the inefficient and labor-intensive effort associated with conventional LDAR programs; however, this concept is not included in FUG-03. The control measure should recognize the problem with inefficiency of existing LDAR programs.

PPP-8

PPP-9

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

The control measure lists seven existing District rules for which it is suggested that the requirements could be enhanced - but the nature of the potential enhancements to the individual rules is not explained. Thus, the overall proposed approach remains vague. The control measure needs to be more specific.

Mention is made of an OGI pilot program, but there is little to suggest what the District might be thinking in this regard. The control measure needs to provide more information and greater clarity, or, in the alternative, there should be a description of a potential stakeholder process through which a pilot program might be developed.

The control measure states that, for example, requirements for "work practices" might be upgraded to "self-inspection programs", and that some of these programs might be upgraded to "LDAR programs". These terms are poorly defined, and are not easily understood.

Facilities subject to Rule 463 and 1178 (Storage of Organic Liquids) utilize a "self-inspection program" but those self-inspection programs are applicable primarily to seals on floating roof tanks. We believe that the District does not intend to suggest utilizing OGI technology for tank seals, and the control measure should clarify this point.

FUG-03 suggests that OGI might be used to "supplement" existing programs. However, clearly the highest and best potential use of the OGI is as a substitute for conventional inspections of components with an organic vapor analyzer.

WSPA's overriding concern is that adding OGI to existing requirements would not be cost-effective. Replacing LDAR with OGI is more attractive, and there are various possibilities that could be explored (e.g., using OGI for difficult-to-monitor components). Using the EPA Alternative Work Practice (AWP) verbatim is not useful, because the final AWP requires conventional LDAR at least annually, and the calibration requirements for OGI are onerous.

The control measure summary table identifies potential VOC reductions of between one and two tons per day by 2019 from an inventory of 3.8 tons per day. WSPA believes that the estimated emissions reductions (roughly 25-50%) are overly optimistic. We would like to understand the source of the 3.8 tons/day emissions inventory as well as the basis for the estimated reductions. We note that the discussion of "Emissions Reduction" states that the emission reductions have not been determined.

PPP-9

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

The cost effectiveness has been estimated to be \$11,000 per ton of emissions reduced. There is simply no basis for the estimated cost effectiveness given that: (1) the emission reductions have not been determined; and (2) there is no specific proposal for rule making. This figure should be removed from the document.

The control measure refers to work by EPA that began in the "early 1970s". WSPA questions the accuracy of this statement; we submit that the time period might be the "early 1990's."

The correlation equations were developed initially by WSPA and API; EPA ultimately approved them.

Recommendations:

1. FUG-03 should be revised to consider the use of optical gas imaging (OGI) technology as a suitable substitute for, not an addition to, conventional LDAR component inspections. This was the intended purpose of "Smart-LDAR" and would help to resolve the inefficient and labor-intensive effort associated with conventional LDAR programs.

5. MCS-03: IMPROVED START-UP, SHUTDOWN AND TURNAROUND PROCEDURES [ALL POLLUTANTS]

This control measure, which is a carryover from 2007 AQMP Control Measure MCS-06, is proposed as a means of reducing all pollutants from activities associated with Start-ups, Shut-downs and Turn-Arounds (S/S/TAs) of process units at various facilities. Although chemical plants and "other types of industries" are mentioned in the control measure, the principal focus has always been on petroleum refineries.

As noted in our comment letter dated 31 August 2012, WSPA believes this measure is should be removed from the 2012 AQMP since the District has already commenced rule development activities on the basis of the 2007 AQMP authority. With that said, we are providing additional comments on the proposed measure presented in Appendix IV of the Revised Draft AQMP.

In the "Background" section there are statements that there are higher emissions associated with process equipment S/S/TAs, that these higher emission rates have been observed, and that the higher emission rates are due to higher equipment loadings during so-called transient operating conditions. Aside from potential flare emissions, WSPA questions the whether equipment loadings and equipment emissions are higher during S/S/TAs. In fact, WSPA has already embarked on a study with the District to answer that very question. It is premature to conclude at this time that equipment loadings and emissions are higher during S/S/TA.

PPP-9

PPP-10

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

With regards to potential flare emissions, the Regulatory History discussion correctly notes that the District's 2005 amendments to Rule 1118 (Control of Emissions from Refinery Flares) enhanced the flare emission reductions that had begun several years earlier. Emissions from refinery flares, which include emissions associated with S/S/TAs have been reduced by ninety percent, or more, since Rule 1118 was adopted in 1998. However, the Regulatory History discussion fails to mention the most recent related development. In Spring 2012, the District and the refineries developed a new enforceable permit condition (S56.1) for the refinery Title V operating permits. That permit condition requires refinery operators to adhere to their respective options for reducing flaring, and to update the lists annually to reflect any revisions. This should reduce flare emission even further.

The Method of Control discussion presents an approach consisting of two phases:

- Phase I, a "technical assessment", will have a target completion in the 2012/2013 timeframe. The discussion in the control measure states that, "Under Phase I, effort (sic) will include establishing procedures that better quantify emission impacts from start-up, shutdown, or turnarounds." WSPA believes that this description misstates the goal of Phase I. Phase I will involve a review of current emission reporting practices (so that the District can better understand current emissions reports), and potential revisions to the District's Annual Emission Report (AER) program, if warranted.

Further, Phase I has been underway since early 2012 as a result of 2007 AQMP CM MCS-06. This is one example of how proposed control measure MCS-03 is redundant.

- Phase II will potentially involve analyses to, (1) "... identify improved operating procedures that minimize emissions..."; (2) "... develop rule amendments that could seek implementation of best management practices ... "; and (3) potentially require additional hardware.

As noted above, refineries are already required (e.g., Rule 1118 and Title V permit condition S56.1) to identify and follow options that minimize flare emissions associated with S/S/TAs. Further, existing Rule 1123 has very effectively regulated VOC emissions due to vessel depressuring, and Rule 1176 effectively regulates liquids drained from equipment into refinery sewer systems.

PPP-10

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

With respect to the potential identification and implementation of Best Management Practices (BMPs), these are already included in the flare minimization requirements of Rule 1118 and the S56.1 permit condition. Further, requirements within the Federal NESHAPs for Start-up, Shut-down, Malfunction Plans (SSMPs) create the same duty for all affected facilities through a mandatory requirement to utilize "Good Air Pollution Practices" - essentially BMPs - during all periods of start-up, shut-down and turnarounds. A facility's SSMPs must be reviewed after each covered activity, and fine-tuned to continually enhance good air pollution control practices. This is another example of how the proposed control measure MCS-03 is redundant.

PPP-10

Recommendations:

1. Proposed measure MCS-03 should be removed from the 2012 AQMP.
6. **EDU-01: FURTHER CRITERIA POLLUTANT REDUCTIONS FROM EDUCATION, OUTREACH, AND INCENTIVES [ALL POLLUTANTS]**

Please see our above comment on proposed measure EDU-01.

Appendix IV-B: District's Mobile Source Control Measures
Proposed Section 182(e)(5) Implementation Measures
Group 2: Off-Road Mobile Sources

1. **OFFRD-04: FURTHER EMISSION REDUCTIONS FROM OCEAN-GOING MARINE VESSELS WHILE AT BERTH [ALL POLLUTANTS]**

The stated purpose of this control measure is to incentivize additional controls on auxiliary engines and boilers on ocean-going marine vessels while at berth. The Revised Draft AQMP notes: "Due to technical and operational (i.e., frequency of calls) reasons, however, cold ironing may not be a viable option for all types of ships. Also, ships require steam for hotelling operations. If all the electrical power for hotelling is supplied by cold ironing, steam must be provided from the ship's boilers or the shore to the ships. Based on energy consumption, steam can account for as much as 30 percent of all energy used during hotelling."

PPP-11

Attachment 1

WSPA Comments on Revised Draft 2012 South Coast Air Quality Management Plan
12 November 2012

These conditions are particularly relevant for crude oil tankers and other bulk liquids marine vessels which call at San Pedro Bay. These tankers are generally not owned or operated by U.S. companies and often suffer from the technical and operational limitations described in the AQMP. Some of these vessels will not be able to comply with shorepower/cold-ironing provisions.

PPP-11

Recommendations:

1. Proposed measure OFFRD-04 should be revised to discuss the technical and operational limitations associated with crude oil tankers and other bulk liquids marine vessels.

2. OFFRD-05: EMISSION REDUCTIONS FROM OCEAN-GOING MARINE VESSELS [NOX, PM]

The stated purpose of this measure is to “incentivize the newest Tier 2 and Tier 3 vessels to call at the Ports of Los Angeles and Long Beach.” The measure goes on to state: “This measure seeks to enhance the Ports’ programs as necessary to maximize the number of Tier 3 vessels calling at the Ports. In addition, other mechanisms that could complement the Port program will be explored. Examples include discussions on the state and federal level of mechanisms to incentivize Tier 2 and Tier 3 vessel calls through the North American ECA and programs to retrofit or repower existing vessels to meet Tier 3 standards.”

PPP-12

It is not clear that the District has the authority to impose this measure, yet the Revised Draft AQMP goes on to suggest “this measure could achieve, at a minimum, NO_x, PM₁₀, and PM_{2.5} reductions of 2.8 tpd, 0.1 tpd, and 0.09 tpd, respectively by 2023. The AQMP should be revised to clarify the legal authority for this measure, details on the method(s) of control, and more details on the basis of the suggested “minimum” emission reductions.

Recommendations:

1. Proposed measure OFFRD-05 should be revised to clarify the legal authority for this measure, details on the method(s) of control, and more details on the basis of the suggested “minimum” emission reductions.

Response to Comment PPP-3:

Please refer to Response to comments S-6, T-3, W-4, W-5, BB-2, and CCC-3.

Response to Comment PPP-4:

Please refer to Response to comment W-7.

Response to Comment PPP-5:

Please refer to Response to comments W-9, and CCC-2.

Response to Comment PPP-6:

Please refer to Response to comments W-2, and EEE-1.

Response to Comment PPP-7:

It is correct that the elements of the 2007 AQMP control measures MCS-03 are carried over and included in the broader scope of the 2012 AQMP control measure EDU-01.

Response to Comment PPP-8:

Any expansion of Rule 1177 applicability will necessarily follow the traditional rulemaking process that will include the thorough evaluation of the feasibility and cost effectiveness of achieving further reductions from the new sources proposed for inclusion. The evaluation will include a full socio-economic and environmental assessment of the impacts of the Rule's expanded applicability.

Response to Comment PPP-9:

The purpose of this control measure is not to replace current traditional LDAR programs, which have produced significant fugitive VOC reductions in the Basin. Rather, it seeks to take advantage of new imaging technologies to institute fugitive emission reductions programs in source categories not currently subject to current LDAR requirement, but in a more efficient and cost-effective manner using

advanced techniques. Staff will explore opportunities that would further enhance the effectiveness of traditional LDAR programs through the use of OGI techniques. Note that the \$11,000 per ton cost effectiveness is based on traditional LDAR programs, and reflects an upper bound considering the lower expected cost of OGI techniques.

Response to Comment PPP-10:

Please refer to Response to comment W-10.

Response to Comment PPP-11:

This measure is a voluntary incentive program targeting potential emissions reductions not regulated by the current CARB regulation. The participation is voluntary based on technically feasible and cost-effective technologies.

Response to Comment PPP-12:

As stated in the comment, this measure seeks to *incentivize* cleaner vessels to call on the Ports of Los Angeles and Long Beach. It builds upon and complements other programs already being implemented. As it does not seek SIP-committed emissions reductions through imposing regulations, there is no need for the legal authority to implement such voluntary incentive programs. The emission reductions referenced are for discussion purposes.

Comments by Sierra Club Angeles Chapter on
Draft Socioeconomic Report of the South Coast Air Quality Management Plan (AQMP)

November 12, 2012, sent to: 2012aqmpcomments@aqmd.gov

Dear South Coast Air Quality Management District,

The Sierra Club has long been concerned about environmental justice issues and promoting green jobs. We are impressed with the chart on page 1-3 showing the "Evolution of Socioeconomic Analysis." However, it is disappointing that so many key enhancements will have to wait for future AQMPs: especially expanding sub-regional analyses to include environmental justice (EJ) areas. The map on page 5-4 does show big improvements in many EJ areas. However, these are mainly the areas where the pollution has been the worst and causing huge health impacts. We request that future Socioeconomic Reports quantify the current costs of health impacts on EJ areas, along with the reductions in health impacts resulting from the Plan.

The section on Green Jobs (p. 2-5) is quite perfunctory and does not address the following key issues:

1. Where are the green jobs located? The District should stress in all its lobbying efforts to support green jobs going to the EJ areas, which are defined on p. 5-3 as high poverty and high impacts: "An important element of the socioeconomic analysis is to identify how the proposed control strategy will impact the sensitive portions of the population, in particular, the segment of the community identified by the District's existing environment justice (EJ) guidance, which is an area that exceeds 10 percent of poverty rate with a cancer risk greater than 850 in a million or a PM_{2.5} concentration greater than 19.02 µg/m³."
2. The differentials in jobs per dollar created by money invested in renewables and efficiency, compared to using fossil fuels. We are concerned that the fossil fuel industry touts the large number of jobs involved in the mining, refining, and distribution of the dangerously polluting fossil fuels. But many studies have shown many more jobs per dollar are created by money invested in renewables and efficiency, compared to using fossil fuels.
3. We request an analysis of how money invested in clean fuels (solar, wind, and geothermal) has a much bigger economic benefit than money invested in fossil fuels, because the fossil fuels create such a huge economic drain on Southern California by all the work and school days lost because of air pollution.

Thank you for the opportunity to comment.

Jim Stewart, PhD, Chair
Sierra Club Angeles Chapter Global Warming, Energy & Air Quality Committee

QQQ-1

Responses to Comment Letter QQQ
Sierra Club Angeles Chapter

Response to Comment QQQ-1:

Staff will study costs of health impacts on EJ areas in future enhancements. For the detailed locations of green jobs, please see the 2010 EDD report of “California’s Green Economy—Summary of Survey Results.” Staff will examine data availability on the differential impacts of investments on clean fuels versus fossil fuels as part of its future endeavors.

RRR. Joyce Dillard, November 12, 2012

Subject: Comments to AQMP Air Quality Management Plan due 11.12.2012

You changed the due date. LA Times Classified Ad read:

NOTICE IS FURTHER GIVEN that the 2012 AQMP is designed to meet federal Clean Air Act requirements and addresses the attainment demonstration requirements of the federal Clean Air Act for the South Coast Air Basin (Los Angeles County, Orange County, San Bernardino County and Riverside County). NOTICE IS FURTHER GIVEN that the 2012 AQMP will be submitted to the California Air Resources Board (CARB) and the Environmental Protection Agency for inclusion into the State Implementation Plan (SIP). NOTICE IS FURTHER GIVEN that the Plan addresses air quality standards for 24-hour PM2.5 and 1-hour ozone, as well as updates provisions relevant to the 8-hour ozone standard. This revision to the AQMP updates transportation emission budgets based on the latest motor vehicle emissions model and planning assumptions. The Plan also incorporates significant new scientific data, emissions inventories, ambient measurements, and air quality models. The 2012 AQMP is jointly prepared by the District, CARB, and Southern California Association of Governments (SCAG). NOTICE IS FURTHER GIVEN that the 2012 AQMP includes new information on key elements such as: Current air quality; Improved emission inventories An overall control strategy comprised of: Stationary and Mobile Source Control Measures; An attainment demonstrations for the 24-hour PM2.5 standard; Updated attainment demonstration for the revoked 1-hour ozone standard; Further specifications of certain commitments to provide emission reductions for the 1-hour and 8-hour ozone standards; Motor vehicle emission budgets for transportation conformity purposes. NOTICE IS FURTHER GIVEN that the Revised Draft 2012 AQMP was released for public comment and review on September 7, 2012 following the release of the initial Draft 2012 AQMP on July 18, 2012. Six regional workshops were held from July 10 through August 9, 2012 to discuss the Plan and solicit public input. Four public hearings were held from September 11 through September 13, 2012 to discuss the modifications to the Draft 2012 AQMP based on the comments received on the Draft 2012 AQMP. Comments on the Revised Draft 2012 AQMP are encouraged to be submitted by November 12, 2012 in order to provide time to respond and incorporated changes to the Plan where appropriate.

In the Overall Attainment Strategy, you indicate

The control measures were chosen based on technical and economic feasibility, as well as other factors such as promoting fair share responsibility and maximizing private/public partnerships. Table 4-1 provides an overview of the criteria used in evaluating and selecting feasible control measures, in no particular order.

We do not understand how you have come to the conclusion for this list without some back-up of analysis and how you determined that private/public partnerships as a strategy

RRR-1

for attainment; and, in Table 4-1 Criteria for Evaluating 2012 AQMP Control Measures when you do not even a rank by priority.

Those Criteria are:

1. Cost-Effectiveness
2. Emission Reduction Potential
3. Enforceability
4. Legal Authority
5. Public Acceptability
6. Rate of Emission Reduction
7. Technological Feasibility

RRR-1

You are creating a market, not addressing the real issue.

You fail to address those out gassing of methane in areas of the South Coast Basin with oil wells, either current or past. There is a study underway by a university professor and non-profit organization that is finding high levels of emission affecting ozone.

RRR-2

You have not sufficiently demanded or enforced mitigation measures over the Metrolink Maintenance Yard issues that affect an Environmental Justice community.

RRR-3

You are understating the health assessment risks.

RECLAIM or any other type mechanism does not address the issue.

Complete Streets and Circulation Element of the General Plan would need to be addressed as the issues from the Department of Transportation Pipeline and Hazardous Materials Safety Administration Docket No. PHMSA-2011-0023-0001 Pipeline Safety: Safety of Gas Transmission Pipelines. The condition of infrastructure and the operations and maintenance of that infrastructure cannot be offset by credits.

RRR-4

The Railroad Safety System should be addressed.

You have not done due diligence and may continue substantial inadequacy.

Joyce Dillard

Subject: Comments to 2012 AQMP Draft Socioeconomic Report due 11.12.2012

Oil wells and the related methane issues tend to be in the Inner City of Downtown Los Angeles.

Other areas in the South Coast Basin have now become populated, though not as dense with oil wells and related methane issues.

You are underplaying this aspect of the basin. You have not addressed those health issues around the poor air quality. You have not even tested these sensitive areas and have never considered this issue in your implementation strategies while you base compliance on unrealistic expectations and disregard to the continuing deterioration of quality of life including health.

You do not address the true costs.

You need to test these areas of special concern. They are unique in the country.

A university professor and a non-profit organization is studying this out gassing of methane in the Los Angeles region and are alarmed at their preliminary findings.

Deteriorating infrastructure is common and (Federal) agencies are aware of the problem as is the Governor's Office of Planning and Research. OPR requires guides local governments in implementation of Elements to the General Plans.

The absence of operations and maintenance funding and/or capital improvements will affect the socio-economic analysis. The cost of living in the South Coast Basin may rise far beyond other communities.

RRR-5

We do not know the cost.

You have no patterns specifying jobs to the air quality reductions measures due to implementation strategies. You are underestimating control costs.

We do not know the cost.

RRR-6

You have not addressed the continuing air quality problem with the railroads and their maintenance yards. There is not an existing Department of Transportation FRA Federal Railroad Administration System Safety Program to cover these problems.

We do not know the cost.

You cannot say there is any quantifiable benefit unless you address and correct the inadequacies of the presumptions.

There is environmental injustice.

RRR-7

Responses to Comment Letter RRR
Joyce Dillard

Response to Comment RRR-1:

Please refer to Response to comment M-2.

Response to Comment RRR-2:

The 2012 AQMP is primarily designed to address the air quality of criteria pollutants, namely PM_{2.5} and ozone. It does not propose measure to address methane emissions and their impact on climate. There is no current evidence that methane significantly affects ozone formation. It is therefore considered inert and not an ozone precursor. There may be co-emitted VOCs from oil operations that do affect ozone formation, and those are accounted for in the AQMP analysis.

Response to Comment RRR-3:

The 2012 AQMP is designed to address the regional air quality of criteria pollutants, namely PM_{2.5} and ozone. Localized toxic impacts and environmental justice issues are addressed through other programs, such as our Clean Communities Plan, diesel emission reduction efforts, air toxic assessment studies, CEQA review, and risk reduction strategies. However, some of the measures designed for regional air quality improvement will have commensurate exposure reduction benefits for local communities

Response to Comment RRR-4:

The NO_x RECLAIM market only applies to the largest stationary sources in the Basin, and does not apply to construction or maintenance of distributed infrastructure.

Response to Comment RRR-5:

Emissions from oil wells in the Basin and their impact on ozone and PM_{2.5} are included in the analysis. Localized impacts are addressed through other programs, such as permitting, CEQA review and AB2588 risk reduction strategies. AQMD staff has recently held a technology symposium on hydraulic fracturing, and is initiating a rulemaking on reporting and public notification.

Response to Comment RRR-6:

Please refer to Response to comments C-1, M-1, KK-5, EEE-2, and HHH-2.

Response to Comment RRR-7:

Please refer to Response to comment RRR-03.

PREFACE

This document constitutes the Final Program Environmental Impact Report (EIR) for the 2012 Air Quality Management Plan (AQMP). The Draft Program EIR was released for a 45-day public review and comment period from September 7, 2012 to October 23, 2012. It was concluded in the Draft Program EIR that the 2012 AQMP has the potential to generate significant adverse environmental impacts to the following environmental topic areas: construction air quality, energy (increased electricity and natural gas demand), hazards and hazardous materials, water demand, construction noise, and transportation and traffic. Measures were identified to mitigate to the maximum extent feasible potentially significant adverse impacts to all environmental topics identified above. In spite of implementing all feasible mitigation measures, impacts to all environmental topics remained significant. In addition, the Draft Program EIR included analyses of potentially significant adverse cumulative environmental impacts and identified and evaluated the relative merits of four project alternatives, including a No Project Alternative, and compared impacts from the project alternatives to the potential impacts from the 2012 AQMP. Thirteen comment letters were received from the public during the public comment period regarding the environmental analyses in the Draft Program EIR. These comment letters and the responses to individual comments are included in Appendix G of this document. No comments in these letters identified other potentially significant adverse environmental impacts from the proposed project not already analyzed in the Draft Program EIR.

In anticipation that the U.S. EPA would likely request that the SCAQMD prepare a federal one-hour ozone SIP, the 2012 AQMP contains ozone control measures that address the federal one-hour ozone standard (revoked) and contributes to making expeditious progress to attain the federal eight-hour ozone standard by 2023. All ozone control measures in the 2012 AQMP were evaluated in the Draft Program EIR. On September 19, 2012, the U.S. EPA published in the Federal Register a proposed "SIP call" which, if finalized, would require the SCAQMD to prepare a demonstration of attainment of the one-hour ozone standard, with attainment required ten years from the date the SIP call is finalized. The same day, the U.S. EPA published in the Federal Register a proposal to withdraw its approval of, and then to disapprove, the transportation control measure (TCM) demonstrations, also referred to as VMT emissions offset demonstrations, in the 2003 one-hour ozone plan and the 2007 eight-hour ozone plan. In response to the two U.S. EPA actions above and in anticipation that they will be finalized, SCAQMD staff has prepared the *One-hour Ozone Attainment Demonstration*, which demonstrates attainment of the federal one-hour ozone standard (revoked) by the year 2022 (2012 AQMP Appendix VII) and the *VMT Offset Requirement Demonstration* (2012 AQMP Appendix VIII). These documents and other minor modification to the proposed project made after circulation of the Draft Program EIR were evaluated by staff and it was concluded that they did not change in any way any conclusions regarding the significance of environmental impacts in the Draft Program EIR.

To facilitate identifying changes in this Final Program EIR, modifications to the document are included as underlined text and text removed from the document is indicated by ~~strikethrough~~. To avoid confusion, minor formatting changes are not shown in underline or strikethrough mode. Staff has reviewed the modifications to the proposed project, including the documentation in new Appendices VII and VIII, and concluded that none of the modifications alter any conclusions reached in the Draft SEA nor provide new information of substantial importance relative to the draft document. As a result, none of the revisions to the Program EIR reflected in this document require recirculation of the document pursuant to CEQA Guidelines §15088.5. Therefore, this document is now constitutes the Final Program EIR for the 2012 AQMP.

CHAPTER 1

INTRODUCTION AND EXECUTIVE SUMMARY

Introduction

California Environmental Quality Act

[Areas of Controversy](#)

Executive Summary: Chapter 2 - Project Description

Executive Summary: Chapter 3 - Environmental Setting

Executive Summary: Chapter 4 - Environmental Impacts and Mitigation Measures

Executive Summary: Chapter 5 - Cumulative Impacts

Executive Summary: Chapter 6 - Alternatives

1.1 INTRODUCTION

The California Legislature adopted the Lewis Air Quality Act in 1976, creating the South Coast Air Quality Management District (SCAQMD) from a voluntary association of air pollution control districts in Los Angeles, Orange, Riverside, and San Bernardino counties. The new agency was charged with developing uniform plans and programs for the South Coast Air Basin (Basin) to attain federal air quality standards by the dates specified in federal law. While the Basin has one of the worst air quality problems in the nation, there have been significant improvements in air quality in the Basin over the last two decades, although some air quality standards are still exceeded relatively frequently, and by a wide margin. The agency was also required to meet state standards by the earliest date achievable through the use of reasonably available control measures.

The Lewis Air Quality Act (now known as the Lewis-Presley Air Quality Management Act) requires that the SCAQMD prepare an Air Quality Management Plan (AQMP) consistent with federal planning requirements. In 1977, amendments to the federal Clean Air Act (CAA) included requirements for submitting State Implementation Plans (SIPs) for non-attainment areas that fail to meet all federal ambient air quality standards (Health & Safety Code §40462). The federal CAA was amended in 1990 to specify attainment dates and SIP requirements for ozone, carbon monoxide (CO), nitrogen dioxide (NO₂) and particulate matter less than 10 microns in diameter (PM₁₀). The California Clean Air Act (CCAA), adopted in 1988, requires the SCAQMD to endeavor to achieve and maintain state ambient air quality standards for ozone, CO, sulfur dioxide (SO₂), and NO₂ by the earliest practicable date (Health & Safety Code §40910), and establishing requirements to update the plan periodically.

The first AQMP was prepared and approved by the SCAQMD in 1979 and has been updated and revised a number of times. The CCAA requires a three-year plan review and update to the AQMP. The following bullet items summarize the main components of those updates and revisions.

- In 1982, the AQMP was revised to reflect better data and modeling tools.
- In 1987, a federal court ordered the United States Environmental Protection Agency (U.S. EPA) to disapprove the 1982 AQMP because it did not demonstrate attainment of all national ambient air quality standards (NAAQS) by 1987 as required by CAA. This, in part, led to the preparation of the 1989 AQMP.
- The 1989 AQMP was adopted on March 17, 1989, and was specifically designed to attain all NAAQS. This plan called for three “tiers” of measures as needed to attain all standards and relied on significant future technology advancement to attain these standards.
- In 1991, the SCAQMD prepared and adopted the 1991 AQMP to comply with the CCAA.

-
- In 1992, the 1991 AQMP was amended to add a control measure containing market incentive programs.
 - In 1994, the SCAQMD prepared and adopted the 1994 AQMP to comply with the CCAA three-year update requirement and to meet the federal CAA requirement for an ozone SIP. The AQMP, as adopted in 1994, included the following.
 - All geographical areas under the jurisdiction of the SCAQMD (referred to herein as the district), as opposed to the Basin.
 - The basic control strategies remained the same although the three-tiered structure of control measures was replaced. Measures previously referred to as Tier I, II, or III were replaced with short-/intermediate-term or long-term control measures;
 - Updated and refined control measures carried over from 1991;
 - The federal post-1996 rate of progress demonstration;
 - Best Available Control Measure (BACM) PM10 Plan;
 - The ozone attainment demonstration plan;
 - Amendments to the federal Reactive Organic Compound (ROC) Rate-of-Progress plan also referred to as the VOC Rate-of Progress Plan;
 - Attainment Demonstration Plans for the federal PM10, nitrogen dioxide, carbon monoxide air quality standards;
 - Expanded use of market incentives;
 - New public outreach and education programs; and
 - Manufacturer-certified products and equipment.
 - The 1997 AQMP was designed to comply with the three-year update requirements specified in the CCAA as well as to include an attainment demonstration for PM10 as required by the federal CAA. Relative to ozone, the 1997 AQMP contained the following changes to the control strategies compared to the 1994 AQMP:
 - Less reliance on transportation control measures (TCMs);
 - Less reliance on long-term control measures that rely on future technologies as allowed under §182 (e)(5) of the CAA; and
 - Removal of other infeasible control measures and indirect source measures.

- In 1999, the ozone plan portion of the 1997 AQMP was amended to address U.S.EPA concerns with the 1997 AQMP plan to provide the following:
 - Greater emission reductions in the near-term than would occur under the 1997 AQMP;
 - Early adoption of the measures that would otherwise be contained in the next three-year update of the AQMP; and
 - Additional flexibility relative to substituting new measures for infeasible measures and recognition of the relevance of cost effectiveness in determining feasibility.
- In April 2000, U.S. EPA approved the 1999 ozone SIP Amendment to the 1997 plan. The 1999 Amendment in part addressed the State's requirements for a triennial plan update.
- The 1997 PM10 SIP, as updated in 2002, was deemed complete by U.S. EPA in November 2002 and approved on April 18, 2003.
- The 2003 AQMP was adopted by the SCAQMD in August 2003. The 2003 AQMP has not yet been approved by the U.S. EPA as part of the SIP. The 2003 AQMP addressed the following control strategies:
 - Attaining the federal PM10 ambient air quality standard for the South Coast Air Basin and Coachella Valley – these portions were approved by the U.S. EPA; in both areas, the attainment demonstration was disapproved by the California Air Resources Board (CARB) withdrew its measures;
 - Attaining the federal one-hour ozone standard;
 - 1997/1999 control measures not yet implemented;
 - Discussion regarding credit/incentive programs and their role in achieving overall emission reduction targets;
 - Revisions to the Post-1996 VOC Rate-of-Progress Plan and SIP for CO;
 - Initial analysis of emission reductions necessary to attain the particulate matter less than 2.5 microns in diameter (PM2.5) and eight-hour ozone standards;
 - The 2003 AQMP was partially approved and partially disapproved.
- The SCAQMD Governing Board approved the 2007 AQMP on June 1, 2007. On September 27, 2007, CARB adopted the State Strategy for the 2007 SIP and the 2007 AQMP as part of the SIP. The following summarizes the major components of the 2007 AQMP:

- ❑ The most current air quality setting (e.g., 2005 data);
- ❑ Updated emission inventories using 2002 as the base year, which also incorporate measures adopted since adopting the 2003 AQMP;
- ❑ Updated emission inventories of stationary and mobile on-road and off-road sources;
- ❑ 2003 AQMP control measures not yet implemented (eight of the control measures originally contained in the 2003 AQMP have been updated or revised for inclusion into the Draft 2007 AQMP);
- ❑ 24 new measures are incorporated into the 2007 AQMP based on replacing the SCAQMD's long-term control measures from the 2003 AQMP with more defined or new control measures and control measure adoption and implementation schedules;
- ❑ SCAQMD's recommended control measures aimed at reducing emissions from sources that are primarily under State and federal jurisdiction, including on-road and off-road mobile sources, and consumer products;
- ❑ SCAG's regional transportation strategy and control measures; and
- ❑ Analysis of emission reduction necessary and attainment demonstration to achieve the federal eight-hour ozone and PM_{2.5} air quality standards.

On November 22, 2010, U.S. EPA issued a notice of proposed partial approval and partial disapproval of the 2007 South Coast SIP for the 1997 Fine Particulate Matter Standards and the corresponding 2007 State Strategy. Specifically, U.S. EPA proposed approving the SIP's inventory and regional modeling analyses, but it also proposed disapproving the attainment demonstration because it relied too extensively on commitments to emission reductions in lieu of fully adopted, submitted, and SIP-approved rules. The notice also cited deficiencies in the SIP's contingency measures.

- In response the U.S. EPA's proposed partial disapproval of the 2007 SIP, on March 4, 2011, the SCAQMD Governing Board approved Revisions to the 2007 PM_{2.5} and Ozone State Implementation Plan for the South Coast Air Basin and Coachella Valley. The revisions to the 2007 PM_{2.5} and Ozone SIP consist of the following:
 - ❑ Updated implementation status of SCAQMD control measures necessary to meet the 2015 PM_{2.5} attainment date;
 - ❑ Revisions to the control measure adoption schedule;
 - ❑ Changes made to the emission inventory resulting from CARB's December 2010 revisions to the on-road truck and off-road equipment rules; and

- An SCAQMD commitment to its “fair share” of additional NO_x emission reductions, if needed, in the event U.S. EPA does not voluntarily accept the “federal assignment.”
- In response to the July 14, 2011 U.S. EPA notice of proposed partial approval and partial disapproval of the 2007 South Coast IP for the 1997 Fine Particulate Matter Standards, at the October 7, 2011 public hearing, the SCAQMD Governing Board approved Further Revisions to PM_{2.5} and Ozone State Implementation Plan for South Coast Air Basin and Coachella Valley. Revisions to the PM_{2.5} SIP included a three-prong approach for identifying contingency measures needed to address U.S. EPA’s partial disapproval:
 - Equivalent emission reductions achieved through improvements in air quality;
 - Relying on committed emission reductions for the 2007 ozone plan;
 - Quantifying excess emission reductions achieved by existing rules and programs that were not originally included in the 2007 PM_{2.5} SIP;
 - U.S. EPA approved the PM_{2.5} SIP except for contingency measures on November 9, 2011. Action is pending on the contingency measures; and
 - U.S. EPA approved the 2007 SIP for the 8-hour ozone standard on March 1, 2012.
- The 2012 AQMP outlines a comprehensive control strategy that meets the requirement for expeditious progress towards attainment with the 24-hour PM_{2.5} federal ambient air quality standard with all feasible control measures and demonstrates attainment of the standard by 2014. The 2012 AQMP is also an update to the 8-hour ozone control plan with new emission reduction commitments from a set of new control measures, which implement the 2007 AQMP’s Section 182 (e)(5) commitments.

1.2 CALIFORNIA ENVIRONMENTAL QUALITY ACT

Pursuant to the California Environmental Quality Act (CEQA), this [Final](#) Program Environmental Impact Report ([PEIR](#)) has been prepared to address the potential environmental impacts associated with the South Coast Air Quality Management District’s [Draft](#) 2012 Air Quality Management Plan (AQMP). The 2012 AQMP is the planning document that sets forth policies and measures to achieve federal and state air quality standards in the region. CEQA Public Resources Code Section 21000 et seq., requires that the potential environmental impacts of proposed projects be evaluated and that feasible methods to reduce or avoid identified significant adverse environmental impact from these projects be identified.

To fulfill the purpose and intent of CEQA, the SCAQMD staff has prepared this [Final](#) Program Environmental Impact Report ([PEIR](#)) to address the potential

environmental impacts associated with the 2012 AQMP. Prior to making a decision on the [Draft](#) 2012 AQMP, the lead agency decision makers must review and certify the [Final Program](#) EIR as providing adequate information on the potential adverse environmental impacts of the AQMP.

1.2.1 Notice of Preparation/Initial Study

The original Notice of Preparation and Initial Study (NOP/IS) were distributed to responsible agencies and interested parties for a 30-day review and comment period on June 28, 2012 [and 11 comment letters were received](#). A revised NOP/IS (included as Appendix A of this [Final](#) Program EIR) was recirculated on August ~~24~~, 2012 for a 30-day comment period ending August 31, 2012, because changes were made to the 2012 AQMP project description during the comment period on the 6/28/12 NOP/IS. The recirculated Initial Study, [referred to herein as the 8/2/12 NOP/IS](#), identified potential adverse impacts in the following environmental topics: aesthetics, air quality and greenhouse gas emissions; energy; hazards and hazardous materials; hydrology and water quality; solid/hazardous waste; and transportation and traffic. Based on public comments [made relative to the 6/28/12 NOP/IS](#), the topics of land use and noise were also added to the [Program](#) EIR. The [Program](#) EIR also includes detailed responses to all [119](#) comment letters received on the [6/28/12 NOP/IS Initial Study](#) (see Appendix B). As indicated in Appendix C, no comment letters were received on the [8/24/12 NOP/IS](#).

1.2.2 [Program](#) EIR Format

The overall format of the [Program](#) EIR is as follows:

- Executive Summary
- Chapter 1: Introduction
- Chapter 2: Project Description
- Chapter 3: Environmental Setting
- Chapter 4: Environmental Impacts and Mitigation Measures
- Chapter 5: Cumulative Impacts
- Chapter 6: Alternatives
- Chapter 7: References
- Chapter 8: Acronyms

1.3 AREAS OF CONTROVERSY

[CEQA Guidelines §15123 \(b\)\(2\) requires a public agency to identify the areas of controversy in the CEQA document, including issues raised by agencies and the public. Over the course of developing the 2012 AQMP, no areas of controversy were identified at the time of release of the NOP/IS relative to the environmental analysis. Further, SCAQMD had not been made aware of any areas of controversy relative to the environmental analysis in any of the comment letters received regarding the NOP/IS.](#)

One comment letter received on the Draft Program EIR identified the following potential area of controversy. Concern was raised regarding the accuracy of the air quality inventory baseline, used as the basis for identifying potential air quality impacts, because it may not have included inventory information provided by the John Wayne Airport operators. However, as noted in response to comment #3-7 in Appendix G of this Final Program EIR, the 2012 AQMP baseline inventory was developed incorporating all information submitted by John Wayne Airport and SCAQMD staff will revise the Integra Report to reflect the updated information provided by the airport authority. Consequently, because the baseline inventory incorporates the data provided by the John Wayne Airport, this issue does not constitute an area of controversy.

Other comment letters were received on the Draft Program EIR, but none identified new issues relative to the environmental analysis or potential areas of controversy that could not be responded to in Appendix G. Since no areas of controversy were identified by SCAQMD or the public during the review and comment periods for both the NOP/IS and the Draft Program EIR, it is concluded that the proposed project does not contain any areas of controversy as defined by CEQA.

1.43 EXECUTIVE SUMMARY: CHAPTER 2 - PROJECT DESCRIPTION

Implementation of the ~~Draft~~ 2012 AQMP control strategies requires a cooperative partnership of governmental agencies at the federal, state, regional and local level. At the federal level, the U.S. EPA is charged with regulation of on-road motor vehicle standards; trains, airplanes, and ships; certain non-road engines; and off-shore oil development. CARB also oversees on-road emission standards, fuel specifications, some off-road sources and consumer product standards. At the regional level, the SCAQMD is responsible for stationary sources and some mobile sources. In addition, the SCAQMD has lead responsibility for the development of the AQMP. Furthermore, at the local level, the Southern California Association of Governments (SCAG) has a dual role of leader and coordinator. In their leadership role, they, in cooperation with local jurisdictions and sub-regional associations, develop strategies for these jurisdictions to implement. As a coordinator, they facilitate the implementation of these strategies (e.g., transportation control measures).

Chapter 2 describes existing air quality regulations and details the proposed approach for the 2012 ~~revision to the~~ AQMP.

1.43.1 Current Control Strategy

The SCAQMD has fulfilled the majority of its emissions reductions commitments specified in the 2007 State Implementation Plan (SIP). Through January 31, 2011, the SCAQMD Governing Board has amended and adopted 12 rules. The majority of these rules have been submitted to U.S. EPA and approved as part of the SIP. Several recently adopted SCAQMD rules have been submitted to CARB and have

been or are expected to be submitted to and subsequently evaluated by U.S. EPA. By 2014, the control measures adopted by the SCAQMD over this period will have achieved 22.5 tons per day of VOC reductions, 7.6 tons per day of NO_x reductions, 4.0 tons per day of SO_x reductions, and 1.0 ton per day of PM_{2.5} reductions. Additional reductions from these adopted rules will be achieved by 2023.

Since the 2007 AQMP was adopted, CARB has adopted (either entirely or partially) many of the 2007 AQMP's control measure commitments. In combination with the regulatory activity and revised inventory forecast, CARB has achieved the emission targets for both 2014 and 2023.

1.43.2 2012 AQMP Control Strategy

The overall control strategy for the ~~Draft~~ 2012 AQMP is designed to meet applicable federal and state requirements. The focus of the AQMP is to demonstrate attainment of the federal 24-hour PM_{2.5} ambient air quality standard by 2014, while making expeditious progress toward attainment of state PM standards. In addition, to further implement the existing 8-hour ozone plan, the ~~Draft~~ 2012 AQMP includes Section 182 (e)(5) implementation measures designed to assist in future attainment of the 8-hour ozone standard. The proposed control measures in the ~~Draft~~ 2012 AQMP are based on implementing all feasible control measures through the application of available technologies and management practices as well as development and deployment of advanced technologies and control methods. In addition, SCAQMD retains certain obligations relative to the (revoked) one-hour ozone standard. For purposes of the environmental analysis, it is expected that full implementation of the attainment strategy for the one-hour ozone standard would have the same environmental effects as implementing all the measures in the ~~Draft~~ 2012 AQMP and the Section 182 (e)(5) measures for the eight-hour standard that were already analyzed in the EIR for the 2007 AQMP. These measures rely on proposed actions to be taken by several agencies that currently have the statutory authority to implement such measures. Similar to the approaches taken in previous AQMPs, the SIP commitment includes an adoption and implementation schedule for each control measure. Each agency is also committed to achieving a total emission reduction target with the ability to substitute specified control measures for control measures deemed infeasible, as long as equivalent reductions are met by other means. These measures are also designed to satisfy the federal Clean Air Act requirement of reasonably available control technologies [§172 (c)], and the California requirement of Best Available Retrofit Control Technologies (BARCT) [Health and Safety Code §40440 (b)(1)].

To ultimately achieve the ozone ambient air quality standards and demonstrate attainment, significant NO_x emissions reductions will be necessary, not only from non-vehicular sources under the jurisdiction of the SCAQMD, but substantial reductions will be necessary from sources primarily under the jurisdiction of CARB (e.g., on-road motor vehicles, off-road equipment, and consumer products) and U.S. EPA (e.g., aircraft, ships, trains, and pre-empted off-road equipment). Without an adequate and fair-share level of reductions from all sources, the emissions reduction

burden would unfairly be shifted to stationary sources that are already stringently regulated. The SCAQMD will continue to work closely with CARB to further control mobile source emissions where federal or State actions do not meet regional needs.

The ~~Draft~~ 2012 AQMP control measures consist of three components: 1) the SCAQMD's stationary and mobile source control measures; 2) suggested State mobile source control measures; and 3) Regional Transportation Strategy and control measures provided by SCAG. These measures rely on not only the traditional command-and-control approach, but also public incentive programs, as well as advanced technologies expected to be developed and deployed in the next several years.

1.54 EXECUTIVE SUMMARY: CHAPTER 3 - ENVIRONMENTAL SETTING

Chapter 3 provides a detailed description of the existing setting of environmental resources identified as having potential significant impacts from the proposed project.

1.54.1 Aesthetics

Aesthetic resources on federal lands are managed by the federal government using various visual resource management programs, such as the Visual Resource Management System utilized by the Federal Bureau of Land Management (BLM) and the Visual Management System utilized by the United States Forest Service (USFS).

The California Coastal Commission (CCC) regulates development projects within the coastal zone for jurisdictions that do not have a local coastal program (LCP) or land use plan (LUP). California's Scenic Highway Program helps to preserve and protect scenic highway corridors from change that would diminish the aesthetic value of land adjacent to those highways. The nearest officially designated Scenic Highway to either the Ports and downtown Los Angeles would be Route 2 (Angeles Crest Scenic Byway) near La Canada/Flintridge, in the northeastern portion of Los Angeles County.

General plans, the primary document that establishes local land use policies and goals, are prepared by the counties and incorporated cities within the district. These general plans establish local policies related to aesthetics and the preservation of scenic resources within their communities or subplanning areas, and may include local scenic highway programs.

1.54.2 Air Quality

It is the responsibility of the SCAQMD to ensure that state and federal ambient air quality standards are achieved and maintained in its geographical jurisdiction. Health-based air quality standards have been established by California and the federal government for the following criteria air pollutants: ozone, (CO), nitrogen dioxide (NO₂), PM10, PM2.5, sulfur dioxide (SO₂), and lead. These standards were established to protect sensitive receptors with a margin of safety from adverse health impacts due to exposure to air pollution. The California standards are more stringent than the federal standards and in the case of PM10 and SO₂, far more stringent. California has also established standards for sulfates, visibility reducing particles, hydrogen sulfide, and vinyl chloride.

SCAQMD also has a general responsibility pursuant to HSC §41700 to control emissions of air contaminants and prevent endangerment to public health. Additionally, state law requires the SCAQMD to implement airborne toxic control measures (ATCM) adopted by CARB, and to implement the Air Toxics “Hot Spots” Act. As a result, the SCAQMD has regulated pollutants other than criteria pollutants such as TACs, greenhouse gases and stratospheric ozone depleting compounds. The SCAQMD has developed a number of rules to control non-criteria pollutants from both new and existing sources. These rules originated through state directives, CAA requirements, or the SCAQMD rulemaking process.

Two inventories are prepared for the [Draft](#)-2012 AQMP for the purpose of regulatory and SIP performance tracking and transportation conformity: an annual average inventory, and a summer planning inventory. The [Draft](#)-2012 AQMP uses annual average day emissions to estimate the cost-effectiveness of control measures, to rank control measure implementation, and to perform PM2.5 modeling and analysis. The summer planning inventory emissions are developed to capture the emission levels during a poor ozone air quality season, and are used to report emission reduction progress as required by the federal and California Clean Air Acts.

Stationary sources can be divided into two major subcategories: point and area sources. Point sources are large emitters with one or more emission sources at a permitted facility with an identified location (e.g., power plants, refineries). Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products, as well as permitted smaller sources), which are distributed across the region. The emissions from these sources are estimated using activity information and emission factors.

Mobile sources consist of two subcategories: on-road and off-road sources. On-road sources are from vehicles that are licensed to drive on public roads. Off-road sources are typically registered with the state and cannot be typically driven on public roads (construction and mining equipment, lawn and gardening equipment, ground support equipment, agricultural equipment).

In the 2008 base year model of the ~~Draft~~ 2012 AQMP, total mobile source emissions account for 60 percent of the VOC and 88 percent of the NO_x emissions based on the summer planning inventory. The on-road mobile category alone contributes about 34 and 59 percent of the VOC and NO_x emissions, respectively, and approximately 68 percent of the CO for the annual average inventory. For directly emitted PM_{2.5}, mobile sources represent 39 percent of the emissions with another 10 percent due to vehicle-related entrained road dust.

Within the category of stationary sources, point sources contribute more SO_x emissions than area sources. Area sources play a major role in VOC emissions, emitting about seven times more than point sources. Area sources, including sources such as commercial cooking, are the predominant source of directly emitted PM_{2.5} emissions (39 percent).

Demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by SCAG for their 2012 RTP are used in the ~~Draft~~ 2012 AQMP. Industry growth factors for 2008, 2014, 2018, 2020, 2023, and 2030 are also provided by SCAG, and interim years are calculated by linear interpolation. Current forecasts indicate that this region will experience a population growth of 11 percent between 2008 and 2023, with a four percent increase in vehicle miles traveled (VMT); and a population growth of 16 percent by the year 2030 with an 11 percent increase in VMT.

Without any additional controls, VOC, NO_x, and SO_x emissions are expected to decrease due to existing regulations, such as controls on off-road equipment, new vehicle standards, and the RECLAIM programs. Due to already-adopted regulations, 2023 on-road mobile sources are expected to account for: about 16 percent of total VOC emissions compared to 34 percent in 2008; about 37 percent of total NO_x emissions compared to 59 percent in 2008; and about 38 percent of total CO emissions compared to 68 percent in 2008. Meanwhile, area sources are expected to become the major contributor to VOC emissions from 35 percent in 2008 to 50 percent in 2023.

The milestone years 2008, 2014, 2019, 2023, and 2030 are the years for which emission inventories were developed as they are relevant target years under the federal CAA and the CCAA. The base year for the 24-hour PM_{2.5} attainment demonstration is 2008. The attainment year for the federal 2006 24-hour PM_{2.5} standard without an extension is 2014 and 2019 represents the latest attainment date with a full five-year extension. The 80 ppb federal 8-hour ozone standard attainment deadline is 2023, and the new 75 ppb 8-hour ozone standard deadline is 2032. A 2030 inventory will be used to approximate this latter year.

1.5.4.3 Energy

Federal and state agencies regulate energy use and consumption through various means and programs. On the federal level, the United States Department of Transportation (U.S. DOT), United States Department of Energy (U.S. DOE), and

U.S. EPA are three agencies with substantial influence over energy policies and programs. Generally, federal agencies influence transportation energy consumption through establishment and enforcement of fuel economy standards for automobiles and light trucks, through funding of energy related research and development projects, and through funding for transportation infrastructure projects.

On the state level, the California Public Utilities Commission (CPUC) and California Energy Commission (CEC) are two agencies with authority over different aspects of energy policy and regulations. The CPUC regulates privately-owned utilities in the energy, rail, passenger transportation, telecommunications, and water fields. The CEC collects and analyzes energy-related data, prepares state-wide energy policy recommendations and plans, promotes and funds energy efficiency and renewable energy resources programs, plans and directs state response to energy emergencies, and regulates the power plant siting and transmission process.

In 2010, 71 percent of the electricity used in California came from in-state sources, while 29 percent was imported into the state. The electricity imported totaled 85,169 gigawatt hours (GWh), with 24,677 GWh coming from the Pacific Northwest, and 60,492 GWh from the Southwest. (Note: A gigawatt is equal to one million kilowatts). For natural gas in 2010, 42 percent of the natural gas used in California came from the Southwest, 22 percent from Canada, 12 percent from in-state, and 23 percent from the Rockies. Also in 2010, 38 percent of the crude oil came from in state, with 12 percent coming from Alaska, and 50 percent being supplied by foreign sources.

One of the key areas of concern in the energy sector is reducing the amount of petroleum based fuels in the district. Consumption of these fuels is a major factor in the amount of criteria pollutants in southern California. Alternative fuels play an important role in the strategy to reach attainment in the region. Renewable energy resources include: biomass, hydro, geothermal, solar and wind.

1.54.4 Hazards and Hazardous Materials

The potential for hazards exist in the production, use, storage, and transportation of hazardous materials. Hazardous materials may be found at industrial production and processing facilities. Some facilities produce hazardous materials as their end product, while others use such materials as an input to their production process. Examples of hazardous materials used as consumer products include gasoline, solvents, and coatings/paints. Hazardous materials are stored at facilities that produce such materials and at facilities where hazardous materials are a part of the production process. Specifically, storage refers to the bulk handling of hazardous materials before and after they are transported to the general geographical area of use. Currently, hazardous materials are transported throughout the district via all modes of transportation including rail, highway, water, air, and pipeline.

Hazard concerns are related to the risks of explosions or the release of hazardous substances or exposure to air toxics. State law requires detailed planning to ensure

that hazardous materials are properly handled, used, stored, and disposed of to prevent or mitigate injury to health or the environment in the event that such materials are accidentally released. Federal laws, such as the Emergency Planning and Community-Right-To-Know Act of 1986 (also known as Title III of the Superfund Amendments and Reauthorization Act or SARA) impose similar requirements. These requirements are enforced by the California Emergency Management Agency (CalEMA).

In 2010, there were a total of 672 hazardous materials incidents (releases, accidents, spills, etc.) reported for Los Angeles, Orange, Riverside and San Bernardino counties, and in 2011 a total of 698 incidents were reported in these four counties. San Bernardino and Los Angeles counties accounted for the largest number of incidents, followed by Orange and Riverside counties.

1.54.5 Hydrology and Water Quality

The Federal Safe Drinking Water Act, enacted in 1974 and implemented by the U.S. EPA, imposes water quality and infrastructure standards for potable water delivery systems nation-wide. The California Safe Drinking Water Act was enacted in 1976. Potable water supply is managed through local agencies and water districts, the State Department of Water Resources (DWR), the Department of Health Services (DHS), the State Water Resources Control Board (SWRCB), the U.S. EPA, and the U.S. Bureau of Reclamation. The DWR manages the State Water Project (SWP), and compiles planning information on supply and demand within the state.

The DWR divides the state into ten hydrologic regions. Some regions contain a great deal of water, some regions are very dry and must have their water imported by aqueducts. The South Coast Air Basin lies within the South Coast Hydrologic Region. More than half of the state's population resides in the region (about 19.6 million people or about 54 percent of the state's population), which covers 11,000 square miles or seven percent of the state's total land. The cities of Los Angeles, Long Beach, Santa Ana, San Bernardino, and Big Bear Lake are among the many urban areas in this section of the state. The Santa Clara, Los Angeles, San Gabriel, and Santa Ana Rivers are among the area's hydrologic features. Most lakes in this area are actually reservoirs, made to hold imported water.

Imported sources account for approximately 75 percent of the total water used in the region. Local water resources, which include groundwater and captured surface water runoff, are fully developed and are expected to remain relatively stable in the future on a region-wide basis. Several groundwater basins in the region are threatened by overdraft conditions, increasing levels of salinity, and contamination by agricultural land to urban development, thereby reducing the land surface available for groundwater recharge. Increasing demand for groundwater may also be limited by water quality, since levels of salinity in sources currently used for irrigation could be unacceptably high for domestic use without treatment.

The SWRCB, and the nine regional water quality control boards (RWQCB), are responsible for protecting surface and groundwater supplies in California. In particular, the SWRCB establishes water-related policies and approves water quality control plans, which are implemented and enforced by the RWQCBs. Five RWQCBs have jurisdiction over areas within the boundaries of the SCAQMD. These agencies also regulate discharges to state waters through federal pre-treatment requirements enforced by the publicly owned treatment works (POTWs).

Water quality of regional surface water and groundwater resources is affected by point source and non-point source discharges occurring throughout individual watersheds. Regulated point sources, such as wastewater treatment effluent discharges, usually involve a single discharge into receiving waters. Non-point sources involve diffuse and non-specific runoff that enters receiving waters through storm drains or from unimproved natural landscaping. Within the regional Basin Plans, the RWQCBs establish water quality objectives for surface water and groundwater resources and designate beneficial uses for each identified waterbody.

Much of the urbanized areas of Los Angeles and Orange Counties are serviced by three [agencies that operate large POTW facilities operating on the coast](#): the City of Los Angeles Bureau of Sanitation's [Hyperion Treatment Plant in El Segundo](#), the [City of Los Angeles Bureau of Sanitation's Terminal Island Facility in San Pedro](#), ~~the Joint Outfall System of the~~ Los Angeles County Sanitation District's (LACSD) [Joint Water Pollution Control Plant \(JWPCP\) in Carson](#), and the Orange County Sanitation District's (OCSD) treatment plants [in Huntington Beach and Fountain Valley](#). These ~~three~~ facilities handle more than 70 percent of the wastewater generated in the entire region.

1.54.6 Land Use and Planning

The district is comprised of the non-desert portion of Los Angeles County, all of Orange County, a portion of southwestern San Bernardino County, and the Salton Sea Air Basin and Mojave Desert Air Basin portions of Riverside County amounting to a jurisdiction of approximately 10,473 square miles and a population of approximately 17 million. Urban development in the district tends to cluster around a well-defined network of state and federal highways which connect the regional populations of the district with other regions in California and across the nation. While most urban development has historically been based in the coastal regions of Los Angeles County and Orange County, there has been considerable urban growth eastward to the mountain and valley regions of Riverside County and San Bernardino County.

Without a vast surplus of open space, developers in Los Angeles County and Orange County have turned to different types of housing and commercial developments, including townhouses, condominiums, apartments, and mixed-use developments that combine commercial and office uses. Older buildings are often renovated or converted to accommodate new residential or commercial uses, and land use patterns in major developed cities have generally shifted from the traditional single-use

pattern to more of a mixed use approach, where residential and commercial land uses are often found adjacent to one another, or within the same building.

Much of the development in Riverside and San Bernardino Counties has taken place within unincorporated county land that both counties possess. Riverside County, in particular, has developed the Riverside County Integrated Project, which seeks to improve the quality of life for its citizens through a complementary array of development projects and programs aimed at creating a balanced and sustainable environment.

1.54.7 Noise

The federal government sets noise standards for transportation-related noise sources that are closely linked to interstate commerce, such as aircraft, locomotives, and trucks, and, for those noise sources, the state government is preempted from establishing more stringent standards. The state government sets noise standards for those transportation noise sources that are not preempted from regulation, such as automobiles, light trucks, and motorcycles. Noise sources associated with industrial, commercial, and construction activities are generally subject to local control through noise ordinances and general plan policies.

Environmental noise levels typically fluctuate across time of day; different types of noise descriptors are used to account for this variability, and different types of descriptors have been developed to differentiate between cumulative noise over a given period and single noise events. Individual noise events, such as train pass-bys or aircraft overflights, are further described using single-event and cumulative noise descriptors.

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. The Federal Transit Administration (FTA) states that in contrast to airborne noise, ground-borne vibration is not a common environmental problem and most people consider groundborne vibration to be an annoyance that may affect concentration or disturb sleep. However, high levels of vibration may damage fragile buildings or interfere with equipment that is highly sensitive to groundborne vibration (e.g., electron microscopes).

Some land uses (residences, schools, hospitals, etc.) are considered more sensitive to ambient noise levels than others due to the amount of noise exposure and the types of activities typically involved and are assigned more stringent noise standards. A noise level of 55 to 60 decibels outdoors is the upper limit for intelligible speech communication inside a typical home. In addition, social surveys and case studies have shown that complaints and community annoyance in residential areas begin to occur at about 55 decibels.

1.54.8 Solid and Hazardous Waste

A total of 32 Class III active landfills and two transformation facilities (e.g., waste-to-energy facilities) are located within the district with a total capacity of 116,796 tons per day and 3,240 tons per day, respectively¹. Permit requirements, capacity and surrounding land use are three of the dominant factors limiting the operations and life of landfills in the ~~South Coast Air D~~istrict. Landfills are permitted by the local enforcement agencies with concurrence from CalRecycle (formerly known as the California Integrated Waste Management Board). Local agencies establish the maximum amount of solid waste that can be received by a landfill each day, and the operational life of a landfill. Landfills are operated by both public and private entities. Landfills in the district are also subject to requirements of the SCAQMD as they pertain to gas collection systems, dust and nuisance impacts.

There are no hazardous waste disposal sites within the jurisdiction of the SCAQMD. Hazardous waste generated at area facilities, which is not reused on-site, or recycled off-site, is disposed of at a licensed in-state hazardous waste disposal facility. Two such facilities are the Chemical Waste Management (CWM) Kettleman Hills facility in King's County, and the Laidlaw Environmental Services (LES) facility in Buttonwillow (Kern County). Kettleman Hills is operating close to capacity, with reportedly less than one percent of capacity remaining. CMW applied to both the DTSC and the U.S. EPA to expand the facility to provide another 12-14 years of life. Buttonwillow receives approximately 900 tons of hazardous waste per day and has a remaining capacity of approximately 8,890,000 cubic yards. The expectant life of the Buttonwillow Landfill is approximately 40 years. Hazardous waste also can be transported to permitted facilities outside of California such as the U.S. Ecology Inc. facility in Beatty, Nevada or the LES facility in Lake Point, Utah.

While the DTSC has primary responsibility in the state for regulating the generation, transfer, storage and disposal of hazardous materials, DTSC may further delegate enforcement authority to local jurisdictions. In addition, the DTSC is responsible and/or provides oversight for contamination cleanup, and administers state-wide hazardous waste reduction programs. The DTSC conducts annual inspections of hazardous waste facilities. Other inspections can occur on an as-needed basis.

California Department of Transportation (Caltrans) sets standards for trucks transporting hazardous wastes in California. The regulations are enforced by the California Highway Patrol (CHP). Trucks transporting hazardous wastes are required to maintain a hazardous waste manifest. The manifest is required to describe the contents of the material within the truck so that wastes can readily be identified in the event of a spill.

¹ [This represents the sum of the permitted capacities of the Southeast Resource Recovery Facility at 2,240 tons per day and the Commerce Refuse-To-Energy Facility at 1,000 tons per day.](http://www.calrecycle.ca.gov/SWFacilities/Directory/19-AK-0083/Detail/)
[http://www.calrecycle.ca.gov/SWFacilities/Directory/19-AA-0506/Detail.](http://www.calrecycle.ca.gov/SWFacilities/Directory/19-AA-0506/Detail/)

1.54.9 Transportation and Traffic

The southern California transportation system is a complex intermodal network that consists of roads, highways, public transit, paratransit, bus, rail, airports, seaports and intermodal terminals designed to carry both people and goods. The transportation system supports the region's economic needs, as well as the demand for personal travel.

Numerous agencies are responsible for transportation planning and investment decisions within the southern California area. SCAG helps integrate the transportation-planning activities in the region to ensure a balanced, multimodal plan that meets regional as well as county, subregional, and local goals, while each of the four counties within the jurisdiction of the SCAQMD has a Transportation Commission or Authority. These agencies are charged with countywide transportation planning activities, allocation of locally generated transportation revenues, and in some cases operation of transit services.

The existing transportation network serving the Southern California area supports the movement of people and goods. On a typical weekday in the four-county region the transportation network supports a total of approximately 420 million vehicle miles of travel (VMT) and 12 million vehicle hours of travel (VHT). Of this total, over half occur in Los Angeles County.

Much of the existing travel in the Southern California area takes place during periods of congestion, particularly during the morning (6:00 AM to 9:00 AM) and evening peak periods (3:00 PM to 7:00 PM). Congestion can be quantified as the amount of travel that takes place in delay (vehicle hours of delay or VHD), and alternately, as the percentage of all travel time that occurs in delay (defined as the travel time spent on the highway due to congestion, which is the difference between VHT at free-flow speeds and VHT at congested speeds). Regional travel time in delay represents approximately 25 percent of all daily, 30 percent of all AM peak period, and 38 percent of all PM peak period travel times.

The regional freeway and highway system is the primary means of person and freight movement for the region. This system provides for direct automobile, bus and truck access to employment, services and goods. The network of freeways and State highways serves as the backbone of the system offering very high capacity limited-access travel and serving as the primary heavy duty truck route system.

Transit use is growing in southern California. As of 2009, transit agencies in the southern California area reported 747.3 million boardings. This represents growth of nearly 20 percent in the ten years between 2000 and 2010, but only four percent growth in per capita trips due to population growth. Metrolink and Metro Rail (Los Angeles County) have seen ridership growth of six percent to eight percent per year.

1.65 EXECUTIVE SUMMARY: CHAPTER 4 - ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Chapter 4 – Environmental Impacts and Mitigation Measures, provides a detailed review of the environmental topics that were identified in the 8/21/12 NOP/IS where potentially significant adverse impacts were identified (see Appendix A). In addition, the evaluation of several environmental resources (land use and noise) was added to the Program EIR based on public comments. Each of the proposed control measures was evaluated to determine the environmental topics that would potentially be impacted, if the control measure or strategy was adopted. The following subsections provide a brief discussion of the potential environmental impacts and mitigation measures for each environmental category analyzed. Table 1-1 provides a summary of the impacts identified under each resource category, identifies mitigation measures that were imposed (if applicable), and identifies the remaining impacts following mitigation.

1.65.1 Aesthetics

Subchapter 4.1 identifies the potential aesthetics impacts as a result of implementing the control measures in the 2012 AQMP.

Control measures ONRD-05, ADV-01 and ADV-02 included in the 2012 AQMP relate primarily to emission reductions through the incorporation of electrically powered trucks and locomotives. To power this equipment, catenary lines (overhead power lines) could be constructed and could potentially result in aesthetic impacts. These lines are similar to “trolley car lines” associated with electrically powered trollies and buses common in metropolitan transportation.

The areas affected by the proposed Zero and Near-Zero Emissions control measures that could result in the installation of catenary lines are expected to be located in commercial, industrial areas, and along existing transportation corridors (e.g., in areas within and adjacent to the Port of Los Angeles and Port of Long Beach, along the I-710 Freeway, along the I-60 Freeway, as well as near railyards in downtown Los Angeles).

The construction and operation of the catenary or overhead power lines that could be used to power Zero and Near Zero vehicles and locomotives are not expected to be visible to any Scenic Highway or any roadway eligible as a Scenic Highway. Therefore, aesthetics impacts associated with the 2012 AQMP are less than significant.

1.65.2 Air Quality

Subchapter 4.2 examines the secondary air pollutant emissions that could occur as a consequence of efforts to improve air quality (e.g., emissions from control equipment such as afterburners). Secondary air quality impacts are potential increases in air pollutant that occur indirectly from implementation of control

measures in the ~~Draft~~ 2012 AQMP. SCAQMD evaluated all ~~Draft~~ 2012 AQMP control measures to identify those control measures that have the potential to generate secondary adverse air quality impacts. Evaluation of control methods for each control measure indicated that there are 27 control measures that could have potential secondary air quality impacts.

While implementing the ~~Draft~~ 2012 AQMP control measures is expected to reduce operational emissions, construction-related activities associated with installing or replacing equipment, for example, are expected to generate emissions from construction worker vehicles, trucks, and construction equipment. Implementation of some of the measures in the 2012 AQMP that require construction may cause significant impacts to air quality (mainly CO and PM10).

Secondary emissions from increased electricity demand, the reformulation of products (lower VOC materials), mobile sources (PZEV and ZEV vehicles), the increased use of fuels (lower fuel economy), and other miscellaneous sources (handling of greenwaste) are considered to be less than significant.

1.65.3 Energy

Subchapter 4.3 identifies the potential energy impacts as a result of implementing stationary and mobile control measures in the 2012 AQMP. The EIR evaluated the potential impacts of the AQMP on electricity, natural gas, petroleum fuels, alternative fuels, and renewable energy.

The increase in electricity associated with the control measures and strategies in the 2012 AQMP is considered to be significant. While the increase in electricity is expected to be within the electric generating capacity of the region, an increase in electricity of greater than one percent represents a substantial increase in electricity. Thus, the energy impacts associated with electricity demand from the implementation of the 2012 AQMP are considered to be significant.

The energy impacts associated with implementation of the control measures and strategies in the 2012 AQMP are expected to result in an increase in natural gas demand. The increased demand for natural gas is considered to be significant.

The energy impacts associated with implementation of the control measures and strategies in the 2012 AQMP are expected to result in a reduction in use (less demand) of petroleum fuels so that no significant impacts on petroleum fuels are expected.

Although an increase in demand for hydrogen as a transportation fuel is expected due to implementation of the control measures and strategies in the 2012 AQMP, this increase is not expected to be significant since hydrogen is not widely available and its use is currently limited. Hydrogen is available or the feedstock that produces it is generally available. Future demand is expected to be met through increased production. The energy impacts associated with the future use of hydrogen is

expected to be less than the current strategy that uses predominately petroleum based fuels so that no significant hydrogen demand impacts on are expected.

The design and goal of the 2012 AQMP is to shift to less polluting transportation fuels. Although an increase in alternative transportation fuels is expected, this increase is not expected to be significant since alternative fuels (e.g., natural gas or hydrogen) are available or the feedstock that produces the fuels is generally available.

Finally, no 2012 AQMP control measures were identified that would adversely affect renewable energy production or interfere with the goals and requirements of the Renewables Portfolio Standard.

1.65.4 Hazards and Hazardous Materials

Subchapter 4.4 identifies the potential hazard impacts as a result of implementing the control measures in the ~~Draft~~ 2012 AQMP. The Initial Study identified the following types of control measures as having potentially significant hazards impacts: 1) use of reformulated coatings, solvents, adhesives, mold release and consumer products; 2) increase in the transportation and disposal of reformulated products; 3) the use of ammonia in selective catalytic reduction (SCR) or selective non-catalytic reduction (SNCR) air pollution control technology; and, 4) use of alternative fuels.

Each control measure in the ~~Draft~~ 2012 AQMP was evaluated for potential hazard and hazardous materials impacts based the technologies expected to be employed through implementation of the control measure. Evaluation of control methods for each control measure indicated that there are 24 (three PM2.5 and 21 ozone precursor) control measures that have potential adverse hazard impacts.

Control Measures MCS-01, CTS-01, CTS-02, CTS-03, and CTS-04 could require reformulation of coatings, adhesives, solvents, mold release, and consumer products. The analysis indicates that the fire hazard impacts associated with reformulation are expected to be significant. Mitigation measures HZ-1 and HZ-2 were imposed that would add consumer warning requirements for all flammable and extremely flammable products and require public education regarding the use of flammable materials are expected to reduce the impacts to less than significant.

Control Measures IND-01, INC-01, ONRD-01, ONRD-03, ONRD-04, ONRD-05, OFFRD-01, OFFRD-02, OFFRD-03, OFFRD-04, ADV-01, ADV-02, ADV-03, ADV-04, ADV-05, ADV-06, and ADV-07 would establish in-use strategies that may require or promote the use of alternative fuels. Hazards impacts from the increased use of alternative fuels (including methanol, ethanol, CNG, LPG, biodiesel, hydrogen and electric/hybrid) are expected to be similar to or less than hazards associated with conventional fuels. Therefore, significant hazard impacts are not expected from the increased use of these alternative fuels. The potential hazards associated with the transportation of LNG were determined to be significant and

mitigation measures HZ-3 through HZ-6 were imposed. However, the mitigation measures would not reduce LNG transport impacts to less than significant.

Control Measures CMB-01, IND-01, MSC-01, OFFRD-02, OFFRD-03, OFFRD-04, ADV-01, ADV-02, ADV-04, and ADV-05 could result in the use of SCR and SNCR to reduce NOx emissions. While the use of aqueous ammonia at concentrations less than 20 percent by volume is expected to reduce hazard impacts associated with ammonia use, the potential for a spill of aqueous ammonia during transportation or on-site could pose a significant hazard impact. Accordingly, significant hazard impacts are expected from the increased use of ammonia in SCR and SNCR technologies and mitigation measures HZ-7 through HZ-10 were imposed that required the use of aqueous ammonia and included containment devices. After mitigation, no remaining significant impacts associated with ammonia use is expected.

Some control measures in the 2012 AQMP could use fuel additives in conjunction with other technologies and methodologies to provide emission reductions. In the past, the introduction of fuel additives into fuels has resulted in environmental impacts (e.g., lead and MTBE). Because of the many requirements before additives can be approved for use, the potential impacts of fuel additives are less than significant because negative impacts would be identified and mitigated, as necessary, prior to their use. Therefore, no mitigation measures are required.

Finally, no hazard impacts were identified pertaining to safety issues associated with implementing MCS-03, Start-up, Shutdown and Turnaround Procedures or from other control measures that would increase the use of catalysts.

1.65.5 Hydrology and Water Quality

Subchapter 4.5 identifies potential hydrology and water quality impacts that may be generated by implementing the 2012 AQMP. Some of the control measures in the 2012 AQMP may result in impacts on water quality and increased wastewater discharge; water quality impacts associated with the use of alternative fuels; water quality impacts associated with increased use of batteries; increased water demand; and use and application of sodium bisulfate for livestock operations.

Wastewater treatment facilities are expected to have sufficient capacity to handle the estimated increase in wastewater that could be generated from reformulation of products and use of air pollution control equipment (e.g., wet ESPs and WGSs). Therefore, no significant impacts associated with wastewater treatment or water quality is expected.

The use of alternative fuels is not expected to result in greater adverse water quality impacts than the use of conventional fuels. No significant adverse hydrology and water quality impacts are expected from the increased use of alternative fuels.

It is expected that the recycling of EV and hybrid batteries will be greater than lead-acid batteries in conventional vehicles, reducing the potential for illegal disposal and potential water quality impacts. No significant adverse water quality impacts are expected from the increased use of EV and hybrid vehicles.

Water demand associated with the manufacture and use of waterborne and add-on air pollution control technologies are potentially significant. While mitigation measures are available, they can vary from jurisdiction to jurisdiction, and may remain significant.

The use and application of SBS should be controlled and monitored to prevent water quality runoff and related water quality impacts. Therefore, the use of SBS is expected to be less than significant.

Potential spills associated with ammonia are expected to be contained on-site due to the requirement for secondary spill containment devices and berms. Therefore, potential ammonia spills are expected to be less than significant.

1.65.6 Land Use and Planning

Subchapter 4.6 examines the potential land use impacts associated with implementation of the proposed control measures in the 2012 AQMP. Potential land use impacts are associated primarily with the construction of support systems (e.g., catenary overhead electrical lines or magnetic infrastructure related to operation of zero- and near-zero transport systems). Control measures ONRD-05, ADV-01, and ADV-02 could require construction activities that may generate land use impacts. Control measures are not expected to conflict with applicable land use plans, policies, or regulations or physically divide an established community. Therefore, no significant adverse land use impacts are expected.

1.65.7 Noise

Subchapter 4.7 identifies 2012 ~~Draft~~ AQMP control measures that could result in potential adverse noise impacts. Control measures that may have noise impacts relate primarily with construction activities associated with air pollution control equipment and construction of support systems (e.g., wayside power, catenary overhead electrical lines, battery charging or fueling infrastructures related to operation of zero- and near-zero transport systems).

A number of control measures could result in the construction of air pollution control equipment including BCM-03, IND-01, MCS-01, CMB-01, FUG-01, FUG-02, OFFRD-04, ADV-01, ADV-02, ADV-03, ADV-04, ADV-05, and ADV-06. Control measures ONRD-05 and ADV-01 could require the installation of catenary overhead electrical lines within or adjacent to existing roadways, streets, freeways, and/or transportation corridors. ADV-02 could require the installation of electrical or magnetic infrastructure along rail lines.

During construction, there may be significant noise and vibration impacts, but these will be temporary in nature and related solely to construction activities. No modification to existing rail or truck traffic routes/corridor is expected; therefore, noise and vibration impacts associated with operational activities are expected to be less than significant.

1.65.8 Solid and Hazardous Waste

Subchapter 4.8 identifies potential solid and hazardous waste impacts that may be generated by implementing the ~~Draft~~ 2012 AQMP. Implementing some of the control measures could increase the generation and disposal of solid and hazardous waste in the region. Specifically, some control measures will encourage the use of electric vehicles which could result in an increase in waste associated with spent batteries (Control Measures IND-01, INC-01, ONRD-01, ONRD-02, ONRD-03, ONRD-04, ONRD-05, OFFRD-01, OFFRD-02, OFFRD-03, ADV-01, ADV-02, ADV-03, ADV-04, ADV-05, and ADV-06). Other control measures could increase the generation of solid or hazardous waste due to installation of air pollution control equipment, such as activated carbon, filters, and catalysts (Control Measures BCM-03, MCS-01, CMB-01, INC-01, OFFRD-02, OFFRD-03, OFFRD-04, ADV-01, ADV-04, and ADV-05). Finally, other control measures would encourage the early retirement of older equipment and replacement with newer and lower emission technology equipment, generating additional waste (Control Measures IND-01, MCS-01, CMB-01, CMB-02, CMB-03, INC-01, ONRD-01, ONRD-02, ONRD-03, ONRD-04, ONRD-05, OFFRD-01, OFFRD-02, OFFRD-03, ADV-01, ADV-02, ADV-05, ADV-06, and ADV-07).

The increased use of EVs and hybrids are not expected to result in a significant increase in the illegal disposal of batteries as they are valuable as a recyclable; no significant solid and hazardous waste impacts were identified due to air pollution control technologies as part of the ~~Draft~~ 2012 AQMP; and control measures that would require new equipment are not expected to result in a significant impact as the equipment being replaced can be reused in areas outside the district or recycled.

1.65.9 Transportation and Traffic

Subchapter 4.9 examines impacts on the potential transportation and traffic impacts associated with implementation of the proposed control measures in the 2012 AQMP. Some of the control measures could require construction activities adjacent to or within existing roadways potentially impacting traffic during construction activities.

The existing rail and truck routes/corridors likely to be modified are located primarily in commercial and industrial zones within the Southern California area. Examples of these areas include, but are not limited to, the Port of Los Angeles, Port of Long Beach, and industrial areas in and around container transfer facilities (rail and truck) near the Terminal Island Freeway, along the Alameda Corridor, as well as inland facilities. Since only existing transportation routes will be modified, no new

transportation routes are anticipated as part of the proposed project, project impacts will be temporary in nature and limited to construction activities.

Implementation of Control Measures ONRD-05 and ADV-01 may contribute to significant adverse operational traffic impacts on roadways because transportation infrastructure improvements pertaining to overhead catenary electrical lines could require the dedication of an existing land exclusive to vehicles using the overhead catenary electrical lines. The dedication of an existing lane would mean that other vehicles would have reduced access to available driving lanes, which could adversely affect traffic and congestion. Mitigation measures for construction and operation would need to be identified on a project-by-project basis. SCAQMD recommends that mitigation measure MM-TR29 from SCAG's 2012-2035 RTP/SCS [Program EIR](#) (which generally requires a traffic management plan) be implemented for all [projects resulting from Control Measures ONRD-05 and/or ADV-01](#) that have the potential to impact roadways. Traffic impacts would remain significant after mitigation.

1.65.10 Other CEQA Topics

1.65.10.1 Growth-Inducing Impacts

CEQA defines growth-inducing impacts as those impacts of a proposed project that "could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. The 2012 AQMP is not expected to foster economic or population growth or result in the construction of additional housing or other infrastructure, either directly or indirectly, that would further encourage growth. The 2012 AQMP could result in construction projects at existing stationary sources and along existing transportation corridors. However, the proposed project would not be considered growth-inducing, because it would not result in an increase in production of resources or cause a progression of growth that could significantly affect the environment either individually or cumulatively.

1.65.10.2 Significant Environmental Effects Which Cannot Be Avoided

The following is a summary of impacts associated with the 2012 AQMP that this [Draft-Final Program EIR](#) concluded are significant and unavoidable:

- Air emissions associated with construction activities due to the implementation of the control measures in the 2012 AQMP were considered to be potentially significant for CO and PM10 emissions.
- The increased demand for electricity and natural gas associated with the 2012 control measures is considered to be significant.
- The potential hazards associated with LNG transport are considered significant.

- Water demand associated with the manufacture and use of waterborne coatings, solvents and other consumer products, and add-on air pollution control technologies are potentially significant. While mitigation measures as available, they can vary from jurisdiction to jurisdiction, and may remain significant.
- Noise and vibration impacts will be temporary in nature and related solely to construction activities, but could be significant.
- Traffic impacts will be temporary in nature and related solely to construction activities, but could be significant.

Feasible mitigation measures have been developed for the identified adverse significant impacts; however, those mitigation measures may not reduce the impacts to less than significant. The 2012 AQMP would place only an incremental demand on nonrenewable and limited resources, such as energy and water supplies relative to the rate of use of these resources due to population growth and increased consumer demand. The largely irretrievable conversion of undeveloped/agricultural land to urban uses is a function of the growing population and local land use authority, not the 2012 AQMP. The 2012 AQMP is expected to result in long-term benefits associated with achieving ambient air quality standards and a reduction in the use of petroleum-based fuels (e.g., increased use of alternative fuels).

1.65.10.3 Relationship Between Short-Term Uses and Long-Term Productivity

Implementing the ~~Draft~~ 2012 AQMP is not expected to achieve short-term goals at the expense of long-term environmental productivity or goal achievement. The purpose of the 2012 AQMP is to set forth a comprehensive control program that will lead the Basin into compliance with the federal 24-hour PM_{2.5} air quality standards and achieve additional reductions in ozone precursors. By attaining federal and state air quality standards, the 2012 AQMP is expected to enhance short and long-term environmental productivity in the region.

1.76 EXECUTIVE SUMMARY: CHAPTER 5 – CUMULATIVE IMPACTS

CEQA Guidelines §15130 (a) requires an EIR to discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable, as defined in §15065 (a)(3). The 2012 AQMP is a regional plan that includes broad policy criteria and as such, the 2012 AQMP Final Program EIR evaluates the environmental impacts associated with implementing the 2012 AQMP stationary and mobile source control measures to determine whether or not the impacts of the project are cumulatively considerable when combined with potential impacts associated with other similar regional projects involving regulatory activities or other projects with similar impacts.

The traffic control measures (TCMs) in the 2012 AQMP (see Appendix E of this [Final](#) Program EIR) were developed and adopted by SCAG as part of the 2012-2035 RTP/SCS and the 2011 Federal Transportation Improvement Program (FTIP). These measures and recommendations have accordingly been moved forward for inclusion in the region's air quality plans and are included as part of the 2012 AQMP. The impacts of implementation of these TCMs were evaluated in the 2012-2035 RTP/SCS Program EIR (SCAG, 2012). The cumulative analysis in this section of the Final Program EIR for the 2012 AQMP relies primarily on the environmental analyses in the SCAG 2012-2035 RTP/SCS Program EIR for the evaluation of the environmental impacts of implementing the TCMs.

Because the TCMs, their associated mitigation measures, and their emissions reductions are included along with the 2012 AQMP in the PM_{2.5} SIP submittal for the Basin and because the TCMs and other projects in the 2012-2035 RTP/SCS have the potential to generate similar impacts, the 2012-2035 RTP/SCS is considered to be a cumulatively related project. In general, the long-term transportation planning requirements for emission reductions from on-road mobile sources within the district are met by SCAG's RTP/SCS, whereas the short-term implementation requirements of the Transportation Conformity Rule are met by SCAG's biennial Regional Transportation Improvement Program (RTIP).

1.76.1 Aesthetics

Implementation of the 2012 AQMP would not in itself result in significant aesthetic impacts.

According to the 2012-2035 RTP/SCS Program EIR, aesthetic impacts are expected to remain significant because it is likely that there will be situations where visual impacts cannot be mitigated to a less than significant level. Aesthetic impacts would remain significant because the population growth projected by 2035 in combination with the projects in the 2012-2035 RTP/SCS would consume currently vacant land that would create significant contrasts with the overall visual character of the existing landscape setting. Potential aesthetic resources impacts would be reduced following the implementation of mitigation measures. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation.

There is no overlap between the 2012 AQMP projects that may affect aesthetics resources and aesthetic resources impacts created by the 2012-2035 RTP/SCS. The 2012 AQMP would not contribute to aesthetic impacts as noted above, so adverse cumulative operational aesthetics resources impacts are concluded to be less than significant.

1.76.2 Agricultural Resources

The 2012 AQMP is not expected to result in significant agriculture resources impacts, as evaluated in the NOP/IS.

For the 2012-2035 RTP/SCS, agricultural resource impacts are expected to remain significant following mitigation as the 2012-2035 RTP/SCS is expected to contribute to the loss and disturbance of agricultural lands as up to 74,300 new lane miles could be developed, some of which could disturb or consume agricultural lands. Potential agricultural resources impacts associated with the 2012-2035 RTP/SCS would be reduced following the implementation of 2012-2035 RTP/SCS Program EIR mitigation measures. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation because implementation of the 2012-2035 RTP/SCS would contribute to significant loss and disturbance of agricultural lands. Moreover, the 2012 AQMP would not contribute to these impacts, so adverse cumulative operational agricultural resources impacts are concluded to be less than significant.

1.76.3 Air Quality

Construction Impacts: Construction activities associated with the 2012 AQMP would result in significant impacts to the air quality resource and any concurrent emissions-generating activities from reasonably foreseeable construction activities would add an additional air emission burden to these significant levels. Therefore, construction air quality impacts from the 2012 AQMP are considered to be cumulatively considerable prior to mitigation and would contribute to significant adverse cumulative impacts from the 2012-2035 RTP/SCS.

Operational Impacts – Criteria Pollutants: The 2012 AQMP would result in overall emission reductions of NO_x, VOC, SO_x, and PM emissions, providing an air quality benefit. The 2012 AQMP would attain the 24-hour federal PM_{2.5} standard by 2014, make progress towards attaining the eight-hour ozone standard, maintain compliance with state and federal NO₂ standards, maintain compliance with state and federal SO₂ standards, and maintain compliance with the federal 24-hour PM₁₀ standard. Secondary emissions from increased electricity demand, control of stationary sources, increased use of reformulated products, mobile sources, increased use of fuels due to reduction in fuel economy, and from miscellaneous sources were considered to be less than significant.

Under the 2012-2035 RTP/SCS, mobile source criteria pollutant emissions would stay approximately the same or decrease, providing an air quality benefit. However, the increase of re-entrained roadway dust would increase proportionately to VMT and as such was considered a significant impact.

Implementation of the 2012 AQMP would not in itself result in significant adverse operational air quality impacts associated with operational activities. For this reason, the 2012 AQMP would not be expected to contribute to significant adverse cumulative impacts from transportation projects projected in the 2012-2035 RTP/SCS.

Operational Impacts – Non-Criteria Pollutants: The 2012 AQMP is expected to result in a reduction of toxic air contaminant (TAC) emissions. The basis for this conclusion is that many TACs are also classified as criteria pollutants (e.g., PM and

VOCs). To the extent that AQMP control measures reduce PM and VOC emissions, associated TAC emission reductions could occur as well. The overall impacts associated with implementation of the 2012 AQMP are an overall reduction in non-criteria pollutants (e.g., toxic air contaminants). Therefore, no significant impacts on non-criteria pollutants have been identified.

Under the 2012-2035 RTP/SCS, as a result of on-going emission controls, cancer and other health risks within any given distance of mobile sources in the region would decline, although the health risks adjacent to transportation facilities would remain higher than regional averages and above desirable levels. As a result of 2012-2035 RTP/SCS policies anticipated growth patterns would concentrate population adjacent to transit and other transportation facilities in High Quality Transit Areas (HQTAs) that could result in more people being exposed to elevated cancer risk as compared to areas of the region more distant from such facilities.

Implementation of the 2012 AQMP would not in itself result in significant air quality impacts associated with non-criteria pollutants. Moreover, the 2012 AQMP would not contribute to impacts associated with transportation projects projected in the 2012-2035 RTP/SCS and, therefore, would not be expected to contribute to a cumulatively considerable impact requiring mitigation.

Greenhouse Gas Impacts: The 2012 AQMP is expected to result in a reduction of GHGs. This conclusion is based on the fact that mobile source control measures would reduce GHG emissions through accelerated penetration of partial zero-emission and zero emission vehicles, the use of alternative fuels such as natural gas, the combustion of which generates less GHG emissions than diesel fuel, along with other energy efficiency and pollution prevention measures.

Implementation of the 2012-2035 RTP/SCS projects would result in a significant increase of greenhouse gas emissions from residential and commercial building construction, operational energy demand, and total mobile source emissions. The 2012-2035 RTP/SCS Program EIR concludes that implementation of 2012-2035 RTP/SCS projects would meet the applicable AB 32 reduction targets (identified in SB 375) with respect to light duty vehicles. However, without technical details as to how each sector of the economy would comply with AB 32, growth anticipated to occur under the 2012-2035 RTP/SCS could result in a significant impact related to AB 32 and the Scoping Plan.

The 2012-2035 RTP/SCS Program EIR concluded that because per capita carbon dioxide emissions from light duty trucks and autos would meet ARB targets by 2020 and would achieve even greater emission reductions in 2035, the 2012-2035 RTP/SCS would result in a less-than-significant impact related to per capita emissions and SB 375.

Air Quality Summary: The air quality impacts associated with 2012 AQMP control measures were determined to be significant for construction activities and less than significant for secondary emissions from increased electricity demand,

control of stationary sources, change in use of lower VOC materials, mobile sources, increase use of fuels due to reduction in fuel economy, miscellaneous sources, non-criteria pollutants, and global warming and ozone. Although mitigation measures identified in the 2012 AQMP [Final](#) Program EIR would reduce construction air quality impacts associated with construction activities, impacts would remain significant and as such would continue to contribute to considerable impacts following mitigation. Since project-specific construction air quality impacts from the 2012 AQMP would be significant, the 2012 AQMP would contribute to significant adverse cumulative construction air quality impacts generated by the 2012-2035 RTP/SCS

Similarly, although mitigation measures identified in the 2012-2035 RTP/SCS Program EIR would reduce air quality and associated health impacts, impacts for construction, operation, TACs, and GHG impacts would continue to contribute to cumulatively considerable impacts following mitigation. The 2012 AQMP would not contribute to these impacts, so adverse cumulative operational air quality impacts are concluded to be less than significant.

1.76.4 Biological Resources

The 2012 AQMP is not expected to result in significant biological resources impacts. 2012-2035 RTP/SCS impacts associated with biological and open space resources would be reduced following the implementation of 2012-2035 RTP/SCS Program EIR mitigation measures. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation due to significant disturbance and removal of natural vegetation that may be utilized by sensitive species, habitat fragmentation and the associated decrease in habitat quality, litter, trampling, light pollution and road noise in previously undisturbed natural areas, displacement of riparian and wetland habitat, siltation of streams and other water bodies during construction, and the loss of prime farmlands, grazing lands, open space and recreation lands. The increased urban development anticipated by the 2012-2035 RTP/SCS would also result in similar impacts. However, since the 2012 AQMP was not identified as creating any adverse biological resources impacts, it would not create cumulatively considerable impacts, so adverse cumulative biological resources impacts from the 2012 AQMP are concluded to be less than significant.

1.76.5 Cultural Resources

The 2012 AQMP is not in itself expected to result in significant cultural resources impacts. The development of transportation facilities as part of the 2012-2035 RTP/SCS may affect historical resources because many projects could be located in older urban centers where structures of architectural or historical significance are likely to be located. In addition, 2012-2035 RTP/SCS transportation projects would significantly affect archaeological and paleontological resources because projects could be located in previously undisturbed areas. However, the 2012 AQMP would not contribute to impacts associated with transportation projects projected in the 2012-2035 RTP/SCS and, therefore, would not be expected to contribute to a

cumulatively considerable impact requiring mitigation. As a result, adverse cumulative cultural resources impacts from the 2012 AQMP are concluded to be less than significant.

1.76.6 Energy

Electricity and natural gas demand impacts associated with the 2012 AQMP control measures were concluded to be significant, while energy impacts associated with use of petroleum fuels, use of alternative fuels and renewable energy sources were considered to be less than significant. Although mitigation measures identified in the 2012 AQMP [Final](#) Program EIR would reduce energy impacts associated with electricity demand, impacts would remain significant and as such would continue to contribute to considerable impacts following mitigation.

2012-2035 RTP/SCS impacts associated with energy resources would be reduced following the implementation of 2012-2035 RTP/SCS Program EIR mitigation measures. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation because energy consumed during construction and expansion of the transportation system, as well as growth that would be accommodated by the 2012-2035 RTP/SCS, would contribute to considerable impacts following mitigation. Therefore, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and in particular with the 2012-2035 RTP/SCS transportation projects, would contribute to a cumulatively considerable electricity and natural gas demand impacts following mitigation.

1.76.7 Geology and Soils

Implementation of the 2012 AQMP would not in itself result in significant geological or soil impacts. Potential geologic and soil resources impacts associated with the 2012-2035 RTP/SCS would be reduced following the implementation of 2012-2035 RTP/SCS Program EIR mitigation measures. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation because implementation of the 2012-2035 RTP/SCS is expected to result in potential damage to transportation infrastructure through surface rupture, ground shaking, liquefaction, and landsliding, as well as long term soil erosion and/or loss of top soil, subsidence, and slope failure. Moreover, the 2012 AQMP would not contribute to geologic and soil resources impacts associated with transportation projects projected in the 2012-2035 RTP/SCS and, therefore, would not be expected to contribute to a cumulatively considerable impact requiring mitigation.

1.76.8 Hazards and Hazardous Materials

It was concluded in the 2012 AQMP [Final](#) Program EIR that potentially significant adverse fire hazard impacts associated with reformulated products and the on-site ammonia storage hazards would be less than significant after mitigation. In spite of implementing mitigation measures, it was concluded that hazards associated with LNG transport would remain significant.

It was concluded in the 2012-2035 RTP/SCS that impacts associated with hazards and hazardous materials would be reduced following the implementation of 2012-2035 RTP/SCS Program EIR mitigation measures. However, impacts from the implementation of the 2012-2035 RTP/SCS, associated with upset and accident conditions, hazardous emissions in vicinity of schools, and disturbance of contaminated property during construction activities would remain significant following mitigation. When combined with past, present, and reasonably foreseeable activities, and in particular with the 2012-2035 RTP/SCS transportation projects, the 2012 AQMP has the potential to contribute to a cumulatively considerable hazards and hazardous materials impacts following mitigation for the risks associated with the transport of LNG.

1.76.9 Hydrology and Water Quality

Although 2012 AQMP impacts associated with water demand would be reduced following the implementation measures, the effectiveness of mitigation measures can vary between jurisdictions, therefore, water demand impacts may remain significant.

2012-2035 RTP/SCS impacts associated with hydrology and water quality would be reduced following the implementation of the 2012-2035 RTP/SCS Program EIR mitigation measures. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation for water quality, wastewater, riparian habitats and waters of the U.S. runoff/drainage, groundwater, flooding, and water supply. Therefore, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and in particular with the 2012-2035 RTP/SCS transportation projects, would contribute to cumulatively considerable impacts following mitigation to water demand impacts. The cumulative impacts of other hydrology and water quality impacts associated with the 2012 AQMP are less than significant.

1.76.10 Land Use and Planning

Implementation of the 2012 AQMP would not result in any significant impacts associated with land use or planning. Potential land use and planning impacts associated with the 2012-2035 RTP/SCS would be reduced following the implementation of 2012-2035 RTP/SCS Program EIR mitigation measures. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation because implementation of the 2012-2035 RTP/SCS would contribute to inconsistencies with general plans, disruption or division of established communities, changes to land uses by changing concentrations of development throughout SCAG, change patterns of growth and urbanization beyond the SCAG region, and cumulatively considerable changes to land use and the intensity of land use. Short-term construction related impacts and long-term or permanent displacement or offsite impacts from new facilities would also potentially occur as a result of implementation of the 2012-2035 RTP/SCS. Moreover, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and in particular with the 2012-2035 RTP/SCS transportation projects, would not be expected to

contribute to cumulatively considerable land use and planning impacts requiring mitigation.

1.76.11 Mineral Resources

Implementation of the 2012 AQMP would not result in any significant impacts associated with mineral resources. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation because implementation of 2012-2035 RTP/SCS would result in increased demand driven by growth and the large number of projects anticipated in the 2012-2035 RTP/SCS. The 2012 AQMP, when combined with past, present, and reasonably foreseeable activities and in particular with the 2012-2035 RTP/SCS transportation projects, would not be expected to contribute to cumulatively considerable mineral resources impacts following mitigation.

1.76.12 Noise

The 2012 AQMP control measures associated with construction of overhead catenary lines could result in significant noise and vibration impacts after mitigation due to the geographic proximity of sensitive receptors. Although impacts would be reduced following implementation of noise mitigation measures identified in the 2012 AQMP [Final](#) Program EIR, noise and vibration impacts associated with the construction of catenary lines would remain significant in areas where sensitive receptors are located near transportation corridors.

2012-2035 RTP/SCS impacts associated with noise would be reduced following the implementation of 2012-2035 RTP/SCS Program EIR mitigation measures. However, 2012-2035 RTP/SCS impacts would remain significant following mitigation for noise and vibration during construction activities and operational activities. Therefore, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and in particular with the 2012-2035 RTP/SCS transportation projects, would contribute to cumulatively considerable construction noise and vibration impacts following mitigation.

1.76.13 Population and Housing

The 2012 AQMP control measures would not result in population and housing impacts. The policies included in the 2012-2035 RTP/SCS seek to direct growth in a way that is efficient for both mobility and land consumption. Implementation of the RTP/SCS would help induce growth to certain vacant areas of the region, a substantial number of residences and businesses would likely be displaced, and the mobility benefits from the RTP/SCS may shift population, households, and employment. This may generate potentially significant adverse cumulative population and housing impacts in spite of implementing mitigation measures. Therefore, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and with 2012-2035 RTP/SCS projects in particular, would not be expected to produce a cumulatively considerable impact following mitigation.

1.76.14 Public Services

The 2012 AQMP control measures would not result in significant public services impacts. The public service impacts from the 2012-2035 RTP/SCS associated with police, fire, and emergency response were concluded to be significant in spite of implementing mitigation measures. Impacts to wildfire threats would also remain significant because development would occur in areas that have a high threat of fire. In addition, the region's demand to accommodate an additional 453,000 school children would remain a significant impact on public services following implementation of 2012-2035 RTP/SCS mitigation measures.

Based on the above information, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and with 2012-2035 RTP/SCS projects in particular, is not expected to produce cumulatively considerable impacts to public services following mitigation.

1.76.15 Recreation

The 2012 AQMP control measures would not result in significant impacts on recreation resources. Impacts associated with recreation resources remain significant following mitigation because the 2012-2035 RTP/SCS would contribute to the loss and disturbance of open space and recreational lands. Based on the above information, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and in particular with the 2012-2035 RTP/SCS transportation projects, would not be expected to contribute to cumulatively considerable recreation impacts following mitigation.

1.76.16 Solid and Hazardous Waste

The 2012 AQMP control measures would not result in significant impacts on solid or hazardous waste. Solid and hazardous waste impacts associated with the 2012-2035 RTP/SCS would remain significant following mitigation because the demand for solid waste services in the SCAG region and the resulting need to move solid waste large distances, potentially out of the region, would remain. Based on the above information, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and in particular with the 2012-2035 RTP/SCS transportation projects, would not be expected to contribute to cumulatively considerable solid or hazardous waste impacts following mitigation.

1.76.17 Transportation and Traffic

The 2012 AQMP control measures that could result in the construction of overhead catenary lines are expected to remain a significant construction impact to traffic after mitigation. Such construction activities would generate traffic associated with construction worker vehicles and trucks delivering equipment, materials and supplies to the project site during the duration of the construction activities. Similarly, transportation infrastructure improvements pertaining to overhead catenary electrical

lines could require the dedication of an existing lane exclusive to vehicles using the overhead catenary electrical lines or fixed guideway systems. Thus, a reduction in the number of available lanes could result in significant adverse operational traffic impacts.

According to the 2012-2035 RTP/SCS [Program](#) EIR, implementation of the RTP/SCS would result in several significant and several less than significant impacts after mitigation. The 2035 VMT and 2035 heavy-duty truck VHD would be substantially greater than the existing conditions and as such would result in a significant impact in spite of implementing mitigation measures. As the population increases through 2035, the number of trips originating and ending in Santa Barbara, San Diego and Kern counties to and from the SCAG region would increase. And the transportation demand from growth, in combination with the accommodating projects in the 2012-2035 RTP/SCS would contribute to a cumulatively considerable transportation impact.

Therefore, the 2012 AQMP, when combined with past, present, and reasonably foreseeable activities, and with 2012-2035 RTP/SCS projects in particular, would contribute to cumulatively considerable construction impacts following mitigation and, since no mitigation measures were identified that reduce potential operation-related traffic impacts, these remain significant.

1.87 EXECUTIVE SUMMARY: CHAPTER 6 – ALTERNATIVES

1.87.1 Alternatives Evaluated in the [Program](#) EIR

Four alternatives were evaluated in the [Program](#) EIR. The following provides a description of each alternative.

Alternative 1, No Project: CEQA requires the specific alternative of no project to be evaluated. A No Project Alternative consists of what would occur if the project was not approved; in this case, not adopting the [Draft](#) 2012 AQMP. The net effect of not adopting the [Draft](#) 2012 AQMP would be a continuation of implementing the 2007 AQMP.

Alternative 2, PM2.5 Attainment Plan Localized PM Control in Mira Loma Area: This alternative is similar to the currently proposed [Draft](#) 2012 AQMP with the following exception. Alternative 2 does not include Control Measure BCM-02. Instead, Alternative 2 includes the same episodic control measures that would apply only to the Mira Loma area as described in the June 28, 2012 NOP/IS. These control measures would be implemented sequentially and as needed to meet the 24-hour PM2.5 standard at the Mira Loma monitoring station.

Alternative 3, Greater Reliance on NOx Emissions Reductions: This alternative would rely to a greater extent on NOx emission reductions, primarily from on-road and off-road mobile sources to achieve the federal 24-hour PM2.5 standard.

Alternative 3 includes all of the same ozone control measures as the ~~Draft~~ 2012 AQMP, but Control Measures ONRD-03 and OFFRD-01 would be modified under Alternative 3 to accelerate implementation of CARB's on-road and off-road regulations, respectively.

Alternative 4, PM2.5 Emissions Reduction Strategies Only: This alternative is considered to be a legally viable alternative because the SCAQMD is only required to submit a PM2.5 plan demonstrating attainment of the 2006 24-hour PM2.5 National Ambient Air Quality Standard no later than three years from December 14, 2012, the effective date of designation of nonattainment of the federal 24-hour PM2.5 standard. However, there is no federal requirement to submit an ozone plan by the same date as the PM2.5 plan. Alternative 4 would only include Control Measures CMB-01, BCM-01, BCM-02, BCM-03, BCM-04, IND-01, EDU-01, and MCS-01, eschewing all the other CAA §182 (e)(5) control measures, but continue implementing the Ozone SIP portion of the 2007 AQMP.

1.87.2 Alternatives Analysis Summary

Of the project Alternatives, Alternative 1 would generate the least amount or least severe environmental impacts compared to the 2012 AQMP. However, of the project alternatives it would achieve the fewest of the project objectives.

Alternative 2 would be expected to generate equivalent impacts to the 2012 AQMP in all environmental topic areas analyzed. It would achieve all of the project objectives, but would not achieve the objectives related to reducing PM2.5 emissions as well as the 2012 AQMP.

Alternative 3 has the potential to generate greater impacts than the 2012 AQMP because Alternative 3 ozone Control Measure ONRD-03 could result in approximately 5,000 additional medium-heavy-duty trucks complying with the year 2010 engine exhaust requirements for the years 2013 through 2017 (1,000 trucks per year, 250 trucks per year (1,250 total trucks) would comply with the 2010 on-road vehicle exhaust requirements using CNG engines and the rest would be diesel or diesel hybrid). Similarly, Alternative 3 OFFRD-01 could result in a total of 19,344 additional repowered vehicles from the year 2014 through 2017. To the extent that these ozone control measures contribute to environmental impacts, they would be greater than environmental impacts from the 2012 AQMP. Consequently, Alternative 3 does meet the requirement to reduce environmental impacts compared to the proposed project.

Alternative 4 would generate fewer environmental impacts or less severe impacts than the 2012 AQMP. It would achieve all but four of the project objectives (e.g., those related to continued progress towards attaining the ozone standards).

Based on the above information, the 2012 AQMP is the most effective project that provides the best balance in achieving all of the project objectives relative to environmental impacts generated.

TABLE 1-1

Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

IMPACT	MITIGATION MEASURES	RESIDUAL IMPACT
AESTHETICS		
Potential visual impacts and impacts to scenic highways due to overhead power lines.	None required since no significant impacts were identified.	Impacts are expected to be less than significant.
AIR QUALITY		
Construction-related activities associated with installing or replacing equipment are expected to generate emissions from construction worker vehicles, trucks, and construction equipment. The secondary impacts associated with construction activities are potentially significant for CO and PM10 emissions.	Develop a Construction Emission Management Plan for the proposed project. The Plan shall include measures to minimize emissions from vehicles including, but not limited to consolidating truck deliveries, prohibiting truck idling in excess of five minutes, description of truck routing, description of deliveries including hours of delivery, description of entry/exit points, locations of parking, and construction schedule. At a minimum the Construction Emission Management Plan will include the following mitigation measures: 1) Prohibit construction equipment from idling longer than five minutes at construction sites; 2) Maintain construction equipment tuned up to manufacturer's recommended specifications that optimize emissions without nullifying engine warranties; 3) Electric welders shall be used in all construction areas that are demonstrated to be served by electricity; 4) Onsite electricity rather than temporary power generators shall be used in all construction areas that are demonstrated to be served by electricity; 5) Use cranes rated 200 hp or greater equipped with Tier 3 or equivalent engines; 6) For off-road construction equipment rated 50 to 200 hp that will be operating for eight hours or more, the project proponent shall use equipment rated 50 to 200 hp equipped with Tier 3 or equivalent engines; and 7) Suspend use of all construction activities that generate air pollutant emissions during first stage smog alerts.	The emissions associated with construction activities from the proposed Draft 2012 AQMP control measures were considered to be significant for CO and PM10 emissions.
Secondary impacts from increased electricity demand are less than significant.	None required since no significant impacts were identified.	Impacts are expected to be less than significant.

TABLE 1-1 (CONTINUED)
Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

IMPACT	MITIGATION MEASURES	RESIDUAL IMPACT
AIR QUALITY (cont.)		
Secondary impacts from control of stationary sources are less than significant.	None required since no significant impacts were identified.	Secondary air quality impacts from stationary sources are expected to be less than significant.
Secondary impacts from change in use of lower VOC materials are less than significant.	None required since no significant impacts were identified.	Secondary air quality impacts from use of lower VOC products are expected to be less than significant.
Secondary impacts from mobile sources are less than significant.	None required since no significant impacts were identified.	Secondary air quality impacts from mobile sources are expected to be less than significant.
Secondary impacts from miscellaneous sources are less than significant.	None required since no significant impacts were identified.	Secondary impacts from miscellaneous sources are expected to be less than significant.
The impacts associated with toxic air contaminants were determined to be less than significant.	None required since no significant impacts were identified.	Toxic air contaminant impacts are expected to be less than significant.
Implementation of the control measures in the Draft-2012 AQMP is expected to reduce emissions of compounds that contribute to global warming and ozone. GHG impacts are less than significant.	None required since no significant impacts were identified.	GHG emission impacts are expected to be less than significant.
ENERGY		
The increase in electricity associated with the Draft-2012 AQMP control strategies is expected to be significant.	Mitigation measures E-1 through E-7 have been identified which would encourage energy efficient equipment/vehicles, encourage increasing capacity of transmission lines, development of project electricity requirements, require energy analyses in environmental documentation, and identify measures to reduce peak energy demand.	Impacts on electricity demand are expected to remain significant following mitigation.
The natural gas impacts from the implementation of the Draft-2012 AQMP are expected to be significant.	Mitigation measures E-8 through E-12 have been identified which would promote energy efficiency and energy conservation, increasing the capacity of natural gas lines, development of project natural gas requirements, require energy analyses in environmental documentation, and identify measures to reduce peak energy demand.	Impacts on natural gas demand are expected to remain significant following mitigation.

TABLE 1-1 (CONTINUED)
Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

IMPACT	MITIGATION MEASURES	RESIDUAL IMPACT
ENERGY (cont.)		
Implementation of the 2012 AQMP is not expected to result in a significant increase on petroleum fuel use and impacts are less than significant.	None required since no significant impacts were identified.	Impacts on petroleum fuel use are expected to be less than significant.
Implementation of the 2012 AQMP is not expected to result in a significant increase on alternative transportation fuel use (e.g., natural gas and hydrogen) and impacts on alternative fuels are less than significant.	None required since no significant impacts were identified.	Impacts are expected to be less than significant.
HAZARDS AND HAZARDOUS MATERIALS		
The analysis indicates that the fire hazard impacts associated with reformulated coatings, solvents, adhesives, mold release and consumer products may be potentially significant.	Mitigation measures HZ-1 and HZ-2 would be implemented which would add consumer warning requirements for all flammable and extremely flammable products and require public education regarding the use of flammable materials.	Potential fire hazards are expected to be mitigated to less than significant.
The hazard impacts associated with the use of alternative fuels were determined to be less than significant for methanol, ethanol, CNG, LPG, biodiesel, hydrogen and electric/hybrids.	None required since no significant impacts were identified.	Hazard impacts for methanol, ethanol, CNG, LPG, biodiesel, hydrogen and electric/hybrids are expected to be less than significant.
The transportation hazard impacts associated with the use of LNG were determined to be significant.	Mitigation measures HZ-3 through HZ-6 would be implemented which would require the installation of secondary containment, valves that fail shut, emergency release valves, barriers to prevent physical damage to tanks, and require integrity testing to prevent failure.	Transportation hazards associated with LNG are expected to remain significant.
The use of ammonia in SCRs and SNCR would result in the increased transport of ammonia and potentially significant impacts in the event of a release.	The use of aqueous ammonia at concentrations less than 20 percent is recommended to minimize impacts.	The use of aqueous ammonia at concentrations less than 20 percent would reduce ammonia transport impacts to less than significant.

TABLE 1-1 (CONTINUED)
Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

IMPACT	MITIGATION MEASURES	RESIDUAL IMPACT
HAZARDS AND HAZARDOUS MATERIALS (cont.)		
The use of ammonia in SCRs and SNCR is considered to be potentially significant and could create significant impacts in the event of an onsite spill.	Mitigation measures HZ-7 through HZ-10 would be implemented which require the installation of safety devices (e.g., tank monitors, lead detection systems), secondary spill containment, and modifications to loading/unloading areas to minimize spills and assure any spills remain onsite.	The use of aqueous ammonia at concentrations less than 20 percent by volume in conjunction with additional mitigation measures are expected to reduce hazard impacts to less than significant.
The hazard impacts associated with fuel additives are expected to be less than significant since the use of fuel additives would require evaluation for their potential health and environmental impacts prior to approval and use.	None required since no significant impacts were identified.	Hazard impacts associated with fuel additives are expected to be less than significant.
The hazards pertaining to safety issues associated with start-up, shutdown, and turnaround procedures or from the increased use of catalyst are less than significant.	None required since no significant impacts were identified.	Hazard impacts associated with start-up, shutdown, and turnaround procedures and associated with the use of catalysts are expected to be less than significant.
HYDROLOGY AND WATER QUALITY		
Wastewater treatment facilities are expected to have sufficient capacity to handle the estimated increase in wastewater that could be generated from reformulation of products and use of air pollution control equipment (e.g., wet ESPs and WGSs). Therefore, no significant impacts associated with wastewater treatment or water quality is expected.	None required since no significant impacts were identified.	Wastewater treatment and water quality impacts are expected to be less than significant.
The use of alternative fuels is not expected to result in greater adverse water quality impacts than the use of regular diesel fuels and is, therefore, less than significant.	None required since no significant impacts were identified.	Alternative fuel impacts on water quality are expected to be less than significant.
No significant adverse water quality impacts are expected from the increased use of EV and hybrid vehicles.	None required since no significant impacts were identified.	Water quality impacts associated with the increased use of EV/hybrids vehicles are expected to be less than significant.

TABLE 1-1 (CONTINUED)
Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

IMPACT	MITIGATION MEASURES	RESIDUAL IMPACT
HYDROLOGY AND WATER QUALITY (cont.)		
Water demand associated with the manufacture and use of waterborne and add-on air pollution control technologies are potentially significant.	Mitigation measures HWQ-1 through HWQ-4 were imposed which include the preparation of updated Urban Water Management Plans; development of Water Supply Assessments on a project specific basis; and develop water conservation measures and encourage the use of recycled water.	Mitigation measures vary from jurisdiction to jurisdiction and water demand impacts may remain significant.
The use and application of SBS should be controlled and monitored to prevent water quality runoff and related water quality impacts. The use of SBS is expected to be less than significant.	None required since no significant impacts were identified.	Water quality impacts associated with the use of SBS are expected to be less than significant.
Potential spills associated with ammonia are expected to be contained on-site due to the requirement for secondary spill containment devices and berms. Therefore, potential ammonia spills are expected to be less than significant.	None required since no significant impacts were identified.	Water quality impacts associated with ammonia use are expected to be less than significant.
LAND USE AND PLANNING		
The Draft 2012 AQMP control measures are not expected to conflict with applicable land use plans, policies, or regulations or physically divide an established community. Therefore, no significant adverse land use impacts are expected.	None required since no significant impacts were identified.	Land use impacts are expected to be less than significant.

TABLE 1-1 (CONTINUED)
Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

IMPACT	MITIGATION MEASURES	RESIDUAL IMPACT
NOISE		
Noise and vibration impacts will be temporary in nature and related solely to construction activities, but could be significant.	Noise and vibration mitigation measures include NO-1 through NO-9 which would require site-specific construction noise reduction programs, measures to track noise complaints, use of noise barriers and other noise attenuation measures, use of engineers to estimate noise vibration levels required to avoid building impacts, compliance with noise ordinances and regulations, and completion of noise evaluations in environmental documents.	Noise impacts may remain significant during construction activities.
No modification to existing rail or truck traffic routes/corridor is expected; therefore, noise and vibration impacts associated with operational activities are expected to be less than significant.	None required since no significant impacts were identified.	Noise impacts during project operation are expected to be less than significant.
SOLID AND HAZARDOUS WASTE		
The increased use of EVs and hybrids are not expected to result in a significant increase in the illegal disposal of batteries. NiMH and Li-ion batteries more common with EVs and hybrids have a long battery life, are valuable, and usually have a monetary incentive associated with return of the battery to the manufacturer.	None required since no significant impacts were identified.	Waste impacts associated with increased use of EV/Hybrids are expected to be less than significant.
No significant solid and hazardous waste impacts were identified due to air pollution control technologies as part of the Draft 2012 AQMP .	None required since no significant impacts were identified.	Waste impacts associated with air pollution control technologies are expected to be less than significant.

TABLE 1-1 (CONCLUDED)
Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

IMPACT	MITIGATION MEASURES	RESIDUAL IMPACT
TRANSPORTATION AND TRAFFIC		
Control measures that would require new equipment will generally require that it occur as the life of the old equipment is exhausted, be reused outside the district, or recycled. Therefore, no significant solid/hazardous waste impacts were identified due to implementation of the control measures.	None required since no significant impacts were identified.	Waste impacts associated with the retirement of old equipment are expected to be less than significant.
Construction-related traffic impacts associated with the installation of catenary overhead electrical lines and related facilities, although temporary in nature, could be significant.	Mitigation measures will need to be developed on a project-specific basis. The SCAQMD recommends that mitigation measure TT-1 be implemented for applicable projects that may impact roadways, which requires that a detailed traffic management plan should be developed for construction activities.	The mitigation measure is expected to reduce the traffic impacts during construction activities; however, construction traffic impacts are expected to remain significant
Adverse operational traffic impacts may also occur as overhead catenary electrical lines could require dedicated lanes.	Mitigation measures would need to be developed on a project-specific basis.	Operational traffic impacts are expected to remain significant.

CHAPTER 2

PROJECT DESCRIPTION

Introduction

Background

Agency Authority – 2012 AQMP

Agency Authority - CEQA

Project Location

Overall Attainment Strategy

Purpose of the 2012 AQMP

Project Description

Project Objectives

2.1 INTRODUCTION

The SCAQMD was created by the California legislature in 1977¹ as the public agency responsible for developing and enforcing air pollution control regulations in the South Coast Air Basin (Basin) and portions of the Salton Sea Air Basin and Mojave Desert Air Basin referred to herein as the district. The Lewis Air Quality Act (now known as the Lewis-Presley Air Quality Management Act) requires the SCAQMD to prepare and adopt an Air Quality Management Plan (AQMP) consistent with federal planning requirements. In 1977, amendments to the federal Clean Air Act (CAA) included requirements for submitting State Implementation Plans (SIPs) for nonattainment areas that fail to meet all federal ambient air quality standards (CAA § 172) and similar requirements exist in state law (Health & Safety Code §40462). The federal CAA was amended in 1990 to specify attainment dates and SIP requirements for ozone, carbon monoxide (CO), nitrogen dioxide (NO₂) and particulate matter with an aerodynamic diameter of less than 10 microns (PM₁₀). In 1997, the United States Environmental Protection Agency (EPA) promulgated ambient air quality standards for a new pollutant, particulate matter with an aerodynamic diameter less than 2.5 microns (PM_{2.5}). The California Clean Air Act (CCAA), adopted in 1988, requires the SCAQMD to endeavor to achieve and maintain state ambient air quality standards for ozone, CO, sulfur dioxide (SO₂), and NO₂ by the earliest practicable date (Health & Safety Code §40910). The CCAA also requires a three-year plan review if necessary, and an update to the AQMP. The EPA is required to periodically update the national ambient air quality standards. The AQMP revision currently under development is primarily triggered by an update to the PM_{2.5} standard, but also provides requirements to attain the (revoked) one-hour ozone standard and measures to continue making progress toward attaining the 8-hour ozone standard.

2.2 BACKGROUND

The first AQMP was prepared and approved by the SCAQMD in 1979 and has been updated and revised eight times since first adopted. The 2012 AQMP will be the tenth plan, not including certain SIPs for specific pollutants (e.g., PM₁₀ for the Coachella Valley and lead), prepared by the SCAQMD. The following bullets summarize the main components of the past AQMP updates and revisions:

- The 1982 AQMP was revised to reflect better data and modeling tools.
- In 1987, a federal court ordered the U.S. Environmental Protection Agency (U.S. EPA) to disapprove the 1982 AQMP because it did not demonstrate attainment of all national ambient air quality standards (NAAQS) by 1987 as required by the CAA. This, in part, led to the preparation of the 1989 AQMP.
- The 1989 AQMP was adopted on March 17, 1989 and was specifically designed to attain all NAAQS. This plan called for three “tiers” of measures as needed to attain all standards and relied on significant future technology advancement to attain these standards.
- In 1991, the SCAQMD prepared and adopted the 1991 AQMP to comply with the CCAA.

¹ The Lewis-Presley Air Quality Management Act, 1976 Cal. State. ch. 324 (codified at H & S Code, Sections 40400 - 40540).

- In 1992, the 1991 AQMP was amended to add a control measure containing market incentive programs.
- In 1994, the SCAQMD prepared and adopted the 1994 AQMP to comply with the CCAA three-year update requirement and to meet the federal CAA requirement for an ozone SIP. The AQMP, as adopted in 1994, included the following:
 - All geographical areas under the jurisdiction of the SCAQMD (referred to here as the district), as opposed to just the South Coast Air Basin;
 - The basic control strategies remained the same although the three-tiered structure of control measures was replaced and measures previously referred to as Tier I, II or III were replaced with short-/intermediate-term or long-term control measures;
 - Updated and refined control measures carried over from 1991;
 - Best Available Control Measure (BACM) PM10 Plan;
 - The ozone attainment demonstration plan;
 - Amendments to the federal Reactive Organic Compound (ROC) Rate-of-Progress Plan (also referred to as the volatile organic compound (VOC) Rate-of-Progress Plan); and
 - Attainment Demonstration Plans for the federal PM10, nitrogen dioxide, and carbon monoxide air quality standards; etc.
- The 1997 AQMP was designed to comply with the three-year update requirements specified in the CCAA as well as to include an attainment demonstration for PM10 as required by the federal CAA. Relative to ozone, the 1997 AQMP contained the following changes to the control strategies compared to the 1994 AQMP:
 - Less reliance on transportation control measures (TCMs);
 - Less reliance on long-term control measures that rely on future technologies as allowed under §182 (e)(5) of the CAA; and
 - Removal of other infeasible control measures and indirect source measures.
- In 1999, the ozone plan portion of the 1997 AQMP was amended to address partial disapproval of the 1997 AQMP by the U.S. EPA and a settlement of litigation by environmental groups challenging the 1997 AQMP to provide the following:
 - Greater emission reductions in the near-term than would occur under the 1997 AQMP;
 - Early adoption of the measures that would otherwise be contained in the next three-year update of the AQMP; and
 - Additional flexibility relative to substituting new measures for infeasible measures and recognition of the relevance of cost effectiveness in determining feasibility.

- In April 2000, U.S. EPA approved the 1999 ozone SIP amendments to the 1997 plan. The 1999 Amendment in part addressed the State’s requirements for a triennial plan update.
- The 2003 AQMP was approved and adopted by the SCAQMD in August 2003. The 2003 AQMP was never fully approved by the U.S. EPA as part of the SIP. The 2003 AQMP addressed the following control strategies:
 - Attaining the federal PM10 ambient air quality standard for the South Coast Air Basin and Coachella Valley - these portions were approved by the U.S. EPA; in both areas, the ozone attainment demonstration was disapproved after the California Air Resources Board (CARB) withdrew its measures;
 - Attaining the federal one-hour ozone standard;
 - 1997/1999 control measures not yet implemented;
 - Revisions to the Post-1996 VOC Rate-of-Progress Plan and SIP for CO;
 - Initial analysis of emission reductions necessary to attain the PM2.5 and eight-hour ozone standards; etc.; and
 - The 2003 AQMP was partially approved and partially disapproved by EPA.
- The SCAQMD Governing Board approved the 2007 AQMP on June 1, 2007. On September 27, 2007, CARB adopted the State Strategy for the 2007 State Implementation Plan and the 2007 South Coast Air Quality Management Plan as part of the (SIP). The 2007 SIP was then forwarded to U.S. EPA for approval. The following summarize the major components of the 2007 AQMP:
 - The most current air quality setting (e.g., 2005 data);
 - Updated emission inventories using 2002 as the base year, which also incorporate measures adopted since adopting the 2003 AQMP;
 - Updated emission inventories of stationary and mobile on-road and off-road sources;
 - 2003 AQMP control measures not yet implemented (eight of the control measures originally contained in the 2003 AQMP were updated or revised for inclusion into the Draft 2007 AQMP);
 - 24 new measures were incorporated into the 2007 AQMP based on replacing the SCAQMD’s long-term control measures from the 2003 AQMP with more defined or new control measures and control measure adoption and implementation schedules;
 - CARB’s recommended control measures aimed at reducing emissions from sources that are primarily under State and federal jurisdiction, including on-road and off-road mobile sources, and consumer products;
 - SCAG’s regional transportation strategy and control measures; and
 - Analysis of emission reductions necessary and attainment demonstrations to achieve the federal eight-hour ozone and PM2.5 air quality standards.

On November 22, 2010, U.S. EPA issued a notice of proposed partial approval and partial disapproval of the 2007 South Coast SIP for the 1997 Fine Particulate Matter Standards and the corresponding 2007 State Strategy. Specifically, U.S. EPA proposed approving the SIP's inventory and regional modeling analyses, but it also proposed disapproving the attainment demonstration because it relied too extensively on commitments to emission reductions in lieu of fully adopted, submitted, and SIP-approved rules. The notice also cited deficiencies in the SIP's contingency measures.

- In response to U.S. EPA's proposed partial disapproval of the 2007 SIP, on March 4, 2011, the SCAQMD Governing Board approved Revisions to the 2007 PM2.5 and Ozone State Implementation Plan for South Coast Air Basin and Coachella Valley. The revisions to the 2007 PM2.5 and Ozone SIP consist of the following:
 - Updated implementation status of SCAQMD control measures necessary to meet the 2015 PM2.5 attainment date;
 - Revisions to the control measure adoption schedule;
 - Changes made to the emission inventory resulting from [California Air Resources Board's \(CARB's\)](#) December 2010 revisions to the on-road truck and off-road equipment rules; and
 - An SCAQMD commitment to its "fair share" of additional NOx emission reductions, if needed, in the event U.S. EPA does not voluntarily accept the "federal assignment."
- In response to the July 14, 2011 U.S. EPA notice of proposed partial approval and partial disapproval of the 2007 South Coast SIP for the 1997 Fine Particulate Matter Standards, at the October 7, 2011 public hearing, the SCAQMD Governing Board approved Further Revisions to PM2.5 and Ozone State Implementation Plan for South Coast Air Basin and Coachella Valley. Revisions to the PM2.5 SIP included a three-prong approach for identifying contingency measures needed to address U.S. EPA's partial disapproval:
 - Equivalent emissions reductions achieved through improvements in air quality;
 - Relying on committed emissions reductions for the 2007 ozone plan;
 - Quantifying excess emissions reductions achieved by existing rules and programs that were not originally included in the 2007 PM2.5 SIP;
 - U.S. EPA approved the PM2.5 SIP except for contingency measures on November 9, 2011. Action is pending on the contingency measures; and
 - U.S. EPA fully approved the 2007 SIP for the 8-hour ozone standard on March 1, 2012.

2.2.1 Progress Implementing the 2007 AQMP

The SCAQMD has fulfilled the majority of its emissions reductions commitments specified in the 2007 SIP. Table 2-1 summarizes the progress achieved toward fulfilling SCAQMD's emissions reductions commitments to attain the 1997 PM2.5 annual and federal 8-hour ozone

standards by the required dates. Through January 31, 2011, the SCAQMD Governing Board has amended and adopted 12 rules. The majority of these rules have been submitted to U.S. EPA and approved as part of the SIP. Several recently adopted SCAQMD rules have been submitted to CARB and have been or are expected to be submitted to and subsequently evaluated by U.S. EPA. As shown in Table 2-1, for the control measures adopted by the [SCAQMD District](#) over this period, 22.5 tons per day of VOC reductions, 7.6 tons per day of NO_x reductions, 4.0 tons per day of SO_x reductions, and 1.0 tons per day of PM_{2.5} reductions will be achieved by 2014. Additional reductions from these adopted rules will be achieved by 2023.

TABLE 2-1

Total 2007 AQMP Emission Reductions
from SCAQMD Control Measures (tons per day)

Pollutant	COMMITMENT ^a		ACHIEVED ^a	
	2014	2023	2014	2023
VOC	10.4	19.2	22.5	26.4
NO _x	10.8	9.2	7.6	10.3
PM _{2.5}	2.9	5.4	1.0	1.6
SO _x	2.9	2.9	4.0	5.7

Source: 2012 AQMP, Chapter 1, Table 1-2

^a 2014 reductions estimated in average annual day, 2023 in planning inventory.

Table 2-2 lists the 2007 AQMP's control measure commitments that have been adopted (either entirely or partially) by CARB since the 2007 AQMP was adopted. The emissions are presented in terms of remaining emissions, rather than reductions, due to some significant changes to the inventory that preclude a direct comparison of committed emissions to those achieved. The table is based on SIP revisions submitted to U.S. EPA in 2011, and thus reflect adopted measures through specific dates in 2011 as described in the footnotes. In combination with the regulatory activity and revised inventory forecast, CARB has achieved the emission targets for both 2014 and 2023.

- The 2014 emissions data reflect the 2014 Emissions Inventory that was included in the March 2011 *Progress Report on Implementation of PM_{2.5} State Implementation Plans*. The inventory is in the process of being updated, and may change slightly in the final [2012 AQMP-draft](#).
- The 2023 emissions data tables reflect the 2023 Emissions Inventory that was current as of August 2011. The inventory is in the process of being updated, and may change slightly in the final [2012 AQMP-draft](#).
- These are remaining emissions. If achieved emissions are lower than the committed emissions, it means the SIP targets are met.
- Remaining emissions are included in "other local, state, and federal emissions"
- Includes benefits of local emission reductions that were not reflected in the revised RFP estimates.

2.3 AGENCY AUTHORITY – 2012 AQMP

The 2012 AQMP sets forth emission reduction programs which require the cooperation of all levels of government: local, regional, state, and federal, as well as public engagement. Each level is represented in the AQMP by the appropriate agency or jurisdiction that has the authority over specific emissions sources. Accordingly, each agency or jurisdiction commits to specific planning and implementation responsibilities.

At the federal level, the U.S. EPA is charged with establishing emission standards including motor vehicle standards; train, airplane, and ship pollutant exhaust and fuel standards; and regulation of non-road engines less than 175 horsepower. CARB, representing the state level, also oversees development of 2012 AQMP control measures for on-road vehicle emission standards in California; motor vehicle fuel specifications; some off-road source emission standards and fuel standards, including marine vessels; and consumer product standards. At the regional level, the SCAQMD is responsible primarily for non-vehicular sources and has limited authority over mobile sources (e.g., in-use fleet regulations, incentives for accelerated vehicle turnover, reduction in average vehicle ridership, etc.). In addition, the SCAQMD has lead responsibility for developing stationary, some area, and indirect source control measures and coordinating the development and adoption of the 2012 AQMP. Lastly, at the local level, the cities and counties and their various departments (e.g., harbors and airports) have a dual role related to transportation and land use. Their efforts are coordinated through the regional metropolitan planning organization for the South Coast Air Basin, the Southern California Association of Governments (SCAG), which is responsible for preparing the transportation

control measure component of the 2012 AQMP. Interagency commitment and cooperation are the keys to success of the 2012 AQMP.

2.4 AGENCY AUTHORITY – CEQA

CEQA, Public Resources Code §21000 et seq., requires that the environmental impacts of proposed projects implemented or approved by governmental agencies be evaluated and that feasible methods to reduce, avoid or eliminate significant adverse impacts of these projects be identified and implemented. The lead agency is the “public agency that has the principal responsibility for carrying out or approving a project that may have a significant effect upon the environment” (Public Resources Code Section 21067). Since the SCAQMD has the primary responsibility for supervising or approving the entire project as a whole, it is the most appropriate public agency to act as lead agency (CEQA Guidelines Section 15051 (b)).

A Program Environmental Impact Report (Program EIR) for the 2012 AQMP is considered to be the appropriate document pursuant to CEQA Guidelines Section 15168 (a)(3), because the 2012 AQMP constitutes a series of actions that can be characterized as one large project and are related in the connection with the issuance or rules, regulations, plans, or other criteria to govern the conduct of a continuing program.

As the lead agency for the ~~proposed~~ 2012 AQMP, SCAQMD staff prepared a Notice of Preparation/Initial Study (NOP/IS) for the ~~proposed~~ 2012 AQMP Program EIR on June 28, 2012. Due to changes in the project description during circulation of the original 6/28/12 NOP/IS circulation, the NOP/IS was revised and recirculated for a 30-day public review and comment period. The NOP/IS was recirculated for a 30-day public review and comment period from August 2, 2012 through August 31, 2012. [Seven scoping meetings were held on July 10, 2012 \(two meetings\), July 11, 2012, July 12, 2012, July 24, 2012, August 9, 2012 and August 23, 2012.](#) Eleven comment letters were submitted to staff in response to the NOP/IS [that was circulated on June 28, 2012. No comments were received in response to the NOP/IS that was circulated on August 2, 2012.](#) A copy of the [recirculated 8/2/12 6/28/12-NOP/IS](#) can be found in Appendix A. Comments and responses to comments received on the 6/28/12 NOP/IS can be found in Appendix B. [As indicated in Appendix C, no comment letters were received on the 8/2/12 NOP/IS. A copy of the recirculated NOP/IS can be found in Appendix C.](#) Comments [received at the scoping meetings](#) and the responses to [these](#) comments ~~received on the recirculated NOP/IS~~ can be found in Appendix D.

2.5 PROJECT LOCATION

The SCAQMD has jurisdiction over an area of approximately 10,743 square miles, consisting of the four-county South Coast Air Basin (Basin) (all of Orange County and the non-desert portions of Los Angeles, Riverside and San Bernardino counties), and the Riverside County portions of the Salton Sea Air Basin (SSAB) and Mojave Desert Air Basin (MDAB), referred to hereafter as the district. The Basin, which is a subregion of the SCAQMD’s jurisdiction, is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto mountains to the north and east. It includes all of Orange County and the nondesert portions of Los Angeles, Riverside, and San Bernardino counties. The Riverside County portion of the SSAB is bounded by the San Jacinto Mountains in the west and spans eastward

up to the Palo Verde Valley. The federal nonattainment area (known as the Coachella Valley Planning Area) is a subregion of the Riverside County and the SSAB that is bounded by the San Jacinto Mountains to the west and the eastern boundary of the Coachella Valley to the east (Figure 2-1).

FIGURE 2-1

Southern California Air Basins

2.6 OVERALL ATTAINMENT STRATEGY

The overall control strategy for the [Draft](#) 2012 AQMP is designed to meet applicable federal and state requirements. The focus of the AQMP is to demonstrate attainment of the federal 24-hour PM_{2.5} ambient air quality standard by 2014, while making expeditious progress toward attainment of state PM standards. In addition, to further implement the existing 8-hour ozone plan, the 2012 AQMP includes section 182 (e)(5) implementation measures designed to assist in future attainment of the 8-hour ozone standard (refer to subsection 1.6.1). The proposed control measures in the [Draft](#) 2012 AQMP are based on implementing all feasible control measures through the application of available technologies and management practices as well as development and deployment of advanced technologies and control methods. In addition, SCAQMD retains certain obligations relative to the (revoked) one-hour ozone standard. For purposes of the environmental analysis, it is expected that full implementation of the attainment strategy for the one-hour ozone standard would have the same environmental effects as implementing all the measures in the [Draft](#) 2012 AQMP and the section 182 (e)(5) measures for the eight-hour standard that were already analyzed in the EIR for the 2007 AQMP. These measures rely on proposed actions to be taken by several agencies that currently have the statutory authority to implement such measures. Similar to the approaches taken in previous AQMPs, the SIP commitment includes an adoption and implementation

schedule for each control measure. Each agency is also committed to achieving a total emission reduction target with the ability to substitute specified control measures for control measures deemed infeasible, as long as equivalent reductions are met by other means. These measures are also designed to satisfy the federal Clean Air Act requirement of reasonably available control technologies [§172 (c)], and the California requirement of Best Available Retrofit Control Technologies (BARCT) [Health and Safety Code §40440 (b)(1)].

To ultimately achieve the ozone ambient air quality standards and demonstrate attainment, significant NO_x emissions reductions will be necessary, not only from non-vehicular sources under the jurisdiction of the SCAQMD, but substantial reductions will be necessary from sources primarily under the jurisdiction of CARB (e.g., on-road motor vehicles, off-road equipment, and consumer products) and U.S. EPA (e.g., aircraft, ships, trains, and pre-empted off-road equipment). Without an adequate and fair-share level of reductions from all sources, the emissions reduction burden would unfairly be shifted to stationary sources that are already stringently regulated. The SCAQMD will continue to work closely with CARB to further control mobile source emissions where federal or State actions do not meet regional needs.

2.6.1 One-hour Ozone Standard Attainment Strategy

The federal one-hour ozone standard was revoked, effective one year after the eight-hour standard designations were effective (e.g., 2005). U.S. EPA guidance indicated that while certain planning requirements remained in effect, a new SIP would not be required if an area failed to attain the standard by the attainment date. However, recent litigation and court decisions have suggested that there likely will be a need for the SCAQMD to prepare a new one-hour ozone SIP in the near future. If a one-hour ozone SIP is requested by U.S. EPA, the SIP would likely be due within 12 months of such a SIP call. The attainment demonstration in the SIP would have to show attainment within five years with a potential five-year extension, which would be a similar timeframe (2022) as is required for the 1997 eight-hour ozone standard (deadline of 2023). However, many new technical issues such as modeling for the attainment demonstration and other CAA requirements would require U.S. EPA's guidance, since the previous preambles/guidelines are no longer directly applicable. Based on previous modeling estimates, the types of control strategies and the amount of reductions that are needed to attain the eight-hour ozone standard are nearly identical to those that would be needed to attain the one-hour ozone standard.

Although the primary purpose of the 2012 AQMP Basin is to set forth a comprehensive and integrated program that will lead the Basin into compliance with the federal 24-hour PM_{2.5} air quality standard, it will also provide an update of certain elements for the 2007 eight-hour ozone plan. The AQMP will update specific elements of the previously approved eight-hour ozone SIP: 1) an updated emissions inventory, and 2) new control measures and commitments for emissions reductions to help fulfill the §182 (e)(5) portion of the eight-hour ozone SIP and one-hour ozone SIP.

In anticipation that U.S. EPA would likely request that the SCAQMD prepare a one-hour ozone SIP, the Final Program EIR for the 2012 AQMP includes 11 project objectives² (see Section 2.9), including the following:

1. Continue making expeditious progress towards attaining the federal eight-hour ozone standard and demonstrate attainment of the federal one-hour ozone standard (revoked) by 2022 – 2023;
2. Reduce population exposure to ozone through continued progress towards attaining the federal one-hour (revoked) and eight-hour ozone standards by 2022 – 2023;

~~Regardless of whether or not U.S. EPA requests that the SCAQMD prepare a one-hour ozone SIP, the 2012 AQMP reflects a multi-agency effort to identify 2012 AQMP~~ includes control measures that specifically address the SCAQMD's efforts to continue making progress towards attaining all state and national ambient air quality standards for ozone. For example, there are four coatings and solvent control measures (CTS 01, CTS02, CTS-03, and CTS-04; Table 2-3); two combustion control measures (CMB-01, RECLAIM phase 2, and CMB-02; Table 2-3); and five §182 (e)(5) implementation measures for on-road mobile sources, five off-road mobile source control measures, and seven advanced control measures (Table 2-4) that all primarily address attaining the ozone standards.

The 2012 AQMP reflects a multi-agency effort ~~to identify 2012 AQMP control measures~~ that specifically addresses the SCAQMD's efforts to attain the federal 24-hour PM_{2.5} standard and the federal one-hour (revoked) and eight-hour ozone standards by 2022 – 2023, respectively. Consistent with CEQA requirements to analyze the whole of the actions from a project, the Final Program EIR prepared for the 2012 AQMP includes an environmental analysis of all PM_{2.5} control measures, as well as, all of the ozone-related control measures in the 2012 AQMP.

On September 19, 2012, the U.S. EPA published in the Federal Register a proposed "SIP call" which, if finalized, would require the SCAQMD to prepare a demonstration of attainment of the one-hour ozone standard, with attainment required by ten years from the date the SIP call is finalized. The same day, the U.S. EPA published in the Federal Register a proposal to withdraw its approval of, and then to disapprove, the transportation control measure (TCM) demonstrations, also referred to as VMT emissions offset demonstrations, in the 2003 one-hour ozone plan and the 2007 eight-hour ozone plan. As explained by the U.S. EPA, both of these actions were taken in response to a decision of the Ninth Circuit Court of Appeals in Association of Irrigated Residents v. EPA, January 27, 2012.

In response to the U.S. EPA's "SIP call" and in anticipation that it will be finalized, SCAQMD staff has prepared this *One-hour Ozone Attainment Demonstration*, which demonstrates attainment of the federal one-hour (revoked) ozone standard by the year 2022. The federal one-hour ozone attainment demonstration in this document contains all of the

² CEQA Guidelines §15124 (b).

same ozone control measures that are included in the 2012 AQMP, as well as, the seven remaining mobile source control measures from the 2007 AQMP.

~~No other control measures to attain the ozone standards were identified during the multi-agency effort to identify 2012 AQMP control measures.~~

Similarly, in connection with the proposed disapproval of the TCM demonstrations for the South Coast Air Basin, the U.S. EPA prepared a guidance document³ for Severe and Extreme ozone nonattainment areas on how to address Clean Air Act (CAA) §182 (d)(1)(A) (VMT emissions offset demonstrations). SCAQMD staff conducted a VMT emissions offset analysis pursuant to U.S. EPA guidance and concluded that actual emissions with controls and VMT growth were substantially less than emissions assuming no new measures and no VMT growth ("ceiling"). Based on this conclusion, no new TCMs are required for the one-hour ozone SIP. SCAQMD staff has prepared the *VMT Offset Requirement Demonstration (2012 AQMP Appendix VIII)* to provide the results of the VMT emissions offset analysis to the public.

With regard to the seven mobile source control measures from the 2007 AQMP, potential environmental impacts from these control measures along with all other 2007 ozone and PM_{2.5} control measures were evaluated in the Final Program EIR for the 2007 AQMP (SCH #2006111064), certified by the SCAQMD Governing Board on June 1, 2007. These remaining measures would be implemented even without the 2012 AQMP. For this reason, the seven mobile source control measures, as well as four other remaining control measures from the 2007 AQMP, were also evaluated as Alternative 1, the No Project Alternative, in the 2012 AQMP Program EIR, which concluded that implementation of the remaining 2007 AQMP control measures would not generate any significant adverse environmental impacts. An acknowledgment of existing 2007 AQMP control measures in this *One-hour Ozone Attainment Demonstration* does not require additional environmental review where no changes are being proposed to the 2007 measures.

~~As a result~~ Based on the above information, the 2012 AQMP can rely on the same ~~no additional~~ control measures and TCMs to address progress in attaining the federal one-hour (revoked) and eight-hour ozone standards by 2022 – 2023, would likely be identified. This means that a the ~~One-hour Ozone SIP-Attainment Demonstration (Appendix VII)~~ would include all of the same ozone-related control measures as the 2012 AQMP. Further, the timing or implementation dates of any of the control measures would not be changed to meet the one-hour standard compared to timing and implementation dates in the 2012 AQMP. Further ~~Therefore~~, by analyzing the 2012 AQMP ozone-related control measures in this Final Program EIR, this Final Program EIR would also serve as the CEQA document for the *One-hour Ozone Attainment Demonstration (2012 AQMP Appendix VII)* and the *VMT Offset Requirement Demonstration (2012 AQMP Appendix VIII)*, a one-hour ozone SIP. Finally, potential impacts from the seven remaining mobile source ozone control measures from the 2007 AQMP have been disclosed to the public in the 2007 AQMP and as part of the

³ U.S. EPA. Office of Transportation and Air Quality. 2012. *Implementing Clean Air Act Section 182 (d)(1)(A): Transportation Control Measures and Transportation Control Strategies to Offset Growth in Emissions Due to Growth in Vehicle Miles Travelled*. EPA-420-B-12-053. August. <http://www.epa.gov/otaq/stateresources/policy/general/420b12053.pdf>.

[alternatives analysis in the Final Program EIR for the 2012 AQMP. Since no changes are being proposed to those existing measures, no additional environmental analysis of the 2007 AQMP control measures is required.](#)

2.7 PURPOSE OF THE 2012 AQMP

The 2012 AQMP will provide an updated air pollution control strategy to attain the 24-hour PM_{2.5} federal ambient air quality standard and to partially fulfill the 2007 AQMP §182 (e)(5) reduction commitment. It has been developed as an integrated Plan taking into consideration: air quality, climate change, transportation, and energy needs. The 2012 AQMP focuses on PM reductions to attain the federal 24-hour PM_{2.5} standard by 2014. The 2012 AQMP also includes ozone reduction strategies to make expeditious progress in attaining the state one-hour and eight-hour ozone standards and the federal eight-hour ozone standards (80 parts per billion (ppb) by 2023 and 75 ppb by 2032). The 2012 AQMP also provides for meeting requirements applicable under the (revoked) one-hour federal ozone standard. In particular the ozone strategy approach relies heavily on NO_x emission reductions, primarily from mobile sources, and identifies actions that can be taken in the next two to three years. The 2012 AQMP relies upon the most recent planning assumptions and the best available information such as CARB's latest EMFAC2011 for the on-road mobile source emissions inventory, CARB's OFF-ROAD 2011 model for the off-road mobile source emission inventory, the latest point source and improved area source inventories as well as the use of new episodes and air quality modeling analysis, and SCAG's forecast assumptions based on its recent 2012 Regional Transportation Plan. The 2012 AQMP includes the current and future air quality in the Coachella Valley. The 2012 AQMP also includes a discussion of ultra-fine particles, near roadway exposure and energy.

It is expected that implementing the 2012 [AQMP](#) control measures will provide benefits of improved air quality. From a public health standpoint, air pollution has been linked to long-term health problems affecting the lungs, heart, blood, brain and immune and nervous systems. Therefore, improving air quality is expected to result in improvements to public health. Additional benefits include improved visibility, reduced destruction of materials and buildings, reduced damage to agricultural crops and habitat for wildlife and, more efficient land use patterns and transportation systems. The 2012 AQMP control measures have the potential to reduce reliance on traditional petroleum fuels, thus, providing reductions in greenhouse gas emissions. The following sections summarize the overall components of the 2012 AQMP and the specific control measures that comprise the 2012 AQMP.

2.8 PROJECT DESCRIPTION

The ~~Draft~~ 2012 AQMP control measures consist of three components: 1) the SCAQMD's Stationary and Mobile Source Control Measures; 2) suggested State Mobile Source Control Measures; and 3) Regional Transportation Strategy and Control Measures provided by SCAG. These measures rely on not only the traditional command-and-control approach, but also public incentive programs, as well as advanced technologies expected to be developed and deployed in the next several years. A summary of these measures is provided in the following subsections. The following bullet points summarize the major components of the 2012 AQMP:

- The most current air quality setting (e.g., 2008 data);
- Updated emission inventories using 2008 as the base year, which also incorporate measures adopted since adopting the 2007 SIP;
- Consider the 2007 AQMP control measures not yet adopted (through January 31, 2011, the SCAQMD Governing Board has amended and adopted 13 rules achieving approximately 96 percent of the SCAQMD’s SIP commitment for both PM_{2.5} and ozone as outlined in the 2007 AQMP);
- New measures are to be incorporated into the [Draft](#) 2012 AQMP;
- SCAG’s 2012 regional transportation strategy and control measures;
- Analysis of emission reductions necessary to achieve the federal 24-hour PM_{2.5} air quality standards, and (revoked) one-hour ozone standard;
- Overview of state and federal planning requirements;
- Implementation schedule for adoption of the proposed control measures;
- Latest information on near-roadway emissions of combustion-related pollutants with particular focus on ultrafine particulates formation, transport, exposure, and health effects and potential control strategies, although there are no ambient air quality standards specifically for ultrafine particulates; and
- Energy Policy Update including: energy consumption, costs, associated emissions for base year 2008 and the future AQMP years, and associated energy impacts and GHG emissions inventory in the Basin.

2.8.1 Stationary Source Control Measures

The stationary source control measures included in the [Draft](#) 2012 AQMP would further reduce emissions from both point sources (permitted facilities) and area sources (generally small and non-permitted). The proposed control strategies for stationary sources under the SCAQMD’s jurisdiction include implementing the remaining revised and partially implemented measures from the 2007 AQMP and new measures that are deemed feasible, which will provide additional emission reduction opportunities. In addition to PM reduction control measures, the 2012 AQMP also identifies control measures to be implemented by the SCAQMD and CARB to partially fulfill the §182 (e)(5) commitment in attaining ambient air quality standards for ozone. These control measures include short-term and Clean Air Act §182 (e)(5) implementation measures, and would regulate both stationary and mobile sources.

The basic principles followed in developing the SCAQMD’s stationary source control measures included: 1) identify PM_{2.5}, ammonia and NO_x reduction opportunities and maximize reductions by the earliest possible and feasible attainment year; and, 2) initiate programs or rulemaking activities for further VOC and NO_x control strategies to maximize ozone reductions by the year 2022-2023 timeframe. Therefore, the proposed control strategy for stationary sources under the SCAQMD’s jurisdiction includes some revised and partially implemented measures from the 2007 AQMP and new measures that are deemed feasible to provide additional control opportunities. In addition, to foster further technology

advancement, advanced clean technologies measures are also included to achieve additional reductions from sources based on implementation and accelerated penetration of advanced technologies. For each control measure, the SCAQMD will seek to achieve the maximum reduction potential that is technically feasible and cost-effective. The control measures to be implemented by the SCAQMD are listed in Table 2-3 summarized in the paragraphs following Table 2-3.

a. Winter average day reductions based on episodic conditions and 75 percent compliance rate.

b. Reduction based on episodic day conditions.

c. Will submit into SIP once technically feasible and cost effective options are confirmed.

d. TBD are reductions to be determined once the technical assessment is complete, and inventory and control approach are identified.

e. Pending because emission reductions will be provided prior to the Final Draft.

f. N/A are reductions that cannot be quantified due to the nature of the measure (e.g., outreach, incentive programs) or if the measure is designed to ensure reductions that have been assumed to occur will, in fact, occur.

g. Reductions submitted in SIP once emission inventories are included in the SIP.

h. TBD are reductions to be determined once the inventory and control approach are identified.

i. [Emission reductions are included in the SIP as a contingency measure.](#)

j. [If Control Measure CMB-01, RECLAIM Phase I, contingency measure emission reductions are not triggered and implemented, Phase II will target a cumulative 3-5 TPD of NOx emission reductions.](#)

2.8.1.1 Summaries of the Stationary Source Control Measures

BCM-01 – Further Reductions from Residential Wood Burning Devices [PM2.5] (formerly BCM-05 in the 2007 AQMP) (formerly control measure MCS-04B): The purpose of this measure would be to seek further PM2.5 emissions reductions from residential wood burning fireplaces and wood stoves whenever key areas in the South Coast Air Basin are forecast to approach the federal 24-hour PM2.5 standard. A review of other California air district regulations has indicated that the most appropriate amendment to the existing

SCAQMD wood smoke control program would be to decrease the mandatory wood burning curtailment forecast threshold from $35 \mu\text{g}/\text{m}^3$ to a more conservative $30 \mu\text{g}/\text{m}^3$. In addition to the existing sub-regional curtailment program of Rule 445 (based on areas forecast to exceed the existing PM_{2.5} standard), this measure would implement a curtailment that would apply Basin-wide whenever a PM_{2.5} level of greater than $30 \mu\text{g}/\text{m}^3$ is forecast at any monitoring station at which the design value has exceeded the current PM_{2.5} 24-hour standard of $35 \mu\text{g}/\text{m}^3$ for either of the two previous periods. Lowering the wood burning curtailment forecast threshold and applying the curtailment to the entire Basin when triggered could potentially reduce Basin-wide ambient PM_{2.5} concentrations on these episodic no-burn days by about 7.1 tons per winter day (assuming 75 percent rule effectiveness).

BCM-02 – Further Reductions from Open Burning [PM_{2.5}]: Rule 444 outlines the criteria and guidelines for agricultural and prescribed burning, as well as training burns, to minimize PM emissions and smoke in a manner that is consistent with state and federal laws. Agricultural burning is open burning of vegetative materials produced from the growing and harvesting of crops. Prescribed burning is a planned open burning of vegetative materials, usually conducted by a fire protection agency and/or department of forestry, to promote a healthier habitat for plants and animals, to prevent plant disease and pests, and to reduce the risk of wild fires. Training burns are hands-on instructional events conducted by fire protection agencies on methods of preventing and/or suppressing fire. Rule 444 currently contains requirements that a no-burn day may be called under a combination of geographical, meteorological, and air quality conditions. This control measure would potentially increase the number of no-burn days by establishing an additional criteria for no-burn during episodic days as described in control measure BCM-01 by implementing a curtailment that would apply Basin-wide whenever a PM_{2.5} level of greater than $30 \mu\text{g}/\text{m}^3$ is forecast at any monitoring station ~~at which the design value has exceeded the current PM_{2.5} 24-hour standard of $35 \mu\text{g}/\text{m}^3$ for either of the two previous three-year design value periods.~~ the design value has exceeded the current PM_{2.5} 24-hour standard of $35 \mu\text{g}/\text{m}^3$ for either of the two previous periods. It should be noted that, as with the current mandatory program, the Basin-wide curtailment criteria will apply for the entire winter season, which is November through February. Under this measure, consideration will also be given to expanding the defined winter season to potentially include October and/or March. Enhancing the open burning restrictions with this new threshold criteria and applying a curtailment to the entire Basin could potentially reduce Basin-wide ambient PM_{2.5} concentrations on these episodic no-burn days by about 4.6 tons per winter day. Since the burning would likely be shifted to other days, the total annual emissions would remain the same, but would not occur on days where high PM_{2.5} levels are forecast.

BCM-03 – Emission Reductions from Under-Fired Charbroilers (Rule 1138) [PM_{2.5}] (formerly BCM-05 in the 2007 AQMP) (formerly Control Measure BCM-01): This proposed measure seeks emission reductions by potentially requiring new and/or existing medium to large volume restaurants with under-fired charbroilers to install control devices meeting a minimum efficiency requirement. Under-fired charbroilers are responsible for the majority of emissions from restaurant operations – 84 percent of PM and 71 percent of VOC emissions. Several control options are currently being evaluated and tested including electrostatic precipitators (ESP), high efficiency particulate arresting (HEPA) filters, wet scrubbers, and thermal oxidizers. Under-fired charbroilers are one of the largest unregulated

sources of directly emitted PM. This control measure will be implemented in two phases. Phase I will be the completion of the technical assessment at CE-CERT, including considerations for compatibility with existing restaurants and all applicable building and safety codes (e.g., fire suppression). Evaluation of cost and affordability associated with the purchase, installation, and operation and maintenance (e.g., cleaning and/or replacing filters) of the equipment will also be assessed.

A technical assessment of potential control technologies is currently ongoing at University of California, Riverside (CE-CERT), to evaluate the efficiency and the cost-effectiveness of various control devices for the capture and control of filterable and/or condensable forms of PM from under-fired charbroilers. The Bay Area AQMD adopted a rule for commercial cooking equipment that controls both chain-driven and under-fired charbroilers. The Bay Area measure will be evaluated to meet the all feasible measures requirement. A rule will be developed if deemed feasible. Technical and economic feasibility, as well as affordability of controls, particularly for existing restaurants relative to retrofit installation and operation/maintenance, will be considered in conjunction with any future rule development to establish requirements for under-fired charbroilers.

BCM-04 – Further Ammonia Reductions from Livestock Waste [Ammonia] (formerly MCS-05 in the 2007 AQMP) (formerly Control Measure MCS-04C): This measure seeks to reduce ammonia emissions from livestock operations with emphasis on dairies. This control measure would apply only-primarily to the Mira Loma area, which further reduce PM_{2.5} emissions in the only area that currently exceeds the federal 24-hour PM_{2.5} standard. Existing Rule 1127 – Emission Reductions from Livestock Waste requires best management practices for dairies and specific requirements regarding manure removal, handling, and composting; however, the rule does not focus on fresh manure, which is one of the largest dairy sources of ammonia emissions.

This control measure will be implemented in two phases. Phase I will be to conduct a technical assessment of the aforementioned method of control. An assessment will be conducted to evaluate the use of sodium bisulfate (SBS) at local dairies to evaluate the technical and economic feasibility of its application. Reducing pH level in manure through the application of acidulant additives (acidifier), such as sodium bisulfate (SBS), is one of the potential mitigations for ammonia. SBS is currently being considered for use in animal housing areas where high concentrations of fresh manure are located. Research indicates that best results occur when SBS is used on “hot spots”. SBS can also be applied to manure stock piles and at fencelines, and upon scraping manure to reduce ammonia spiking from the leftover remnants of manure and urine. A rule will be developed if deemed feasible. SBS application may be required seasonally or episodically during times when high ambient PM_{2.5} levels are forecast.

If deemed feasible and effective, Phase II would implement the measure as needed to address future PM_{2.5} standards. Rule requirements would be specific to dairies in the AQMD jurisdiction and may be unique to localized operations only.

CMB-01 – Further NO_x Reductions from RECLAIM [NO_x] – Phase I: ~~This proposed control measure will seek further reductions of 2 tpd of NO_x allocations by 2014. The proposed Phase~~

I reductions are designed to serve as a contingency measure. It would be implemented if the Basin does not attain the federal 24-hr PM2.5 standard by 2014. If necessary, Phase I is expected to be adopted in 2013 and the shave will be implemented/triggered for compliance year 2015 if the attainment of 24-hr PM2.5 standard is not met by 2014. In addition, staff would seek to identify appropriate approaches during rulemaking to implement the allocation shaving methodology. The control measure has the ability to produce co-benefits in the reduction of PM2.5 and ozone.

CMB-01 – Further Emission Reductions from NOx RECLAIM [NOx] – Phase II: This proposed NOx control measure ~~would seek further reductions in NOx allocations by the year is expected to be adopted by 2015 for implementation between 2017 and 2020 to be consistent with the 2012 AQMP.~~ If control measure CMB-01, RECLAIM Phase I, contingency measure emission reductions are not triggered and implemented, Phase II will target a cumulative three to five tons per day of NOx emission reductions. This phase of control is to implement periodic BARCT evaluation as required under state law. The control measure has the ability to produce co-benefits in the reduction of PM2.5 and ozone.

CMB-02 – NOx Reductions from Biogas Flares [NOx]: There are no source specific rules regulating NOx emissions from biogas flares. Flare NOx emissions are regulated through new source review and BACT. This control measure proposes that, consistent with the feasible measures, older biogas flares be gradually replaced with new flares that meet current BACT. Strategies that minimize flaring and associated emissions can also be considered as alternative control options.

CMB-03 – Reductions from Commercial Space Heating [NOx] (Rule 1111): This control measure would apply to space heaters used for comfort heating. SCAQMD Rule 1111 - NOx Emissions from Natural Gas-Fired Fan Type Central Furnaces, regulates natural gas-fired commercial space heaters with input rates less than 175,000 Btu/hr. This control measure is expected to reduce NOx emissions from affected heaters by reducing the NOx emission control limit for new space heaters for commercial applications, which can be achieved through the use of low-NOx burners or other low emitting combustion technologies.

CTS-01 – Further VOC Reductions from Architectural Coatings (Rule 1113) [VOC]: SCAQMD adopted Rule 1113 – Architectural Coatings, in 1977 and it has undergone numerous amendments. This proposed control measure seeks to reduce VOC emissions from large volume coating categories such as flat, non-flat and primer, sealer, undercoaters (PSU) and from phasing out the currently exempt use of high-VOC architectural coatings sold in one liter containers or smaller. Additional VOC emission reductions could be achieved from the application of architectural coatings by use of application techniques with greater transfer efficiency. Such transfer efficiency improvements could be achieved through the use of a laser paint targeting system, which has been shown to improve transfer efficiency on average by 30 percent over equipment not using a targeting system, depending on the size, shape and configuration of the substrate. The proposal is anticipated to be accomplished with a multi-phase adoption and implementation schedule.

CTS-02 – Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]: This control measure seeks to reduce VOC emissions from

miscellaneous coating, adhesive, solvent and lubricant categories by further limiting the allowable VOC content in formulations. Examples of the miscellaneous categories to be considered include, but are not limited to, coatings used in aerospace and marine applications; adhesives used in a variety of sealing applications; solvents for graffiti abatement activities; and lubricants used as metalworking fluids to reduce heat and friction to prolong the life of the tool, improve product quality, and carry away debris. Reductions would be achieved by lowering the VOC content of the coatings, adhesives and lubricants. For solvents, reductions could be achieved with the use of alternative low-VOC products or non-VOC product/equipment at industrial facilities. The proposal is anticipated to be accomplished with a multi-phase adoption and implementation schedule.

CTS-03 – Further VOC Reductions from Mold Release Products [VOC]: Metal, fiberglass, composite and plastic products are often manufactured using molds which form the part into a particular configuration. Mold release agents are used to ensure that the parts, as they are made, can be released easily and quickly from the molds. These agents are often blended with VOC solvent carriers and may also contain toxic components such as toluene and xylene. Mold release products are also used for concrete stamping operations to keep the mold from adhering to the fresh concrete. Residential and commercial concrete stamping is a rapidly growing industry and overall VOC emissions are estimated to be significant. This control measure would reduce VOC emissions from mold release products on metal, fiberglass, composite and plastic products, as well as concrete stamping operations, by requiring the use of low-VOC content mold release products.

CTS-04 – Further VOC Reductions from Consumer Products [VOC]: This [control](#) measure seeks to eliminate or revise the exemption for low vapor pressure solvents in CARB's consumer products regulation, which exempts low vapor pressure volatile organic compounds (LVP-VOC) from counting towards the compliance obligation for consumer product VOC limits. Recent testing conducted by the [SCAQMD District](#) on institutional cleaners found that traditionally formulated consumer products may contain significant amounts of LVP-VOC solvents. In some cases, such as certain multipurpose solvents, the products were 100 percent LVP-VOC solvents. Further testing indicated that many of the LVP-VOC solvents evaporate nearly as quickly as the traditional solvents they were meant to replace and have Maximum Incremental Reactivity (MIR) values well above the threshold considered to be non-reactive, currently based on ethane. Therefore, an evaluation of the continued need for use of LVP-VOC solvents in certain categories is warranted.

FUG-01 – ~~Further~~ VOC Reductions from Vacuum Trucks [VOC]: This control measure [will primarily focus on high-emitting seeks to reduce emissions from the further venting of vacuum trucks operations, such as those found in petrochemical industries and other operations that include the transfer of volatile liquids such as gasoline.](#) Emissions from such operations can be reduced through the utilization of control technologies, including but not limited to, carbon adsorption systems, internal combustion engines, thermal oxidizers, refrigerated condensers and liquid scrubbers. Additionally, implementation of a leak detection and repair (LDAR) program may further reduce fugitive emissions.

FUG-02 – Emission Reduction from LPG Transfer and Dispensing [VOC]: In June 2012, the SCAQMD adopted phase I Rule 1177 - Liquefied Petroleum Gas (LPG) Transfer and

Dispensing. Rule 1177 requires use of low-emission fixed liquid level gauges or equivalent alternatives while filling LPG-containing tanks and cylinders, use of low-emission connectors, routine leak checks and repairs of LPG transfer and dispensing equipment. The purpose of Control Measure FUG-02 is to further reduce fugitive VOC emissions associated with the transfer and dispensing of LPG by expanding rule applicability to include LPG transfer and dispensing at currently exempted facilities such as refineries, marine terminals, natural gas processing plants and pipeline transfer stations, as well as facilities that conduct fill-by-weight techniques.

FUG-03 – Further VOC Reductions from Fugitive VOC Emissions [VOC]: This control measure would broaden the applicability of improved leak detection and repair (LDAR) programs to remove additional fugitive VOC emissions. Areas for further study may include, but are not limited to, Rule 1142 - Marine Vessel Tank Operations, and wastewater separators. This control measure would explore the opportunity of incorporating a recently developed advanced optical gas imaging technology to detect leaks (Smart LDAR) to more easily identify and repair leaks in a manner that is less time consuming and labor intensive. Additionally, vapor recovery systems are currently required to have a control efficiency of 95 percent. In an effort to further reduce VOC emissions from these types of operations, this control measure would explore opportunities and the feasibility of further improving the collection/control efficiency of existing control systems, resulting in additional VOC reductions.

MCS-01 – Application of All Feasible Measures Assessment [All Pollutants]: This control measure is to address the state law requirement for all feasible measures for ozone. Existing rules and regulations for pollutants such as VOC, NO_x, SO_x and PM typically reflect BARCT requirements at the time the rules or regulations were adopted or amended. However, BARCT continually evolves as feasible and cost-effective new technology becomes available or becomes more efficient. Through this proposed control measure, the SCAQMD would commit to the adoption and implementation of the new retrofit control technology standards. Finally, staff would review actions taken by other air districts for applicability in the district.

MCS-02 – Further Emission Reductions from Greenwaste Processing (Chipping and Grinding Not Associated with Composting) [VOC]: Chipped or ground greenwaste and/or woodwaste have the potential to emit VOCs when being stockpiled or land-applied for various purposes. Chipping and grinding is a process to mechanically reduce the size of greenwaste and woodwaste pieces. SCAQMD rules have established best management practices (BMPs) for greenwaste composting and related operations under Rule 1133.1 – Chipping and Grinding Activities, and Rule 1133.3 – Greenwaste Composting Operations. During rule development, stakeholders raised the need to develop a holistic approach to identifying and accounting for emissions from all greenwaste streams and reducing potential emissions from greenwaste material handling operations at chipping and grinding facilities and other related facilities, not just the ones associated with composting operations. This control measure would seek to establish additional BMPs for handling processed or unprocessed greenwaste material by greenwaste processors, haulers, and operators who inappropriately stockpile material or directly apply the material to land. The implementation of the control measure would be in two phases. [First](#)In Phase 1, the existing database would be reviewed to refine greenwaste material inventory, and second, a rule would potentially be developed to incorporate

technically feasible and cost-effective BMPs or controls. SCAQMD staff will work with counties and cities relative to green material handling practices in light of the aforementioned state diversion requirements and goals in order to determine green material end use and minimize any potential adverse impacts associated with implementing this measure.

In Phase 2, a rule would potentially be developed to incorporate technically feasible and cost-effective BMPs or controls. The SCAQMD will convene its working group involving all stakeholders to develop cost-effective and workable solutions for this source category.

MCS-03 – Improved Start-up, Shutdown and Turnaround Procedures [All Pollutants] (formerly MCS-06 in the 2007 AQMP): This proposed control measure seeks to reduce emissions during equipment startup, shutdown, and turnaround. Opportunities for further reducing emissions from start-up, shut-down and turnaround activities potentially exist at refineries as well as other industries. Examples of possible areas for improvement may include implementing BMPs, promoting better engineering and equipment design, diverting or eliminating process streams that are vented to flares, and installing redundant equipment to increase operational reliability. This measure will be implemented through a two-phase effort to first collect/refine emissions and related data and then, based on the data collected, assess viable controls, if appropriate.

IND-01 - Backstop Measures for Indirect Sources of Emissions from Ports and Port-Related Sources [NO_x, SO_x, PM_{2.5}] (formerly MOB-03 in the 2007 AQMP): This measure would be designed to ensure NO_x, SO_x and PM_{2.5} emissions reductions from port-related sources are sufficient to attain the 24-hour federal PM_{2.5} ambient air quality standard. If emission levels projected to result from the current regulatory requirements and voluntary reduction strategies specified by the Ports are not realized, the 24-hr federal PM_{2.5} ambient air quality standard may not be achieved. This control measure is designed to ensure that the necessary emission reductions from port-related sources projected in the 2012 AQMP milestone years are achieved or if it is later determined through a SIP amendment that additional region-wide reductions are needed due to the change in Basin-wide carrying capacity for PM_{2.5} attainment.

This measure is divided into two phases. The Phase I requirements are triggered if emission levels projected to result from the current regulatory requirements and voluntary reduction strategies that are assumed and relied upon in the 2012 AQMP are not realized. Once triggered, the ports will be required to develop and implement a plan to reduce emissions from their sources to meet the emission targets. Phase II is designed to reduce emissions if it is later determined through a SIP amendment that additional region-wide reductions are needed due to the change in Basin-wide carrying capacity for PM_{2.5} attainment. In this case, the ports will be required to further reduce their emissions on a “fair-share” basis.

INC-01: Economic Incentive Programs to Adopt Zero and Near-Zero Technologies [NO_x]: The primary objective of this measure is to develop a program that promotes and encourages adoption and installation of cleaner, more efficient combustion equipment, such as boilers, water heaters and commercial space heating, through economic incentive programs subject to the availability of public funding. Incentives may include grants for new purchases

of equipment as well as loan programs in areas where long-term cost savings from increased efficiency are achieved.

INC-02: Expedited Permitting and CEQA Preparation Facilitating the Manufacturing of Zero and Near-Zero Technologies [All Pollutants]: This proposed [control](#) measure is aimed at providing incentives for companies to manufacture zero and near-zero emission technologies locally, thus, populating the market, potentially lowering the purchase cost, and increasing demand. With availability and usage of such technologies, air quality benefits would be achieved. This proposed measure focuses on two elements: 1) processing the required air permit(s) in an expedited procedure; and 2) prioritizing the preparation, circulation and certification of any applicable CEQA document where the SCAQMD is the lead agency. A stakeholder process will be initiated to design the program and collaborate with other existing [SCAQMD](#) or local programs.

EDU-01: Further Criteria Pollutant Reductions from Education Outreach and Incentives [All Pollutants] (formerly MCS-02, MCS-03): This proposed control measure would provide educational outreach and incentives for consumers to contribute to clean air efforts. Examples include the usage of energy efficient products, new lighting technology, “super compliant” coatings, tree planting, and the use of lighter colored roofing and paving materials which reduce VOC or NOx by lowering the ambient temperature. In addition, this proposed measure intends to increase the effectiveness of energy conservation programs through public education and awareness as to the environmental effects and benefits from conservation. Finally, educational and incentive tools to be used include social comparison applications (e.g., lifestyle comparisons of personal energy use and efficiency), social media, and public/private partnerships.

2.8.2 Mobile Source Control Measures

This subsection describes SCAQMD staff’s proposed control measures to be included in the 2012 AQMP to reduce mobile source emissions to provide progress in attaining the eight-hour ozone and one-hour ozone ambient air quality standards by 2022-2023. The §182 (e)(5) proposed implementation measures presented in this subsection are based upon a variety of control technologies that are commercially available and/or technologically feasible to implement in the next several years. The focus of these measures includes accelerated retrofits or replacement of legacy fleets of vehicles or equipment, acceleration of vehicle turnover through voluntary vehicle retirement programs, and greater use of cleaner fuels in the near-term. In the longer-term, in order to attain the federal ozone ambient air quality standard, there is a need to increase the penetration and deployment of near-zero and zero-emissions vehicles such as plug-in hybrids, battery-electric, and fuel cell vehicles; accelerate the penetration and use of cleaner fuels (either alternative fuels or new formulations of gasoline and diesel fuels); and obtain additional emission reductions from aircraft engines. As set forth in the descriptions of individual control measures in Table 2-4, some of the measures will likely require action by CARB, while some control measures recognize actions being taken by other agencies.

TABLE 2-4

Mobile Source Control Measures Categorized by Source Type

§182 (e)(5) PROPOSED IMPLEMENTATION 8-HOUR OZONE MEASURES - ON-ROAD MOBILE SOURCES				
CM Number	Title	Adoption	Implementation Period	Reduction (tpd)
ONRD-01	Accelerated Penetration of Partial Zero-Emission and Zero Emission Vehicles [VOC, NO _x , PM]	N/A	Ongoing	TBD ^a

TABLE 2-4 (Concluded)

Mobile Source Control Measures Categorized by Source Type

§182 (e)(5) PROPOSED IMPLEMENTATION 8-HOUR OZONE MEASURES - ON-ROAD MOBILE SOURCES				
ADV-05	§182 (e) Proposed Implementation Measures for the Deployment of Cleaner Ocean-Going Marine Vessels [NOx]	N/A	2012 and on	TBD ^d
ADV-06	§182 (e) Proposed Implementation Measures for the Deployment of Cleaner Off-Road Equipment [NOx]	N/A	2012 and on	TBD ^d
ADV-07	§182 (e) Proposed Implementation Measures for the Deployment of Cleaner Aircraft Engines [NOx]	N/A	2012 and on	TBD ^d

- a) Emission reductions will be determined after projects are identified and implemented
- b) Reductions achieved locally in Mira Loma region
- c) Submitted into the SIP once technically feasible and cost effective options are confirmed
- d) Emission reductions will be quantified after the projects are demonstrated.

2.8.2.1 Summaries of §182 (e)(5) Implementation 8-Hour Ozone Measures – On-Road Mobile Sources

By 2023, it is estimated that about 12 million vehicles will be operating in the Basin. To address emissions from these vehicles, SCAQMD staff is proposing five on-road mobile source control measures. The first two measures focus on on-road light- and medium-duty vehicles operating in the South Coast Air Basin, while the remaining three measures focus on heavy-duty vehicles. Summaries of each of the five on-road mobile source control measures are provided in the following paragraphs.

ONRD-01 – Accelerated Penetration of Partial Zero-Emission and Zero Emission Vehicles [NOx]: This measure proposes to continue incentives for the purchase of zero-emission vehicles and hybrid vehicles with a portion of their operation in an “all electric range” mode. The state Clean Vehicle Rebate Pilot (CVRP) program is proposed to continue from 2015 to 2023 with a proposed funding for up to \$5,000 per vehicle. The proposed measure seeks to provide funding assistance for up to 1,000 zero-emission or partial-zero emission vehicles per year.

ONRD-02 – Accelerated Retirement of Older Light-Duty and Medium-Duty Vehicles [NOx]: This proposed [control](#) measure calls for promoting the permanent retirement of older eligible vehicles through financial incentives currently offered through local funding incentive programs and the AB 118 Enhanced Fleet Modernization Program (EFMP). This [proposed control](#) measure seeks to retire up to 2,000 older light- and medium-duty vehicles (up to 8,500 lbs gross vehicle weight) per year. Funding incentives of up to \$2,500 per vehicle are proposed for the scrapping of the vehicle, which may include a replacement voucher for a newer or new vehicle.

ONRD-03 – Accelerated Penetration of Partial Zero-Emission and Zero Emission Medium Heavy-Duty Vehicles [NOx]: The objective of the proposed action is to accelerate

the introduction of advanced hybrid and zero-emission technologies for Class 4 through 6 heavy-duty vehicles. The state is currently implementing a Hybrid Vehicle Incentives Project (HVIP) program to promote zero-emission and hybrid heavy-duty vehicles. This proposed [control](#) measure seeks to continue the program from 2015 to 2023 to deploy up to 1,000 zero- and partial-zero emission vehicles per year with up to \$25,000 funding assistance per vehicle. Zero-emission vehicles and hybrid vehicles with a portion of their operation in an “all electric range” mode would be given the highest priority.

ONRD-04 – Accelerated Retirement of Older Heavy-Duty Vehicles [NOx]: This proposed [control](#) measure seeks to replace up to 1,000 heavy-duty vehicles per year with newer or new vehicles that at a minimum, meet the 2010 on-road heavy-duty NOx exhaust emissions standard of 0.2 g/bhp-hr. Given that exceedances of the 24-hour PM2.5 air quality standard occur in the Mira Loma region, priority will be placed on replacing older diesel trucks that operate primarily at the warehouse and distribution centers located in the Mira Loma area. Funding assistance of up to \$35,000 per vehicle is proposed and the level of funding will depend upon the NOx emissions certification level of the replacement vehicle. In addition, a provision similar to the Surplus Off-Road Option for NOx (SOON) provision of the statewide In-Use Off-Road Fleet Vehicle Regulation will be sought to ensure that additional NOx emission reduction benefits are achieved.

ONRD-05 – Further Emission Reductions from Heavy-Duty Vehicles Serving Near-Dock Railyards [NOx, PM]: This proposed control measure calls for a requirement that any cargo container moved between the Ports of Los Angeles and Long Beach to the nearby railyards (the Intermodal Container Transfer Facility and the proposed Southern California International Gateway) be with zero-emission technologies. This [control](#) measure would be fully implemented by 2020 through the deployment of zero-emission trucks or any alternative zero-emission container movement system such as a fixed guideway system. This [control](#) measure calls for CARB to either adopt a new regulation or amend an existing regulation to require such deployment by 2020. [In lieu of a regulation or to complement a regulation, other enforceable mechanisms may achieve the objectives of the control measures. The Ports of Los Angeles and Long Beach have successfully implemented the Clean Truck Program as mentioned above. A second phase of such a program could be implemented to bring zero-emission trucks or hybrid trucks with sufficient all electric range to serve the near-dock railyards. In addition, incentives funding programs will encourage the deployment of such zero-emission trucks.](#) To the extent the measure can feasibly be extended beyond near-dock railyards, this would be considered for adoption by CARB.

2.8.2.2 §182 (e)(5) Implementation 8-Hour Ozone Measures – Off-Road Mobile Sources

SCAQMD staff is proposing five control measures that seek further emission reductions from off-road mobile sources and industrial equipment. Off-road mobile sources such as aircraft, locomotives, and marine vessels are principally regulated by federal and state agencies. In addition, several of the off-road mobile source control measures include certain local actions that can result in emission reductions beyond the emissions standard setting authority of the state and EPA. Summaries of each of the five off-road mobile source control measures are provided in the following paragraphs.

OFFRD-01 – Extension of the SOON Provision for Construction/Industrial Equipment [NOx]: This [control](#) measure seeks to continue the Surplus Off-Road Option for NOx (SOON) provision of the statewide In-Use Off-Road Fleet Vehicle Regulation beyond 2014 through the 2023 timeframe. In order to implement the SOON program in this timeframe, funding of up to \$30 million per year would be sought to help fund the repower or replacement of older Tier 0 and Tier 1 equipment, with reductions that are considered surplus to the statewide regulation with Tier 4 or cleaner engines.

OFFRD-02 – Further Emission Reductions from Freight Locomotives [NOx]: ~~This~~ proposed control measure ~~carries forward the freight locomotive control measures from is to meet the commitment in~~ the 2007 SIP. ~~This control measure calls for replacing existing locomotive engines with the accelerated use of~~ Tier 4 locomotives in the South Coast Air Basin. ~~This~~ [control](#) measure calls for CARB to seek further emission reductions from freight locomotives through enforceable mechanisms within its authority to achieve 95 percent or greater introduction of Tier 4 locomotives by 2023.

OFFRD-03 – Further Emission Reductions from Passenger Locomotives [NOx]: This [control](#) measure recognizes the recent actions by the Southern California Regional Rail Authority (SCRRA or Metrolink) to consider replacement of their existing Tier 0 passenger locomotives with Tier 4 locomotives. The SCRRA adopted a plan that contains a schedule to replace their older existing passenger locomotives with Tier 4 locomotives by 2017. More recently, SCRRA released a Request for Quotes on the cost of new or repowered passenger locomotives with locomotive engines that meet Tier 4 emission levels.

OFFRD-04 – Further Emission Reductions from Ocean-Going Marine Vessels While at Berth [NOx]: This [control](#) measure seeks additional emission reductions from ocean-going marine vessels while at berth. The actions would affect ocean-going vessels that are not subject to the statewide Shorepower Regulation or vessel calls that are considered surplus to the statewide regulation. ~~This~~ [control](#) measure seeks at a minimum to have an additional 25 percent of vessel calls beyond the statewide regulation to deploy shorepower technologies or alternative forms of emissions reduction as early as possible. Such actions could be implemented through additional incentives programs or through the San Pedro Bay Ports as part of the implementation of the Ports Clean Air Action Plan.

OFFRD-05 – Emission Reductions from Ocean-Going Marine Vessels [NOx]: This [control](#) measure recognizes the recent actions at the Ports of Los Angeles and Long Beach to initiate an incentives program for cleaner ocean-going vessels to call at the ports. The program has been initiated as part of the San Pedro Bay Ports Clean Air Action Plan. The program will provide financial incentives for cleaner Tier 2 and Tier 3 ocean-going vessels to call at the ports. This [control](#) measure also recognizes the need to monitor progress under such programs and augment them as necessary to ensure sufficient results. The program will be monitored on annual basis and, if necessary, any adjustments to the program will be made.

§182 (e)(5) Implementation to Deploy Advanced Control Technologies

SCAQMD staff is also proposing the following seven additional §182 (e) proposed implementation [control](#) measures to deploy the cleanest control technologies as early as possible and the development, demonstration, and deployment of near-zero and zero-emission

technologies. Many of these actions have already begun. However, additional research and development will be needed that will lead to commercial development of control technologies that achieve emission levels below current adopted emission standards. Other near-zero and zero-emission technologies that are commercially available will require infrastructure development to facilitate their deployment.

ADV-01 – §182 (e)(5) Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission On-Road Heavy-Duty Vehicles [NOx] This [control](#) measure would continue the efforts underway to develop zero-emission and near-zero emission technologies for on-road heavy-duty vehicle applications. Such technologies include, but are not limited to, fuel cell, battery-electric, hybrid-electric with all electric range, and overhead catenary systems. Hybrid-electric systems incorporate an engine powered by conventional fuels or alternative fuels such as natural gas. The actions provided in [this](#) proposed [control](#) measure are based on the SCAG 2012 Regional Transportation Plan.

ADV-02 – §182 (e)(5) Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission Locomotives [NOx] This [control](#) measure calls for the development and deployment of zero-emission and near-zero emission technologies for locomotives. Such technologies include overhead catenary systems, hybrid locomotives that have some portion of their operation in an “all electric range” mode, and alternative forms of external power such as a battery tender car. The actions provided in [this](#) proposed [control](#) measure are based on the SCAG 2012 Regional Transportation Plan. The zero-emission technologies could apply to freight and passenger locomotives.

ADV-03 – §182 (e)(5) Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission Cargo Handling Equipment [NOx] This [control](#) measure recognizes the actions underway to develop and deploy zero- and near-zero emission technologies for various cargo handling equipment. The San Pedro Bay Ports are currently demonstrating battery-electric yard tractors. In addition, battery-electric, fuel cell, and hybridized systems could be deployed on smaller cargo handling equipment. In addition, the use of alternative fuels for conventional combustion engines could potentially result in greater emissions benefits.

ADV-04 – §182 (e)(5) Proposed Implementation Measures for the Deployment of Cleaner Commercial Harborcraft [NOx] Several commercial harbor craft operators have begun deployment of hybrid systems in their harbor craft to further reduce criteria pollutant emissions and improve fuel efficiency. Other cleaner technologies include the use of alternative fuels, retrofit of existing older marine engines with selective catalytic converters, and diesel particulate filters. This [control](#) measure recognizes several efforts between the [SCAQMD District](#) and the Ports of Los Angeles and Long Beach to further demonstrate control technologies that could be deployed on commercial harbor craft that could go beyond the statewide Harbor Craft Regulation.

ADV-05 – §182 (e)(5) Proposed Implementation Measures for the Deployment of Cleaner Ocean-Going Marine Vessels [NOx] The Ports of Los Angeles and Long Beach, CARB, and the [SCAQMD District](#) have sponsored research and demonstration of various control technologies to further reduce emissions from ocean-going vessels. In addition, the

San Pedro Bay Ports Clean Air Action Plan contains a measure to further demonstrate such technologies on ocean-going vessels. This [control](#) measure recognizes many of these efforts and the need to further demonstrate retrofit technologies on existing ocean-going vessels.

ADV-06 – §182 (e)(5) Proposed Implementation Measures for the Deployment of Cleaner Off-Road Equipment [NO_x] The [SCAQMD's District](#), Mobile Source Air Pollution Reduction Review Committee (MSRC), and CARB have been conducting an off-road “showcase” program for retrofit technologies to further reduce emissions from older off-road equipment. In addition, several major off-road engine manufacturers are investigating the potential use of hybrid systems to further reduce criteria pollutant and greenhouse gas emissions. Potential advanced technologies include hybrid systems that utilize batteries, fuel cells, or plug-in capabilities, which could result in lower emissions compared to Tier 4 emission levels when combined with future Tier 4 compliant engines. This [control](#) measure ~~will be is~~ implemented by the [SCAQMD District](#), CARB and U.S. EPA.

ADV-07 – §182 (e)(5) Proposed Implementation Measures for the Deployment of Cleaner Aircraft Engines [NO_x] This [control](#) measure recognizes the efforts of the Federal Aviation Administration’s Continuous Lower Energy, Emissions and Noise (CLEEN) Program. The goal of the CLEEN Program is the development of new aircraft engines that potentially can be up to 60 percent cleaner in NO_x emissions than current aircraft engines. The actions under this [control](#) measure are to continue the development of cleaner aircraft engines and work with the airlines and local airport authorities to develop mechanisms to route the cleanest aircraft to serve the South Coast Air Basin.

2.8.3 Transportation Control Measures from the Southern California Association of Governments 2012 – 2035 Regional Transportation Plan and Sustainable Communities Strategy

The Southern California Association of Governments (SCAG), the Metropolitan Planning Organization (MPO) for Southern California, is mandated to comply with federal and state transportation and air quality regulations. Further, pursuant to California Health and Safety Code (HSC) §40460, SCAG has the responsibility of preparing and approving the portions of the AQMP related to regional demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies. The SCAQMD combines its portion of the AQMP with those portions prepared by SCAG and required by HSC §40460.

The transportation strategy and transportation control measures (TCMs) to be included as part of the 2012 PM_{2.5} AQMP and SIP for the South Coast Air Basin, as defined in the Health and Safety Code, are based on SCAG’s adopted 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and 2011 Federal Transportation Improvement Program (FTIP), which were developed in consultation with federal, state and local transportation and air quality planning agencies and other stakeholders. A list of the TCMs from the 2012-2035 RTP/SCS can be found in [Appendix E of the Final Program EIR and Appendix B](#) of the recirculated NOP/IS.

The 2012 – 2035 Regional Transportation Strategy and Transportation Control Measures portion of the 2012 AQMP/SIP consists of the following three related sections.

- Section I. Linking Regional Transportation Planning to Air Quality Planning: As required by federal and state laws, SCAG is responsible for ensuring that the regional transportation plan, program, and projects are supportive of the goals and objectives of AQMPs/SIPs. SCAG is also required by state law to develop demographic projections and regional transportation strategy and control measures for the AQMPs/SIPs. SCAG prepares the RTP/SCS, which is updated every four years, and the Federal Transportation Improvement Plan biennially.
- Section II. Regional Transportation Strategy and Transportation Control Measures: The 2012-2035 RTP/SCS was formally adopted by the SCAG Regional Council on April 4, 2012. The 2012-2035 RTP/SCS contains a host of improvements to every component of the regional multimodal transportation system including:
 - Active transportation (non-motorized transportation, such as biking and walking)
 - Transportation demand management (TDM)
 - Transportation system management (TSM)
 - Transit
 - Passenger and high-speed rail
 - Goods movement
 - Aviation and airport ground access
 - Highways
 - Arterials
 - Operations and maintenance

Included within these transportation system improvements are projects that reduce vehicle use or change traffic flow or congestion conditions (“TCMs”). TCMs include the following three main categories of transportation improvement projects and programs:

- High occupancy vehicle (HOV) measures,
- Transit and systems management measures, and
- Information-based transportation strategies.
- Section III. Reasonably Available Control Measure Analysis: As required by the CAA, a RACM analysis must be included as part of the overall control strategy in the AQMP/SIP to ensure that all potential control measures are evaluated for implementation and that justification is provided for those measures that are not implemented. Based on this comprehensive review, it is determined that the TCMs being implemented in the South Coast Air Basin are inclusive of all TCM RACM. None of the candidate measures reviewed and determined to be infeasible meets the criteria for RACM implementation.

The 2012-2035 RTP/SCS was formally adopted by the SCAG Regional Council on April 4, 2012. In conjunction with preparing the 2012-2035 RTP/SCS, SCAG also prepared a 2012 Final Program EIR (State Clearinghouse #2011051018) for the 2012-2035 RTP/SCS to evaluate potential impacts from the project at the program level. Potential adverse impacts from implementing the TCMs were also evaluated in the 2012 [AQMP](#) Final Program EIR. The [Final](#) Program EIR for the 2012 AQMP will rely on the environmental analyses in SCAG's 2012 Final Program EIR for the 2012-2035 RTP/SCS for the evaluation of the environmental impacts of implementing the TCMs. Environmental impacts from implementing the TCMs will be addressed in the [Draft-Final](#) Program EIR for the 2012 AQMP under cumulative impacts.

2.8.4 Coordination with the State's Greenhouse Gas Reduction Efforts

The Basin faces several ozone and PM attainment challenges, as strategies for significant emission reductions become harder to identify and the federal standards continue to become more stringent. California's Greenhouse Gas reductions targets under AB32 add new challenges and timelines that affect many of the same sources that emit criteria pollutants. In finding the most cost-effective and efficient path to meet multiple deadlines for multiple air quality and climate objectives, it is essential that an integrated planning approach is developed. Responsibilities for achieving these goals span all levels of government, and coordinated and consistent planning efforts among multiple government agencies are a key component of an integrated approach.

To this end, and concurrent with the development of the 2012 AQMP, the [SCAQMD District](#), [the Air Resources Board](#) [CARB](#), and San Joaquin Valley Air Pollution Control District engaged in a joint effort to take a coordinated and integrated look at strategies needed to meet California's multiple air quality and climate goals, as well as its energy policies. California's success in reducing smog has largely relied on technology and fuel advances, and as health-based air quality standards are tightened, the introduction of cleaner technologies must keep pace. More broadly, a transition to zero- and near-zero emission technologies is necessary to meet 2023 and 2032 air quality standards and 2050 climate goals. Many of the same technologies will address air quality, climate and energy goals. As such, strategies developed for air quality and climate change planning should be coordinated to make the most efficient use of limited resources and the time needed to develop cleaner technologies. The product of this collaborative effort, the draft Vision for Clean Air: A Framework for Air Quality and Climate Planning, examines how those technologies can meet both air quality and climate goals over time. A public review draft of this document is now available at <http://www.aqmd.gov/aqmp/2012aqmp/> and serves as context and a resource for the 2012 AQMP.

2.8.5 Ultrafine Particles

The [Draft](#) 2012 AQMP also includes a discussion of the emerging issues of ultrafine particle and near-roadway exposures. There is growing concern about the potential health effects as caused by exposure for people living near major roadways to criteria pollutants and air toxics emitted from both gasoline and diesel vehicles (HEI, 2010). Recent toxicological and epidemiological studies have identified living near major roadways as a risk factor for

respiratory and cardiovascular problems and other health related issues. These very minute particles (consisting primarily of organic material, soot, and trace elements) have a different chemical composition than the larger PM fractions (PM_{2.5} and PM₁₀). Due to their small size, UFPs can penetrate deeply into the human respiratory tract, into the blood stream, and be transported to other critical organs such as the heart and brain. Furthermore, their large surface area may provide a mechanism for delivering potentially toxic adsorbed material into the lung and other organs.

UFPs are emitted from almost every fuel combustion process, including diesel, gasoline, and jet engines, as well as external combustion processes such as wood burning. Consequently, there is growing concern that people living in close proximity to highly trafficked roadways and other sources of combustion-related pollutants (e.g., airports and rail yards) may be exposed to significant levels of UFPs and other air toxics.

Over the last decade, substantial efforts have been made to better characterize the physical and chemical properties of UFPs and their potential impact on people living in close proximity to roadways and other emissions sources. Two areas of research have received particular attention:

- On-roadways, near-roadways, and in-vehicle measurements
- Effect of UFP reduction technologies

From a regulatory perspective, the U.S. focus has been on reducing the mass of PM emitted in the ambient air. However, UFPs contribute a very small portion of the overall atmospheric particle mass concentration. Thus, there has been growing interest over the last two decades to study, understand, and regulate the size and number of particles found in PM generated from diesel and other combustion engines. Partly because light-duty diesel vehicles are very common in European countries, the European Union has already adopted standards that phase in particle number limits for passenger car and light-duty vehicle emissions. However, there are still concerns related to the health impacts of non-solid organic UFP components that are not addressed by the European solid particle number standard.

Recently, CARB staff prepared a preliminary discussion paper on proposed amendments to California's Low-Emission Vehicle (LEV III) Regulations, to address UFP emissions from light-duty motor vehicles by promoting a solid particle number based PM compliance strategy (CARB, 2010)⁴. CARB staff ultimately decided that the complexity of the issues warranted further study and understanding before proceeding. Although the ~~SCAQMD District~~ has limited authority to regulate mobile source pollution in the near-roadway environment, ~~SCAQMD District~~ staff has implemented a variety of measures to assess and reduce the health impacts of near-roadway emissions on local communities. The ~~SCAQMD District~~ continues to demonstrate and incentivize the deployment of zero/near-zero emission technology, has implemented numerous installations of high-efficiency air filtration in schools, and conducts outreach and education on near-roadway health impacts. Furthermore, on July 1, 2012 the ~~SCAQMD District~~ began the next Multiple Air Toxics Exposure Study (MATES IV) to characterize the carcinogenic risk from exposure to air toxics in the Basin. A new focus of

⁴ http://www.arb.ca.gov/msprog/levprog/leviii/meetings/051810/pm_disc_paper-v6.pdf

MATES IV will be the inclusion of measurements of UFP and BC concentrations across the Basin, and near specific combustion sources (e.g., airports, freeways, rail yards, busy intersections, and warehouse operations) to evaluate the long- and short-term exposures to these pollutants.

Environmental impacts from implementing potential control, mitigation, and policy strategies for limiting exposures to ultrafine particles will be addressed in the [Draft-Final](#) Program EIR for the 2012 AQMP under cumulative impacts.

2.9 PROJECT OBJECTIVES

CEQA Guidelines §15124 (b) requires an EIR to include a statement of objectives, which describes the underlying purpose of the proposed project. The purpose of the statement of objectives is to aid the lead agency in identifying alternatives and the decision-makers in preparing a statement of findings and a statement of overriding considerations, if necessary. The objectives of the proposed 2012 AQMP are summarized in the following points.

1. Reduce PM_{2.5} nonattainment pollutants and their precursors on an expeditious implementation schedule;
2. Demonstrate attainment of the 24-hour PM_{2.5} national ambient air quality standard at the earliest possible date;
3. Reduce population exposure to PM_{2.5} by achieving the 24-hour PM_{2.5} national ambient air quality standard;
4. Continue making expeditious progress towards attaining the federal eight-hour ozone standard and demonstrate attainment of the federal one-hour ozone standard (revoked) by 2022 – 2023;
5. Reduce population exposure to ozone through continued progress towards attaining the federal one-hour (revoked) and eight-hour ozone standards by 2022 – 2023;
6. Reduce nonattainment pollutants at a rate of five percent per year, or include all feasible measures and an expeditious adoption schedule;
7. Update planning assumptions and the best available information such as SCAG's 2012 RTP, CARB's latest EMFAC2011 for the on-road mobile source emissions inventory, and CARB's OFF-ROAD 2011 model;
8. Update emission inventories using 2008 as the base year and incorporate emission reductions achieved from all applicable rules and regulations and the latest demographic forecasts;
9. Update any remaining control measures from the 2007 AQMP and incorporated into the 2012 AQMP as appropriate;
10. Compliance with federal contingency measure requirements;

11. Continue to work closely with businesses and industry groups to identify the most cost-effective and efficient path to meeting clean air goals while being sensitive to their economic concerns.

CHAPTER 3.0

EXISTING SETTING

Existing Setting

3.0 EXISTING SETTING

CEQA Guidelines §15360 (Public Resources Code Section 21060.5) defines “environment” as “the physical conditions that exist within the area which will be affected by a proposed project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance.” According to CEQA Guidelines §15125 (a), a CEQA document must include a description of the physical environment in the vicinity of the project, as it exists at the time the Notice of Preparation (NOP) is published from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. The description of the environmental setting shall be no longer than is necessary to provide an understanding of the significant effects of the proposed project and its alternatives. Since this [CEQA document](#) is a programmatic EIR that covers the SCAQMD’s entire jurisdiction, the existing setting for each category of impact is described on a regional level.

The following subchapters describe the existing environmental setting for those environmental areas identified in the Initial Study (see Appendix A) that could be adversely affected by the proposed project. These areas include the following [topics](#): aesthetics; air quality; energy; hazards [and hazardous materials](#); hydrology and water quality; land use [and planning](#); noise; solid and hazardous waste [management](#); and, transportation and traffic.

SUBCHAPTER 3.1

AESTHETICS

Introduction

Regulatory Setting

Environmental Setting

3.1 AESTHETICS

3.1.1 Introduction

The [2012](#) AQMP control measures could potentially create projects that can affect the visual character quality within the district. Specifically, on-road mobile source control measures that include electrification of trucks using a catenary (overhead-wired) system have the potential to adversely affect scenic resources such as scenic highways. Therefore, an overview of existing aesthetic resources, including scenic highways and coastal zones within the district, is provided in this subchapter.

3.1.2 Regulatory Setting

3.1.2.1 Federal

Aesthetic resources on federal lands are managed by the federal government using various visual resource management programs, depending on the type of federal land and/or the federal agency involved with a given project. Examples of federal visual resource management programs include the Visual Resource Management System utilized by the Federal Bureau of Land Management (BLM) and the Visual Management System utilized by the United States Forest Service (USFS).

3.1.2.2 State

3.1.2.2.1 California Coastal Act

The California Coastal Act of 1976 was enacted to regulate development projects within California's Coastal Zone. The act includes requirements that protect views and aesthetic resources through siting and design control measures, which are typically implemented at the local planning level through local coastal programs (LCPs) or land use plans (LUPs). According to the California Coastal Act:

The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance. Permitted development shall be sited and designed to protect views to and along the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas. New development in highly scenic areas such as those designated in the California Coastline Preservation and Recreation Plan prepared by the Department of Parks and Recreation and by local government shall be subordinate to the character of its setting (California Public Resources Code, California Coastal Act [Chapter 3 (Coastal Resources Planning and Management Policies) Article 6, Section 30251]).

For local jurisdictions that do not have an approved LCP, regulation of development projects within the coastal zone remains under the jurisdiction of the California Coastal Commission (CCC).

3.1.2.2.2 *State Scenic Highway Program*

California's Scenic Highway Program was created by the California Legislature in 1963 to preserve and protect scenic highway corridors from change that would diminish the aesthetic value of land adjacent to those highways. When a city or county nominates an eligible scenic highway for official designation, it must adopt ordinances to preserve the scenic quality of the corridor or document such regulations that already exist in various portions of local codes. These ordinances make up the scenic corridor protection program.

Scenic corridor protection programs include policies intended to preserve the scenic qualities of the highway corridor, including regulation of land use and density of development, detailed land and site planning, control of outdoor advertising (including a ban on billboards), careful attention to and control of earthmoving and landscaping, and careful attention to design and appearance of structures and equipment (California Streets and Highways Code §260 et seq.).

3.1.2.3 Local

3.1.2.3.1 *Counties and Cities*

The geographic area encompassed by the district includes numerous cities and unincorporated communities in the counties of Los Angeles, Orange, San Bernardino, and Riverside. Each of these counties and incorporated cities has prepared a general plan, which is the primary document that establishes local land use policies and goals. Many of these general plans also establish local policies related to aesthetics and the preservation of scenic resources within their communities or subplanning areas, and may include local scenic highway programs.

3.1.2.3.2 *Local Coastal Programs*

The CCC and the local governments along the coast share responsibility for managing the state's coastal resources. Through coordination with the CCC, coastal cities and counties develop LCPs. These programs are the primary means for carrying out the policies of the California Coastal Act at the local level. In general, these policies are intended to promote public access and enhance recreational use of the coast as well as protection of natural resources in the coastal zone. Examples of counties, cities and local jurisdictions within the district that do have an approved LCP or LUP include Los Angeles County and the County of Orange and the cities of Santa Monica, El Segundo, Manhattan Beach, Hermosa Beach, Redondo Beach, Palos Verdes Estates, Rancho Palos Verdes, Long Beach, Avalon, Huntington Beach, Newport Beach, Irvine, Laguna Beach, Laguna Niguel, Dana Point, and San Clemente.

Following approval by the CCC, an LCP is certified and the local governments implement the programs. LCPs include two main components, a Land Use Plan and an Implementation Plan. These components may include policies or regulations that apply to preservation of visual and scenic resources within the coastal zone. Typically, these policies relate to preservation of views of the coast.

3.1.3 Environmental Setting

This environmental setting subchapter describes the aesthetics resources settings that may be adversely affected by the proposed project. Specifically, this environmental setting subchapter describes visual character and quality, visual resources, scenic highways, and coastal zones within the district.

3.1.3.1 Visual Character and Quality

Visual character and quality are defined by the built and natural environment. The *visual character* of a view is descriptive cataloguing of underlying landforms and landcover including the topography, general land use patterns, scale, form, and the presence of natural areas. Urban features, such as structures, roads, utility lines, and other development associated with human activities also help to define visual character. *Visual quality* is an evaluative appraisal of the aesthetics of a view and is established using a well-established approach to visual analysis adopted from the Federal Highway Administration (FHWA) based upon the relative degree of vividness, intactness, and unity found within the visual setting, as defined in the following bullet points (FHWA, 1981).

- Vividness is the visual power or memorability of landscape components as they combine in striking and distinctive patterns.
- Intactness is the visual integrity of the landscape and its freedom from encroaching elements; this factor can be present in well-kept urban and rural landscapes, as well as in natural settings.
- Unity is the degree to which the visual resources of the landscape join together to form a coherent, harmonious visual pattern. Unity refers to the compositional harmony or inter-compatibility between landscape elements.

Each of the three criteria is independent and intended to evaluate one aspect of visual quality; however, no one criterion considered alone equates to visual quality.

The perception of visual quality can vary significantly among viewers depending on their level of visual sensitivity (interest). Sensitive viewers' perceptions can vary seasonally and even hourly as weather, light, shadow, and the elements that compose the viewshed change. Form, line, color, and texture are the basic components used to describe visual character and quality for most visual assessments (FHWA, 1981). Sensitivity depends upon the length of time the viewer has access to a particular view. Typically, residential viewers have extended viewing periods and are often concerned about changes in views from their homes. Visual sensitivity is, therefore, considered to be high for neighborhood residential areas. Visual sensitivity is considered to be less important for commuters and other people driving along surrounding streets. Views from vehicles are generally more fleeting and temporary, yet under certain circumstances are sometimes considered important (e.g., viewers who are driving for pleasure, views/vistas from scenic corridors).

As discussed in the Subchapter 3.1 - Aesthetics, of the Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) Final Environmental

Impact Report (FEIR), various jurisdictions within the SCAG region, which includes the jurisdiction of SCAQMD such as cities, counties, and federal or regional agencies, provide guidelines regarding the preservation and enhancement of visual quality in their plans or regulations¹. An example of such guidance is the Caltrans Scenic Highway Visual Quality Program Intrusion Examples, which are presented in Table 3.1-1. As the table illustrates, a given visual element may be considered desirable or undesirable, depending on design, location, use, and other considerations. Because of the size and diversity of the area within the SCAQMD's jurisdiction, it is not possible to apply uniform standards to all areas within the district.

TABLE 3.1-1

Caltrans Scenic Highway Program – Examples of Visual Quality Intrusions

Minor Intrusion	Moderate Intrusion	Major Intrusion
Buildings: Residential, Commercial, and Industrial Developments		
Widely dispersed buildings. Natural landscape dominates. Wide setbacks and buildings screened from roadway. Forms, exterior colors and materials are compatible with landscape. Buildings have cultural or historical significance.	Increased numbers of buildings, not well integrated into the landscape. Smaller setbacks and lack of roadway screening. Buildings do not dominate the landscape or obstruct scenic view.	Dense and continuous development. Highly reflective surfaces. Buildings poorly maintained. Visible blight. Development along ridgelines. Buildings dominate the landscape or obstruct scenic view.
Unsightly Land Uses: Dumps, Quarries, Concrete Plants, Tank Farms, Auto Dismantling		
Screened from view so that most of facility is not visible from the highway.	Not screened and visible but programmed/funded for removal and site restoration. Land use is visible but does not dominate the landscape or obstruct scenic view.	Not screened and visible by motorists. Will not be removed or modified. Land use dominates the landscape or obstructs scenic view.
Commercial Retail Development		
N/A	Neat and well landscaped. Single story. Generally blends with surroundings. Development is visible but does not dominate the landscape or obstruct scenic view.	Not harmonious with surroundings. Poorly maintained or vacant. Blighted. Development dominates the landscape or obstructs scenic view.

¹ California cities and counties are not required to include visual quality elements in their General Plans although many do. However, the General Plans are required to include a Conservation Element, which includes resources such as waterways and forests that frequently are also scenic resources.

TABLE 3.1-1 (Continued)

Caltrans Scenic Highway Program – Examples of Visual Quality Intrusions

Minor Intrusion	Moderate Intrusion	Major Intrusion
Parking Lots		
Screened from view so that most of the vehicles and pavement are not visible from the highway.	Neat and well landscaped. Generally blends with surroundings. Pavement and/or vehicles visible but do not dominate the landscape or degrade scenic view.	Not screened or landscaped. Pavement and/or vehicles dominate the landscape or degrade scenic view.
Off-Site Advertising Structures		
N/A	N/A	Billboards degrade or obstruct scenic view.
Noise Barriers		
N/A	Noise barriers are well landscaped and complement the natural landscape. Noise barriers do not degrade or obstruct scenic view.	Noise barriers degrade or obstruct scenic view.
Power Lines and Communication Facilities		
Not easily visible from road.	Visible, but do not dominate scenic view.	Towers, poles or lines dominate view. Scenic view is degraded.
Agriculture: Structures, Equipment, Crops		
Generally blends in with scenic view. Is indicative of regional culture.	Not compatible with the natural landscape. Scale and appearance of structures and equipment visually competes with natural landscape.	Scale and appearance of structures and equipment are incompatible with and dominates natural landscape. Structures, equipment or crops degrade or obstruct scenic view.
Exotic Vegetation		
Used as screening and landscaping. Generally is compatible with scenic view.	Competes with native vegetation for visual dominance.	Incompatible with and dominates natural landscape. Scenic view is degraded.
Clearcutting		
N/A	Clearcutting or deforestation is evident, but is in the distant background.	Clearcutting or deforestation is evident. Scenic view is degraded.
Erosion		
Minor soil erosion (i.e., rill erosion).	Rill erosion starting to form gullies.	Large slip outs and/or gullies with little or no vegetation. Scenic view is degraded.

TABLE 3.1-1 (Concluded)

Caltrans Scenic Highway Program – Examples of Visual Quality Intrusions

Minor Intrusion	Moderate Intrusion	Major Intrusion
Grading		
Grading generally blends with adjacent landforms and topography.	Some changes, less engineered appearance and restoration are taking place.	Extensive cut and fill. Unnatural appearance, scarred hillsides or steep slopes with little or no vegetation. Canyons filled in. Scenic view is degraded.
Road Design		
Blends in and complements scenic view. Roadway structures are suitable for location and compatible with landscape.	Large cut and fill slopes are visible. Scale and appearance of roadway, structures, and appurtenances are incompatible with landscape.	N/A

Source: Caltrans, 2008

The *viewshed* can be defined as all of the surface area visible from a particular location or sequence of locations, and is described in terms of the dominance of landforms, landcover, and manmade development constituting visual character. Views of high visual quality in urban settings generally have several of the following additional characteristics:

- Harmony in scale with the surroundings;
- Context sensitive architectural design; and,
- Impressive landscape design features.

Areas of medium visual quality have interesting forms but lack unique architectural design elements or landscape features. Areas of low visual quality have uninteresting features and/or undistinguished architectural design and /or other common elements.

3.1.3.2 Visual Resources

Visual resources include historic buildings that uniquely identify a setting, views identified as significant in local plans, and/or views from scenic highways. The importance of a view to viewers is related to the position of the viewers relative to the resource and the distinctiveness of a particular view. The visibility and visual dominance of landscape elements are usually described with respect to their placement in the viewshed.

Visual resources occur in a diverse array of environments within the boundaries of the district, ranging in character from urban centers to rural agricultural land, natural woodlands, and coastal views. The extraordinary range of visual features in the region is afforded by the mixture of climate, topography, flora, and fauna found in the natural environment, and the diversity of style, composition, and distribution of the built environment. Views of the coast from locations in Los Angeles and Orange counties are considered valuable visual resources, while views of various mountain ranges are prevalent throughout the district. Other natural

features that may be visually significant in the district include rivers, streams, creeks, lakes, and reservoirs.

The County of Los Angeles General Plan identifies regional open space and recognized scenic areas, generally including the Santa Monica Mountains, as well as the San Gabriel Mountains, Verdugo Hills, Santa Susana Mountains, Simi Hills, Santa Monica Mountains, and Puente Hills. In addition, ridgelines and hillsides are generally considered to be scenic resources, with specific measures for the protection of these areas (LA County, 2010).

The County of Orange General Plan identifies the Santa Ana Mountains along with their distinctive twin peaks known as “Saddleback” as the county’s signature landmark. The Plan designates 10 scenic “viewscape corridors,” which include among others Pacific Coast Highway, Oso Parkway, Ortega Highway, Jamboree Road, Santiago Canyon Road, and Laguna Canyon Road. These designated viewscape corridors provide scenic views of the Santa Ana Mountains, Lomas de Santiago and the San Joaquin Hills, as well as numerous canyons and valleys including the Santa Ana Canyon, Capistrano Valley, Laguna, Aliso, Wood, Moro, San Juan, Trabuco Santiago, Modjeska, Silverado, Limestone, and Black Star Canyons. Finally, the General Plan identifies nearly 42 miles of coastline and approximately 33 miles of sandy beaches as defining scenic resources (Orange County, 2011).

The County of Riverside General Plan identifies regional scenic resources, including Santa Ana River basin, Lake Mathews, Lake Perris, Lake Elsinore, Lake Skinner, Vail Lake, the San Jacinto River, Murrieta Creek, the Santa Margarita River, the vineyard/citrus region near Temecula, the Diamond Valley Reservoir, Joshua Tree National Park, Whitewater River, the Santa Rosa Mountains, and a portion of the Salton Sea (Riverside County, [2011/2009](#)).

The County of San Bernardino General Plan identifies several scenic areas, including the San Gabriel Mountains, the San Bernardino Mountains, La Loma Hills, Jurupa Hills, Chino Hills, Yucaipa Hills, Holcomb Valley, and the Mojave Desert. In addition, Big Bear Lake, Silverwood Lake, Lake Arrowhead, and Lake Gregory, along with associated waterways, serve as defining characteristics of the mountain regions within the County. San Bernardino County has a wide variety of scenic and wilderness areas respectively categorized as the Mountain, Valley, and Desert regions. Each region has its own defined measures for protecting the specific resources contained in this region. The County of San Bernardino also considers desert night-sky views to be scenic resources and has enacted measures to reflect this (San Bernardino County, [2007/2012](#)).

In addition to County plans, many of the cities within the district have general plan policies, and in some cases, ordinances, related to the protection of visual resources. In addition to the visual resources related to natural areas, many features of the built environment that may also have visual significance include individual or groups of structures that are distinctive due to their aesthetic, historical, social, or cultural significance or characteristics, such as architecturally appealing buildings or groups of buildings, landscaped freeways, bridges or overpasses, and historic resources.

3.1.3.3 Scenic Highways

Within the district, there are numerous officially designated state and county scenic highways and one historic parkway, as listed in Table 3.1-2.

There are also a number of roadways that have been determined eligible for state scenic highway designation, as listed in Table 3.1-3.

TABLE 3.1-2

Scenic Highways Within District Borders

Route	County	Location	Description	Miles	Designation
2	Los Angeles	From near La Cañada Flintridge north to the San Bernardino County line.	This U.S. Forest Service Scenic Byway and State Scenic Highway winds along the spine of the San Gabriel Mountains. It provides views of the mountain peaks, the Mojave Desert, and the Los Angeles Basin.	55	ODSSH ^(a)
38	San Bernardino	From east of South Fork Campground to State Lane.	This U.S. Forest Service Scenic Byway and State Scenic Highway crosses the San Bernardino Mountains at Onyx Summit. It features forested mountainsides with far-off desert vistas near the summit.	16	ODSSH
62	Riverside	From I-10 north to the San Bernardino County line.	This highway features high desert country scenery and leads to or from Joshua Tree National Monument. Large “windmill farms,” where wind power is used to generate electricity, can be seen along the way.	9	ODSSH
74	Riverside	From west boundary of the San Bernardino National Forest to SR-111 in Palm Desert.	This road goes from the southern Mojave Desert to oak and pine forests of San Bernardino National Forest. It offers views of the San Jacinto Valley and peaks of the San Jacinto Mountains.	48	ODSSH
91	Orange	From SR-55 to east of Anaheim city limit.	This freeway runs along the banks of the Santa Ana River. Views include residential and commercial development with intermittent riparian and chaparral vegetation.	4	ODSSH

TABLE 3.1-2 (Continued)

Scenic Highways Within District Borders

Route	County	Location	Description	Miles	Designation
243	Riverside	From SR-74 to the Banning city limit.	This U.S. Forest Service Scenic Byway and State Scenic Highway traverses forested mountain scenery along a ridge of the San Bernardino Mountains. It then drops in a series of switchbacks offering views of the San Bernardino Valley and the desert scenery.	28	ODSSH
N/A	Los Angeles	Mulholland Highway from SR- 1 to Kanan Dume Road and from west of Cornell Road to east of Las Virgenes Road.	With the dramatic canyons, oak woodlands, open spaces and ocean views of the Santa Monica Mountains, Mulholland Highway offers travelers views of the mountains, the Pacific Ocean, and historic sites along its stretch.	19	ODCSH ^(b)
N/A	Los Angeles	Malibu Canyon- Las Virgenes Highway from State Route 1 to Lost Hills Road.	The rugged terrain and ancient rock formations along this route have been a backdrop of many early California settlers. The formations have known presence dating to the original De Anza expedition of Spanish colonists.	7.4	ODCSH

3.1.3.4 Coastal Zones

According to the California Coastal Act of 1976, a coastal zone is the land and water area of the State of California from the Oregon border to the border of Mexico, extending seaward to the state's outer limit of jurisdiction, including all offshore islands, and extending inland generally 1,000 yards from the mean high tide line of the sea. In significant coastal estuarine, habitat, and recreational areas, the coastal zone extends inland to the first major ridgeline paralleling the sea or five miles from the mean high tide line of the sea, whichever is less, and in developed urban areas the coastal zone generally extends inland less than 1,000 yards.

The coastal zone within the district generally extends from Leo Carrillo State Park in Malibu in the northwestern corner of Los Angeles County to San Clemente Beach in San Clemente near the southern tip of Orange County.

Local Coastal Plans (LCPs) typically contain policies on visual access and site development review. LCPs are basic planning tools used by local governments to guide development in the coastal zone, in partnership with the California Coastal Commission. LCPs contain the ground rules for future development and protection of coastal resources in the 75 coastal cities and counties. The LCPs specify appropriate location, type, and scale of new or changed uses of land and water. Each LCP includes a land use plan and measures to implement the plan (such as zoning ordinances). Prepared by local government, these programs govern decisions that determine the short- and long-term conservation and use of coastal resources. While each LCP reflects unique characteristics of individual local coastal communities, regional and statewide interests and concerns must also be addressed in conformity with Coastal Act goals and policies.

SUBCHAPTER 3.2

AIR QUALITY

Criteria Air Pollutants

Non-Criteria Air Pollutants

3.2 AIR QUALITY

3.2.1 Criteria Air Pollutants

The purpose of the 2012 AQMP is designed to address the federal eight-hour and one-hour (revoked) ozone and PM_{2.5} air quality standards, to satisfy the planning requirements of the federal Clean Air Act (CAA), and to develop transportation emission budgets using the latest approved motor vehicle emissions model and planning assumptions. This chapter summarizes emissions that occurred in the Basin during the 2008 base year, and projected emissions in the years 2014, 2019, 2023, and 2030. More detailed emission data analyses are presented in Appendix III of the [Draft-2012 AQMP](#). The 2008 base year emissions inventory reflects adopted air regulations with current compliance dates as of 2008; whereas future baseline emissions inventories are based on adopted air regulations with both current and future compliance dates. A list of the SCAQMD's and CARB's rules and regulations that are part of the base year and future-year baseline emissions inventories is presented in Appendix III of the [Draft-2012 AQMP](#). The SCAQMD is committed to implement the SCAQMD rules that are incorporated in the [Draft-2012 AQMP](#) future baseline emissions inventories.

The emissions inventory is divided into four major classifications: point, area, on-road, and off-road sources. The 2008 base year point source emissions are based principally on reported data from facilities using the SCAQMD's Annual Emissions Reporting Program. The area source emissions are estimated jointly by CARB and the SCAQMD. The on-road emissions are calculated by applying CARB's EMFAC2011 emission factors to the transportation activity data provided by Southern California Association of Governments (SCAG) from their adopted 2012 Regional Transportation Plan (2012 RTP). CARB's 2011 In-Use Off-Road Fleet Inventory Model is used for the construction, mining, gardening and agricultural equipment. CARB also provides other off-road emissions, such as ocean-going vessels, commercial harbor craft, locomotives and cargo handling equipment. Aircraft emissions are based on an updated analysis by the SCAQMD. The future emission forecasts are primarily based on demographic and economic growth projections provided by SCAG. In addition, emission reductions resulting from SCAQMD regulations adopted by June, 2012 and CARB regulations adopted by August 2011 are included in the baseline.

This chapter summarizes the major components of developing the base year and future baseline inventories. More detailed information, such as CARB's and the SCAQMD's emission reductions resulting from adopted rules and regulations since the 2007 AQMP, growth factors, and demographic trends, are presented in Appendix III of the [Draft-2012 AQMP](#). In addition, the top ten source categories contributing to the 2008, 2014, and 2023 emission inventories are identified in this chapter. Understanding information about the highest emitting source categories leads to the identification of potentially more effective and/or cost effective control strategies for improving air quality.

3.2.1.1 Current Emission Inventories

Two inventories are prepared for the [Draft-2012 AQMP](#) for the purpose of regulatory and SIP performance tracking and transportation conformity: an annual average inventory, and a

summer planning inventory. Baseline emissions data presented in this chapter are based on average annual day emissions (e.g., total annual emissions divided by 365 days) and seasonally adjusted summer planning inventory emissions. The ~~Draft~~ 2012 AQMP uses annual average day emissions to estimate the cost-effectiveness of control measures, to rank control measure implementation, and to perform PM_{2.5} modeling and analysis. The summer planning inventory emissions are developed to capture the emission levels during a poor ozone air quality season, and are used to report emission reduction progress as required by the federal and California CAAs.

Detailed information regarding the emissions inventory development for the base year and future years, the emissions by major source category of the base year, and future baseline emission inventories are presented in Appendix III of the ~~Draft~~ 2012 AQMP. Attachments A and B to Appendix III list the annual average and summer planning emissions by major source category for 2008, 2014, 2017, 2019, 2023 and 2030, respectively. Attachment C to Appendix III of the ~~Draft~~ 2012 AQMP has the top VOC and NO_x point sources which emitted greater than or equal to ten tons per year in 2008. Attachment D to the Appendix III of the ~~Draft~~ 2012 AQMP contains the on-road emissions by vehicle class and by pollutant for 2008, 2014, 2019, 2023 and 2030. Attachment E to Appendix III of the ~~Draft~~ 2012 AQMP shows emissions associated with the combustion of diesel fuel for various source categories.

3.2.1.1.1 *Stationary Sources*

Stationary sources can be divided into two major subcategories: point and area sources. Point sources are large emitters with one or more emission sources at a permitted facility with an identified location (e.g., power plants, refineries). These facilities have annual emissions of four tons or more of either VOC, NO_x, SO_x, PM, or annual emissions of over 100 tons of CO or toxic air contaminants (TACs). Facility owners/operators are required to report their criteria pollutant emissions and selected TACs to the SCAQMD on an annual basis, if any of these thresholds are exceeded.

Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products, as well as, permitted sources smaller than the above thresholds), which are distributed across the region. There are about 400 area source categories for which emissions are jointly developed by CARB and the SCAQMD. The emissions from these sources are estimated using activity information and emission factors. Activity data are usually obtained from survey data or scientific reports (e.g., Energy Information Administration (EIA) reports for fuel consumption other than natural gas fuel, Southern California Gas Company for natural gas consumption, paint suppliers, and SCAQMD databases). The emission factors are based on rule compliance factors, source tests, Material Safety Data Sheets (MSDS), default factors (mostly from AP-42, U.S. EPA's published emission factor compilation), or weighted emission factors derived from the point sources in annual emissions reports. Socioeconomic data may also be used to estimate emissions over specific areas.

Appendix III of the ~~Draft~~ 2012 AQMP has more detail regarding emissions from specific source categories such as fuel combustion sources, landfills, composting waste, metal-

coating operations, architectural coatings, and livestock waste. Since the 2007 AQMP was finalized, new area source categories, such as liquefied petroleum gas (LPG) transmission losses, storage tank and pipeline cleaning and degassing, and architectural colorants were characterized and included in the emission inventories. These updates and new additions are listed below:

- Fuel combustion sources: The emissions inventories from commercial and industrial internal combustion engines were updated to include the portable equipment emissions.
- Landfills: The emission inventories for this area source category was revised to incorporate CARB's landfills greenhouse gas (GHG) emissions.
- Composting waste operations: The emission inventories for this area source category were revised to include the emissions from green waste composting covered under SCAQMD Rule 1133.3. The 2007 AQMP only included the emissions from co-composting, as it relates to SCAQMD Rule 1133.2.
- Metal coating operations: The area source emissions inventory in the 2007 AQMP only included the emissions from small permitted facilities with VOC emissions below four tons per year. As such, emissions from these sources have been underreported in the 2007 AQMP. During the rule development process amending Rule 1107, SCAQMD staff discovered numerous small shops using coating materials with compliant high-solid content, which were subsequently thinned beyond the allowable limits allowed by Rule 1107. The ~~Draft~~ 2012 AQMP revised emission inventory adjusts the 2007 AQMP emission inventory to account for excess emissions from these coating activities.
- Architectural coating category: Three new area source categories were added to the emissions inventory under this category to track the emissions from colorants.
- LPG transmission losses: This newly added area source category was developed to quantify the emissions from LPG storage and fueling losses.
- Livestock waste sources: This emission inventory category was updated to reflect the difference in types of dairy cattle milking cows, dry cows, calves, and heifers as each type of cattle has specific VOC and NH₃ emission factors based on the quantity of manure production.
- Storage tanks and pipeline cleaning: This new area source emissions category was added to quantify the emissions from these types of operations.

3.2.1.1.2 *Mobile Sources*

Mobile sources consist of two subcategories: on-road and off-road sources. On-road sources are from vehicles that are licensed to drive on public roads. Off-road sources are typically registered with the state and cannot be typically driven on public roads. On-road vehicle emissions are calculated by applying CARB's EMFAC2011 emissions factors to the transportation activity data provided by SCAG in their adopted 2012 RTP. Spatial distribution data from Caltrans' Direct Travel Impact Model (DTIM4) are used to generate gridded emissions for regional air quality modeling. Off-road emissions are calculated using CARB's 2011 In-Use Off-Road Emissions Inventory model for construction, mining, gardening, and agricultural equipment. Ship, locomotive, and aircraft emissions are excluded from CARB's In-Use Off-Road Emissions Inventory model. The emissions for 2008 and future years were revised separately based on the most recently available data.

3.2.1.1.3 *On-Road*

CARB's EMFAC2011 has been updated to reflect more recent vehicle population, activity, and emissions data. Light-duty motor vehicle fleet age, vehicle type, and vehicle population are updated based on 2009 California Department of Motor Vehicles data. The model also reflects recently adopted rules and benefits that were not reflected in EMFAC2007. The rules and benefits include on-road diesel fleet rules, the Pavley Clean Car Standards, and the Low Carbon Fuel standard. The most important improvement in the model is the integration of new data and methods to estimate emissions from diesel trucks and buses. CARB's Truck and Bus Regulation for the on-road heavy-duty in-use diesel vehicles applies to nearly all privately owned diesel fueled trucks and privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. EMFAC2011 includes the emissions benefits of the Truck and Bus Rule and previously adopted rules for other on-road diesel equipment. The impacts of the recent recession on emissions, quantified as part of the truck and bus rulemaking, are also included.

EMFAC2011 uses a modular emissions modeling approach that departs from past EMFAC versions. The first module, named EMFAC-LDV, is used as the basis for estimating emissions from gasoline powered on-road vehicles, diesel vehicles below 14,000 pounds GVWR, and urban transit buses. The second module, called EMFAC-HD, is the basis for emissions estimates for diesel trucks and buses with a GVWR greater than 14,000 pounds operating in California. This module is based on the Statewide Truck and Bus Rule emissions inventory that was developed between 2007 and 2010 and approved by ~~the~~ CARB Board in December 2010. The third module is called EMFAC2011SG. It takes the output from EMFAC-LDV and EMFAC-HD and applies scaling factors to estimate emissions consistent with user-defined vehicle miles of travel and vehicle speeds. Together the three modules comprise EMFAC2011.

Several external adjustments were made to EMFAC2011 in the ~~Draft~~ 2012 AQMP to reflect CARB's rules and regulations, which were adopted after the development of EMFAC2011. The adjustments include the advanced clean cars regulations, reformulated gasoline, and smog check improvement.

Figure 3.2-1 compares the on-road emissions between EMFAC2007 V2.3 used in the 2007 AQMP and EMFAC2011 used in the ~~Draft~~ 2012 AQMP, respectively. It should be noted that the comparison for 2008 reflects changes in methodology; whereas, the comparison for 2023 includes adopted rules and updated growth projections since the release of EMFAC2007. In general, the emissions are lower in EMFAC2011 as compared to EMFAC2007. The lower emissions can be attributed to additional rules and regulations, which result in reduced emissions, revisions to growth projections, and the economic impacts of the recent recession.

3.2.1.1.4 *Off-Road*

Emissions from off-road vehicle categories (construction & mining equipment, lawn & gardening equipment, ground support equipment, agricultural equipment) in CARB's In-Use Off-Road Emissions Inventory Model were developed primarily based on estimated activity levels and emission factors. Ships, commercial harbor craft, locomotives, aircraft, and cargo handling equipment emissions are not included in CARB's In-Use Off-Road Emissions Inventory Model. Separate models or estimations were used for these emissions sources. The off-road source population, activities, and emission factors were re-evaluated and re-estimated since the 2007 AQMP. Consequently, the emissions are modified accordingly.

The major updates and/or improvements to the off-road inventory include:

1. The equipment population in CARB's In-Use Off-Road Emissions Inventory model was updated by using the equipment population reported to CARB for rule compliance. Based on information from CARB, the total population in 2009 was 26 percent lower than had been anticipated in 2007 due to fleet downsizing during the recent recession.
2. The equipment hours of use in CARB's In-Use Off-Road Emissions Inventory model were updated with reported activity data for the period between 2007 and 2009. According to CARB staff, the new data indicates a 30 percent or greater reduction in most cases in 2009 activity data when compared to 2007 activity data due to the recession.
3. The equipment load factor in CARB's In-Use Off-Road Emissions Inventory model was updated using a 2009 academic study and information from engine manufacturers. According to CARB, the new data suggests that the load factors should be reduced by about 33 percent.
4. According to CARB staff, construction activity and emissions have dropped by more than 50 percent between 2005 and 2011. Emissions beyond 2011 are uncertain and depend on the pace of economic recovery. The future growth in CARB's In-Use Off-Road Emissions Inventory model was projected based on the average of the future forecast scenarios. CARB's data suggest off-road activity and emissions will recover slowly from the recessionary lows.
5. Locomotive inventories reflect the 2008 U.S. EPA Locomotive regulations and adjustments due to economic activity.

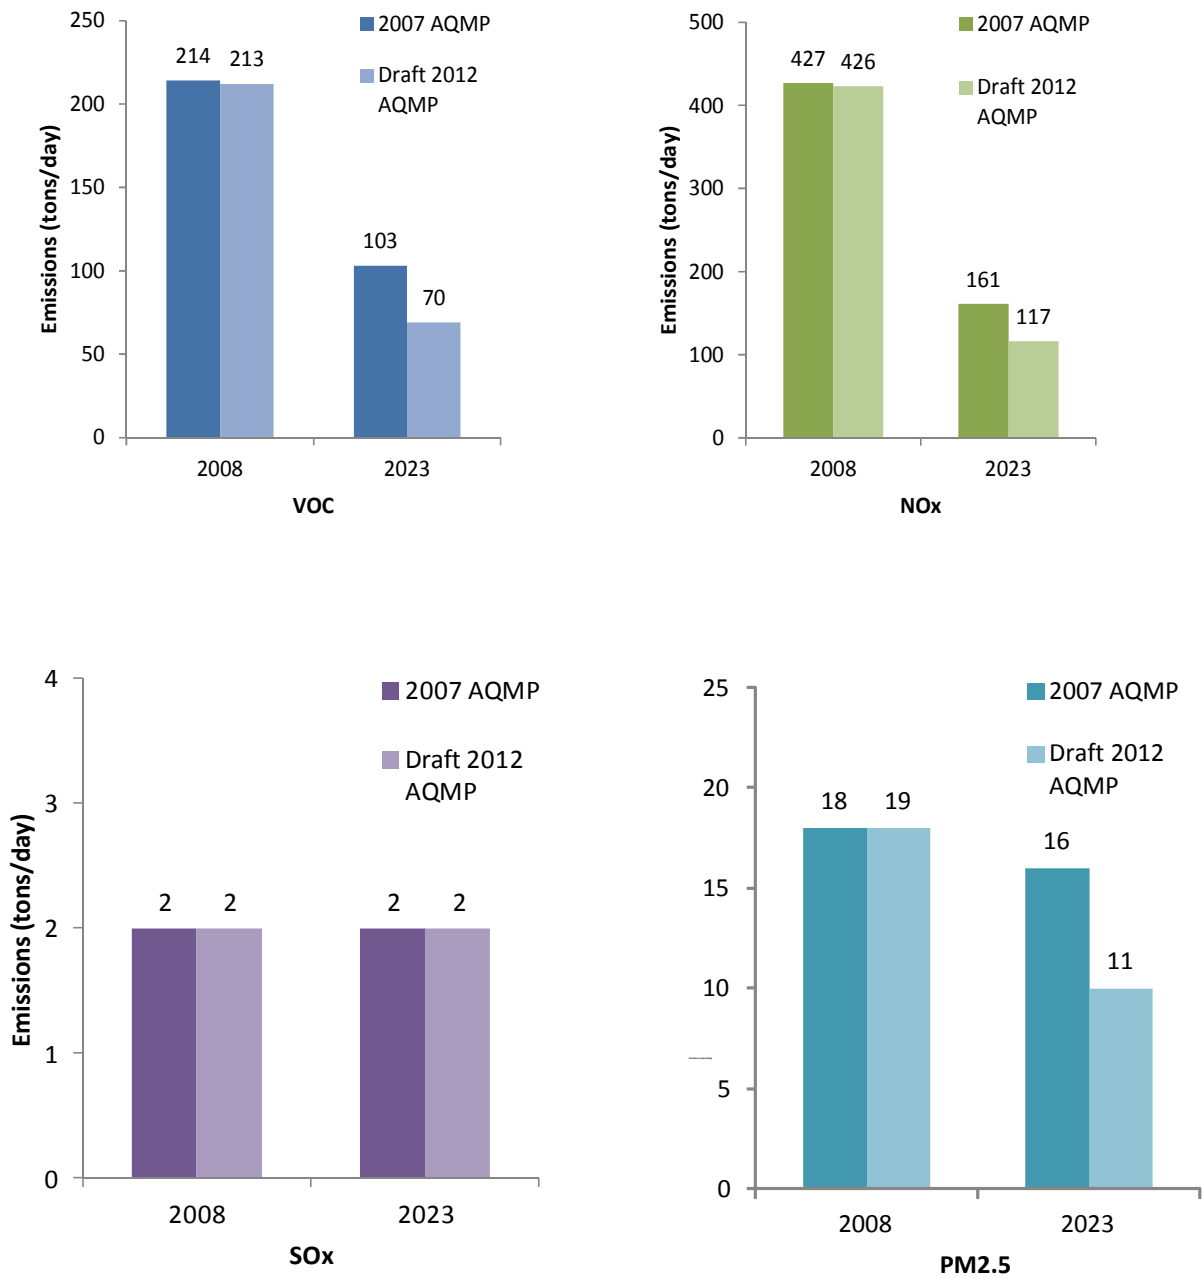

FIGURE 3.2-1

Comparison of On-Road Emissions Between EMFAC2007 V2.3 (2007 AQMP) and EMFAC2011 (Draft 2012 AQMP) (VOC & NO_x – Summer Planning; SO_x & PM_{2.5} – Annual Average Inventory)

6. Cargo handling equipment was updated with population, activity, engine load, and recessionary impacts on growth. The updates are based on new information collected since 2005. The new information includes CARB's regulatory reporting data, which includes all the cargo handling equipment in the state including their model year, horsepower and activity. In addition, the Ports of Los Angeles and Long Beach have developed annual emissions inventories, and a number of the major rail yards and other ports in the state have completed individual emission inventories.
7. Ocean-going vessel emissions in the ~~Draft~~ 2012 AQMP included CARB's fuel regulation for ocean-going vessels and the 2007 shore power regulation. The improvements and corrections include recoding the model for speed, updating auxiliary engine information, updating ship routing, revising vessel speed reduction compliance rates, and an adjustment factor to estimate the effects of the recession. In March 2010, the International Maritime Organization (IMO) officially designated the waters within 200 miles of the North American Coast as an Emissions Control Area (ECA). Beginning August 2012, IMO requires ships that travel these waters use fuel with a sulfur content of less than or equal to 1.0 percent, and in 2015 the sulfur limit will be further reduced to 0.1 percent. Additionally, vessels built after January 1, 2016, will be required to meet the most stringent IMO Tier 3 NOx emission levels, while transiting within the 200 mile ECA zone. Outer Continental Shelf (OCS) emissions (e.g., emissions from vessels beyond the three-mile state waters line) are included in the ships emissions as well.
8. Another improvement was the development of a separate emission category for commercial harbor craft using a new commercial harbor craft database. CARB approved a regulation to significantly reduce diesel PM and NOx emissions from diesel-fueled engines on commercial harbor craft vessels. These vessels emit an estimated three tons per day of diesel PM and 70 tons per day of NOx statewide in 2007. The harbor craft database includes emissions from crew and supply, excursion, fishing, pilot, tow boats, barge, and dredge vessels.
9. The aircraft emissions inventory was updated for the 2008 base year and the 2035 forecast year based on the latest available activity data and calculation methodologies. A total of 43 airports were identified as having aircraft operations within the SCAQMD boundaries including commercial air carrier, air taxi, general aviation, and military aircraft operations. The sources of activity data include airport operators (for several commercial and military airports), FAA's databases (e.g., Bureau of Transportation Statistics, Air Traffic Activity Data System, and Terminal Area Forecast), and SCAG. For commercial air carrier operations, SCAG's 2035 forecast, which is consistent with the forecast adopted for the 2012 RTP, reflects the future aircraft fleet mix. The emissions calculation methodology was primarily based on the application of FAA's Emissions and Dispersion Modeling System (EDMS) model for airports with detailed activity data for commercial air carrier operations (by aircraft make and model). For other airports and aircraft types (e.g., general aviation, air taxi, military), the total number of landing and takeoff activity data was used in conjunction with the U.S. EPA's average emission factors for major aircraft types (e.g., general aviation, air taxi,

military). For the intermediate milestone years, the emissions inventories were linearly interpolated between 2008 and 2035.

Several external adjustments to the off-road emissions were made to reflect CARB's rules and regulations and new estimates of activity. The adjustments include locomotives, large spark ignition engines and non-agricultural internal combustion engines. Figure 3.2-2 shows a comparison between the off-road baseline emissions in the 2007 AQMP and the ~~Draft~~ 2012 AQMP. In general, the emissions are lower in the 2011 In-Use Off-Road Emissions Inventory model, except for 2008 SOx emissions. The projected 2008 off-road NOx emissions in the 2007 AQMP were 339 tons per day, while the 2008 base year off-road NOx emissions in the ~~Draft~~-2012 AQMP are 209 tons per day. The 2011 In-Use Off-Road Emissions Inventory generated lower emissions because of rules and regulations adopted since 2007 OFFROAD model, updated data, future growth corrections and recessionary impacts to commercial and industrial mobile equipment. The higher 2008 estimated SOx emissions reflect a temporary stay in the implementation of the lower sulfur content marine fuel regulation that occurred during a portion of 2008.

3.2.1.1.5 *Uncertainty in the Inventory*

An effective AQMP relies on a complete and accurate emission inventory. Over the years, significant improvements have been made in emission estimates for sources affected by control measures. Increased use of continuous monitoring and source tests has contributed to the improvement in point source inventories. Technical assistance to facilities and auditing of reported emissions by SCAQMD staff have also improved the accuracy of the emissions inventory. Area source inventories that rely on average emission factors and regional activities have inherent uncertainty. Industry-specific surveys and source-specific studies during rule development have provided much needed refinement to the emissions estimates.

Mobile source inventories remain the greatest challenge due to new information continuously collected from the large number and types of equipment and engines. Every AQMP revision provides an opportunity to further improve the current knowledge of mobile source inventories. The ~~Draft~~-2012 AQMP is not an exception. As described earlier, many improvements were included in EMFAC2011, and such work is ongoing. However, it should be acknowledged that there are still areas that could be significantly improved if better data were available. Technological changes and advancement in the area of electric, hybrid, flexible fuel, fuel cell vehicles coupled with changes in future gasoline prices all add uncertainty to the on-road emissions inventory.

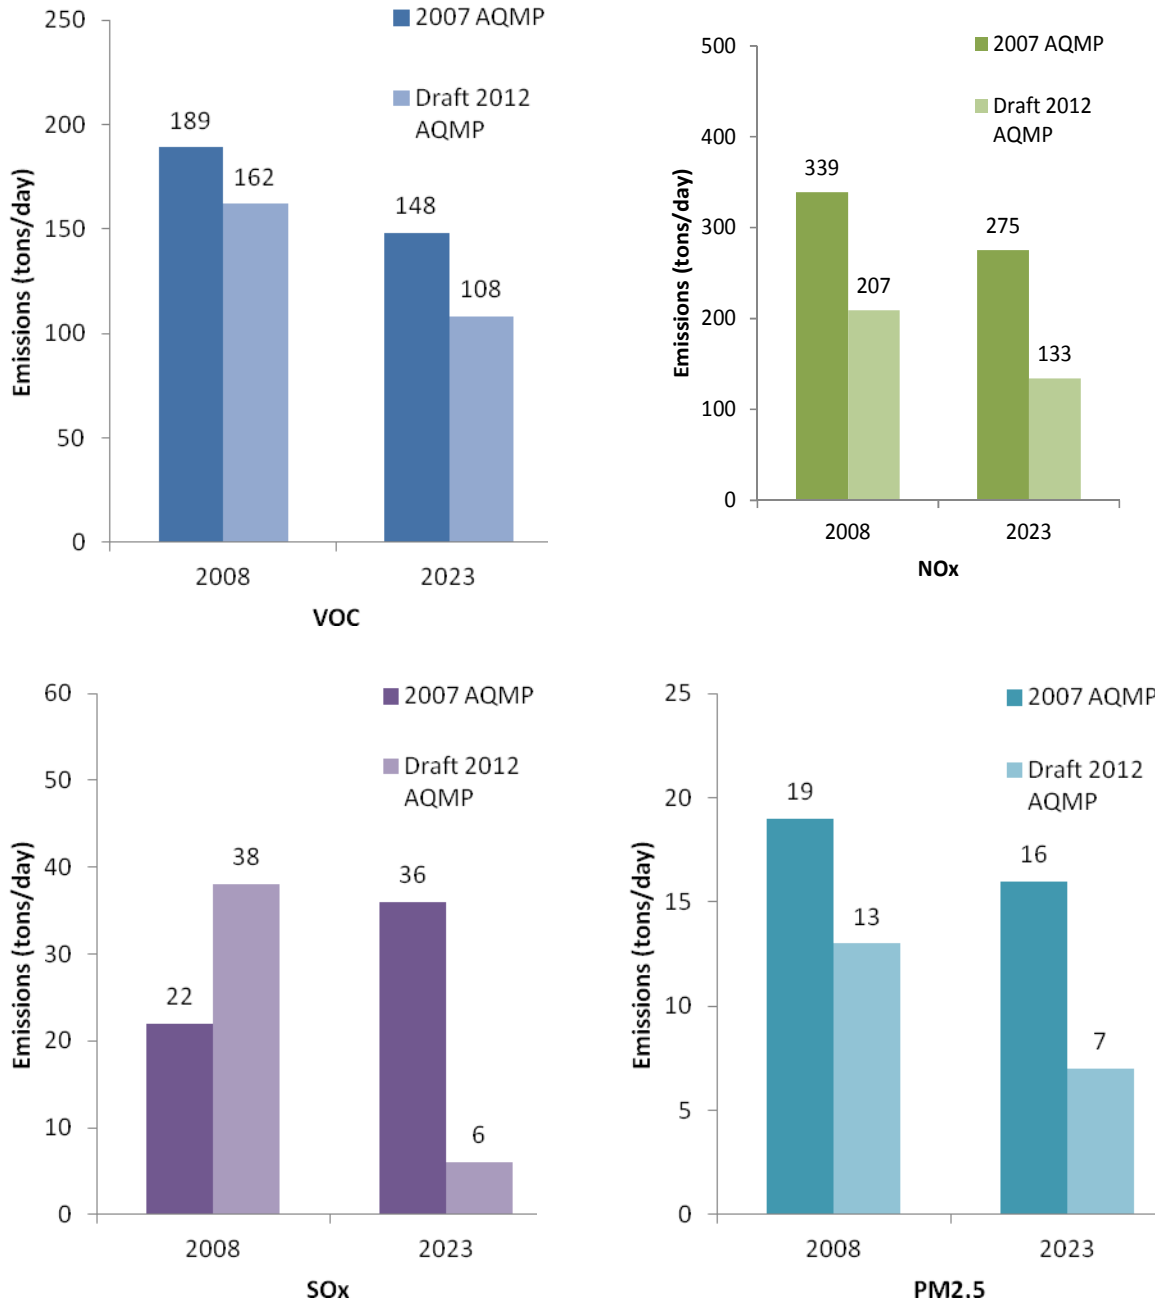

FIGURE 3.2-2

Comparison of Off-Road Emissions Between 2007 AQMP and Draft 2012 AQMP (VOC & NOx – Summer Planning; SOx & PM2.5 – Annual Average Inventory)

It is important to note that the recent recession began in 2007, and since it was unforeseen at the time, associated impacts were not included in the 2007 AQMP. As the Draft 2012 AQMP is developed, Southern California is in a slow economic recovery. The impact of the recession is deep and is still being felt and, thus, adds to the uncertainty in the emission estimates provided in this analysis. There are many challenges with making accurate

projections of future growth, such as, where vehicle trips will occur, the distribution between various modes of transportation (such as trucks and trains), as well as, estimates for population growth and changes to the numbers and types of jobs held. Forecasts are made with the best information available; nevertheless, these issues contribute to the overall uncertainty in emissions projections. Fortunately, AQMP updates are generally developed every three to four years; thereby allowing for frequent improvements to the emission inventories.

3.2.1.1.6 *Gridded Emissions*

The air quality modeling region for the 2012 AQMP extends to Southern Kern County in the north, the Arizona border in the east, northern Mexico in the south and more than 100 miles offshore to the west. The modeling area is divided into a grid system comprised of four kilometer square grid cells defined by Lambert Conformal coordinates. Both stationary and mobile source emissions are allocated to individual grid cells within the modeled area. In general, daily modeling emissions are used. Variations in temperature, hours of operation, speed of motor vehicles, and/or other factors are considered in developing gridded motor vehicle emissions. The gridded emissions data used for both PM_{2.5} and ozone modeling applications differ from the average annual day or planning inventory emission data in two respects: (1) the air quality modeling region covers larger geographic areas than the Basin; and (2) emissions used in air quality modeling represent day-specific instead of average or seasonal conditions. For PM_{2.5}, the annual average day is used in the air quality modeling, which represents the characteristic of emissions that contribute to year-round particulate impacts. The summer planning inventory, which is used for ozone modeling analyses, focuses on the warmer months (May through October) when evaporative VOC emissions play an important role in ozone formation.

3.2.1.2 Base Year Emissions - 2008 Emission Inventory

Table 3.2-1A compares the annual average emissions between the 2008 base year in the ~~Draft~~ 2012 AQMP and the projected 2008 emissions in the 2007 AQMP by major source category for VOC and NO_x. Table 3.2-1B compares the annual average emissions between the 2008 base year in the ~~Draft~~ 2012 AQMP and the projected 2008 emissions in the 2007 AQMP for SO_x and PM_{2.5}. Due to the economic recession which began in 2007, it is expected that the more recent 2008 base year emissions estimates should be lower than the previously projected 2008 emissions. Yet, several categories show higher emissions in the 2008 base year in the ~~Draft~~ 2012 AQMP, such as fuel consumption, waste disposal, petroleum production and marketing for VOC; fuel consumption for NO_x; off-road emissions for SO_x; and industrial processes for PM_{2.5}. The reasons for these differences are as follows:

1. Fuel consumption – The emissions from commercial and industrial internal combustion engines were updated to include portable equipment emissions, which were overlooked in the 2007 AQMP. The update causes increases in emissions for this category.

2. Waste disposal – Due to erroneous activity data reported by point sources in the 2007 AQMP, landfill emissions were revised substantially upward in the corrected emissions inventory used for the 2012 AQMP. In addition, landfill emission estimation methodology was revised to incorporate CARB’s GHG Emission Inventory data, which includes the amount of methane being generated in 2008. Industry stakeholders have requested further evaluation of these emission factors used. As a result, the SCAQMD staff will initiate a working group to undertake this effort.
3. Petroleum production and marketing – Two new area source categories (LPG transmission, storage tanks and pipeline cleaning and degassing) were added to the ~~Draft~~ 2012 AQMP. LPG transmission sources were added based on data from the development of Rule 1177. LPG transmission source category includes the fugitive emissions associated with transfer and dispensing of LPG and is based on emission rates derived from the SCAQMD source tests conducted in 2008 and 2011, sale volumes provided by the industry association, and category breakdowns. A total of 8.4 tons per day VOC emissions were added to the 2008 emissions inventory. The storage tanks and pipeline cleaning and degassing source category was updated based on Rule 1149 amendments to reflect more frequent degassing events, as well as, the effectiveness of control techniques. During the amendment to the rule, it was determined that the actual number of degassing events were more than triple the number that was estimated when the rule was originally developed. It was also originally assumed that once the degassing rule requirements were fulfilled, there would be no more fugitive emissions; however, a review of degassing logs indicated that sludge and product residual in the storage tanks continued to generate fugitive emissions, which significantly increase the emissions from the storage tanks. Finally, the source category was expanded to include previously exempted tanks and pipelines. The storage tanks and pipeline source adds 1.4 tons per day VOC to the 2008 base year.
4. Off-road SO_x – CARB adopted a regulation in 2005 to set sulfur content limits on marine fuels for auxiliary diesel engines and diesel-electric engines operated on ocean-going vessels within California waters and 24 nautical miles of the California coastline. The regulation became effective January 1, 2007, and as a result the SO_x reductions were accounted for in the 2007 AQMP. However, pursuant to an injunction issued by a federal district court (district court), CARB ceased enforcing the regulation in the fall of 2007. See *Pacific Merchant Shipping Ass’n v. Thomas A. Cackette* (E.D. Cal. Aug. 30, 2007), No. Civ. S-06 2791-WBS-KJM. CARB filed an appeal with the Ninth Circuit and requested a stay of the injunction pending the appeal. As permitted under the appellate court stay, CARB decided to continue to enforce the regulation while litigation involving the regulation remained active. On May 7, 2008, CARB issued another announcement to discontinue enforcement of the regulation pursuant to the same injunction after the Court of Appeals issued its decisions which invalidated the 2005 regulation. In the meantime, CARB staff prepared a new Ocean-Going Vessel Clean Fuel Regulation that was approved by its Board on July 24, 2008, and implementation began on July 1, 2009. The 2008 regulation includes the auxiliary engines and also the main engines and auxiliary boilers on ocean-going vessels within the same 24 nautical miles zone as the earlier auxiliary engine rule. The 2008

regulation achieves higher SO_x reductions than the original auxiliary engine rule, primarily due to regulating the main engines and auxiliary boilers in addition to the auxiliary engines.

Tables 3.2-1A and 3.2-1B show the 2008 emissions inventory by major source category. Table 3.2-2A shows annual average emissions, while 3.2-2B shows the summer planning inventory. Stationary sources are subdivided into point (e.g., chemical manufacturing, petroleum production, and electric utilities) and area sources (e.g., architectural coatings, residential water heaters, consumer products, and permitted sources smaller than the emission reporting threshold – generally four tons per year). Mobile sources consist of on-road (e.g., light-duty passenger cars) and off-road sources (e.g., trains and ships). Entrained road dust emissions are also included.

Figure 3.2-3 characterizes relative contributions by stationary and mobile source categories. On- and off-road sources continue to be the major contributors for each of the five criteria pollutants. Overall, total mobile source emissions account for 59 percent of the VOC and 88 percent of the NO_x emissions for these two ozone-forming pollutants, based on the summer planning inventory. The on-road mobile category alone contributes about 33 and 59 percent of the VOC and NO_x emissions, respectively, and approximately 27 percent of the CO for the annual average inventory. For directly emitted PM_{2.5}, mobile sources represent 23 percent of the emissions with another 10 percent due to vehicle-related entrained road dust.

Within the category of stationary sources, point sources contribute more SO_x emissions than area sources. Area sources play a major role in VOC emissions, emitting about seven times more than point sources. Area sources, including sources such as commercial cooking, are the predominant source of directly emitted PM_{2.5} emissions (39 percent).

3.2.1.3 Future Emissions

3.2.1.3.1 *Data Development*

The milestone years 2008, 2014, 2019, 2023, and 2030 are the years for which emission inventories were developed as they are relevant target years under the federal CAA and the California CAA. The base year for the 24-hour PM_{2.5} attainment demonstration is 2008. The attainment year for the federal 2006 24-hour PM_{2.5} standard without an extension is 2014 and 2019 represents the latest attainment date with a full five-year extension. The 80 ppb federal 8-hour ozone standard attainment deadline is 2023, and the new 75 ppb 8-hour ozone standard deadline is 2032. A 2030 inventory will be used to approximate this latter year.

VOC Emissions: 639 tons per day

NOx Emissions: 721 tons/day

CO Emissions: 2881 tons/day

SOx Emissions: 54 tons/day

Directly Emitted PM2.5 Emissions: 80 tons/day

FIGURE 3.2-3
Relative Contribution by Source Category to 2008 Emission Inventory
(VOC & NOx – Summer Planning; CO, SOx, & PM2.5 – Annual Average Inventory)

Future stationary emission inventories are divided into RECLAIM and non-RECLAIM emissions. Future NO_x and SO_x emissions from RECLAIM sources are estimated based on their allocations as specified by SCAQMD Rule 2002 –Allocations for NO_x and SO_x. The forecasts for non-RECLAIM emissions were derived using: (1) emissions from the 2008 base year; (2) expected controls after implementation of SCAQMD rules adopted by June, 2012, and CARB rules adopted as of August 2011; and (3) activity growth in various source categories between the base and future years.

Demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by SCAG for their 2012 RTP are used in the [Draft-2012 AQMP](#). Industry growth factors for 2008, 2014, 2018, 2020, 2023, and 2030 are also provided by SCAG, and interim years are calculated by linear interpolation. Table 3.2-3 summarizes key socioeconomic parameters used in the [Draft-2012 AQMP](#) for emissions inventory development.

TABLE 3.2-3

Baseline Demographic Forecasts in the [Draft-2012 AQMP](#)

CATEGORY	2008	2023	2023 % GROWTH FROM 2008	2030	2030 % GROWTH FROM 2008
Population (Millions)	15.6	17.3	11%	18.1	16%
Housing Units (Millions)	5.1	5.7	12%	6.0	18%
Total Employment (Millions)	7.0	7.7	10%	8.1	16%
Daily VMT (Millions)	379	396	4%	421	11%

Current forecasts indicate that this region will experience a population growth of 11 percent between 2008 and 2023, with a four percent increase in vehicle miles traveled (VMT); and a population growth of 16 percent by the year 2030 with a 11 percent increase in VMT.

As compared to the projections in the 2007 AQMP, the current 2030 projections in the [Draft 2012 AQMP](#) show about 1.5 million less population (7.6 percent less), 900,000 less total employment (10 percent less), and 32 million miles less in the daily VMT forecast (7.1 percent less).

3.2.1.3.2 *Summary of Future Baseline Emissions*

Emissions data by source categories (point, area, on-road mobile and off-road mobile sources) and by pollutants are presented in Tables 3.2-4 through 3.2-7 for the years 2014, 2019, 2023, and 2030. The tables provide annual average, as well as, summer planning inventories.

Without any additional controls, VOC, NO_x, and SO_x emissions are expected to decrease due to existing regulations, such as controls on off-road equipment, new vehicle standards,

and the RECLAIM programs. Figure 3.2-4 illustrates the relative contribution to the 2023 emissions inventory by source category. A comparison of Figures 3.2-3 and 3.2-4 indicates that the on-road mobile category continues to be a major contributor to CO and NOx emissions. However, due to already-adopted regulations, on-road mobile sources in 2023 account for: about 16 percent of total VOC emissions compared to 33 percent in 2008; about ~~37~~³⁶ percent of total NOx emissions compared to 59 percent in 2008; and about 38 percent of total CO emissions compared to 27 percent in 2008. Meanwhile, area sources became a major contributor to VOC emissions from 17 percent in 2008 to 25 percent in 2023.

FIGURE 3.2-4

Relative Contribution by Source Category to 2023 Emission Inventory
(VOC & NOx – Summer Planning; CO, SOx, & PM2.5 – Annual Average Inventory)

3.2.1.2 Air Quality Monitoring

This section provides an overview of air quality in the district. A more detailed discussion of current and projected future air quality in the district, with and without additional control measures can be found in the Final Program EIR for the 2012 AQMP (Chapter 3).

It is the responsibility of the SCAQMD to ensure that state and federal ambient air quality standards are achieved and maintained in its geographical jurisdiction. Health-based air quality standards have been established by California and the federal government for the following criteria air pollutants: ozone, CO, NO₂, PM₁₀, PM_{2.5} SO₂ and lead. These standards were established to protect sensitive receptors with a margin of safety from adverse health impacts due to exposure to air pollution. The California standards are more stringent than the federal standards and in the case of PM₁₀ and SO₂, far more stringent. California has also established standards for sulfates, visibility reducing particles, hydrogen sulfide, and vinyl chloride. The state and national ambient air quality standards for each of these pollutants and their effects on health are summarized in Table 3.2-8. The SCAQMD monitors levels of various criteria pollutants at 34 monitoring stations. The 2010 air quality data from SCAQMD's monitoring stations are presented in Table 3.2-9.

3.2.1.2.1 Carbon Monoxide

CO is a colorless, odorless, relatively inert gas. It is a trace constituent in the unpolluted troposphere, and is produced by both natural processes and human activities. In remote areas far from human habitation, carbon monoxide occurs in the atmosphere at an average background concentration of 0.04 ppm, primarily as a result of natural processes such as forest fires and the oxidation of methane. Global atmospheric mixing of CO from urban and industrial sources creates higher background concentrations (up to 0.20 ppm) near urban areas. The major source of CO in urban areas is incomplete combustion of carbon-containing fuels, mainly gasoline. According to the 2007 AQMP, in 2002, the inventory baseline year, approximately 98 percent of the CO emitted into the Basin's atmosphere was from mobile sources. Consequently, CO concentrations are generally highest in the vicinity of major concentrations of vehicular traffic.

CO is a primary pollutant, meaning that it is directly emitted into the air, not formed in the atmosphere by chemical reaction of precursors, as is the case with ozone and other secondary pollutants. Ambient concentrations of CO in the Basin exhibit large spatial and temporal variations due to variations in the rate at which CO is emitted and in the meteorological conditions that govern transport and dilution. Unlike ozone, CO tends to reach high concentrations in the fall and winter months. The highest concentrations frequently occur on weekdays at times consistent with rush hour traffic and late night during the coolest, most stable portion of the day.

TABLE 3.2-8

State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	State Standard^a	Federal Primary Standard^b	Most Relevant Effects
Ozone (O₃)	1-hour	0.09 ppm (180 µg/m ³)	No Federal Standard	(a) Short-term exposures: 1) Pulmonary function decrements and localized lung edema in humans and animals; and, 2) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (b) Long-term exposures: Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (c) Vegetation damage; and, (d) Property damage.
	8-hour	0.070 ppm (137 µg/m ³)	0.075 ppm (147 µg/m ³)	
Suspended Particulate Matter (PM₁₀)	24-hour	50 µg/m ³	150 µg/m ³	(a) Excess deaths from short-term exposures and exacerbation of symptoms in sensitive patients with respiratory disease; and (b) Excess seasonal declines in pulmonary function, especially in children.
	Annual Arithmetic Mean	20 µg/m ³	No Federal Standard	
Suspended Particulate Matter (PM_{2.5})	24-hour	No State Standard	35 µg/m ³	(a) Increased hospital admissions and emergency room visits for heart and lung disease; (b) Increased respiratory symptoms and disease; and (c) Decreased lung functions and premature death.
	Annual Arithmetic Mean	12 µg/m ³	15.0 µg/m ³	
Carbon Monoxide (CO)	1-Hour	20 ppm (23 mg/m ³)	35 ppm (40 mg/m ³)	(a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease; (c) Impairment of central nervous system functions; and, (d) Possible increased risk to fetuses.
	8-Hour	9 ppm (10 mg/m ³)	9 ppm (10 mg/m ³)	

TABLE 3.2-8 (Concluded)
State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	State Standard ^a	Federal Primary Standard ^b	Most Relevant Effects
Nitrogen Dioxide (NO₂)	1-Hour	0.18 ppm (339 µg/m ³)	0.100 ppm (188 µg/m ³)	(a) Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; (b) Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; and, (c) Contribution to atmospheric discoloration.
	Annual Arithmetic Mean	0.030 ppm (57 µg/m ³)	0.053 ppm (100 µg/m ³)	
Sulfur Dioxide (SO₂)	1-Hour	0.25 ppm (655 µg/m ³)	75 ppb (196 µg/m ³)–	Broncho-constriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma.
	24-Hour	0.04 ppm (105 µg/m ³)		
Sulfates	24-Hour	25 µg/m ³	No Federal Standard	(a) Decrease in ventilatory function; (b) Aggravation of asthmatic symptoms; (c) Aggravation of cardio-pulmonary disease; (d) Vegetation damage; (e) Degradation of visibility; and, (f) Property damage
Hydrogen Sulfide (H₂S)	1-Hour	0.03 ppm (42 µg/m ³)	No Federal Standard	Odor annoyance.
Lead (Pb)	30-Day Average	1.5 µg/m ³	No Federal Standard	(a) Increased body burden; and (b) Impairment of blood formation and nerve conduction.
	Calendar Quarter	No State Standard	1.5 µg/m ³	
	Rolling 3-Month Average	No State Standard	0.15 µg/m ³	
Visibility Reducing Particles	8-Hour	Extinction coefficient of 0.23 per kilometer - visibility of ten miles or more due to particles when relative humidity is less than 70 percent.	No Federal Standard	The Statewide standard is intended to limit the frequency and severity of visibility impairment due to regional haze. This is a visibility based standard not a health based standard. Nephelometry and AISI Tape Sampler; instrumental measurement on days when relative humidity is less than 70 percent.
Vinyl Chloride	24-Hour	0.01 ppm (26 µg/m ³)	No Federal Standard	Highly toxic and a known carcinogen that causes a rare cancer of the liver.

a The California ambient air quality standards for O₃, CO, SO₂ (1-hour and 24-hour), NO₂, PM₁₀, and PM₂₅ are values not to be exceeded. All other California standards shown are values not to be equaled or exceeded.

b The national ambient air quality standards, other than O₃ and those based on annual averages, are not to be exceeded more than once a year. The O₃ standard is attained when the expected number of days per calendar year with maximum hourly average concentrations above the standards is equal to or less than one.

KEY: ppb = parts per billion parts of air, by volume ppm = parts per million parts of air, by volume µg/m³ = micrograms per cubic meter mg/m³ = milligrams per cubic meter

^g Lead and sulfate samples were collected every six days at all sites monitored.

Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of worsening oxygen supply to the heart.

Inhaled CO has no direct toxic effect on the lungs, but exerts its effect on tissues by interfering with oxygen transport by competing with oxygen to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for oxygen supply can be adversely affected by exposure to CO. Individuals most at risk include patients with diseases involving heart and blood vessels, fetuses (unborn babies), and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes.

Reductions in birth weight and impaired neurobehavioral development have been observed in animals chronically exposed to CO resulting in COHb levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels. These include pre-term births and heart abnormalities.

Carbon monoxide concentrations were measured at 25 locations in the Basin and neighboring SSAB areas in 2010. Carbon monoxide concentrations did not exceed the standards in 2010. The highest one-hour average carbon monoxide concentration recorded (6.0 ppm in the South Central Los Angeles County area) was 17 percent of the federal one-hour carbon monoxide standard of 35 ppm. The highest eight-hour average carbon monoxide concentration recorded (3.6 ppm in the South Central Los Angeles County area) was 40 percent of the federal eight-hour carbon monoxide standard of 9.0 ppm. The state one-hour standard is also 9.0 ppm. The highest eight-hour average carbon monoxide concentration is 18 percent of the state eight-hour carbon monoxide standard of 20 ppm.

The 2003 AQMP revisions to the SCAQMD's CO Plan served two purposes: it replaced the 1997 attainment demonstration that lapsed at the end of 2000; and it provided the basis for a CO maintenance plan in the future. In 2004, the SCAQMD formally requested the U.S. EPA to re-designate the Basin from non-attainment to attainment with the CO National Ambient Air Quality Standards. On February 24, 2007, U.S. EPA published in the Federal Register its proposed decision to re-designate the Basin from non-attainment to attainment for CO. The comment period on the re-designation proposal closed on March 16, 2007 with no comments received by the U.S. EPA. On May 11, 2007, U.S. EPA published in the Federal Register its final decision to approve the SCAQMD's request for re-designation from non-attainment to attainment for CO, effective June 11, 2007.

3.2.1.2.2 *Ozone*

Ozone (O₃), a colorless gas with a sharp odor, is a highly reactive form of oxygen. High ozone concentrations exist naturally in the stratosphere. Some mixing of stratospheric ozone downward through the troposphere to the earth's surface does occur; however, the extent of ozone transport is limited. At the earth's surface in sites remote from urban areas ozone concentrations are normally very low (e.g., from 0.03 ppm to 0.05 ppm).

While ozone is beneficial in the stratosphere because it filters out skin-cancer-causing ultraviolet radiation, it is a highly reactive oxidant. It is this reactivity which accounts for its damaging effects on materials, plants, and human health at the earth's surface.

The propensity of ozone for reacting with organic materials causes it to be damaging to living cells and ambient ozone concentrations in the Basin are frequently sufficient to cause health effects. Ozone enters the human body primarily through the respiratory tract and causes respiratory irritation and discomfort, makes breathing more difficult during exercise, and reduces the respiratory system's ability to remove inhaled particles and fight infection.

Individuals exercising outdoors, children and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible subgroups for ozone effects. Short-term exposures (lasting for a few hours) to ozone at levels typically observed in southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. In recent years, a correlation between elevated ambient ozone levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple sports and live in high ozone communities. Elevated ozone levels are also associated with increased school absences.

Ozone exposure under exercising conditions is known to increase the severity of the abovementioned observed responses. Animal studies suggest that exposures to a combination of pollutants which include ozone may be more toxic than exposure to ozone alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.

In 2010, the SCAQMD regularly monitored ozone concentrations at 28 locations in the Basin and SSAB. Maximum ozone concentrations for all areas monitored were below the stage 1 episode level (0.20 ppm) and below the health advisory level (0.15 ppm). Maximum ozone concentrations in the SSAB areas monitored by the SCAQMD were lower than in the Basin and were below the health advisory level.

In 2010, the maximum ozone concentrations in the Basin continued to exceed federal standards by wide margins. Maximum one-hour and eight-hour average ozone concentrations were 0.143 ppm and 0.123 ppm, respectively (the maximum one-hour was recorded in the Central San Bernardino Valley 1 area, the eight-hour maximum was recorded in the Central San Bernardino Mountains area). The federal one-hour ozone standard was revoked and replaced by the eight-hour average ozone standard effective June 15, 2005. U.S. EPA has revised the federal eight-hour ozone standard from 0.84 ppm to 0.075 ppm, effective May 27, 2008. The maximum eight-hour concentration was 164 percent of the new federal standard. The maximum one-hour concentration was 159 percent of the one-hour state ozone standard of 0.09 ppm. The maximum eight-hour concentration was 175 percent of the eight-hour state ozone standard of 0.070 ppm.

The objective of the 2012 AQMP is to attain and maintain ambient air quality standards. Based upon the modeling analysis described in the Program Environmental Impact Report for the 2007 AQMP, implementation of all control measures contained in the 2012 AQMP is anticipated to bring the district into compliance with the federal eight-hour ozone standard by 2023 and the state eight-hour ozone standard beyond 2023.

3.2.1.2.3 *Nitrogen Dioxide*

NO₂ is a reddish-brown gas with a bleach-like odor. Nitric oxide (NO) is a colorless gas, formed from the nitrogen (N₂) and oxygen (O₂) in air under conditions of high temperature and pressure which are generally present during combustion of fuels; NO reacts rapidly with the oxygen in air to form NO₂. NO₂ is responsible for the brownish tinge of polluted air. The two gases, NO and NO₂, are referred to collectively as NO_x. In the presence of sunlight, NO₂ reacts to form nitric oxide and an oxygen atom. The oxygen atom can react further to form ozone, via a complex series of chemical reactions involving hydrocarbons. Nitrogen dioxide may also react to form nitric acid (HNO₃) which reacts further to form nitrates, components of PM_{2.5} and PM₁₀.

Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposures to NO₂ at levels found in homes with gas stoves, which are higher than ambient levels found in southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO₂ in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma and/or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups. More recent studies have found associations between NO₂ exposures and cardiopulmonary mortality, decreased lung function, respiratory symptoms and emergency room asthma visits.

In animals, exposure to levels of NO₂ considerably higher than ambient concentrations results in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of ozone exposure increases when animals are exposed to a combination of ozone and NO₂.

In 2010, nitrogen dioxide concentrations were monitored at 24 locations. No area of the Basin or SSAB exceeded the federal or state standards for nitrogen dioxide. The Basin has not exceeded the federal standard for nitrogen dioxide (0.0534 ppm) since 1991, when the Los Angeles County portion of the Basin recorded the last exceedance of the standard in any county within the United States.

In 2010, the maximum annual average concentration was 26.2 ppb recorded in the Pomona/Walnut Valley area. Effective March 20, 2008, CARB revised the nitrogen dioxide one-hour standard from 0.25 ppm to 0.18 ppm and established a new annual standard of 0.30 ppm. In addition, U.S. EPA has established a new federal one-hour NO₂ standard of 100 ppb (98th percentile concentration), effective April 7, 2010. The highest one-hour average concentration recorded (97.0 ppb in Pomona/Walnut Valley) was 53 percent of the state

one-hour standard and the highest annual average concentration recorded (26.2 ppb in Pomona/Walnut Valley) was 87 percent of the state annual average standard. NO_x emission reductions continue to be necessary because it is a precursor to both ozone and PM (PM_{2.5} and PM₁₀) concentrations.

3.2.1.2.4 *Sulfur Dioxide*

SO₂ is a colorless gas with a sharp odor. It reacts in the air to form sulfuric acid (H₂SO₄), which contributes to acid precipitation, and sulfates, which are components of PM₁₀ and PM_{2.5}. Most of the SO₂ emitted into the atmosphere is produced by burning sulfur-containing fuels.

Exposure of a few minutes to low levels of SO₂ can result in airway constriction in some asthmatics. All asthmatics are sensitive to the effects of SO₂. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, is observed after acute higher exposure to SO₂. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO₂.

Animal studies suggest that despite SO₂ being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract.

Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO₂ levels. In these studies, efforts to separate the effects of SO₂ from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.

No exceedances of federal or state standards for sulfur dioxide occurred in 2010 at any of the seven district locations monitored. The maximum one-hour sulfur dioxide concentration was 40.0 ppb, as recorded in the South Coastal Los Angeles County 1 area. The maximum 24-hour sulfur dioxide concentration was 6.0 ppb, as recorded in South Coastal Los Angeles County 1 area. The U.S. EPA revised the federal sulfur dioxide standard by establishing a new one-hour standard of 0.075 ppm and revoking the existing annual arithmetic mean (0.03 ppm) and the 24-hour average (0.14 ppm), effective August 2, 2010. The state standards are 0.25 ppm for the one-hour average and 0.04 ppm for the 24-hour average. Though sulfur dioxide concentrations remain well below the standards, sulfur dioxide is a precursor to sulfate, which is a component of fine particulate matter, PM₁₀, and PM_{2.5}. Historical measurements showed concentrations to be well below standards and monitoring has been discontinued.

3.2.1.2.5 *Particulate Matter (PM₁₀ and PM_{2.5})*

Of great concern to public health are the particles small enough to be inhaled into the deepest parts of the lung. Respirable particles (particulate matter less than about 10 micrometers in diameter) can accumulate in the respiratory system and aggravate health problems such as asthma, bronchitis and other lung diseases. Children, the elderly,

exercising adults, and those suffering from asthma are especially vulnerable to adverse health effects of PM10 and PM2.5.

A consistent correlation between elevated ambient fine particulate matter (PM10 and PM2.5) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. Studies have reported an association between long-term exposure to air pollution dominated by fine particles (PM2.5) and increased mortality, reduction in life-span, and an increased mortality from lung cancer.

Daily fluctuations in fine particulate matter concentration levels have also been related to hospital admissions for acute respiratory conditions, to school and kindergarten absences, to a decrease in respiratory function in normal children and to increased medication use in children and adults with asthma. Studies have also shown lung function growth in children is reduced with long-term exposure to particulate matter. In addition to children, the elderly, and people with pre-existing respiratory and/or cardiovascular disease appear to be more susceptible to the effects of PM10 and PM2.5.

The SCAQMD monitored PM10 concentrations at 21 locations in 2010. The federal 24-hour PM10 standard (150 $\mu\text{g}/\text{m}^3$) was not exceeded at any of the locations monitored in 2010. The maximum 24-hour PM10 concentration of 107 $\mu\text{g}/\text{m}^3$ was recorded in the Coachella Valley No. 2 area and was 71 percent of the federal standard and 214 percent of the much more stringent state 24-hour PM10 standard (50 $\mu\text{g}/\text{m}^3$). The state 24-hour PM10 standard was exceeded at 12 of the 21 monitoring stations. The maximum annual average PM10 concentration of 42.3 $\mu\text{g}/\text{m}^3$ was recorded in Mira Loma. The maximum annual average PM10 concentration in Mira Loma was 211 percent of the state standard. The federal annual PM10 standard has been revoked.

In 2010, PM2.5 concentrations were monitored at 20 locations throughout the district. U.S. EPA revised the federal 24-hour PM2.5 standard from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$, effective December 17, 2006. In 2010, the maximum PM2.5 concentrations in the Basin exceeded the new federal 24-hour PM2.5 standard in all but six locations. The maximum 24-hour PM2.5 concentration of 54.2 $\mu\text{g}/\text{m}^3$ was recorded in the Mira Loma area, which represents 154 percent of the federal standard of 35 $\mu\text{g}/\text{m}^3$. The maximum annual average concentration of 15.2 $\mu\text{g}/\text{m}^3$ was recorded in Mira Loma, which represents 101 percent of the federal standard of 15 $\mu\text{g}/\text{m}^3$ and 126 percent of the state standard of 12 $\mu\text{g}/\text{m}^3$.

Similar to PM10 concentrations, PM2.5 concentrations were higher in the inland valley areas of San Bernardino and Metropolitan Riverside counties. However, PM2.5 concentrations were also high in Central Los Angeles County. The high PM2.5 concentrations in Los Angeles County are mainly due to the secondary formation of smaller particulates resulting from mobile and stationary source activities. In contrast to PM10, PM2.5 concentrations were low in the Coachella Valley area of SSAB. PM10 concentrations are normally higher in the desert areas due to windblown and fugitive dust emissions.

3.2.1.2.6 *Lead*

Lead in the atmosphere is present as a mixture of a number of lead compounds. Leaded gasoline and lead smelters have been the main sources of lead emitted into the air. Due to the phasing out of leaded gasoline, there was a dramatic reduction in atmospheric lead in the Basin over the past three decades.

Fetuses, infants, and children are more sensitive than others to the adverse effects of lead exposure. Exposure to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure.

Lead poisoning can cause anemia, lethargy, seizures, and death. It appears that there are no direct effects of lead on the respiratory system. Lead can be stored in the bone from early-age environmental exposure, and elevated blood lead levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland), and osteoporosis (breakdown of bone tissue). Fetuses and breast-fed babies can be exposed to higher levels of lead because of previous environmental lead exposure of their mothers.

The old federal and current state standards for lead were not exceeded in any area of the district in 2010. There have been no violations of these standards at the SCAQMD's regular air monitoring stations since 1982, as a result of removal of lead from gasoline. The maximum quarterly average lead concentration ($0.01 \mu\text{g}/\text{m}^3$ at monitoring stations in South San Gabriel Valley, South Central Los Angeles County, and Central San Bernardino Valley No. 2) was 0.7 percent of the old federal quarterly average lead standard ($1.5 \mu\text{g}/\text{m}^3$). The maximum monthly average lead concentration ($0.01 \mu\text{g}/\text{m}^3$ in South San Gabriel Valley and South Central Los Angeles County), measured at special monitoring sites immediately adjacent to stationary sources of lead was 0.7 percent of the state monthly average lead standard. No lead data were obtained at SSAB and Orange County stations in 2010. Because historical lead data showed concentrations in SSAB and Orange County areas to be well below the standard, measurements have been discontinued.

On November 12, 2008, U.S. EPA published new national ambient air quality standards for lead, which became effective January 12, 2010. The existing national lead standard, $1.5 \mu\text{g}/\text{m}^3$, was reduced to $0.15 \mu\text{g}/\text{m}^3$, averaged over a rolling three-month period. The new federal standard was not exceeded at any source/receptor location in 2010. Nevertheless, U.S. EPA designated the Los Angeles County portion of the Basin as non-attainment for the new lead standard, effective December 31, 2010, primarily based on emissions from two battery recycling facilities. In response to the new federal lead standard, the SCAQMD adopted Rule 1420.1 – Emissions Standard for Lead from Large Lead-Acid Battery Recycling Facilities, in November 2010, to ensure that lead emissions do not exceed the new federal standard. Further, in May 2012, the SCAQMD adopted the 2012 Lead SIP to address the revision to the federal lead standard, which outlines the strategy and pollution control activities to demonstrate attainment of the federal lead standard before December 31, 2015.

3.2.1.2.7 *Sulfates*

Sulfates (SO_x) are chemical compounds which contain the sulfate ion and are part of the mixture of solid materials which make up PM₁₀. Most of the sulfates in the atmosphere are produced by oxidation of SO₂. Oxidation of sulfur dioxide yields sulfur trioxide (SO₃) which reacts with water to form sulfuric acid, which contributes to acid deposition. The reaction of sulfuric acid with basic substances such as ammonia yields sulfates, a component of PM₁₀ and PM_{2.5}.

Most of the health effects associated with fine particles and SO₂ at ambient levels are also associated with SO_x. Thus, both mortality and morbidity effects have been observed with an increase in ambient SO_x concentrations. However, efforts to separate the effects of SO_x from the effects of other pollutants have generally not been successful.

Clinical studies of asthmatics exposed to sulfuric acid suggest that adolescent asthmatics are possibly a subgroup susceptible to acid aerosol exposure. Animal studies suggest that acidic particles such as sulfuric acid aerosol and ammonium bisulfate are more toxic than non-acidic particles like ammonium sulfate. Whether the effects are attributable to acidity or to particles remains unresolved.

In 2010, the state 24-hour sulfate standard (25 µg/m³) was not exceeded in any of the monitoring locations in the district. No sulfate data were obtained at SSAB and Orange County stations in 2010. Historical sulfate data showed sulfate concentrations in the SSAB and Orange County areas to be well below the standard; thus, measurements in these areas have been discontinued. There are no federal sulfate standards.

3.2.1.2.8 *Vinyl Chloride*

Vinyl chloride is a colorless, flammable gas at ambient temperature and pressure. It is also highly toxic and is classified by the American Conference of Governmental Industrial Hygienists (ACGIH) as A1 (confirmed carcinogen in humans) and by the International Agency for Research on Cancer (IARC) as 1 (known to be a human carcinogen)(Air Gas, 2010). At room temperature, vinyl chloride is a gas with a sickly sweet odor that is easily condensed. However, it is stored as a liquid. Due to the hazardous nature of vinyl chloride to human health there are no end products that use vinyl chloride in its monomer form. Vinyl chloride is a chemical intermediate, not a final product. It is an important industrial chemical chiefly used to produce polymer polyvinyl chloride (PVC). The process involves vinyl chloride liquid fed to polymerization reactors where it is converted from a monomer to a polymer PVC. The final product of the polymerization process is PVC in either a flake or pellet form. Billions of pounds of PVC are sold on the global market each year. From its flake or pellet form, PVC is sold to companies that heat and mold the PVC into end products such as PVC pipe and bottles.

In the past, vinyl chloride emissions have been associated primarily with sources such as landfills. Risks from exposure to vinyl chloride are considered to be a localized impacts rather than regional impacts. Because landfills in the district are subject to SCAQMD 1150.1, which contains stringent requirements for landfill gas collection and control,

potential vinyl chloride emissions are below the level of detection. Therefore, the SCAQMD does not monitor for vinyl chloride at its monitoring stations.

3.2.1.2.9 Volatile Organic Compounds

It should be noted that there are no state or national ambient air quality standards for VOCs because they are not classified as criteria pollutants. VOCs are regulated, however, because limiting VOC emissions reduces the rate of photochemical reactions that contribute to the formation of ozone. VOCs are also transformed into organic aerosols in the atmosphere, contributing to higher PM₁₀ and lower visibility levels.

Although health-based standards have not been established for VOCs, health effects can occur from exposures to high concentrations of VOCs because of interference with oxygen uptake. In general, ambient VOC concentrations in the atmosphere are suspected to cause coughing, sneezing, headaches, weakness, laryngitis, and bronchitis, even at low concentrations. Some hydrocarbon components classified as VOC emissions are thought or known to be hazardous. Benzene, for example, one hydrocarbon component of VOC emissions, is known to be a human carcinogen.

3.2.1.2.10 Visibility

In 2005, annual average visibility at Rudiboux (Riverside), the worst case, was just over 10 miles (SCAQMD, 2007). With the exception of Lake County, which is designated in attainment, all of the air districts in California are currently designated as unclassified with respect to the CAAQS for visibility reducing particles.

In Class-I wilderness areas, which typically have visual range measured in tens of miles the deciview metric is used to estimate an individual's perception of visibility. The deciview index works inversely to visual range which is measured in miles or kilometers whereby a lower deciview is optimal. In the South Coast Air Basin, the Class-I areas are typically restricted to higher elevations (greater than 6,000 feet above sea level) or far downwind of the metropolitan emission source areas. Visibility in these areas is typically unrestricted due to regional haze despite being in close proximity to the urban setting. The 2005 baseline deciview mapping of the Basin is presented in Figure 3.2-5. All of the Class-I wilderness areas reside in areas having average deciview values less than 20 with many portions of those areas having average deciview values less than 10. By contrast, Rubidoux, in the Basin has a deciview value exceeding 30.

3.2.1.2.10.1 Federal Regional Haze Rule

The federal Regional Haze Rule, established by the U.S. EPA pursuant to CAA section 169A, establishes the national goal to prevent future and remedy existing impairment of visibility in federal Class I areas (such as federal wilderness areas and national parks). U.S. EPA's visibility regulations (40 CFR 51.300 through 51.309), require states to develop measures necessary to make reasonable progress towards remedying visibility impairment in these federal Class I areas. Section 169A and these regulations also require Best Available Retrofit Technology for certain large stationary sources that were put in place between 1962

and 1977. See Regional Haze Regulations and Guidelines for Best Available Retrofit Technology (BART) Determinations, 70 Fed. Reg. 39104 (July 6, 2005).

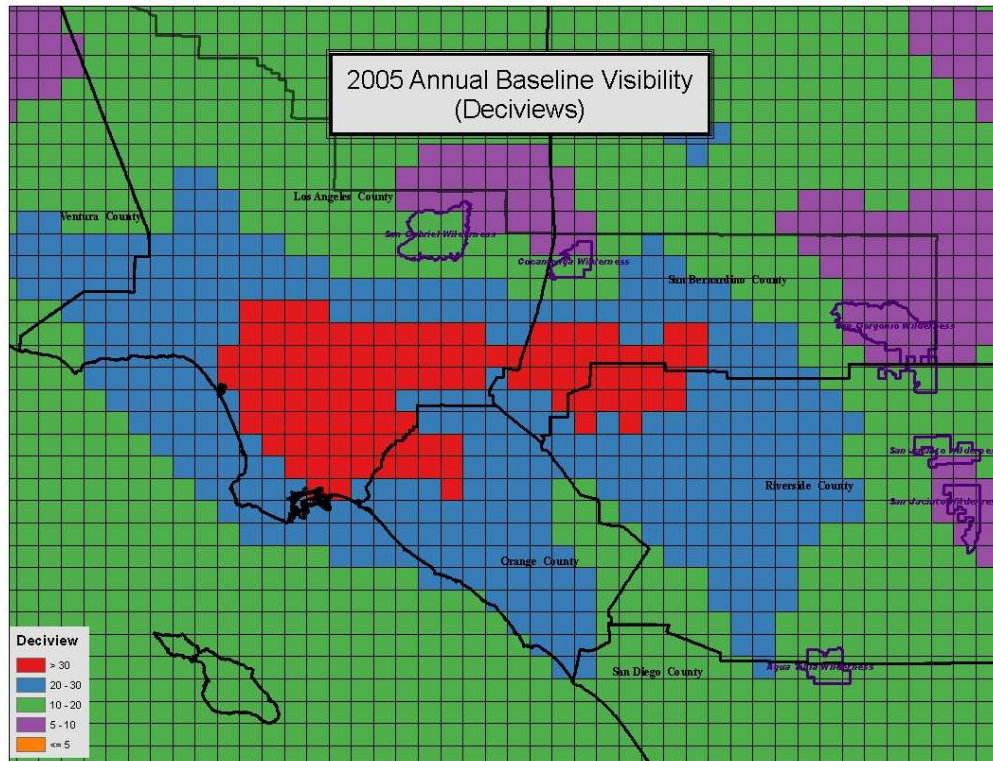

FIGURE 3.2-5

2005 Annual Baseline Visibility

3.2.1.2.10.2 *California Air Resources Board*

Since deterioration of visibility is one of the most obvious manifestations of air pollution and plays a major role in the public's perception of air quality, the state of California has adopted a standard for visibility or visual range. Until 1989, the standard was based on visibility estimates made by human observers. The standard was changed to require measurement of visual range using instruments that measure light scattering and absorption by suspended particles.

The visibility standard is based on the distance that atmospheric conditions allow a person to see at a given time and location. Visibility reduction from air pollution is often due to the presence of sulfur and nitrogen oxides, as well as particulate matter. Visibility degradation occurs when visibility reducing particles are produced in sufficient amounts such that the extinction coefficient is greater than 0.23 inverse kilometers (to reduce the visual range to less than 10 miles) at relative humidity less than 70 percent, 8-hour average (from 10:00 a.m. to 6:00 p.m.) according to the state standard. Future-year visibility in the Basin is projected empirically using the results derived from a regression analysis of visibility with

air quality measurements. The regression data set consisted of aerosol composition data collected during a special monitoring program conducted concurrently with visibility data collection (prevailing visibility observations from airports and visibility measurements from district monitoring stations). A full description of the visibility analysis is given in Appendix V of the 2012 AQMP.

With future year reductions of PM_{2.5} from implementation of all proposed emission controls for 2015, the annual average visibility would improve from 10 miles (calculated for 2008) to over 20 miles at Rubidoux, for example. Visual range in 2021 at all other Basin sites is expected to equal or exceed the Rubidoux visual range. Visual range is expected to double from the 2008 baseline due to reductions of secondary PM_{2.5}, directly emitted PM_{2.5} (including diesel soot) and lower nitrogen dioxide concentrations as a result of 2007 AQMP controls.

To meet Federal Regional Haze Rule requirements, ~~the CARB California Air Resources Board~~ adopted the California Regional Haze Plan on January 22, 2009, addressing California's visibility goals through 2018. As stated in Table 3.3-12 above, ~~the~~ California's statewide standard (applicable outside of the Lake Tahoe area) for Visibility Reducing Particles is an extinction coefficient of 0.23 per kilometer over an 8-hour averaging period. This translates to visibility of ten miles or more due to particles when relative humidity is less than 70 percent.

3.2.2 Non-Criteria Pollutants

Although the SCAQMD's primary mandate is attaining the State and National Ambient Air Quality Standards for criteria pollutants within the district, SCAQMD also has a general responsibility pursuant to HSC §41700 to control emissions of air contaminants and prevent endangerment to public health. Additionally, state law requires the SCAQMD to implement airborne toxic control measures (ATCM) adopted by CARB, and to implement the Air Toxics "Hot Spots" Act. As a result, the SCAQMD has regulated pollutants other than criteria pollutants such as TACs, greenhouse gases and stratospheric ozone depleting compounds. The SCAQMD has developed a number of rules to control non-criteria pollutants from both new and existing sources. These rules originated through state directives, CAA requirements, or the SCAQMD rulemaking process.

In addition to promulgating non-criteria pollutant rules, the SCAQMD has been evaluating AQMP control measures as well as existing rules to determine whether or not they would affect, either positively or negatively, emissions of non-criteria pollutants. For example, rules in which VOC components of coating materials are replaced by a non-photochemically reactive chlorinated substance would reduce the impacts resulting from ozone formation, but could increase emissions of toxic compounds or other substances that may have adverse impacts on human health.

The following subsections summarize the existing setting for the two major categories of non-criteria pollutants: compounds that contribute to TACs global climate change, and stratospheric ozone depletion.

3.2.2.1 Air Quality – Toxic Air Contaminants

3.2.2.1.1 *Federal*

Under Section 112 of the CAA, U.S. EPA is required to regulate sources that emit one or more of the 187 federally listed hazardous air pollutants (HAPs). HAPs are air toxic pollutants identified in the CAA, which are known or suspected of causing cancer or other serious health effects. The federal HAPs are listed on the U.S. EPA website at <http://www.epa.gov/ttn/atw/orig189.html>. In order to implement the CAA, approximately 100 National Emission Standards for Hazardous Air Pollutants (NESHAPs) have been promulgated by U.S. EPA for major sources (sources emitting greater than 10 tons per year of a single HAP or greater than 25 tons per year of multiple HAPs). The SCAQMD can either directly implement NESHAPs or adopt rules that contain requirements at least as stringent as the NESHAP requirements. However, since NESHAPs often apply to sources in the district that are controlled, many of the sources that would have been subject to federal requirements already comply or are exempt.

In addition to the major source NESHAPs, U.S. EPA has also controlled HAPs from urban areas by developing Area Source NESHAPs under their Urban Air Toxics Strategy. U.S. EPA defines an area source as a source that emits less than 10 tons annually of any single hazardous air pollutant or less than 25 tons annually of a combination of hazardous air pollutants. The CAA requires the U.S. EPA to identify a list of at least 30 air toxics that pose the greatest potential health threat in urban areas. U.S. EPA is further required to identify and establish a list of area source categories that represent 90 percent of the emissions of the 30 urban air toxics associated with area sources, for which Area Source NESHAPs are to be developed under the CAA. U.S. EPA has identified a total of 70 area source categories with regulations promulgated for more than 30 categories so far. [Appendix A lists key NESHAPs recently adopted or amended by U.S. EPA.](#)

The federal toxics program recognizes diesel engine exhaust as a health hazard, however, diesel particulate matter itself is not one of their listed toxic air contaminants. Rather, each toxic compound in the speciated list of compounds in exhaust is considered separately. Although there are no specific NESHAP regulations for diesel PM, diesel particulate emission reductions are realized through federal regulations including diesel fuel standards and emission standards for stationary, marine, and locomotive engines; and idling controls for locomotives.

3.2.2.1.2 *State*

The California air toxics program was based on the CAA and the original federal list of hazardous air pollutants. The state program was established in 1983 under the Toxic Air Contaminant Identification and Control Act, Assembly Bill (AB) 1807, Tanner. Under the state program, toxic air contaminants are identified through a two-step process of risk identification and risk management. This two-step process was designed to protect residents from the health effects of toxic substances in the air.

3.2.2.1.2.1 *Control of TACs under the TAC Identification and Control Program*

California's TAC identification and control program, adopted in 1983 as AB 1807, is a two-step program in which substances are identified as TACs, and ATCMs are adopted to control emissions from specific sources. CARB has adopted a regulation designating all 188 federal hazardous air pollutants (HAPs) as TACs.

ATCMs are developed by CARB and implemented by the SCAQMD and other air districts through the adoption of regulations of equal or greater stringency. Generally, the ATCMs reduce emissions to achieve exposure levels below a determined health threshold. If no such threshold levels are determined, emissions are reduced to the lowest level achievable through the best available control technology unless it is determined that an alternative level of emission reduction is adequate to protect public health.

Under California law, a federal NESHAP automatically becomes a state ATCM, unless CARB has already adopted an ATCM for the source category. Once a NESHAP becomes an ATCM, CARB and each air pollution control or air quality management district have certain responsibilities related to adoption or implementation and enforcement of the NESHAP/ATCM.

3.2.2.1.2.2 *Control of TACs under the Air Toxics "Hot Spots" Act*

The Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588) establishes a state-wide program to inventory and assess the risks from facilities that emit TACs and to notify the public about significant health risks associated with the emissions. Facilities are phased into the AB 2588 program based on their emissions of criteria pollutants or their occurrence on lists of toxic emitters compiled by the SCAQMD. Phase I consists of facilities that emit over 25 tons per year of any criteria pollutant and facilities present on the SCAQMD's toxics list. Phase I facilities entered the program by reporting their air TAC emissions for calendar year 1989. Phase II consists of facilities that emit between 10 and 25 tons per year of any criteria pollutant, and submitted air toxic inventory reports for calendar year 1990 emissions. Phase III consists of certain designated types of facilities which emit less than 10 tons per year of any criteria pollutant, and submitted inventory reports for calendar year 1991 emissions. Inventory reports are required to be updated every four years under the state law.

3.2.2.1.2.3 *Air Toxics Control Measures*

As part of its risk management efforts, CARB has passed state ATCMs to address air toxics from mobile and stationary sources. Some key ATCMs for stationary sources include reductions of benzene emissions from service stations, hexavalent chromium emissions from chrome plating, perchloroethylene emissions from dry cleaning, ethylene oxide emissions from sterilizers, and multiple air toxics from the automotive painting and repair industries.

Many of CARB's recent ATCMs are part of the CARB Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (DRRP) which was adopted in September 2000 (<http://www.arb.ca.gov/diesel/documents/rrpapp.htm>) with the goal of reducing diesel particulate matter emissions from compression ignition engines and

associated health risk by 75 percent by 2010 and 85 percent by 2020. The DRRP includes strategies to reduce emissions from new and existing engines through the use of ultra-low sulfur diesel fuel, add-on controls, and engine replacement. In addition to stationary source engines, the plan addresses diesel PM emissions from mobile sources such as trucks, buses, construction equipment, locomotives, and ships. [Appendix A lists key ATCMs recently adopted or amended by CARB.](#)

3.2.2.1.3 SCAQMD

SCAQMD has regulated criteria air pollutants using either a technology-based or an emissions limit approach. The technology-based approach defines specific control technologies that may be installed to reduce pollutant emissions. The emission limit approach establishes an emission limit, and allows industry to use any emission control equipment, as long as the emission requirements are met. The regulation of TACs often uses a health risk-based approach, but may also require a regulatory approach similar to criteria pollutants, as explained in the following subsections.

3.2.2.1.3.1 Rules and Regulations

Under the SCAQMD's toxic regulatory program there are 15 source-specific rules that target toxic emission reductions that regulate over 10,000 sources such as metal finishing, spraying operations, dry cleaners, film cleaning, gasoline dispensing, and diesel-fueled stationary engines to name a few. In addition, other source-specific rules targeting criteria pollutant reductions also reduce toxic emissions, such as Rule 461 which reduces benzene emissions from gasoline dispensing and Rule 1124 which reduces perchloroethylene, trichloroethylene, and methylene chloride emissions from aerospace operations.

New and modified sources of toxic air contaminants in the district are subject to Rule 1401 - New Source Review of Toxic Air Contaminants and Rule 212 - Standards for Approving Permits. Rule 212 requires notification of the SCAQMD's intent to grant a permit to construct a significant project, defined as a new or modified permit unit located within 1000 feet of a school (a state law requirement under AB 3205), a new or modified permit unit posing an maximum individual cancer risk of one in one million (1×10^{-6}) or greater, or a new or modified facility with criteria pollutant emissions exceeding specified daily maximums. Distribution of notice is required to all addresses within a 1/4-mile radius, or other area deemed appropriate by the SCAQMD. Rule 1401 currently controls emissions of carcinogenic and non-carcinogenic (health effects other than cancer) air contaminants from new, modified and relocated sources by specifying limits on cancer risk and hazard index (explained further in the following discussion), respectively. The rule lists nearly 300 TACs that are evaluated during the SCAQMD's permitting process for new, modified or relocated sources. During the past decade, more than 80 compounds have been added or had risk values amended. The addition of diesel particulate matter from diesel-fueled internal combustion engines as a TAC in March 2008 was the most significant of recent amendments to the rule. Rule 1401.1 sets risk thresholds for new and relocated facilities near schools. The requirements are more stringent than those for other air toxics rules in order to provide additional protection to school children.

3.2.2.1.3.2 *Air Toxics Control Plan*

In March 2000, the SCAQMD Governing Board approved the Air Toxics Control Plan (ATCP) which was the first comprehensive plan in the nation to guide future toxic rulemaking and programs. The ATCP was developed to lay out the SCAQMD's air toxics control program which built upon existing federal, state, and local toxic control programs as well as co-benefits from implementation of State Implementation Plan (SIP) measures. The concept for the plan was an outgrowth of the Environmental Justice principles and the Environmental Justice Initiatives adopted by the [SCAQMD](#) Governing Board in October 1997. Monitoring studies and air toxics regulations that were created from these initiatives emphasized the need for a more systematic approach to reducing toxic air contaminants. The intent of the plan was to reduce exposure to air toxics in an equitable and cost-effective manner that promotes clean, healthful air in the district. The plan proposed control strategies to reduce toxic air contaminants in the district implemented between years 2000 and 2010 through cooperative efforts of the SCAQMD, local governments, CARB and U.S. EPA.

3.2.2.1.3.3 *2003 Cumulative Impact Reduction Strategies*

The SCAQMD Governing Board approved a cumulative impacts reduction strategy in September 2003. The resulting 25 cumulative impacts strategies were a key element of the 2004 Addendum to the ATCP. The strategies included rules, policies, funding, education, and cooperation with other agencies. Some of the key SCAQMD accomplishments related to the cumulative impacts reduction strategies were:

- Rule 1401.1 which set more stringent health risk requirements for new and relocated facilities near schools
- Rule 1470 which established diesel PM emission limits and other requirements for diesel-fueled engines
- Rule 1469.1 which regulated chrome spraying operations
- Rule 410 which addresses odors from transfer stations and material recovery facilities
- Intergovernmental Review comment letters for CEQA documents
- SCAQMD's land use guidance document
- Additional protection in toxics rules for sensitive receptors, such as more stringent requirements for chrome plating operations and diesel engines located near schools

3.2.2.1.3.4 *Addendum to the ATCP*

The Addendum to the ATCP (Addendum) was adopted by the SCAQMD Governing Board in 2004 and served as a status report regarding implementation of the various mobile and stationary source strategies in the 2000 ATCP and introduced new measures to further address air toxics. The main elements of the Addendum were to address the progress made

in implementation of the 2000 ATCP control strategies provide a historical perspective of air toxic emissions and current air toxic levels; incorporate the Cumulative Impact Reduction Strategies approved by the [SCAQMD Governing Board](#) in 2003 and additional measures identified in the 2003 AQMP; project future air toxic levels to the extent feasible; and summarize future efforts to develop the next ATCP. Significant progress had been made in implementing most of the SCAQMD strategies from the 2000 ATCP and the 2004 Addendum. CARB has also made notable progress in mobile source measures via its Diesel Risk Reduction Plan, especially for goods movement related sources, while the U.S. EPA continued to implement their air toxic programs applicable to stationary sources

3.2.2.1.3.5 *Clean Communities Plan*

On November 5, 2010, the SCAQMD Governing Board approved the 2010 Clean Communities Plan (CCP). The CCP was an update to the 2000 Air Toxics Control Plan (ATCP) and the 2004 Addendum. The objective of the 2010 CCP is to reduce the exposure to air toxics and air-related nuisances throughout the district, with emphasis on cumulative impacts. The elements of the 2010 CCP are community exposure reduction, community participation, communication and outreach, agency coordination, monitoring and compliance, source-specific programs, and nuisance. The centerpiece of the 2010 CCP is a pilot study through which the SCAQMD staff will work with community stakeholders to identify and develop solutions community-specific to air quality issues in two communities: (1) the City of San Bernardino; and (2) Boyle Heights and surrounding areas.

3.2.2.1.3.6 *Control of TACs under the Air Toxics "Hot Spots" Act*

In October 1992, the SCAQMD Governing Board adopted public notification procedures for Phase I and II facilities. These procedures specify that AB 2588 facilities must provide public notice when exceeding the following risk levels:

- Maximum Individual Cancer Risk: greater than 10 in one million (10×10^{-6})
- Total Hazard Index: greater than 1.0 for TACs except lead, or > 0.5 for lead

Public notice is to be provided by letters mailed to all addresses and all parents of children attending school in the impacted area. In addition, facilities must hold a public meeting and provide copies of the facility risk assessment in all school libraries and a public library in the impacted area.

The AB2588 Toxics "Hot Spots" Program is implemented through Rule 1402. The SCAQMD continues to review health risk assessments submitted. Notification is required from facilities with a significant risk under the AB 2588 program based on their initial approved health risk assessments and will continue on an ongoing basis as additional and subsequent health risk assessments are reviewed and approved.

There are currently about 600 facilities in the SCAQMD's AB2588 program. Since 1992 when the state Health and Safety Code incorporated a risk reduction requirement in the program, the SCAQMD has reviewed and approved over 300 HRAs, 44 facilities were required to do a public notice, and 21 facilities were subject to risk reduction. Currently,

over 96 percent of the facilities in the program have cancer risks below ten in a million and over 98 percent have acute and chronic hazard indices of less than one.

3.2.2.1.3.7 *CEQA Intergovernmental Review Program*

The SCAQMD staff, through its Intergovernmental Review (IGR) provides comments to lead agencies on air quality analyses and mitigation measures in CEQA documents. The following are some key programs and tools that have been developed more recently to strengthen air quality analyses, specifically as they relate to exposure of mobile source air toxics:

- SCAQMD’s Mobile Source Committee approved the “Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Emissions” (August 2002). This document provides guidance for analyzing cancer risks from diesel particulate matter from truck idling and movement (e.g., truck stops, warehouse and distribution centers, or transit centers), ship hotelling at ports, and train idling.
- Cal/EPA and CARB’s “Air Quality and Land Use Handbook: A Community Health Perspective” (April 2005), provides recommended siting distances for incompatible land uses.
- Western Riverside Council of Governments Air Quality Task Force developed a policy document titled, “Good Neighbor Guidelines for Siting New and/or Modified Warehouse/Distribution Facilities” (September 2005). This document provides guidance to local government on preventive measures to reduce neighborhood exposure to toxic air contaminants from warehousing facilities.

3.2.2.1.3.8 *Environmental Justice (EJ)*

Environmental justice has long been a focus of the SCAQMD. In 1990, the SCAQMD formed an Ethnic Community Advisory Group that was recently restructured as the Environmental Justice Advisory Group (EJAG). EJAG’s mission is to advise and assist SCAQMD in protecting and improving public health in SCAQMD’s most impacted communities through the reduction and prevention of air pollution.

In 1997, the [SCAQMD](http://www.aqmd.gov/ej/history.htm) Governing Board adopted four guiding principles and ten initiatives (<http://www.aqmd.gov/ej/history.htm>) to ensure environmental equity. Also in 1997, the [SCAQMD](http://www.aqmd.gov/ej/history.htm) Governing Board expanded the initiatives to include the “Children’s Air Quality Agenda” focusing on the disproportionate impacts of poor air quality on children. Some key initiatives that have been implemented were the Multiple Air Toxics Exposure Studies (MATES, MATES II and MATES III); the Clean Fleet Rules, the Cumulative Impacts strategies; funding for lower emitting technologies under the Carl Moyer Program; the Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning; a guidance document on Air Quality Issues in School Site Selection; and the 2000 Air Toxics Control Plan and its 2004 Addendum. Key initiatives focusing on communities and residents include the Clean Air Congress; the Clean School Bus Program; Asthma and Air Quality Consortium; Brain and Lung Tumor and Air Pollution Foundation; air quality

presentations to schools and community and civic groups; and Town Hall meetings. Technological and scientific projects and programs have been a large part of the SCAQMD's EJ program since its inception. Over time, the EJ program's focus on public education, outreach, and opportunities for public participation have greatly increased. Public education materials and other resources for the public are available on the SCAQMD's website (www.AQMD.gov)

3.2.2.1.3.9 *AB 2766 Subvention Funds*

AB2766 subvention funds, money collected by the state as part of vehicle registration and passed through to the SCAQMD, is used to fund projects of local cities that reduce motor vehicle air pollutants. The Clean Fuels Program, funded by a surcharge on motor vehicle registrations in the SCAQMD, reduces TAC emissions through co-funding projects to develop and demonstrate low-emission clean fuels and advanced technologies, and to promote commercialization and deployment of promising or proven technologies in Southern California.

3.2.2.1.3.10 *Carl Moyer Program*

Another program that targets diesel emission reductions is the Carl Moyer program which provides grants for projects that achieve early or extra emission reductions beyond what is required by regulations. Examples of eligible projects include cleaner on-road, off-road, marine, locomotive, and stationary agricultural pump engines. Other endeavors of the SCAQMD's Technology Advancement Office help to reduce diesel PM emissions through co-funding research and demonstration projects of clean technologies, such as low-emitting locomotives.

3.2.2.1.3.11 *Control of TACs with Risk Reduction Audits and Plans*

Senate Bill (SB) 1731, enacted in 1992 and codified at HSC §44390 et seq., amended AB 2588 to include a requirement for facilities with significant risks to prepare and implement a risk reduction plan which will reduce the risk below a defined significant risk level within specified time limits. SCAQMD Rule 1402 - Control of Toxic Air Contaminants From Existing Sources, was adopted on April 8, 1994, to implement the requirements of SB 1731.

In addition to the TAC rules adopted by SCAQMD under authority of AB 1807 and SB 1731, the SCAQMD has adopted source-specific TAC rules, based on the specific level of TAC emitted and the needs of the area. These rules are similar to the state's ATCMs because they are source-specific and only address emissions and risk from specific compounds and operations.

3.2.2.1.3.12 *Multiple Air Toxics Exposure Studies*

Multiple Air Toxics Exposure Study (MATES)

In 1986, SCAQMD conducted the first MATES Study to determine the Basin-wide risks associated with major airborne carcinogens. At the time, the state of technology was such that only twenty known air toxic compounds could be analyzed and diesel exhaust

particulate did not have an agency accepted carcinogenic health risk value. Toxic air contaminants are determined by the U.S. EPA, and by the Cal/EPA, including the Office of Environmental Health Hazard Assessment and the ARB. For purposes of MATES, the California carcinogenic health risk factors were used. The maximum combined individual health risk for simultaneous exposure to pollutants under the study was estimated to be 600 to 5,000 in one million.

Multiple Air Toxics Exposure Study II (MATES II)

At its October 10, 1997 meeting, the SCAQMD Governing Board directed staff to conduct a follow up to the MATES study to quantify the magnitude of population exposure risk from existing sources of selected air toxic contaminants at that time. The follow up study, MATES II, included a monitoring program of 40 known air toxic compounds, an updated emissions inventory of toxic air contaminants (including microinventories around each of the 14 microscale sites), and a modeling effort to characterize health risks from hazardous air pollutants. The estimated basin-wide carcinogenic health risk from ambient measurements was 1,400 per million people. About 70 percent of the basin wide health risk was attributed to diesel particulate emissions; about 20 percent to other toxics associated with mobile sources (including benzene, butadiene, and formaldehyde); about 10 percent of basin wide health risk was attributed to stationary sources (which include industrial sources and other certain specifically identified commercial businesses such as dry cleaners and print shops.)

Multiple Air Toxics Exposure Study III (MATES III)

MATES III was a follow up to previous air toxics studies in the Basin and was part of the SCAQMD Governing Board's 2003-04 Environmental Justice Workplan. The MATES III Study consists of several elements including a monitoring program, an updated emissions inventory of toxic air contaminants, and a modeling effort to characterize carcinogenic health risk across the Basin. Besides toxics, additional measurements include organic carbon, elemental carbon, and total carbon, as well as, Particulate Matter (PM), including PM_{2.5}. It did not estimate mortality or other health effects from particulate exposures. MATES III revealed a general downward trend in air toxic pollutant concentrations with an estimated basin-wide lifetime carcinogenic health risk of 1,200 in one million. Mobile sources accounted for 94 percent of the basin-wide lifetime carcinogenic health risk with diesel exhaust particulate contributing to 84 percent of the mobile source basin-wide lifetime carcinogenic health risk. Non-diesel carcinogenic health risk was reduced declined by 50 percent from the MATES II values.

3.2.2.2.4 *Health Effects*

3.2.2.2.4.1 *Carcinogenic Health Risks from Toxic Air Contaminants*

One of the primary health risks of concern due to exposure to TACs is the risk of contracting cancer. The carcinogenic potential of TACs is a particular public health concern because it is currently believed by many scientists that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of causing cancer. It is

currently estimated that about one in four deaths in the United States is attributable to cancer. About two percent of cancer deaths in the United States may be attributable to environmental pollution (Doll and Peto 1981). The proportion of cancer deaths attributable to air pollution has not been estimated using epidemiological methods.

3.2.2.2.4.2 *Non-Cancer Health Risks from Toxic Air Contaminants*

Unlike carcinogens, for most TAC non-carcinogens it is believed that there is a threshold level of exposure to the compound below which it will not pose a health risk. Cal/EPA's Office of Environmental Health Hazard Assessment (OEHHA) develops Reference Exposure Levels (RELs) for TACs which are health-conservative estimates of the levels of exposure at or below which health effects are not expected. The non-cancer health risk due to exposure to a TAC is assessed by comparing the estimated level of exposure to the REL. The comparison is expressed as the ratio of the estimated exposure level to the REL, called the hazard index (HI).

3.2.2.2 Climate Change

Global climate change is a change in the average weather of the earth, which can be measured by wind patterns, storms, precipitation, and temperature. Historical records have shown that temperature changes have occurred in the past, such as during previous ice ages. Data indicate that the current temperature record differs from previous climate changes in rate and magnitude.

Gases that trap heat in the atmosphere are often called greenhouse gases (GHGs), comparable to a greenhouse, which captures and traps radiant energy. GHGs are emitted by natural processes and human activities. The accumulation of greenhouse gases in the atmosphere regulates the earth's temperature. Global warming is the observed increase in average temperature of the earth's surface and atmosphere. The primary cause of global warming is an increase of GHGs in the atmosphere. The six major GHGs are carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), sulfur hexafluoride (SF₆), hydrofluorocarbons (HFCs), and perfluorocarbon (PFCs). The GHGs absorb longwave radiant energy emitted by the Earth, which warms the atmosphere. The GHGs also emit longwave radiation both upward to space and back down toward the surface of the Earth. The downward part of this longwave radiation emitted by the atmosphere is known as the "greenhouse effect." Emissions from human activities such as fossil fuel combustion for electricity production and vehicles have elevated the concentration of these gases in the atmosphere.

CO₂ is an odorless, colorless greenhouse gas. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic (human caused) sources of CO₂ are from burning coal, oil, natural gas, and wood.

CH₄ is a flammable gas and is the main component of natural gas. N₂O, also known as laughing gas, is a colorless greenhouse gas. Some industrial processes such as fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions also

contribute to the atmospheric load of N₂O. HFCs are synthetic man-made chemicals that are used as a substitute for chlorofluorocarbons (whose production was stopped as required by the Montreal Protocol) for automobile air conditioners and refrigerants. The two main sources of PFCs are primary aluminum production and semiconductor manufacture. SF₆ is an inorganic, odorless, colorless, nontoxic, nonflammable gas. SF₆ is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

Scientific consensus, as reflected in recent reports issued by the United Nations Intergovernmental Panel on Climate Change, is that the majority of the observed warming over the last 50 years can be attributable to increased concentration of GHGs in the atmosphere due to human activities. Industrial activities, particularly increased consumption of fossil fuels (e.g., gasoline, diesel, wood, coal, etc.), have heavily contributed to the increase in atmospheric levels of GHGs. The United Nations Intergovernmental Panel on Climate Change constructed several emission trajectories of greenhouse gases needed to stabilize global temperatures and climate change impacts. It concluded that a stabilization of greenhouse gases at 400 to 450 ppm carbon dioxide-equivalent concentration is required to keep global mean warming below two degrees Celsius, which is assumed to be necessary to avoid dangerous impacts from climate change.

The potential health effects from global climate change may arise from temperature increases, climate-sensitive diseases, extreme events, air quality impacts, and sea level rise. There may be direct temperature effects through increases in average temperature leading to more extreme heat waves and less extreme cold spells. Those living in warmer climates are likely to experience more stress and heat-related problems (e.g., heat rash and heat stroke). In addition, climate sensitive diseases may increase, such as those spread by mosquitoes and other disease carrying insects. Those diseases include malaria, dengue fever, yellow fever, and encephalitis. Extreme events such as flooding, hurricanes, and wildfires can displace people and agriculture, which would have negative consequences. Drought in some areas may increase, which would decrease water and food availability. Global warming may also contribute to air quality problems from increased frequency of smog and particulate air pollution.

The impacts of climate change will also affect projects in various ways. Effects of climate change are rising sea levels and changes in snow pack. The extent of climate change impacts at specific locations remains unclear. It is expected that Federal, State and local agencies will more precisely quantify impacts in various regions. As an example, it is expected that the California Department of Water Resources will formalize a list of foreseeable water quality issues associated with various degrees of climate change. Once state government agencies make these lists available, they could be used to more precisely determine to what extent a project creates global climate change impacts.

3.2.2.2.1 *Federal*

3.2.2.2.1.1 *Greenhouse Gas Endangerment Findings*

On December 7, 2009, the U.S. EPA Administrator signed two distinct findings regarding greenhouse gases under section 202(a) of the CAA (). The Endangerment Finding stated that CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆ taken in combination endanger both the public health and the public welfare of current and future generations. The Cause or Contribute Finding stated that the combined emissions from motor vehicles and motor vehicle engines contribute to the greenhouse gas air pollution that endangers public health and welfare. These findings were a prerequisite for implementing GHG standards for vehicles. The U.S. EPA and the National Highway Traffic Safety Administration (NHTSA) finalized emission standards for light-duty vehicles in May 2010 and for heavy-duty vehicles in August of 2011.

3.2.2.2.1.2 *Renewable Fuel Standard*

The RFS program was established under the Energy Policy Act (EPA) of 2005, and required 7.5 billion gallons of renewable-fuel to be blended into gasoline by 2012. Under the Energy Independence and Security Act (EISA) of 2007, the RFS program was expanded to include diesel, required the volume of renewable fuel blended into transportation fuel be increased from nine billion gallons in 2008 to 36 billion gallons by 2022, established new categories of renewable fuel and required U.S. EPA to apply lifecycle GHG performance threshold standards so that each category of renewable fuel emits fewer greenhouse gases than the petroleum fuel it replaces. The RFS is expected to reduce greenhouse gas emissions by 138 million metric tons, about the annual emissions of 27 million passenger vehicles, replacing about seven percent of expected annual diesel consumption and decreasing oil imports by \$41.5 billion.

3.2.2.2.1.3 *GHG Tailoring Rule*

On May 13, 2010, U.S. EPA finalized the Tailoring Rule to phase in the applicability of the PSD and Title V operating permit programs for GHGs. The rule was tailored to include the largest GHG emitters, while excluding smaller sources (restaurants, commercial facilities and small farms). The first step (January 2, 2011 to June 30, 2011) addressed the largest sources that contributed 65 percent of the stationary GHG sources. Title V GHG requirements were triggered only when affected facility owners/operators were applying, renewing or revising their permits for non-GHG pollutants. PSD GHG requirements were applicable only if sources were undergoing permitting actions for other non-GHG pollutants and the permitted action would increase GHG emission by 75,000 metric tons of CO₂e per year or more.

The second step (July 1, 2011 to June 30, 2013), included sources that emit or have the potential to emit 100,000 of CO₂e metric tons per year or more. Newly constructed sources that are not major sources for non-GHG pollutants would not be subject to PSD GHG requirements unless it emits 100,000 tons of CO₂e per year or more. Modifications to a major source would not be subject to PSD GHG requirements unless it generates a net

increase of 75,000 tons of CO₂e per year or more. Sources not subject to Title V would not be subject to Title V GHG requirements unless 100,000 tons of CO₂e per year or more would be emitted.

The third step of the Tailoring Rule was finalized on July 12, 2012. The third step determined not to lower the current PSD and Title V applicability thresholds for GHG-emitting sources established in the Tailoring Rule for Steps 1 and 2. The rule also promulgates regulatory revisions for better implementation of the federal program for establishing plantwide applicability limitations (PALs) for GHG emissions, which will improve the administration of the GHG PSD permitting programs.

3.2.2.2.1.4 *GHG Reporting Program*

U.S. EPA issued the Mandatory Reporting of Greenhouse Gases Rule (40 CFR Part 98) under the 2008 Consolidated Appropriations Act. The Mandatory Reporting of Greenhouse Gases Rule requires reporting of GHG data from large sources and suppliers under the Greenhouse Gas Reporting Program (GHGRP). Suppliers of certain products that would result in GHG emissions if released, combusted or oxidized; direct emitting source categories; and facilities that inject CO₂ underground for geologic sequestration or any purpose other than geologic sequestration are included. Facilities that emit 25,000 metric tons or more per year of GHGs in CO₂ equivalents (CO₂e) are required to submit annual reports to U.S. EPA. For the 2010 calendar, there were 6,260 entities that reported GHG data under this program, and 467 of the entities reporting were from California. Of the 3,200 million metric tons of CO₂e that were reported nationally, 112 million metric tons were from California. Power plants were the largest stationary source of direct U.S. GHG emissions with 2,326 million metric tons of CO₂e, followed by refineries with 183 million metric tons of CO₂e. CO₂ emissions accounted for largest share of direct emissions with 95 percent, followed by methane with four percent, and nitrous oxide and fluorinated gases representing the remaining one percent.

3.2.2.2.2 *State*

3.2.2.2.2.1 *Executive Order S-3-05*

In June 2005, then Governor Schwarzenegger signed Executive Order S-3-05, which established emission reduction targets. The goals would reduce GHG emissions to 2000 levels by 2010, then to 1990 levels by 2020, and to 80 percent below 1990 levels by 2050.

3.2.2.2.2.2 *AB 32: Global Warming Solutions Act*

On September 27, 2006, Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006, was enacted by the State of California and signed by Governor Schwarzenegger. AB 32 expanded on Executive Order #S-3-05. The legislature stated that “global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California.” AB 32 represents the first enforceable state-wide program in the United States to cap all GHG emissions from major industries that includes penalties for non-compliance. While acknowledging that national and international actions will be necessary to fully address the issue of global warming, AB 32 lays out a

program to inventory and reduce greenhouse gas emissions in California and from power generation facilities located outside the state that serve California residents and businesses.

AB 32 requires CARB to:

- Establish a statewide GHG emissions cap for 2020, based on 1990 emissions by January 1, 2008;
- Adopt mandatory reporting rules for significant sources of GHG by January 1, 2008;
- Adopt an emissions reduction plan by January 1, 2009, indicating how emissions reductions will be achieved via regulations, market mechanisms, and other actions; and
- Adopt regulations to achieve the maximum technologically feasible and cost-effective reductions of GHG by January 1, 2011.

The combination of Executive Order #S-3-05 and AB 32 will require significant development and implementation of energy efficient technologies and shifting of energy production to renewable sources.

Consistent with the requirement to develop an emission reduction plan, CARB prepared a Scoping Plan indicating how GHG emission reductions will be achieved through regulations, market mechanisms, and other actions. The Scoping Plan was released for public review and comment in October 2008 and approved by CARB on December 11, 2008. The Scoping Plan calls for reducing greenhouse gas emissions to 1990 levels by 2020. This means cutting approximately 30 percent from business-as-usual (BAU) emission levels projected for 2020, or about 15 percent from today's levels. Key elements of CARB staff's recommendations for reducing California's greenhouse gas emissions to 1990 levels by 2020 contained in the Scoping Plan include the following:

- Expansion and strengthening of existing energy efficiency programs and building and appliance standards;
- Expansion of the Renewables Portfolio Standard to 33 percent;
- Development of a California cap-and-trade program that links with other Western Climate Initiative (WCI) Partner programs to create a regional market system;
- Establishing targets for transportation-related greenhouse gases and pursuing policies and incentives to achieve those targets;
- Adoption and implementation of existing State laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard; and
- Targeted fees, including a public good charge on water use, fees on high GWP gases and a fee to fund the state's long-term commitment to AB 32 administration.

In response to the comments received on the Draft Scoping Plan and at the November 2008 public hearing, CARB made a few changes to the Draft Scoping Plan, primarily to:

- State that California “will transition to 100 percent auction” of allowances and expects to “auction significantly more [allowances] than the Western Climate Initiative minimum;”
- Make clear that allowance set-asides could be used to provide incentives for voluntary renewable power purchases by businesses and individuals and for increased energy efficiency;
- Make clear that allowance set-asides can be used to ensure that voluntary actions, such as renewable power purchases, can be used to reduce greenhouse gas emissions under the cap;
- Provide allowances are not required from carbon neutral projects; and
- Mandate that commercial recycling be implemented to replace virgin raw materials with recyclables.

3.2.2.2.3 *SB 97 - CEQA: Greenhouse Gas Emissions*

On August 24, 2007, Governor Schwarzenegger signed into law Senate Bill (SB) 97 – CEQA: Greenhouse Gas Emissions stating, “This bill advances a coordinated policy for reducing greenhouse gas emissions by directing the Office of Planning and Research (OPR) and the Resources Agency to develop CEQA guidelines on how state and local agencies should analyze, and when necessary, mitigate greenhouse gas emissions.” OPR’s amendments provided guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in draft CEQA documents. The amendments did not establish a threshold for significance for GHG emissions. The amendments became effective on March 18, 2010. SB 97 was repealed on January 1, 2010.

3.2.2.2.4 *Office of Planning and Research - Technical Advisory on CEQA and Climate Change*

Consistent with SB 97, on June 19, 2008, OPR released its “Technical Advisory on CEQA and Climate Change,” which was developed in cooperation with the Resources Agency, the Cal/EPA, and the CARB. According to OPR, the “Technical Advisory” offers the informal interim guidance regarding the steps lead agencies should take to address climate change in their CEQA documents, until CEQA guidelines are developed pursuant to SB 97 on how state and local agencies should analyze, and when necessary, mitigate greenhouse gas emissions.

According to OPR, lead agencies should determine whether greenhouse gases may be generated by a proposed project, and if so, quantify or estimate the GHG emissions by type and source. Second, the lead agency must assess whether those emissions are individually or cumulatively significant. When assessing whether a project’s effects on climate change are “cumulatively considerable” even though its GHG contribution may be individually limited, the lead agency must consider the impact of the project when viewed in connection

with the effects of past, current, and probable future projects. Finally, if the lead agency determines that the GHG emissions from the project as proposed are potentially significant, it must investigate and implement ways to avoid, reduce, or otherwise mitigate the impacts of those emissions.

In 2009, total California greenhouse gas emissions were 457 million metric tons of carbon dioxide equivalent (MMTCO₂e); net emissions were 453 MMTCO₂e, reflecting the influence of sinks (net CO₂ flux from forestry). While total emissions have increased by 5.5 percent from 1990 to 2009, emissions decreased by 5.8 percent from 2008 to 2009 (485 to 457 MMTCO₂e). The total net emissions between 2000 and 2009 decreased from 459 to 453 MMTCO₂e, representing a 1.3 percent decrease from 2000 and a 6.1 percent increase from the 1990 emissions level. The transportation sector accounted for approximately 38 percent of the total emissions, while the industrial sector accounted for approximately 20 percent. Emissions from electricity generation were about 23 percent with almost equal contributions from in-state and imported electricity.

Per capita emissions in California have slightly declined from 2000 to 2009 (by 9.7 percent), but the overall nine percent increase in population during the same period offsets the emission reductions. From a per capita sector perspective, industrial per capita emissions have declined 21 percent from 2000 to 2009, while per capita emissions for ozone depleting substances (ODS) substitutes saw the highest increase (52 percent).

From a broader geographical perspective, the state of California ranked second in the United States for 2007 greenhouse gas emissions, only behind Texas. However, from a per capita standpoint, California had the 46th lowest GHG emissions. On a global scale, California had the 14th largest carbon dioxide emissions and the 19th largest per capita emissions. The GHG inventory is divided into three categories: stationary sources, on-road mobile sources, and off-road mobile sources.

3.2.2.2.2.5 *AB 1493 Vehicular Emissions: Carbon Dioxide*

Prior to the U.S. EPA and NHTSA joint rulemaking, the Governor signed Assembly Bill (AB) 1493 (2002). AB 1493 requires that CARB develop and adopt, by January 1, 2005, regulations that achieve “the maximum feasible reduction of greenhouse gases emitted by passenger vehicles and light-duty trucks and other vehicles determined by CARB to be vehicles whose primary use is noncommercial personal transportation in the state.”

CARB originally approved regulations to reduce GHGs from passenger vehicles in September 2004, with the regulations to take effect in 2009. Amendments to CCR Title 13, Sections 1900 and 1961 (13 CCR 1900, 1961), and adoption of Section 1961.1 (13 CCR 1961.1). California’s first request to the U.S. EPA to implement GHG standards for passenger vehicles was made in December 2005 and denied in March 2008. The U.S. EPA then granted California the authority to implement GHG emission reduction standards for new passenger cars, pickup trucks and sport utility vehicles on June 30, 2009.

On April 1, 2010, the CARB filed amended regulations for passenger vehicles as part of California’s commitment toward the National Program to reduce new passenger vehicle

GHGs from 2012 through 2016. The amendments will prepare California to harmonize its rules with the federal Light-Duty Vehicle GHG Standards and CAFE Standards (discussed above).

3.2.2.2.2.6 *Senate Bill 1368 (2006)*

SB 1368 is the companion bill of AB 32 and was signed by Governor Schwarzenegger in September 2006. SB 1368 requires the California Public Utilities Commission (PUC) to establish a greenhouse gas emission performance standard for baseload generation from investor owned utilities by February 1, 2007. The California Energy Commission (CEC) must establish a similar standard for local publicly owned utilities by June 30, 2007. These standards cannot exceed the greenhouse gas emission rate from a baseload combined-cycle natural gas fired plant. The legislation further requires that all electricity provided to California, including imported electricity, must be generated from plants that meet the standards set by the PUC and CEC.

3.2.2.2.2.7 *Executive Order S-1-07 (2007)*

Governor Schwarzenegger signed Executive Order S-1-07 in 2007 which finds that the transportation sector is the main source of GHG emissions in California. The executive order proclaims the transportation sector accounts for over 40 percent of statewide GHG emissions. The executive order also establishes a goal to reduce the carbon intensity of transportation fuels sold in California by a minimum of 10 percent by 2020.

In particular, the executive order established a Low-Carbon Fuel Standard (LCFS) and directed the Secretary for Environmental Protection to coordinate the actions of the CEC, the ARB, the University of California, and other agencies to develop and propose protocols for measuring the “life-cycle carbon intensity” of transportation fuels. This analysis supporting development of the protocols was included in the State Implementation Plan for alternative fuels (State Alternative Fuels Plan adopted by CEC on December 24, 2007) and was submitted to CARB for consideration as an “early action” item under AB 32. CARB adopted the LCFS on April 23, 2009.

3.2.2.2.2.8 *Senate Bill 375 (2008)*

SB 375, signed in September 2008, aligns regional transportation planning efforts, regional GHG reduction targets, and land use and housing allocation. As part of the alignment, SB 375 requires Metropolitan Planning Organizations (MPOs) to adopt a Sustainable Communities Strategy (SCS) or Alternative Planning Strategy (APS) which prescribes land use allocation in that MPO’s Regional Transportation Plan (RTP). CARB, in consultation with MPOs, is required to provide each affected region with reduction targets for GHGs emitted by passenger cars and light trucks in the region for the years 2020 and 2035. These reduction targets will be updated every eight years but can be updated every 4 years if advancements in emissions technologies affect the reduction strategies to achieve the targets. CARB is also charged with reviewing each MPO’s SCS or APS for consistency with its assigned GHG emission reduction targets. If MPOs do not meet the GHG reduction

targets, transportation projects located in the MPO boundaries would not be eligible for funding programmed after January 1, 2012.

CARB appointed the Regional Targets Advisory Committee (RTAC), as required under SB 375, on January 23, 2009. The RTAC's charge was to advise ARB on the factors to be considered and methodologies to be used for establishing regional targets. The RTAC provided its recommendation to CARB on September 29, 2009. CARB must adopt final targets by September 30, 2010.

3.2.2.2.2.9 *Executive Order S-13-08 (2008)*

Governor Schwarzenegger signed Executive Order S-13-08 on November 14, 2008 which directs California to develop methods for adapting to climate change through preparation of a statewide plan. The executive order directs OPR, in cooperation with the Resources Agency, to provide land use planning guidance related to sea level rise and other climate change impacts by May 30, 2009. The order also directs the Resources Agency to develop a state Climate Adaptation Strategy by June 30, 2009 and to convene an independent panel to complete the first California Sea Level Rise Assessment Report. The assessment report is required to be completed by December 1, 2010 and required to meet the following four criteria:

1. Project the relative sea level rise specific to California by taking into account issues such as coastal erosion rates, tidal impacts, El Niño and La Niña events, storm surge, and land subsidence rates;
2. Identify the range of uncertainty in selected sea level rise projections;
3. Synthesize existing information on projected sea level rise impacts to state infrastructure (e.g., roads, public facilities, beaches), natural areas, and coastal and marine ecosystems; and
4. Discuss future research needs relating to sea level rise in California.

3.2.2.2.2.10 *Senate Bills 1078 and 107 and Executive Order S-14-08 (2008)*

SB 1078 (Chapter 516, Statutes of 2002) requires retail sellers of electricity, including investor owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2017. SB 107 (Chapter 464, Statutes of 2006) changed the target date to 2010. In November 2008, then Governor Schwarzenegger signed Executive Order S-14-08, which expands the state's Renewable Portfolio Standard to 33 percent renewable power by 2020.

3.2.2.2.2.11 *SB X-1-2*

SB X1-2 was signed by Governor Edmund G. Brown, Jr., in April 2011. SB X1-2 created a new Renewables Portfolio Standard (RPS), which preempted the CARB's 33 percent Renewable Electricity Standard. The new RPS applies to all electricity retailers in the state including publicly owned utilities (POUs), investor-owned utilities, electricity service providers, and community choice aggregators. These entities must adopt the new RPS goals

of 20 percent of retail sales from renewables by the end of 2013, 25 percent by the end of 2016, and the 33 percent requirement by the end of 2020.

3.2.2.2.2 SCAQMD

The SCAQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the AQMP. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include support of the adoption of a California greenhouse gas emission reduction goal.

3.2.2.2.2.1 Basin GHG Policy and Inventory

The SCAQMD has established a policy, adopted by the SCAQMD Governing Board at its September 5, 2008 meeting, to actively seek opportunities to reduce emissions of criteria, toxic, and climate change pollutants. The policy includes the intent to assist businesses and local governments implementing climate change measures, decrease the agency's carbon footprint, and provide climate change information to the public. The SCAQMD will take the following actions:

1. Work cooperatively with other agencies/entities to develop quantification protocols, rules, and programs related to greenhouse gases;
2. Share experiences and lessons learned relative to the Regional Clean Air Incentives Market (RECLAIM) to help inform state, multi-state, and federal development of effective, enforceable cap-and-trade programs. To the extent practicable, staff will actively engage in current and future regulatory development to ensure that early actions taken by local businesses to reduce greenhouse gases will be treated fairly and equitably. SCAQMD staff will seek to streamline administrative procedures to the extent feasible to facilitate the implementation of AB 32 measures;
3. Review and comment on proposed legislation related to climate change and greenhouse gases, pursuant to the 'Guiding Principles for SCAQMD Staff Comments on Legislation Relating to Climate Change' approved at the [SCAQMD Governing Board's](#) Special Meeting in April 2008;
4. Provide higher priority to funding Technology Advancement Office (TAO) projects or contracts that also reduce greenhouse gas emissions;
5. Develop recommendations through a public process for an interim greenhouse gas CEQA significance threshold, until such time that an applicable and appropriate statewide greenhouse gas significance level is established. Provide guidance on analyzing greenhouse gas emissions and identify mitigation measures. Continue to consider GHG impacts and mitigation in SCAQMD lead agency documents and in comments when SCAQMD is a responsible agency;
6. Revise the SCAQMD's Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning to include information on greenhouse gas strategies as a resource for local governments. The Guidance Document will be consistent with state guidance, including CARB's Scoping Plan;

7. Update the Basin's greenhouse gas inventory in conjunction with each Air Quality Management Plan. Information and data used will be determined in consultation with CARB, to ensure consistency with state programs. Staff will also assist local governments in developing greenhouse gas inventories;
8. Bring recommendations to the [SCAQMD Governing Board](#) on how the agency can reduce its own carbon footprint, including drafting a Green Building Policy with recommendations regarding SCAQMD purchases, building maintenance, and other areas of products and services. Assess employee travel as well as other activities that are not part of a GHG inventory and determine what greenhouse gas emissions these activities represent, how they could be reduced, and what it would cost to offset the emissions;
9. Provide educational materials concerning climate change and available actions to reduce greenhouse gas emissions on the SCAQMD website, in brochures, and other venues to help cities and counties, businesses, households, schools, and others learn about ways to reduce their electricity and water use through conservation or other efforts, improve energy efficiency, reduce vehicle miles traveled, access alternative mobility resources, utilize low emission vehicles and implement other climate friendly strategies; and
10. Conduct conferences, or include topics in other conferences, as appropriate, related to various aspects of climate change, including understanding impacts, technology advancement, public education, and other emerging aspects of climate change science.

On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for projects where the SCAQMD is lead agency. SCAQMD's recommended interim GHG significance threshold proposal uses a tiered approach to determining significance. Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA. Tier 2 consists of determining whether or not the project is consistent with a GHG reduction plan that may be part of a local general plan, for example. Tier 3 establishes a screening significance threshold level to determine significance using a 90 percent emission capture rate approach, which corresponds to 10,000 metric tons of CO₂ equivalent emissions per year (MTCO₂e/year). Tier 4, to be based on performance standards, is yet to be developed. Under Tier 5 the project proponent would allow offsets to reduce GHG emission impacts to less than the proposed screening level. If CARB adopts statewide significance thresholds, SCAQMD staff plans to report back to the [SCAQMD Governing Board](#) regarding any recommended changes or additions to the SCAQMD's interim threshold.

Table 3.2-10 presents the GHG emission inventory by major source categories in calendar year 2008, as identified in the 2012 AQMP, for Basin. The emissions reported herein are based on in-basin energy consumption and do not include out-of-basin energy production (e.g., power plants, crude oil production) or delivery emissions (e.g., natural gas pipeline loss). Three major GHG pollutants have been included: the CO₂, N₂O, and CH₄. These GHG emissions are reported in MMTCO₂e. Mobile sources generate 59.4 percent of the

equipment, airport equipment, oil and gas drilling equipment. The remaining 40.6 percent of the total Basin GHG emissions are from stationary and area sources. The largest stationary/area source is fuel combustion, which is 27.8 percent of the total Basin GHG emissions (68.6 percent of the GHG emissions from the stationary and area source category).

3.2.2.3 Air Quality – Ozone Depletion

The Montreal Protocol on Substances that Deplete the Ozone Layer (Montreal Protocol) is an international treaty designed to phase out halogenated hydrocarbons (chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons (HCFCs)), which are considered ozone depleting substances (ODSs). The Montreal Protocol was first signed in September 16, 1987 and has been revised seven times. The United States ratified the original Montreal Protocol and each of its revisions.

3.2.2.3.1 *Federal*

Under Title VI of the CAA, U.S. EPA is responsible for programs that protect the stratospheric ozone layer. Title 40, Part 82 of the Code of Federal Regulations contains U.S. EPA's regulations to protect the ozone layer. U.S. EPA regulations phase out the production and import of ODSs consistent with the Montreal Protocol. ODSs are typically used as refrigerants or as foam blowing agents. ODS are regulated as Class I or Class II controlled substances. Class I substances have a higher ozone-depleting potential and have been completely phased out in the U.S., except for exemptions allowed under the Montreal Protocol. Class II substances are hydrochlorofluorocarbons (HCFCs), which are transitional substitutes for many Class I substances and are being phased out.

3.2.2.3.2 *State*

3.2.2.3.2.1 *AB 32: Global Warming Solutions Act*

Some ODS exhibit high global warming potentials. As stated in Section 3.2.2.2.23-1, ARB developed a cap and trade regulation under AB 32. The cap and trade regulation includes the Compliance Offset Protocol Ozone Depleting Substances Projects, which provides methods to quantify and report GHG emission reductions associated with the destruction of high global warming potential ODS sourced from and destroyed within the U.S. that would have otherwise been released to the atmosphere. The protocol must be used to quantify and report GHG reductions under the ARB's GHG Cap and Trade Regulation.

3.2.2.3.2.2 *Refrigerant Management Program*

As part AB 32, ARB adopted a regulation (Refrigerant Management Program) in 2009 to reduce GHG emissions from stationary sources through refrigerant leak detection and monitoring, leak repair, system retirement and retrofitting, reporting and recordkeeping, and proper refrigerant cylinder use, sale, and disposal.

3.2.2.3.2.3 *HFC Emission Reduction Measures for Mobile Air Conditioning - Regulation for Small Containers of Automotive Refrigerant*

The automotive refrigerant small containers regulation applies to the sale, use, and disposal of small containers of automotive refrigerant with a GWP greater than 150. Emission reductions are achieved through implementation of four requirements: 1) use of a self-sealing valve on the container, 2) improved labeling instructions, 3) a deposit and recycling program for small containers, and 4) an education program that emphasizes best practices for vehicle recharging. This regulation went into effect on January 1, 2010 with a one-year sell-through period for containers manufactured before January 1, 2010. The target recycle rate is initially set at 90 percent, and rose to 95 percent beginning January 1, 2012.

3.2.2.3.2 *SCAQMD*

The SCAQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy targeted a transition away from chlorofluorocarbons (CFCs) as an industrial refrigerant and propellant in aerosol cans. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives for ODSs:

- phase out the use and corresponding emissions of chlorofluorocarbons (CFCs), methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995;
- phase out the large quantity use and corresponding emissions of hydrochlorofluorocarbons (HCFCs) by the year 2000;
- develop recycling regulations for HCFCs; and
- develop an emissions inventory and control strategy for methyl bromide.

3.2.3.3.2.1 *Rule 1122 – Solvent Degreasers*

Rule 1112 applies to all persons who own or operate batch-loaded cold cleaners, open-top vapor degreasers, all types of conveyORIZED degreasers, and air-tight and airless cleaning systems that carry out solvent degreasing operations with a solvent containing Volatile Organic Compounds (VOCs) or with a NESHAP halogenated solvent. Some ODSs (carbon tetrachloride and 1,1,1-trichloroethane) are NESHAP halogenated solvents.

3.2.2.3.2.2 *Rule 1171 – Solvent Cleaning Operations*

Rule 1171 reduces emissions of volatile organic compounds (VOCs), toxic air contaminants, and stratospheric ozone-depleting or globalwarming compounds from the use, storage and disposal of solvent cleaning materials in solvent cleaning operations and activities

3.2.2.3.2.3 *Rule 1411 - Recovery or Recycling of Refrigerants from Motor Vehicle Air Conditioners*

Rule 1411 prohibits release or disposal of refrigerants used in motor vehicle air conditioners and prohibits the sale of refrigerants in containers which contain less than 20 pounds of refrigerant.

3.2.2.3.2.4 *Rule 1415 - Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems*

Rule 1415 reduces emissions of high-global warming potential refrigerants from stationary air conditioning systems by requiring persons subject to this rule to reclaim, recover, or recycle refrigerant and to minimize refrigerant leakage.

3.2.2.3.2.5 *Rule 1418 - Halon Emissions from Fire Extinguishing Equipment*

Rule 1418 reduce halon emissions by requiring the recovery and recycling of halon from fire extinguishing systems, by limiting the use of halon to specified necessary applications, and by prohibiting the sale of portable halon fire extinguishers that contain less than five pounds of halon.

SUBCHAPTER 3.3

ENERGY

Regulatory Setting

Energy Trends in General (Statewide)

Alternative Clean Transportation Fuels

Renewable Energy

Consumptive Uses

3.3 ENERGY

This subsection describes existing regulatory setting relative energy production and demand, including alternative and renewable fuels, and trends within California and the district.

3.3.1 Regulatory Setting

Federal and state agencies regulate energy use and consumption through various means and programs. On the federal level, the United States Department of Transportation (U.S. DOT), United States Department of Energy (U.S. DOE), and United States Environmental Protection Agency (U.S. EPA) are three agencies with substantial influence over energy policies and programs. Generally, federal agencies influence transportation energy consumption through establishment and enforcement of fuel economy standards for automobiles and light trucks, through funding of energy related research and development projects, and through funding for transportation infrastructure projects.

On the state level, the California Public Utilities Commission (CPUC) and California Energy Commission (CEC) are two agencies with authority over different aspects of energy. The CPUC regulates privately-owned utilities in the energy, rail, passenger transportation, telecommunications, and water fields. The CEC collects and analyzes energy-related data, prepares state-wide energy policy recommendations and plans, promotes and funds energy efficiency and renewable energy resources programs, plans and directs state response to energy emergencies, and regulates the power plant siting and transmission process. Some of the more relevant federal and state transportation-energy-related laws and plans are discussed in the following subsections.

3.3.1.1 Federal Regulations

3.3.1.1.1 Energy Policy and Conservation Act

The Energy Policy and Conservation Act of 1975 sought to ensure that all vehicles sold in the U.S. would meet certain fuel economy goals. Through this Act, Congress established the first fuel economy standards for on-road motor vehicles in the U.S. Pursuant to the Act, the National Highway Traffic and Safety Administration, which is part of the U.S. DOT, is responsible for establishing additional vehicle standards and for revising existing standards. Since 1990, the fuel economy standard for new passenger cars has been 27.5 miles per gallon. Since 1996, the fuel economy standard for new light trucks (gross vehicle weight of 8,500 pounds or less) has been 20.7 miles per gallon. Heavy-duty vehicles (e.g., vehicles and trucks over 8,500 pounds gross vehicle weight) are not currently subject to fuel economy standards. Compliance with federal fuel economy standards is not determined for each individual vehicle model, but rather, compliance is determined on the basis of each manufacturer's average fuel economy for the portion of their vehicles produced for sale in the U.S. The Corporate Average Fuel Economy (CAFE) program, which is administered by U.S. EPA, was created to determine vehicle manufacturers' compliance with the fuel economy standards. The U.S. EPA calculates a CAFE value for each manufacturer based on city and highway fuel economy test results and vehicle sales. Based on the information

generated under the CAFE program, the U.S. DOT is authorized to assess penalties for noncompliance.

3.3.1.1.2 National Energy Act

The National Energy Act of 1978 included the following statutes: Energy Tax Act, National Energy Conservation Policy Act, Power Plant and Industrial Fuel Use Act, and the National Gas Policy Act. The Power Plant and Industrial Fuel Use Act restricted the fuel used in power plants, however, these restrictions were lifted in 1987. The Energy Tax Act was superseded by the Energy Policy Acts of 1992 and 2005. The National Gas Policy Act gave the Federal Energy Regulatory Commission authority over natural gas production and established pricing guidelines. The National Energy Conservation Policy Act (NECPA). The NECPA set minimum energy performance standards, which replaced those in the EPCA. The federal standards preempted state standards. The NECPA was amended by the Energy Policy and Conservation Act Amendments of 1985.

3.3.1.1.3 Public Utility Regulatory Policies Act of 1978 (PURPA) (Public Law 95-617)

PURPA was passed in response to the unstable energy climate of the late 1970s. PURPA sought to promote conservation of electric energy. Additionally, PURPA created a new class of nonutility generators, small power producers, from which, along with qualified co-generators, utilities are required to buy power.

PURPA was in part intended to augment electric utility generation with more efficiently produced electricity and to provide equitable rates to electric consumers. Utility companies are required to buy all electricity from qualifying facilities (Qfs) at avoided cost (avoided costs are the incremental savings associated with not having to produce additional units of electricity). PURPA expanded participation of nonutility generators in the electricity market and demonstrated that electricity from nonutility generators could successfully be integrated with a utility's own supply. PURPA requires utilities to buy whatever power is produced by Qfs (usually cogeneration or renewable energy). The Fuel Use Act (FUA) of 1978 (repealed in 1987) also helped Qfs become established. Under FUA, utilities were not allowed to use natural gas to fuel new generating technologies, but Qfs, which were by definition not utilities, were able to take advantage of abundant natural gas and abundant new technologies (such as combined-cycle).

3.3.1.1.4 Energy Policy Act of 1992

The Energy Policy Act of 1992 is comprised of twenty-seven titles. It addressed clean energy use and overall national energy efficiency to reduce dependence on foreign energy, incentives for clean, radioactive waste protection standards, and renewable energy and energy conservation in buildings and efficiency standards for appliances.

3.3.1.1.5 Energy Policy Act of 2005

The Energy Policy Act of 2005 addresses energy efficiency; renewable energy requirements; oil, natural gas and coal; alternative-fuel use; tribal energy, nuclear security; vehicles and

vehicle fuels, hydropower and geothermal energy, and climate change technology. The Act provides revised annual energy reduction goals (two percent per year beginning in 2006), revised renewable energy purchase goals, federal procurement of Energy Star or Federal Energy Management Program-designated products, federal green building standards, and fuel cell vehicle and hydrogen energy system research and demonstration.

3.3.1.1.6 Clean Air Act

Section 211(o) of the Clean Air Act (the Act), as amended by the Energy Policy Act of 2005, requires the Administrator of the U.S. Environmental Protection Agency (U.S. EPA) to annually determine a renewable fuel standard (RFS), which is applicable to refiners, importers, and certain blenders of gasoline, and publish the standard in the Federal Register by November 30 of each year. On the basis of this standard, each obligated party determines the volume of renewable fuel that it must ensure is consumed as motor vehicle fuel. This standard is calculated as a percentage, by dividing the amount of renewable fuel that the Act requires to be blended into gasoline for a given year by the amount of gasoline expected to be used during that year, including certain adjustments specified by the Act.

3.3.1.1.7 Corporate Average Fuel Economy (CAFE) Program

Compliance with federal fuel economy standards is determined on the basis of each manufacturer's average fuel economy for the portion of their vehicles produced for sale in the U.S. The CAFE program, which is administered by the U.S. EPA, was created to determine vehicle manufacturers' compliance with the fuel economy standards. The U.S. EPA calculates a CAFE value for each manufacturer based on city and highway fuel economy test results and vehicle sales. Based on the information generated under the CAFE program, the USDOT is authorized to assess penalties for noncompliance.

3.3.1.1.8 Energy Independence and Security Act of 2007 (EISA)

The Energy Independence and Security Act of 2007 was signed into law by President Bush on December 19, 2007. The Act's objectives are to move the United States toward greater energy independence and security, increase the production of clean renewable fuels, protect consumers, increase the efficiency of products, buildings and vehicles, promote greenhouse gas research, improve the energy efficiency of the Federal government, and improve vehicle fuel economy.

The renewable fuel standard in the Act requires 36 billion gallons of ethanol per year by 2022, with corn ethanol limited to 15 billion gallons. The new CAFE standard is for light duty vehicles 35 miles per gallon by 2020. The Act also specifies that vehicle attribute-based standards are to be developed separately for cars and light trucks. The Act creates a CAFE credit and transfer program among manufacturers and across a manufacturer's fleet. It would allow an extension through 2019 of the CAFE credits specified under the Alternative Motor Fuels Act. It establishes appliance energy efficiency standards for boilers, dehumidifiers, dishwashers, clothes washers, external power supplies, commercial walk-in coolers and freezers, federal buildings; lighting energy efficiency standards for

general service incandescent lighting in 2012; and standards for industrial electric motor efficiency

3.3.1.2 State Regulations

The CEC and CPUC have jurisdiction over the investor-owned utilities (IOUs) in California. Within the district, the CEC also collects information for the Los Angeles Department of Water and Power (LADWP) and the Burbank, Glendale and Pasadena Municipal Utilities. The applicable state regulations, laws, and executive orders relevant to energy use are discussed below.

3.3.1.2.1 *California Building Energy Efficiency Standards: Title 24*

California established statewide building energy efficiency standards following legislative action. The legislation required the standards to be cost-effective based on the building life cycle and to include both prescriptive and performance-based approaches. The 2005 Building Energy Efficiency Standards were adopted in November 2003, took effect October 1, 2005, and followed by a 2008 update.

3.3.1.2.2 *AB 1007, Alternative Fuels Plan*

Assembly Bill (AB) 1007, (Pavley, Chapter 371, Statutes of 2005) requires the CEC to prepare a state plan to increase the use of alternative fuels in California (Alternative Fuels Plan). The CEC prepared the plan in partnership with CARB, and in consultation with the other state, federal and local agencies in December 2007. The Alternative Fuels Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality.

3.3.1.2.3 *AB 1493, Vehicle Climate Change Standards*

AB 1493 required the state to develop and adopt regulations that achieve the maximum feasible and cost-effective reduction of climate change emissions emitted by passenger vehicles and light-duty trucks. Regulations were adopted by CARB in September 2004. Compliance with these standards is expected to improve fuel efficiency.

3.3.1.2.4 *Senate Bill (SB) 1368, Greenhouse Gas Emissions Performance Standard for Major Power Plant Investments*

This law requires the CEC to develop and adopt by regulation a greenhouse gas emissions performance standard for long-term procurement of electricity by local publicly-owned utilities. The CEC must adopt the standard on or before June 30, 2007 and must be consistent with the standard adopted by the CPUC for load-serving entities under their jurisdiction on or before February 1, 2007. On January 25, 2007, and on May 23, 2007, respectively, the CPUC and the CEC adopted specific regulations regarding greenhouse gas emissions performance standards for IOUs and other electricity service providers under SB 1368. Compliance with these standards is expected to improve fuel use.

3.3.1.2.5 *California Solar Initiative*

On January 12, 2006, the CPUC approved the California Solar Initiative (CSI), which provides \$2.9 billion in incentives between 2007 and 2017. CSI is part of the Go Solar California campaign, and builds on 10 years of state solar rebates offered to California's IOU territories: Pacific Gas & Electric (PG&E), Southern California Edison (SCE), and San Diego Gas & Electric (SDG&E.) The California Solar Initiative is overseen by the CPUC, and includes a \$2.5 billion program for commercial and existing residential customers, funded through revenues and collected from gas and electric utility distribution rates. Furthermore, the CEC will manage \$350 million targeted for new residential building construction, utilizing funds already allocated to the CEC to foster renewable projects between 2007 and 2011.

Current incentives provide an upfront, capacity-based payment for a new system. In its August 24, 2006 decision, the CPUC shifted the program from volume-based to performance-based incentives and clarified many elements of the program's design and administration. These changes were enacted in 2007, when the CSI incentive system changed to performance-based payments.

3.3.1.2.6 *Reducing California's Petroleum Dependence*

The CEC and CARB produced a joint report Reducing California's Petroleum Dependence to highlight petroleum consumption and to establish a performance based goal to reduce petroleum consumption in California over the next thirty years. The report includes the following recommendations to the Governor and Legislature regarding petroleum:

- Adopt the recommended statewide goal of reducing demand for on-road gasoline and diesel to 15 percent below the 2003 demand level by 2020 and maintaining that level for the foreseeable future.
- Work with the California delegation and other states to establish national fuel economy standards that double the fuel efficiency of new cars, light trucks, and sport utility vehicles.
- Establish a goal to increase the use of non-petroleum fuels to 20 percent of on-road fuel consumption by 2020, and 30 percent by 2030.

The CEC will use these recommendations when developing its series of recommendations to the Governor and Legislature for the integrated energy plan for electricity, natural gas, and transportation fuels.

3.3.1.2.7 *Renewables Portfolio Standard*

California's renewables portfolio standard (RPS) requires retail sellers of electricity to increase their procurement of eligible renewable energy resources by at least one percent per year so that 20 percent of their retail sales are procured from eligible renewable energy resources by 2017. If a seller falls short in a given year, they must procure more renewables in succeeding years to make up the shortfall. Once a retail seller reaches 20 percent, they

need not increase their procurement in succeeding years. RPS was enacted via SB 1078 (Sher), signed September 2002 by Governor Davis. The CEC and the CPUC are jointly implementing the standard. In 2006, RPS was modified by Senate Bill 107 to require retail sellers of electricity to reach the 20 percent renewables goal by 2010. In 2011, RPS was further modified by Senate Bill 2 to require retailers to reach 33 percent renewable energy by 2020.

3.3.1.2.8 *California Environmental Quality Act (CEQA)*

Appendix F of the CEQA Guidelines describes the types of information and analyses related to energy conservation that are to be included in EIRs that are prepared pursuant to CEQA. In Appendix F of the CEQA Guidelines, energy conservation is described in terms of decreased per capita energy consumption, decreased reliance on natural gas and oil, and increased reliance on renewable energy sources. To assure that energy implications are considered in project decisions, EIRs must include a discussion of the potentially significant energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful and unnecessary consumption of energy.

3.3.1.3 Local Regulations

3.3.1.1.1 *Clean Cities Program*

The U.S. DOE Clean Cities Program promotes voluntary, locally based government/industry partnerships for the purpose of expanding the use of alternatives to gasoline and diesel fuel by accelerating the deployment of alternative fuel vehicles and building a local alternative fuel vehicle refueling infrastructure. The mission of the Clean Cities Program is to advance the nation's and energy security by supporting local decisions to adopt practices that contribute to the reduction of petroleum consumption. Clean Cities carries out this mission through a network of more than 80 volunteer coalitions, which develop public/private partnerships to promote alternative fuels and vehicles, fuel blends, fuel economy, hybrid vehicles, and idle reduction.

3.3.1.1.2 *San Gabriel Valley Energy Efficiency Partnership*

In April 2006, the SCAG's Regional Council authorized SCAG's Executive Director to enter into a partnership with SCE to incentivize energy efficiency programs in the San Gabriel Valley Subregion. The San Gabriel Valley Energy Wise Program (SGVEWP) agreement was fully executed on October 20, 2006 with the main goal to save a combined three million kilowatt-hours (kWh) by providing technical assistance and incentive packages to cities by 2008. The program has been extended seeks to reduce energy usage in the region by approximately five million kWh by 2012. The SGVEWP is funded by California utility customers and administered by SCE under the auspices of the CPUC.

3.3.2 Energy Trends In General (Statewide)

Figure 3.3-1 shows California's major sources of energy. In 2010, 71 percent of the electricity came from in-state sources, while 29 percent was imported into the state. The

electricity imported totaled 85,169 gigawatt hours (GWh), with 24,677 GWh coming from the Pacific Northwest, and 60,492 GWh from the Southwest. (Note: A gigawatt is equal to one million kilowatts). For natural gas in 2010, 42 percent came from the Southwest, 22 percent from Canada, 12 percent from in-state, and 23 percent from the Rockies. Also in 2010, 38 percent of the crude oil came from in state, with 12 percent coming from Alaska, and 50 percent being supplied by foreign sources (CEC, 2012).

Source: California Energy Commission

FIGURE 3.3-1

California's Major Sources of Energy

3.3.2.1 Electricity

Power plants in California provided approximately 71 percent of the total in-state electricity demand in 2010 of which 15 percent came from renewable sources such as biomass, geothermal, small hydro, solar, and wind. The Pacific Northwest provided another 8.5 percent of the total electricity demand of which 31 percent came from renewable sources. The Southwestern U.S. provided 20.8 percent of the total electricity demand, with 11.1 percent coming from renewable sources. In total, 13.7 percent of the total in-state electricity demand for 2010 came from renewable sources (CEC, 2012a). Five of the state's largest power plants are located in Basin (U.S. Energy Information Administration, 2012). The largest power plants in California are located in northern California. The Moss Landing Natural Gas Power Plant (net summer capacity 2,529 megawatts (MW)) is located in Monterey Bay in Monterey County and the Diablo Canyon Nuclear Plant (net summer

capacity 2,240 MW) is located in Avila Beach in San Luis Obispo County. The third and fourth largest power plants in California are the San Onofre Nuclear Generating Station (net summer capacity 2,150 MW) in San Diego and the AES Alamitos Natural Gas Power Generating Station (net summer capacity 1,997 MW) in Long Beach in Los Angeles County. The San Onofre Nuclear Generating Station is operated by Southern California Edison International, San Diego Gas & Electric Company, and the City of Riverside Utilities Department. It is currently not operating while it is undergoing repairs. [The Los Angeles Department of Water and Power \(LADWP\)](#) ~~County~~ operates [the](#) state's fifth and sixth largest power plants: [the Castaic Pump-Storage Power Plant¹](#) in Castaic (net summer capacity 1,620 MW) and Haynes Natural Gas Power Plant (net summer capacity 1,524MW) in Long Beach. The seventh and eighth largest power plants in California are outside of the Basin: the Ormond Beach Natural Gas Power Plant (net summer capacity 1,516 MW) in City and County of Oxnard and Pittsburg Natural Gas Power Plant (net summer capacity 1,311 MW) in the City of Pittsburg in Contra Costa County. The AES Redondo Beach Natural Gas Power Plant (net summer capacity 1,310 MW) in Redondo Beach is the ninth largest in the state (AES, 2010). The Helms Pumped Storage (net summer capacity 1,212 MW) in Sierra National Forest of Fresno County is the tenth largest power plant in the state.

Local electricity distribution service is provided to customers within southern California by one of two investor-owned utilities – either SCE or SDG&E – or by a publicly owned utility, such as the Los Angeles Department of Water and Power (LADWP) and the Imperial Irrigation District. SCE is the largest electric utility company in Southern California with a service area that covers all or nearly all of Orange, San Bernardino, and Ventura Counties, and most of Los Angeles and Riverside Counties. SCE delivers 78 percent of the retail electricity sales to residents and businesses in southern California. SDG&E provides local distribution service to the southern portion of Orange County (SCAG, 2012).

The LADWP is the largest of the publicly owned electric utilities in southern California. LADWP provides electricity service to the most of the customers located in the City of Los Angeles and provides approximately 20 percent of the total electricity demand in the Basin. The other publicly owned utilities in southern California include Anaheim, Azusa, Banning, Burbank, Cerritos, Colton, Glendale, Pasadena, Riverside, Vernon, and the Imperial Irrigation District (SCAG, 2012).

Table 3.3-1 shows the amount of electricity delivered to residential and nonresidential entities in the counties in the Basin.

¹ [The Castaic Pump-Storage Power plant is operated by the LADWP in cooperation with the Department of Water Resources \(DWR\).](#)

TABLE 3.3-1

2011 Electricity Use GWh (Aggregated, includes self generation and renewables)

3.3.2.2 Natural Gas

Four regions supply California with natural gas. Three of them—the Southwestern U.S., the Rocky Mountains, and Canada—supplied 88 percent of all the natural gas consumed in California in 2010. The remainder is produced in California (CEC, 2012c).

Southern California Gas Company (SoCalGas), an investor-owned utility company, provides natural gas service throughout the district, except for the southern portion of Orange County, portions of San Bernardino County, and the City of Long Beach. The Long Beach Gas & Oil Department (LBGOD) is municipally owned and operated by the City of Long Beach, providing gas service for the cities of Long Beach and Signal Hill (LBGOD, 2012). San Diego Gas & Electric Company provides natural gas services to the southern portion of Orange County. In San Bernardino County, Southwest Gas Corporation provides natural gas services to Victorville, Big Bear, Barstow, and Needles (SCAG, 2012).

Table 3.3-2 provides the estimated use of natural gas in California by residential, commercial and industrial sectors. In 2010, about 50 percent of the natural gas consumed in California was for electric generation purposes (2,312 + 784/6,133).

California is currently ranked fourth among the oil producing states, behind Texas, Louisiana, and Alaska, respectively. Crude oil production in California averaged 629,500 barrels per day in 2009, a decline of 3.04 percent from 2008. Statewide oil production has declined to levels not seen since 1941 (DOGGR, [20092010](#)). California also ranks first in gasoline and jet fuel consumption and third in distillate fuel consumption (U.S. EIA, 2012).

3.3.2.3 Liquid Petroleum Fuels

California relies on oil produced within the state, Alaska, and foreign nations to supply its refineries and produce the petroleum that is used in automobiles and for other purposes. The percentage of oil that is imported from foreign nations has increased dramatically over the past 20 years. For example, in 1991, California imported just four percent of oil from

foreign sources (30.7 million barrels out of a total of 683.5 million barrels), and in 2011, California imported 49.9 percent of oil from foreign sources (300 million barrels out of a total of 600.7 million barrels). The long-term oil supply outlook for California remains one of declining in-state and Alaska supplies leading to increasing dependence on foreign oil sources (CEC, 2012d).

TABLE 3.3-2

California Natural Gas Demand 2010
(Million Cubic Feet per Day – MMcf/d)

Sector	Utility	Non-Utility	Total
Residential	1,193	--	1,193
Commercial	493	--	493

Total	4,729	1,403	6,133

Source: California Gas Report, 2010

Most gasoline and diesel fuel sold in California for on-road motor vehicles is refined in California to meet state-specific formulations required by CARB. Major petroleum refineries in California are concentrated in three counties: Contra Costa County in northern California, Kern County in central California, and Los Angeles County in southern California. In Los Angeles County, petroleum refineries are located mostly in the southern portion of the county (SCAG, 2012). In 2010 14,860 million gallons of gasoline and 1,414 million gallons of diesel were sold by retail facilities. Sales data reported does not include commercial fleets, government entities, private cardlocks (facilities open only to participating companies and not the general public), or rental facilities/equipment yards. The state total and sales by county are presented in Table 3.3.-3. In fiscal year 2011, 14,728,734,063 gallons of gasoline and 2,564,017,901 gallons of diesel were sold in California (California State Board of Equalization, 2012). The volume of gasoline also includes aviation fuel.

3.3.3 Alternative Clean Transportation Fuels

The demand for transportation fuels in California is increasing at a rapid rate. It is projected to grow by almost 35 percent over the next 20 years. Unless habits change, petroleum will be the primary source of California's transportation fuels for the foreseeable future. As demand continues to rise and in-state and Alaskan petroleum supplies diminish, California will rely more and more on foreign imports of crude oil (Consumer Energy Center, 2012).

TABLE 3.3-3

Retail Gasoline Sales by California Total and by County
(millions of gallons per year)

Description	California	Los Angeles	Orange	Riverside	San Bernardino
Gasoline ^a	14,860	3,658	1,406	952	902
Diesel ^b	1,414	235	47	93	149

^a CEC, 2012k

^b CEC, 2012l

Alternative fuels, as defined by the Energy Policy Act of 1992, include ethanol, natural gas, propane, hydrogen, biodiesel, electricity, methanol, and P-Series fuels, a family of renewable, non-petroleum liquid fuels that can substitute for gasoline. These fuels are being used worldwide in a variety of vehicle applications. Use of these fuels for transportation can generally reduce air pollutant emissions and can be domestically produced and, in some cases, derived from renewable sources. The Energy Policy Act of 2005 directed the U.S. DOE to carry out a study to plan for the transition from petroleum to hydrogen in a significant percentage of vehicles sold by 2020.

Use of renewable and other alternative fuels in the United States and California is expected to continue growing, primarily as a consequence of federal and state regulations mandating ever-increasing levels of renewable content in gasoline and diesel fuel, carbon reduction rules, and incentives for increasing alternative fuel consumption.

3.3.3.1 Biodiesel

Biodiesel is a domestically produced, renewable fuel that can be manufactured from vegetable oils, animal fats, or recycled restaurant greases. According to the U.S. DOE, pure biodiesel (B100) is considered an alternative fuel under Energy Policy Act. Lower-level biodiesel blends are not considered alternative fuels, but covered fleets can earn one Energy Policy Act credit for every 450 gallons of B100 purchased for use in blends of 20 percent or higher (SCAG, 2012).

Biodiesel is the only alternative fuel to have fully completed the health effects testing requirements under the Clean Air Act (CAA). The use of biodiesel in a conventional diesel engine results in substantial reductions of unburned hydrocarbons, carbon monoxide, and particulate matter compared to emissions from diesel fuel (Consumer Energy Center, 2012a).

Production of biodiesel in the United States dramatically increased in response to federal legislation that went into effect in 2005 included a \$1 per gallon blending credit for all biodiesel blended with conventional diesel fuel, but declined in 2009 and 2010 with the temporary loss of the subsidy in conjunction with poor production economics (high feedstock costs relative to market price of diesel fuel). Output is expected to rebound as refiners and other obligated parties strive to meet biodiesel blending requirements mandated

by the Renewables Fuels Standard Expansion (RFS2) and could set record levels of production (CEC, 2011).

Biodiesel use in California has been modest over the last several years due to an inadequate level of distribution infrastructure (lack of storage tanks at terminals) and varying approaches and interpretations of regulations controlling the concentration of biodiesel that is permissible in USTs. As such, biodiesel use in California is estimated to have been no higher than 20 million gallons over the last several years. Table 3.3-4 shows the reported retail sale of biodiesel was 1,673,555 gallons in 2010 (CEC, 2012m). Retail sales do not include distributed by commercial fleets, government entities, private cardlocks (unattended dispensing facilities not open to the public), rental facilities/equipment yards, and special user groups. Biodiesel use is expected to increase in California as the distribution and retail infrastructure improves, storage tank issues are fully resolved, and obligated parties under the state's LCFS turn to greater quantities of biodiesel to help achieve compliance with their sales of diesel fuel (CEC, 2011).

TABLE 3.3-4

Reported Retail Biodiesel Sales in California in 2010
(gallons per year)

Reporting Year	Conventional Fuel Component (Gallons)	Biodiesel Component (Gallons)	Total Biodiesel Throughput (Gallons)	Stations Reported
2010	926,043	747,512	1,673,555	44

Source: CEC, 2012m

3.3.3.2 Natural Gas

Natural gas is a mixture of hydrocarbons - mainly methane (CH₄) - and is produced either from gas wells or in conjunction with crude oil production worldwide and locally at relatively low cost. The interest in natural gas as an alternative fuel for automobiles stems mainly from its clean burning qualities, its domestic resource base, and its commercial availability to end users. Because of the gaseous nature of this fuel, it must be stored onboard a vehicle in either a compressed gaseous state (CNG) or in a liquefied state (LNG) (SCAG, 2012).

Natural gas vehicles have been introduced in a wide variety of commercial applications, from light-duty trucks and sedans (e.g., taxi cabs), to heavy-duty vehicles (e.g., transit buses, street sweepers, and school buses). In California, transit agency buses are some of the most visible CNG vehicles.

With consumption of natural gas increasing nationwide, 21 percent from 2006 to 2010 (U.S. EIA, 2012a), and California's demand expected to grow up to 96 percent in 2030 (CEC, 2011a), the fueling infrastructure for natural gas vehicles continues to grow. California has over 260 natural gas fueling stations. In southern California alone, there are more than 100 public fueling stations in major metropolitan areas from Los Angeles to the Mexican border (U.S. DOE, 2012).

3.3.3.3 Electricity

Electricity can be used as a transportation fuel to power battery electric and fuel cell vehicles. When used to power electric vehicles (EVs), electricity is stored in an energy storage device such as a battery. Fuel cell vehicles use electricity produced from an electrochemical reaction that takes place when hydrogen and oxygen are combined in the fuel cell "stack." The production of electricity using fuel cells takes place without combustion or pollution and leaves only two byproducts, heat and water.

Electric vehicles have several different charging systems: 120-volt, 240-volt, direct-current, and inductive charging. An electric vehicle that accepts 120-volt power can do so from any standard electrical outlet with a 12- or 16-amp dedicated branch circuit (with no other receptacles or loads on the circuit). A 240-volt system requires the installation of a home charging station and is available at most public charging stations. Direct current (DC) fast charging equipment (480 volt) provides 50 kW to the battery. This option enables charging along heavy traffic corridors and at public stations. Inductive charging equipment was installed for all electric vehicles in the early 1990s, such as the GM/Saturn EV-1, Toyota RAV4 EV, and the Chevy S10, and is still being used in certain areas. Some companies are working on inductive charging options for future electric drive vehicles. The most common types of EVs use either 120-volt or 240-volt electrical systems (SCAG, 2012).

The U.S. DOE's Advanced Vehicle Testing Activity (AVTA) promotes the use of EVs in commercial fleets in the United States. During 1996, AVTA requested and received proposals from interested groups to become qualified vehicle testers (QVT). SCE headed one QVT. According to SCE, California's approximately 20,000 megawatts of excess off-peak (nighttime) electricity capacity would allow the charging of millions of electro-drive technologies without the need for new power generation facilities (SCAG, 2012).

By 2020, the CEC estimates there will be more than 2.5 million plug-in electric vehicles (PEVs) in California. Over the 2011-2012 period, there will be significant investment in California's charging infrastructure. The Federal government's American Recovery and Reinvestment Act of 2009 funds matched with CEC program funds in California and other private and public funding are available to support PEV charging infrastructure for the deployment of PEVs in California. Currently there are about 250 public/commercial plug-in stations in Southern California, with more than 2,400 additionally planned (CEC, 2011).

One of the attractions of PEVs compared to internal combustion engine vehicles is the convenience of home charging instead of fueling at a gas station. ICF International estimates that in the early market, roughly 95 percent of charging will either be at home or at fleet facilities. Charging at home may require additional equipment and the broad consensus is that residential charging is the highest priority for deployment because consumers like the convenience and it encourages charging during periods of off-peak electrical demand. The CEC will consider providing PEV consumers with incentives to help defray the cost of home electric vehicle supply equipment (EVSE) (CEC, 2011).

3.3.3.4 Ethanol and E85

Ethanol, or ethyl alcohol, is a clear, colorless liquid that is the same alcohol that is found in alcoholic beverages. In California, ethanol is blended into gasoline (up to 10 percent) for use by most automobiles or in a more pure state (85 percent) as an alternative fuel.

As of June 2011, there was an estimated 472 million gallons of idle ethanol production capacity in the United States, about 3.2 percent of total production capacity of 14.65 billion gallons. Most of these facilities use corn as their sole or primary feedstock. The pace of construction and expansion of additional ethanol plants that use corn for a feed stock has slowed because the RFS2 regulations restrict affected facilities to use a maximum 15 billion gallons of year by 2015 of that corn based ethanol. Refiners and marketers can use even greater quantities of conventional ethanol but they would not earn additional RFS2 compliance credits.

Most ethanol used for fuel in California is being blended into gasoline at concentrations from five to ten percent, and has replaced methyl tertiary butyl ether (MTBE) as a gasoline component. Most gasoline supplied in the state today contains at least six percent ethanol (Consumer Energy Center, 2012b).

Blends of at least 85 percent ethanol are considered alternative fuels under the Energy Policy Act. E85, a blend of 85 percent ethanol and 15 percent gasoline is used in flexible fuel vehicles (FFVs) that are currently offered by most major auto manufacturers. FFVs can run on gasoline, E85, or any combination of the two and qualify as alternative fuel vehicles under Energy Policy Act regulations (SCAG, 2012).

In the United States, ethanol is most widely produced through fermentation and distillation of corn. Due to poor economic conditions, only three of the five California corn-based ethanol facilities are operating. These three facilities collectively produce 170 million gallons of ethanol per year. The two idle facilities have a production capacity of an additional 71 million gallons per year (CEC, 2011).

As of October 2009, there were nearly 409,636 registered FFVs in California which could use either gasoline or E85. Although there is a large population of FFVs in California, there are a modest but growing number of retail stations that offer E85. As of July 2011, there were approximately 60 stations that offered E85 to the public. Table 3.3-5 shows the reported retail sale of E85 was 1,995,812 gallons in 2010 (CEC, 2012m). Retail sales does not include distributed by commercial fleets, government entities, private cardlocks (unattended dispensing facilities not open to the public), rental facilities/equipment yards, and special user groups. With upgraded infrastructure and increasing availability of E85, sales in California are forecast to rise from 13.2 million gallons in 2009 to more than 3,000 million gallons by 2030 (CEC, 2011n).

During 2010, rail imports represented 95.8 percent of the ethanol consumed and in state production represented 4.2 percent. There were no marine imports of ethanol during 2010 due to unfavorable economics in foreign source countries. However, it is projected that ethanol imports from Brazil will be needed to meet demand mandated by the RFS2 and

LCFS requirements. Especially, since ethanol produced from sugarcane in Brazil is the type of commercially available ethanol that has the lowest carbon intensity

3.3.3.5 Methanol and M85

Methanol, also known as wood alcohol, can be used as an alternative fuel in flexible fuel vehicles that run on M85 (a blend of 85 percent methanol and 15 percent gasoline). Methanol was sold in California as part of a public-private partnership demonstration program between the state of California and oil companies. After the demonstration program ended, however, the oil companies discontinued selling M85. M85 is no longer available.

TABLE 3.3-5

Reported Retail E-85 Sales in California in 2010
(gallons per year)

Conventional Fuel Component)	Ethanol Component	Total E-85 Throughput	Count of Facilities

3.3.3.6 Hydrogen as a Transportation Fuel

Hydrogen is the simplest and lightest fuel. At atmospheric pressure and ambient temperatures hydrogen is a colorless, odorless, tasteless, and non-toxic gas that burns invisibly. Hydrogen is being explored for use in combustion engines and fuel cell electric vehicles. The ability to create hydrogen from a variety of resources and its clean-burning properties make it a desirable alternative fuel.

In 2011, there were approximately 250 hydrogen fuel cell vehicles (FCVs) operating in California, compared to only 15 registered in 2009. These vehicles use stored hydrogen, which is combined with oxygen from the atmosphere through an electrochemical reaction to produce electricity, which is then used to power an electric motor. Like battery electric vehicles, FCVs produce no tailpipe emissions and store the hydrogen fuel in on-board pressure tanks. Today's FCVs hold enough hydrogen in their on-board tanks to support driving ranges of roughly 250 miles. Current refueling is relatively quick, taking about three to five minutes per fill for a 700 bar tank (CEC, 2011).

Although there is no significant transportation distribution system currently for hydrogen transportation use, hydrogen could be transported and delivered using the established hydrogen infrastructure; for significant market penetration, the infrastructure will need further development (SCAG, 2012). Currently, there are 23 hydrogen stations in California, only five of which are public (U.S. DOE, 2012).

3.3.3.7 Propane (LPG)

Propane (C₃H₈) is a three-carbon alkane gas used as a clean-burning, high-energy alternative fuel for decades to power light-, medium-, and heavy-duty propane vehicles.

Propane, also known as liquefied petroleum gas (LPG) or autogas, is produced as a by-product of natural gas processing and petroleum refining. As an alternative fuel, it is stored under pressure inside a tank, as a colorless, odorless liquid and as pressure is released, the liquid propane vaporizes and turns into gas that is used for combustion. Propane has a high octane rating and excellent properties for spark-ignited internal combustion engines. It is non-toxic and presents no threat to soil, surface water, or groundwater.

Propane is a popular fuel choice for vehicles because there is already an infrastructure of pipelines, processing facilities, and storage for its efficient distribution. Domestic availability, high-energy density, clean-burning qualities, and its relatively low cost also add to its popularity.

Propane is the third most commonly used transportation fuel used in the United States, behind gasoline and diesel. Over time, propane has been used in several niche applications such as for fork-lifts, both inside and outside warehouses, and at construction sites. Use of propane can result in lower vehicle maintenance costs, lower emissions, and fuel costs savings when compared to conventional gasoline and diesel. In 2010, the California state fleet operated more than 1,100 vehicles that use propane as an alternative fuel and there are more than 2,200 facilities in California that dispense propane (U.S. DOE, 2012). Propane is an unregulated fuel in California (except for storage and safety issues). Prices are set by supply and demand. Because it is an unregulated commodity, no data is collected by the state on LPG sales or usage. The latest usage data presented by the CEC is that 26 million gallons of propane were dispensed in 2004 (CEC, 2012o).

3.3.4 Renewable Energy

Renewable energy is energy that comes from sources that regenerate and can be sustained indefinitely, unlike fossil fuels, which are exhaustible. The five most common renewable sources are biomass, hydropower, geothermal, wind, and solar. Unlike fossil fuels, non-biomass renewable sources of energy do not directly emit greenhouse gasses.

The production and use of renewable fuels has grown quickly in recent years as a result of higher prices for oil and natural gas, and a number of state and federal government incentives, including the Energy Policy Acts of 2002 and 2005. The use of renewable fuels is expected to continue to grow over the next 30 years, although projections show that reliance on non-renewable fuels to meet most energy needs will continue.

In 2011, consumption of renewable sources in the United States totaled about nine quadrillion British thermal units (Btu) or about nine percent of all energy used nationally. About 13 percent of U.S. electricity was generated from renewable sources in 2011 (U.S. EIA, 2012c). In 2009, 11.6 percent of all electricity came from renewable sources in California (CEC, 2012p).

The Renewables Portfolio Standard (RPS) requires investor-owned utilities, electric service providers, and community choice aggregators regulated by the CPUC to procure 33 percent of retail sales per year from eligible renewable sources by 2020. CPUC issues quarterly renewable energy progress report to the state Legislature, showing that the state's utilities

have met the goal of serving 20 percent of their electricity with renewable energy and are already on track to far surpass that goal in 2012 (CEC, 2012n). The quarterly reports report focuses on California's three large investor-owned utilities: Pacific Gas and Electric (PG&E), Southern California Edison (SCE), and San Diego Gas & Electric (SDG&E). These investor-owned utilities currently provide approximately 68 percent of the state's electric retail sales and analyzing this data provides significant insight into the state's RPS progress. On March 1, 2012, the large investor-owned utilities reported in their 2012 RPS Procurement Progress Reports that they served 20.6 percent of their electricity with RPS-eligible generation in 2011. Table 3.3-6 shows the renewable electricity use in Los Angeles, Orange, Riverside and San Bernardino in 2011.

TABLE 3.3-6

2011 Renewable Electricity Use in GW

Sector	Los Angeles	Orange	Riverside	San Bernardino	Total
Ag & Water Pump	5	0	3	1	10
Commercial	127	32	48	44	252
Industry	10	3	0	3	16

3.3.4.1 Hydroelectric Power

Hydroelectric power, or hydropower, is generated when hydraulic turbines connected to electrical generators are turned by the force of flowing or falling water. In 2007, hydro-produced electricity used by California totaled nearly 43,625 GWh or 14.5 percent of the total system power. In-state production accounted for 69.5 percent of all hydroelectricity, while imports from other states totaled 30.5 percent (CEC, 2012e).

California has nearly 343 hydroelectric facilities with an installed capacity about 13,057 MW. Hydro facilities are broken down into two categories: larger than 30 MW capacity facilities are called "large hydro"; smaller than 30 MW capacity facilities are considered "small hydro" and are totaled into the renewable energy portfolio standards. The amount of hydroelectricity produced varies each year, largely dependent on rainfall. During the drought from 1986 to 1992, production fell to less than 22,400 GWh (CEC, 2012e), while total generation increased from 211,028 GWh to 245,535 GWh over the same period of time.

The larger hydro plants on dams in California (such as Shasta, Folsom, Oroville, etc.) are operated by the U.S. Bureau of Reclamation and the state's Department of Water Resources. Smaller plants are operated by utilities, mainly PG&E and Sacramento Municipal Utility District. Licensing of hydro plants is done by the Federal Energy Regulatory Commission

with input from state and federal energy, environmental protection, fish and wildlife, and water quality agencies.

3.3.4.2 Geothermal Energy

Geothermal energy technologies use the clean, sustainable heat from the earth. Geothermal resources include the heat retained in shallow ground, hot water and rock found a few miles beneath the Earth's surface, and extremely high-temperature molten rock, also known as magma, located deep in the Earth. Geothermal energy can be used to generate electricity or used directly in many commercial and industrial applications.

The energy from high-temperature reservoirs (225°F - 600°F) can be used by three different types of geothermal power plants to produce electricity. Dry steam plants use steam from underground wells to rotate a turbine, which activates a generator to produce electricity. Binary cycle plants use the heat from lower-temperature reservoirs (225°F - 360°F) to boil a working fluid, which is then vaporized in a heat exchanger and used to power a generator. The water, which never comes into direct contact with the working fluid, is then injected back into the ground to be reheated. The flash stream plant, the most common type of geothermal power plant, uses water at temperatures above 360°F. As this hot water flows up through wells in the ground, the decrease in pressure causes some of the water to boil into steam which is then used to power a generator (U.S. DOE, 2012a).

The most developed of the high-temperature resource areas of the state is the Geysers. North of San Francisco, the Geysers were first tapped as a geothermal resource to generate electricity in 1960. It is one of only two locations in the world where a high-temperature, dry steam is found that can be directly used to turn turbines and generate electricity. Dry steam does not create condensation, which damages steam turbine blades. Other major geothermal locations in the state include the Imperial Valley area east of San Diego and the Coso Hot Springs area near Bakersfield.

Because of its location on the Pacific's "ring of fire" and because of tectonic plate conjunctions, California contains the largest amount of geothermal generating capacity in the United States. In 2007, geothermal energy in California produced 13,000 GWh of electricity. Combined with another 440 GWh of imported geothermal electricity, then geothermal energy produced 4.5 percent of the state's total system power. A total of 42 operating geothermal power plants with an installed capacity of 1,727 MW are in California, about two-thirds of the total United States' geothermal generation (CEC, 2012q).

Direct use systems harness the energy from low to moderate temperature reservoirs (68°-302°F) for various commercial and industrial uses, such as heating buildings, growing plants in greenhouses, drying crops, heating water at fish farms, and pasteurizing milk. Usually, a well is drilled into a geothermal reservoir to provide a steady stream of hot water. The water is brought up through the well, and a mechanical system -- piping, heat exchangers and controls -- delivers the heat directly for its intended use. A disposal system then either injects the cooled water underground or disposes of it on the surface (CEC, 2012f).

Forty-six of California's 58 counties have lower temperature resources for direct-use geothermal. In fact, the City of San Bernardino has developed one of the largest geothermal direct-use projects in North America, heating at least three dozen buildings - including a 15-story high-rise and government facilities - with fluids distributed through 15 miles of pipelines (Consumer Energy Center, 2012c).

3.3.4.3 Biomass Electricity

Biomass technologies break down organic matter to release stored energy from the sun. There are many types of biomass - organic matter such as plants, residue from agriculture and forestry, and the organic component of municipal and industrial wastes - that can now be used to produce fuels, chemicals, and power. This flexibility has resulted in the increased use of biomass technologies with 53 percent of all renewable energy consumed in the United States in 2007 coming from biomass (U.S. DOE, 2012b).

Biopower is the production of electricity or heat from biomass resources by technologies including direct combustion, co-firing, and anaerobic digestion.

3.3.4.3.1 *Direct Combustion*

Direct combustion using conventional boilers is the most common method of producing electricity from biomass. Boilers primarily burn waste wood products from the agriculture and wood-processing industries to produce steam that spins a turbine connected to a generator to produce electricity. Municipal solid waste power plants use direct combustion to create electricity through three methods:

- **Mass Burn:** Sorted municipal refuse is fed into a hopper to feed a boiler. The heat from the combustion process is used to turn water into steam to power a turbine-generator.
- **Refuse-Derived Fuel:** Pelletized or fluff municipal refuse, which comes from a by-product of a resource recovery operation where non-combustible materials are removed, are used to feed a boiler. The heat from the combustion process is used to turn water into steam to power a turbine-generator.
- **Pyrolysis/Thermal Gasification:** Related technologies where thermal decomposition of organic material at elevated temperatures with little (Thermal Gasification) to no (Pyrolysis) oxygen or air produces combustible gases. The gases are combusted to produce heat and turn water into steam to power a turbine-generator.

3.3.4.3.2 *Co-Firing*

Co-firing involves replacing a portion of the petroleum-based fuel in high-efficiency coal-fired boilers with biomass. Co-firing has been successfully demonstrated in most boiler technologies, including pulverized coal, cyclone, fluidized bed, and spreader stoker units.

Co-firing biomass can significantly reduce the sulfur dioxide emissions of coal-fired power plants and is a least-cost renewable energy option for many power producers.

3.3.4.3.3 *Anaerobic Digestion*

Anaerobic digestion, or methane recovery, is a common technology used to convert organic waste to electricity or heat. It is widely used in the agriculture, municipal waste, and brewing industries. In anaerobic digestion, organic matter is decomposed by bacteria in the absence of oxygen to produce methane and other byproducts that form a renewable natural gas (U.S. DOE, 2012b).

[The Los Angeles County Sanitation District \(LACSD\) operates a combined cycle turbine facility in Carson that uses digester gas to produce 20 MW. In addition, the LACSD operates a landfill gas Rankine cycle steam plant at the Puente Hills Landfill to produce approximately 48 MW.](#)

[Lastly, Royal Farms No. 1 in Tulare, California is a third example of uses—anaerobic digestion use at their facility.](#) Hog manure is slurried and sent to a Hypalon-covered lagoon for biogas generation. The collected biogas fuels a 70 kW engine-generator and a 100 kW engine-generator which helps the farm to be able to meet its own monthly electric and heat energy demand (CEC, 2012g).

There are about 132 waste-to-energy plants in California, with a total capacity of almost 1,000 MW. In 2007, 6,236 GWh of electricity in homes and businesses was produced from biomass: burning forestry, agricultural, and urban biomass; converting methane-rich landfill gas to energy; and processing wastewater and dairy biogas into useful energy. Biomass power plants produced 2.1 percent of the total electricity in California in 2007, or about one-fifth of all the renewable energy (CEC, 2012g).

3.3.4.4 Wind Power

Wind power is the conversion of the kinetic energy of the wind into a useful form of energy. Wind can be harnessed by wind turbines, windmills, windpumps, or sails. These technologies use wind power for practical purposes such as generating electricity, grinding grain, pumping water, or propelling a boat.

A wind turbine works much like the propeller of an airplane. The blades of a turbine are tilted at an angle and contoured such that the movement of the air is channeled creating low and high pressures on the blade that force it to move. The blade is connected to a shaft, which in turn is connected to an electrical generator. The mechanical energy of the turning blades is changed into electricity.

California has several wind farms, a group of wind turbines in the same location used to produce electricity, strategically placed in windy areas, as one of the problems with using wind to generate power is that wind is not always constant.

Wind energy plays an integral role in California's electricity portfolio. In 2007, turbines in wind farms generated 6,802 GWh of electricity - about 2.3 percent of the state's gross

system power. Additionally, hundreds of homes and farms are using smaller wind turbines to produce electricity (CEC, 2012h).

There are many windy areas in California. Problems with using wind to generate power are that it is not windy all year long nor is the wind speed constant. It is usually windier during the summer months when wind rushes inland from cooler areas, such as near the ocean, to replace hot rising air in California's warm central valleys and deserts. By placing wind turbines in these windy areas, California's wind power supply variance can be minimized. Utility-scale wind power generation facilities can be found in Altamont Pass, Solano, Pacheco Pass, the Tehachapi Ranges, and San Geronio Pass.

3.3.4.5 Solar (Photovoltaic Cells)

Solar energy technologies produce electricity from the energy of the sun through photovoltaic (PV) cells, also known as solar cells. PV cells are electricity-producing devices made of semiconductor materials coming in many sizes and shapes, often connected together to ultimately form PV systems. When light shines on a PV cell, the energy of absorbed light transfers to electrons in the atoms of the PV cell semiconductor material causing electrons to escape from their normal positions in the atoms and become part of the electric flow, or current, in an electrical circuit. While small PV systems can provide electricity for homes, businesses, and remote power needs, larger PV systems provide much more electricity for contribution to the electric power system.

The PV cells for small systems can be purchased in two formats: 1) as a stand-alone module that is attached to the roof or on a separate system; or, 2) using integrated roofing materials with dual functions -- as a regular roofing shingle and as a solar cell making electricity.

California's cumulative installed capacity of PV systems in 1998 was 6.3 MW. In 2008, the capacity of PV systems reached about 440 MW, producing 661.5 GWh of electricity for the state (CEC, 2012i).

3.3.4.6 Solar Thermal Energy

Solar thermal energy (STE) is the technology for converting the sun's energy into thermal energy (heat) through solar thermal collectors. The U.S. EIA classifies solar thermal collectors into three categories:

- Low-temperature: Flat plate collectors are used to warm homes, buildings, and swimming pools.
- Medium-temperature: Flat plate collectors are used to heat water or air for residential and commercial uses.
- High-temperature: Mirrors or lenses are used to concentrate STE for electric power production.

Low and medium-temperature collectors can be further classified as either passive or active heating systems. In a passive system, air is circulated past a solar heat surface and through the building by convection (meaning that less dense warm air tends to rise while denser cool

air moves downward). No mechanical equipment is needed for passive solar heating. Active heating systems require a collector to absorb and collect solar radiation. Fans or pumps are used to circulate the heated air or heat absorbing fluid. Active systems often include some type of energy storage system.

High-temperature systems used in solar thermal power plants use the sun's rays to heat a fluid to very high temperatures through the use of mirrors or lenses. The fluid is then circulated through pipes so it can transfer its heat to water to produce steam. The steam, in turn, is converted into mechanical energy in a turbine and into electricity by a conventional generator coupled to the turbine.

California has 11 of the 13 solar thermal power plants in the United States. These facilities are concentrated in the desert areas of the state in the Mojave area. Solar thermal plants produced 675 GWh in 2007, or 0.22 percent of the state's total electricity production (CEC, 2012i).

California's electric utility companies are required to use renewable energy to produce 20 percent of their power by 2010 and 33 percent by 2020 and a main source of the required renewable energy will be solar energy. Many large solar energy projects are being proposed in California's desert area on federal Bureau of Land Management (BLM) land. The developments of 34 large solar thermal power plants have been proposed with a planned combined capacity of 24,000 MW (CEC, 2012i).

3.3.5 Consumptive Uses

3.3.5.1 Transportation

Transportation (i.e., the movement of people and goods from place to place) is an important end use of energy in California, accounting for approximately 40 percent of total statewide energy consumption in 2010, and 11.3 percent of total U.S. energy consumption (U.S. EIA, 2012). Nonrenewable energy products derived from crude oil, including gasoline, diesel, kerosene, and residual fuel, provide most of the energy consumed for transportation purposes by on-road motor vehicles (e.g., automobiles and trucks), locomotives, aircraft, and ships. In addition, energy is consumed in connection with construction and maintenance of transportation infrastructure, such as highways, rail facilities, runways, and shipping terminals. Trends in transportation-related technology foretell increased use of electricity and natural gas for transportation purposes.

Transportation energy is derived from a wide variety of petroleum products. Automobiles and trucks consume gasoline and diesel fuel. Turbine aircraft consume kerosene fuel; trucks and locomotives consume diesel fuel; and ships consume residual fuel oil. The transportation sector consumes relatively minor amounts of natural gas or electricity but propelled mainly by air quality laws and regulations, technological innovations in transportation are expected to increasingly rely on compressed natural gas and electricity as energy sources. Biodiesel, derived from plant sources such as used vegetable oils, is a small but growing source of transportation fuel. Vehicles powered by fuels other than gasoline or diesel are referred to as "alternative fuel vehicles" (SCAG, 2008).

3.3.5.2 Residential, Commercial, Industrial, and Other Uses

Major energy consumption sectors (in addition to transportation) include residential, commercial, industrial uses as well as street lighting, mining, and agriculture. Unlike transportation, these sectors primarily consume electricity and natural gas. Total annual electricity consumption in the SCAG region is approximately 123,678 million kWh (39,432 kWh for residential uses and 84,246 kWh for nonresidential uses) (SCAG, 2008). The residential, commercial, and industrial sectors account for approximately 30, 39, and 19 percent, respectively, of total regional electricity consumption. The agriculture, mining and other uses account for another 14 percent (CEC, 2005).

Within the residential sector, lighting, small appliances, and refrigeration account for most (approximately 60 percent) of the electricity consumption, and within the industrial and commercial sector, lighting, motors, and air cooling account for most (approximately 65 percent) of the electricity consumption. Electricity use by households varies depending on the local climate and on the housing type (e.g., single-family vs. multi-family), as per the four distinct geographic zones in the SCAG region: the cooler and more temperate coastal zone; an inland valley zone; the California central valley zone, and the desert zone, where temperatures are more extreme.

Californians consumed approximately 12,774 million therms of natural gas per year in 2010 (CEC, 2012r). Approximately, 4,662 million therms of natural gas per year were consumed in Los Angeles, Orange, Riverside and San Bernardino Counties (CEC, 2012s). The California Energy Commission (CEC) expects residential natural gas use to increase by 1.3 percent per year and commercial natural gas use to increase by 1.8 percent per year. Industrial natural gas demand increased in 2010 over 2009. The most recent data from the CEC show that the residential sector uses the largest amount of natural gas, both across the state and in the SCAG region. Statewide, the industrial sector was second in the amount of natural gas consumed. The commercial sector falls behind residential, mining, and industrial uses in natural gas consumption in the SCAG region and statewide. The agricultural sector accounts for only one percent of the natural gas use statewide and in the SCAG region.

3.3.5.3 Consumption Reduction Efforts

There are various policies and initiatives to reduce petroleum vehicle fuel consumption and increase the share of renewable energy generation and use in the region. These strategies include energy efficient building practices, smarter land use with access to public transportation, increasing automobile fuel efficiency, and participating in energy efficiency incentive program. All publicly-owned utilities and most municipal-owned utilities that provide electric and natural gas service also administer energy conservation programs. These programs typically include home energy audits; incentives for replacement of existing appliances with new, energy-efficient models; provision of resources to inform businesses on development and operation of energy-efficient buildings; and construction of infrastructure to accommodate increased use of motor vehicles powered by natural gas or electricity (CEC, 2012s).

SUBCHAPTER 3.4

HAZARDS AND HAZARDOUS MATERIALS

Introduction

Hazardous Materials Regulations

Emergency Response to Hazardous Materials and Waste Incidents

Hazardous Materials Incidents

Hazards Associated with Air Pollution Control, Coating Reformulations, and Alternative Fuels

3.4 HAZARDS AND HAZARDOUS MATERIALS

3.4.1 Introduction

The goal of the 2012 AQMP is to attain the federal PM_{2.5} ambient air quality standards and make expeditious progress in attaining the federal one-hour and eight-hour ozone standards thereby improving air quality and protecting public health. Some of the proposed 2012 AQMP control measures intended to improve overall air quality may have direct or indirect hazards and hazardous materials impacts associated with their implementation. Hazard concerns are related to the potential for fires, explosions or the release of hazardous materials/substances in the event of an accident or upset conditions.

The potential for hazards exist in the production, use, storage, and transportation of hazardous materials. Hazardous materials may be found at industrial production and processing facilities. Some facilities produce hazardous materials as their end product, while others use such materials as an input to their production process. Examples of hazardous materials used as consumer products include gasoline, solvents, and coatings/paints. Hazardous materials are stored at facilities that produce such materials and at facilities where hazardous materials are a part of the production process. Specifically, storage refers to the bulk handling of hazardous materials before and after they are transported to the general geographical area of use. Currently, hazardous materials are transported throughout the district via all modes of transportation including rail, highway, water, air, and pipeline.

The Initial Study for the 2012 AQMP identified the use of reformulated coatings, solvents, and consumer products, potential exposure to toxic air contaminants, flammability and toxicity of reformulated products, add-on control devices (e.g., SCRs), and use of alternative fuels and fuel additives as possibly increasing the potential for hazards.

3.4.2 Hazardous Materials Regulations

Incidents of harm to human health and the environment associated with hazardous materials have created a public awareness of the potential for adverse effects from careless handling and/or use of these substances. As a result, the use, storage and transport of hazardous materials are subject to numerous laws and regulations at all levels of government. The most relevant existing hazardous materials laws and regulations include hazardous materials management planning, hazardous materials transportation, hazardous materials worker safety requirements, hazardous waste handling requirements and emergency response to hazardous materials and waste incidents. Potential risk of upset is a factor in the production, use, storage and transportation of hazardous materials. Risk of upset concerns are related to the risks of explosions or the release of hazardous substances in the event of an accident or upset. The most relevant hazardous materials laws and regulations are summarized in the following subsection of this section.

3.4.2.1 Definitions

A number of properties may cause a substance to be hazardous, including toxicity, ignitability, corrosivity, and reactivity. The term "hazardous material" is defined in different ways for different regulatory programs. For the purposes of this [Final](#) Program EIR, the term "hazardous materials" refers to both hazardous materials and hazardous wastes. A hazardous material is defined as hazardous if it appears on a list of hazardous materials prepared by a federal, state, or local regulatory agency or if it has characteristics defined as hazardous by such an agency. The California Health & Safety Code §25501 (k) defines hazardous material as follows:

"Hazardous material" means any material that because of its quantity, concentrations, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. "Hazardous materials" include but are not limited to hazardous substances, hazardous waste, and any material which a handler or the administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.

Examples of the types of materials and wastes considered hazardous are hazardous chemicals (e.g., toxic, ignitable, corrosive, and reactive materials), radioactive materials, and medical (infectious) waste. The characteristics of toxicity, ignitability, corrosivity, and reactivity are defined in Title 22, California Code of Regulations (CCR), §66261.20-66261.24 and are summarized below:

Toxic Substances: Toxic substances may cause short-term or long-lasting health effects, ranging from temporary effects to permanent disability, or even death. For example, such substances can cause disorientation, acute allergic reactions, asphyxiation, skin irritation, or other adverse health effects if human exposure exceeds certain levels. (The level depends on the substances involved and are chemical-specific.) Carcinogens (substances that can cause cancer) are a special class of toxic substances. Examples of toxic substances include benzene (a component of gasoline and a suspected carcinogen) and methylene chloride (a common laboratory solvent and a suspected carcinogen).

Ignitable Substances: Ignitable substances are hazardous because of their ability to burn. Gasoline, hexane, and natural gas are examples of ignitable substances.

Corrosive Materials: Corrosive materials can cause severe burns. Corrosives include strong acids and bases such as sodium hydroxide (lye) or sulfuric acid (battery acid).

Reactive Materials: Reactive materials may cause explosions or generate toxic gases. Explosives, pure sodium or potassium metals (which react violently with water), and cyanides are examples of reactive materials.

3.4.2.2 Federal Regulations

The U.S. EPA is the primary federal agency charged with protecting human health and with safeguarding the natural environment over air, water, and land. The U.S. EPA works to develop and enforce regulations that implement environmental laws enacted by Congress. The U.S. EPA is responsible for researching and setting national standards for a variety of environmental programs, and delegates to states and Indian tribes the responsibility for issuing permits and for monitoring and enforcing compliance. Since 1970, Congress has enacted numerous environmental laws that pertain to hazardous materials, for the U.S. EPA to implement as well as to other agencies at the federal, state and local level, as described in the following subsections.

3.4.2.2.1 *Toxic Substances Control Act*

The Toxic Substances Control Act (TSCA) was enacted by Congress in 1976 (see 15 U.S.C. §2601 et seq.) and gave the U.S. EPA the authority to protect the public from unreasonable risk of injury to health or the environment by regulating the manufacture, sale, and use of chemicals currently produced or imported into the United States. The TSCA, however, does not address wastes produced as byproducts of manufacturing. The types of chemicals regulated by the act fall into two categories: existing and new. New chemicals are defined as “any chemical substance which is not included in the chemical substance list compiled and published under [TSCA] section 8(b).” This list included all of chemical substances manufactured or imported into the United States prior to December 1979. Existing chemicals include any chemical currently listed under section 8 (b). The distinction between existing and new chemicals is necessary as the act regulates each category of chemicals in different ways. The U.S. EPA repeatedly screens both new and existing chemicals and can require reporting or testing of those that may pose an environmental or human-health hazard. The U.S. EPA can ban the manufacture and import of those chemicals that pose an unreasonable risk.

3.4.2.2.2 *Emergency Planning and Community Right-to-Know Act*

The Emergency Planning and Community Right-to-Know Act (EPCRA) is a federal law adopted by Congress in 1986 that is designed to help communities plan for emergencies involving hazardous substances. EPCRA establishes requirements for federal, state and local governments, Indian tribes, and industry regarding emergency planning and "Community Right-to-Know" reporting on hazardous and toxic chemicals. The Community Right-to-Know provisions help increase the public's knowledge and access to information on chemicals at individual facilities, their uses, and releases into the environment. States and communities, working with facilities, can use the information to improve chemical safety and protect public health and the environment. There are four major provisions of EPCRA:

- 1) Emergency Planning (Sections 301 – 303) requires local governments to prepare chemical emergency response plans, and to review plans at least annually. These sections also require state governments to oversee and coordinate local planning efforts. Facilities that maintain Extremely Hazardous Substances (EHS) on-site (see 40 CFR Part 355 for the list of EHS chemicals) in quantities greater than

corresponding Threshold Planning Quantities must cooperate in the preparation of the emergency plan.

- 2) Emergency Release Notification (Section 304) requires facilities to immediately report accidental releases of EHS chemicals and hazardous substances in quantities greater than corresponding Reportable Quantities (RQs) as defined under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) to state and local officials. Information about accidental chemical releases must be made available to the public.
- 3) Hazardous Chemical Storage Reporting (Sections 311 – 312) requires facilities that manufacture, process, or store designated hazardous chemicals to make Material Safety Data Sheets (MSDSs) describing the properties and health effects of these chemicals available to state and local officials and local fire departments. These sections also require facilities to report to state and local officials and local fire departments, inventories of all on-site chemicals for which MSDSs exist. Lastly, information about chemical inventories at facilities and MSDSs must be available to the public.
- 4) Toxic Chemical Release Inventory (Section 313) requires facilities to annually complete and submit a Toxic Chemical Release Inventory Form for each Toxic Release Inventory (TRI) chemical that are manufactured or otherwise used above the applicable threshold quantities.

Implementation of EPCRA has been delegated to the State of California. The California Emergency Management Agency requires facilities to develop a Hazardous Materials Business Plan if they handle hazardous materials in quantities equal to or greater than 55 gallons, 500 pounds, or 200 cubic feet of gas or extremely hazardous substances above the threshold planning quantity. The Hazardous Materials Business Plan is provided to State and local emergency response agencies and includes inventories of hazardous materials, an emergency plan, and implements a training program for employees.

3.4.2.2.3 *Hazardous Materials Transportation Act*

Hazardous Materials Transportation Act: The Hazardous Material Transportation Act (HMTA), adopted in 1975 (see 49 U.S.C. 5101 – 5127), gave the Secretary of Transportation the regulatory and enforcement authority to provide adequate protection against the risks to life and property inherent in the transportation of hazardous material in commerce. The United States Department of Transportation (U.S. DOT) (see 49 CFR Parts 171-180) oversees the movement of hazardous materials at the federal level. The Hazardous Materials Transportation Act requires that carriers report accidental releases of hazardous materials to U.S. DOT at the earliest practical moment. Other incidents that must be reported include deaths, injuries requiring hospitalization, and property damage exceeding \$50,000. The hazardous material regulations also contain emergency response provisions which include incident reporting requirements. Reports of major incidents go to the National Response Center, which in turn is linked with CHEMTREC, a public service hotline established by the chemical manufacturing industry for emergency responders to

obtain information and assistance for emergency incidents involving chemicals and hazardous materials.

The Research and Special Programs Administration (RSPA) of the U.S. DOT implements the hazardous materials regulations. The regulations cover the definition and classification of hazardous materials, communication of hazards to workers and the public, packaging and labeling requirements, operational rules for shippers, and training. These regulations apply to interstate, intrastate, and foreign commerce by air, rail, ships, and motor vehicles, and also cover hazardous waste shipments. The Federal Aviation Administration Office of Hazardous Materials Safety is responsible for overseeing the safe handling of hazardous materials aboard aircraft. The Federal Railroad Administration oversees the transportation of hazardous materials by rail. The U.S. Coast Guard regulates the bulk transport of hazardous materials by sea. The Federal Highway Administration (FHWA) is responsible for highway routing of hazardous materials and issuing highway safety permits.

3.4.2.2.4 Hazardous Materials Waste Regulations

Resource Conservation and Recovery Act: The Resource Conservation and Recovery Act (RCRA) was adopted in 1976 (see 40 CFR Parts 238-282) and authorizes the U.S. EPA to control the generation, transportation, treatment, storage, and disposal of hazardous waste. The RCRA regulation specifies requirements for generators, including waste minimization methods, as well as for transporters and for treatment, storage, and disposal facilities. The RCRA regulation also includes restrictions on land disposal of wastes and used oil management standards. Under RCRA, hazardous wastes must be tracked from the time of generation to the point of disposal. In 1984, RCRA was amended with addition of the Hazardous and Solid Waste Amendments, which authorized increased enforcement by the U.S. EPA, more strict hazardous waste standards, and a comprehensive Underground Storage Tank (UST) program. Likewise, the Hazardous and Solid Waste Amendments focused on waste reduction and corrective action for hazardous releases. The use of certain techniques for the disposal of some hazardous wastes was specifically prohibited by the Hazardous and Solid Waste Amendments. Individual states may implement their own hazardous waste programs under RCRA, with approval by the U.S. EPA.

Comprehensive Environmental Response, Compensation and Liability Act: The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), which is often commonly referred to as Superfund, is a federal statute that was enacted in 1980 to address abandoned sites containing hazardous waste and/or contamination. CERCLA was amended in 1986 by the Superfund Amendments and Reauthorization Act, and by the Small Business Liability Relief and Brownfields Revitalization Act of 2002.

CERCLA contains prohibitions and requirements concerning closed and abandoned hazardous waste sites; establishes liability of persons responsible for releases of hazardous waste at these sites; and creates a trust fund to provide for cleanup when no responsible party can be identified. The trust fund is funded largely by a tax on the chemical and petroleum industries. CERCLA also provides federal jurisdiction to respond directly to releases or impending releases of hazardous substances that may endanger public health or the environment.

CERCLA also enabled the revision of the National Contingency Plan (NCP) which provided the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, or contaminants. The NCP also established the National Priorities List, which identifies hazardous waste sites eligible for long-term remedial action financed under the federal Superfund program.

Prevention of Accidental Releases and Risk Management Programs: Requirements pertaining to the prevention of accidental releases are promulgated in Section 112 (r) of the Clean Air Act Amendments of 1990 [42 U.S.C. 7401 et. Seq.]. The objective of these requirements was to prevent the accidental release and to minimize the consequences of any such release of a hazardous substance. Under these provisions, facilities that produce, process, handle or store hazardous substance have a duty to: 1) identify hazards which may result from releases using hazard assessment techniques; 2) design and maintain a safe facility and take steps necessary to prevent releases; and, 3) minimize the consequence of accidental releases that occur.

In accordance with the requirements in Section 112 (r), U.S. EPA adopted implementing guidelines in 40 CFR Part 68. Under this part, stationary sources with more than a threshold quantity of a regulated substance shall be evaluated to determine the potential for and impacts of accidental releases from any processes subject to the federal risk management requirements. Under certain conditions, the owner or operator of a stationary source may be required to develop and submit a Risk Management Plan (RMP). RMPs consist of three main elements: a hazard assessment that includes off-site consequences analyses and a five-year accident history, a prevention program, and an emergency response program.

3.4.2.2.5 *Hazardous Material Worker Safety Requirements*

Occupational Safety and Health Administration Act: The federal Occupational Safety and Health Administration (OSHA) is an agency of the United States Department of Labor that was created by Congress under the Occupational Safety and Health Act in 1970. OSHA is the agency responsible for assuring worker safety in the handling and use of chemicals in the workplace. Under the authority of the Occupational Safety and Health Act of 1970, OSHA has adopted numerous regulations pertaining to worker safety (see 29 CFR Part 1910). These regulations set standards for safe workplaces and work practices, including the reporting of accidents and occupational injuries. Some OSHA regulations contain standards relating to hazardous materials handling to protect workers who handle toxic, flammable, reactive, or explosive materials, including workplace conditions, employee protection requirements, first aid, and fire protection, as well as material handling and storage. For example, facilities which use, store, manufacture, handle, process, or move hazardous materials are required to conduct employee safety training, have available and know how to use safety equipment, prepare illness prevention programs, provide hazardous substance exposure warnings, prepare emergency response plans, and prepare a fire prevention plan.

Subpart H is a pertinent section of 29 CFR Part 1910 which includes procedures and standards for safe handling, storage, operation, remediation, and emergency response activities involving hazardous materials and waste. Some key subsections in Subpart H include §1910.106 (Flammable and Combustible Liquids) and §1910.120 (Hazardous Waste

Operations and Emergency Response). The Hazardous Waste Operations and Emergency Response regulations contain requirements for worker training programs, medical surveillance for workers engaging in the handling of hazardous materials or wastes, and waste site emergency and remediation planning, for those who are engaged in specific clean-up, corrective action, hazardous material handling, and emergency response activities (see 29 CFR §1910.120 (a)(1)(i-v) and §1926.65 (a)(1)(i-v)).

Process Safety Management: As part of the numerous regulations pertaining to worker safety adopted by OSHA, specific requirements that pertain to Process Safety Management (PSM) of Highly Hazardous Chemicals were adopted in 29 CFR Part 1910.119 and 8 CCR §5189 to protect workers at facilities that have toxic, flammable, reactive or explosive materials. PSM program elements are aimed at preventing or minimizing the consequences of catastrophic releases of chemicals and include process hazard analyses, formal training programs for employees and contractors, investigation of equipment mechanical integrity, and an emergency response plan. Specifically, the PSM program requires facilities that use, store, manufacture, handle, process, or move hazardous materials to conduct employee safety training; have an inventory of safety equipment relevant to potential hazards; have knowledge on use of the safety equipment; prepare an illness prevention program; provide hazardous substance exposure warnings; prepare an emergency response plan; and prepare a fire prevention plan.

Emergency Action Plan: An Emergency Action Plan (EAP) is a written document required by OSHA standards promulgated in 29 CFR 1910.38 (a) to facilitate and organize a safe employer and employee response during workplace emergencies. An EAP is required by all that are required to have fire extinguishers. At a minimum, an EAP must include the following: 1) a means of reporting fires and other emergencies; 2) evacuation procedures and emergency escape route assignments; 3) procedures to be followed by employees who remain to operate critical plant operations before they evacuate; 4) procedures to account for all employees after an emergency evacuation has been completed; 5) rescue and medical duties for those employees who are to perform them; and, 6) names or job titles of persons who can be contacted for further information or explanation of duties under the plan.

National Fire Regulations: The National Fire Codes (NFC), Title 45, published by the National Fire Protection Association (NFPA) contains standards for laboratories using chemicals, which are not requirements, but are generally employed by organizations in order to protect workers. These standards provide basic protection of life and property in laboratory work areas through prevention and control of fires and explosions, and also serve to protect personnel from exposure to non-fire health hazards.

In addition to the NFC, the NFPA adopted a hazard rating system (e.g., NFPA 704). NFPA 704 is a “standard (that) provides a readily recognized, easily understood system for identifying specific hazards and their severity using spatial, visual, and numerical methods to describe in simple terms the relative hazards of a material. It addresses the health, flammability, instability, and related hazards that may be presented as short-term, acute exposures that are most likely to occur as a result of fire, spill, or similar emergency¹.” In

¹ NFPA, FAQ for Standard 704. <http://www.nfpa.org/faq.asp?categoryID=928&cookie%5Ftest=1#23057>

addition, the hazard ratings per NFPA 704 are used by emergency personnel to quickly and easily identify the risks posed by nearby hazardous materials in order to help determine what, if any, specialty equipment should be used, procedures followed, or precautions taken during the first moments of an emergency response. The scale is divided into four color-coded categories, with blue indicating level of health hazard, red indicating the flammability hazard, yellow indicating the chemical reactivity, and white containing special codes for unique hazards such as corrosivity and radioactivity. Each hazard category is rated on a scale from 0 (no hazard; normal substance) to 4 (extreme risk). Table 3.4-1 summarizes what the codes mean for each hazards category.

TABLE 3.4-1
NFPA 704 Hazards Rating Codes

Hazard Rating Code	Health (Blue)	Flammability (Red)	Reactivity (Yellow)	Special (White)
4 = Extreme	Very short exposure could cause death or major residual injury (extreme hazard)	Will rapidly or completely vaporize at normal atmospheric pressure and temperature, or is readily dispersed in air and will burn readily. Flash point below 73 °F.	Readily capable of detonation or explosive decomposition at normal temperatures and pressures.	W = Reacts with water in an unusual or dangerous manner.
3 = High	Short exposure could cause serious temporary or moderate residual injury	Liquids and solids that can be ignited under almost all ambient temperature conditions. Flash point between 73 °F and 100 °F.	Capable of detonation or explosive decomposition but requires a strong initiating source, must be heated under confinement before initiation, reacts explosively with water, or will detonate if severely shocked.	OXY = Oxidizer
2 = Moderate	Intense or continued but not chronic exposure could cause temporary incapacitation or possible residual injury.	Must be moderately heated or exposed to relatively high ambient temperature before ignition can occur. Flash point between 100 °F and 200 °F.	Undergoes violent chemical change at elevated temperatures and pressures, reacts violently with water, or may form explosive mixtures with water.	SA = Simple asphyxiant gas (includes nitrogen, helium, neon, argon, krypton and xenon).
1 = Slight	Exposure would cause irritation with only minor residual injury.	Must be heated before ignition can occur. Flash point over 200 °F.	Normally stable, but can become unstable at elevated temperatures and pressures	

TABLE 3.4-1 (Concluded)
 NFPA 704 Hazards Rating Codes

Hazard Rating Code	Health (Blue)	Flammability (Red)	Reactivity (Yellow)	Special (White)
0 = Insignificant	Poses no health hazard, no precautions necessary	Will not burn	Normally stable, even under fire exposure conditions, and is not reactive with water.	

In addition to the above information, there are also a number of other physical or chemical properties may cause a substance to be a fire hazard. With respect to determining whether any substance is classified as a fire hazard, MSDS lists the National Fire Protection Association 704 flammability hazard ratings (e.g., NFPA 704). NFPA 704 is a “standard (that) provides a readily recognized, easily understood system for identifying flammability hazards and their severity using spatial, visual, and numerical methods to describe in simple terms the relative flammability hazards of a material².”

Although substances can have the same NFPA 704 Flammability Ratings Code, other factors can make each substance’s fire hazard very different from each other. For this reason, additional chemical characteristics, such as auto-ignition temperature, boiling point, evaporation rate, flash point, lower explosive limit (LEL), upper explosive limit (UEL), and vapor pressure, are also considered when determining whether a substance is fire hazard. The following is a brief description of each of these chemical characteristics.

Auto-ignition Temperature: The auto-ignition temperature of a substance is the lowest temperature at which it will spontaneously ignite in a normal atmosphere without an external source of ignition, such as a flame or spark.

Boiling Point: The boiling point of a substance is the temperature at which the vapor pressure of the liquid equals the environmental pressure surrounding the liquid. Boiling is a process in which molecules anywhere in the liquid escape, resulting in the formation of vapor bubbles within the liquid.

Evaporation Rate: Evaporation rate is the rate at which a material will vaporize (evaporate, change from liquid to a vapor) compared to the rate of vaporization of a specific known material. This quantity is represented as a unitless ratio. For example, a substance with a high evaporation rate will readily form a vapor which can be inhaled or explode, and thus have a higher hazard risk. Evaporation rates generally have an inverse relationship to boiling points (i.e., the higher the boiling point, the lower the rate of evaporation).

Flash Point: Flash point is the lowest temperature at which a volatile liquid can vaporize to form an ignitable mixture in air. Measuring a liquid's flash point requires an ignition source. At the flash point, the vapor may cease to burn when the source of ignition is

² National Fire Protection Association, FAQ for Standard 704.
<http://www.nfpa.org/faq.asp?categoryID=928&cookie%5Ftest=1#23057>.

removed. There are different methods that can be used to determine the flashpoint of a solvent but the most frequently used method is the Tagliabue Closed Cup standard (ASTM D56), also known as the TCC. The flashpoint is determined by a TCC laboratory device which is used to determine the flash point of mobile petroleum liquids with flash point temperatures below 175 degrees Fahrenheit (79.4 degrees Centigrade).

Flash point is a particularly important measure of the fire hazard of a substance. For example, the Consumer Products Safety Commission (CPSC) promulgated Labeling and Banning Requirements for Chemicals and Other Hazardous Substances in 15 U.S.C. §1261 and 16 CFR Part 1500. Per the CPSC, the flammability of a product is defined in 16 CFR Part 1500.3 (c)(6) and is based on flash point. For example, a liquid needs to be labeled as: 1) "Extremely Flammable" if the flash point is below 20 degrees Fahrenheit; 2) "Flammable" if the flash point is above 20 degrees Fahrenheit but less than 100 degrees Fahrenheit; or, 3) "Combustible" if the flash point is above 100 degrees Fahrenheit up to and including 150 degrees Fahrenheit.

Lower Explosive Limit (LEL): The lower explosive limit of a gas or a vapor is the limiting concentration (in air) that is needed for the gas to ignite and explode or the lowest concentration (percentage) of a gas or a vapor in air capable of producing a flash of fire in presence of an ignition source (e.g., arc, flame, or heat). If the concentration of a substance in air is below the LEL, there is not enough fuel to continue an explosion. In other words, concentrations lower than the LEL are "too lean" to burn. For example, methane gas has a LEL of 4.4 percent (at 138 degrees Centigrade) by volume, meaning 4.4 percent of the total volume of the air consists of methane. At 20 degrees Centigrade, the LEL for methane is 5.1 percent by volume. If the atmosphere has less than 5.1 percent methane, an explosion cannot occur even if a source of ignition is present. When the concentration of methane reaches 5.1 percent, an explosion can occur if there is an ignition source.

Upper Explosive Limit (UEL): The upper explosive limit of a gas or a vapor is the highest concentration (percentage) of a gas or a vapor in air capable of producing a flash of fire in presence of an ignition source (e.g., arc, flame, or heat). Concentrations of a substance in air above the UEL are "too rich" to burn.

Vapor Pressure: Vapor pressure is an indicator of a chemical's tendency to evaporate into gaseous form.

Health Hazards Guidance: In addition to fire impacts, health hazards can also be generated due to exposure of chemicals present in both conventional as well as reformulated products. Using available toxicological information to evaluate potential human health impacts associated with conventional solvents and potential replacement solvents, the toxicity of the conventional solvents can be compared to solvents expected to be used in reformulated products. As a measure of a chemical's potential health hazards, the following values need to be considered: the Threshold Limit Values (TLVs) established by the American Conference of Governmental Industrial Hygiene (ACGIH), OSHA's Permissible Exposure Limits (PELs), the Immediately Dangerous to Life and Health (IDLH) levels recommended by the National Institute for Occupational Safety and Health (NIOSH),

permissible exposure limits (PEL) established by OSHA, and health hazards developed by the National Safety Council. The following is a brief description of each of these values.

Threshold Limit Values (TLVs): The TLV of a chemical substance is a level to which it is believed a worker can be exposed day after day for a working lifetime without adverse health effects. The TLV is an estimate based on the known toxicity in humans or animals of a given chemical substance, and the reliability and accuracy of the latest sampling and analytical methods. The TLV for chemical substances is defined as a concentration in air, typically for inhalation or skin exposure. Its units are in parts per million (ppm) for gases and in milligrams per cubic meter (mg/m³) for particulates. The TLV is a recommended guideline by ACGIH.

Permissible Exposure Limits (PEL): The PEL is a legal limit, usually expressed in ppm, established by OSHA to protect workers against the health effects of exposure to hazardous substances. PELs are regulatory limits on the amount or concentration of a substance in the air. A PEL is usually given as a time-weighted average (TWA), although some are short-term exposure limits (STEL) or ceiling limits. A TWA is the average exposure over a specified period of time, usually eight hours. This means that, for limited periods, a worker may be exposed to concentrations higher than the PEL, so long as the average concentration over eight hours remains lower. A short-term exposure limit is one that addresses the average exposure over a 15 to 30 minute period of maximum exposure during a single work shift. A ceiling limit is one that may not be exceeded for any period of time, and is applied to irritants and other materials that have immediate effects. The OSHA PELs are published in 29 CFR 1910.1000 Table Z1.

Immediately Dangerous to Life and Health (IDLH): IDLH is an acronym defined by NIOSH as exposure to airborne contaminants that is "likely to cause death or immediate or delayed permanent adverse health effects or prevent escape from such an environment." IDLH values are often used to guide the selection of breathing apparatus that are made available to workers or firefighters in specific situations.

3.4.2.2.6 Oil and Pipeline Regulations and Oversight

Oil Pollution Act: The Oil Pollution Act was signed into law in 1990 to give the federal government authority to better respond to oil spills (see 33 U.S.C. §2701). The Oil Pollution Act improved the federal government's ability to prevent and respond to oil spills, including provision of money and resources. The Oil Pollution Act establishes polluter liability, gives states enforcement rights in navigable waters of the State, mandates the development of spill control and response plans for all vessels and facilities, increases fines and enforcement mechanisms, and establishes a federal trust fund for financing clean-up.

The Oil Pollution Act also establishes the National Oil Spill Liability Trust Fund to provide financing for cases in which the responsible party is either not readily identifiable, or refuses to pay the cleanup/damage costs. In addition, the Oil Pollution Act expands provisions of the National Oil and Hazardous Substances Pollution Contingency Plan, more commonly called the National Contingency Plan, requiring the federal government to direct all public and private oil spill response efforts. It also requires area committees, composed of federal,

state, and local government officials, to develop detailed, location-specific area contingency plans. In addition, the Oil Pollution Act directs owners and operators of vessels, and certain facilities that pose a serious threat to the environment, to prepare their own specific facility response plans. The Oil Pollution Act increases penalties for regulatory non-compliance by responsible parties; gives the federal government broad enforcement authority; and provides individual states the authority to establish their own laws governing oil spills, prevention measures, and response methods. The Oil Pollution Act requires oil storage facilities and vessels to submit to the Federal government plans detailing how they will respond to large discharges. The U.S. EPA has published regulations for aboveground storage facilities and the Coast Guard has done the same for oil tankers.

Oil Pollution Prevention Regulation: In 1973, EPA issued the Oil Pollution Prevention regulation (see 40 CFR 112), to address the oil spill prevention provisions contained in the Clean Water Act of 1972. The Spill Prevention, Control, and Countermeasure (SPCC) Rule is part of the Oil Pollution Prevention regulations (see Subparts A through C of 40 CFR Part 112). Specifically, the SPCC rule includes requirements for oil spill prevention, preparedness, and response to prevent oil discharges to navigable waters and adjoining shorelines. The rule requires specific facilities to prepare, amend, and implement SPCC Plans. SPCC Plans require applicable facilities to take steps to prevent oil spills including: 1) using suitable storage containers/tanks; 2) providing overfill prevention (e.g., high-level alarms); 3) providing secondary containment for bulk storage tanks; 4) providing secondary containment to catch oil spills during transfer activities; and, 5) periodically inspecting and testing pipes and containers.

U.S. Department of Transportation, Office of Pipeline Safety: The Office of Pipeline Safety, within the U.S. DOT, Pipeline and Hazards Material Safety Administration, has jurisdictional responsibility for developing regulations and standards to ensure the safe and secure movement of hazardous liquid and gas pipelines under its jurisdiction in the United States. The Office of Pipeline Safety has the following key responsibilities:

- Support the operation of, and coordinate with the United States Coast Guard on the National Response Center and serve as a liaison with the Department of Homeland Security and the Federal Emergency Management Agency on matters involving pipeline safety;
- Develop and maintain partnerships with other federal, state, and local agencies, public interest groups, tribal governments, and the regulated industry and other underground utilities to address threats to pipeline integrity, service, and reliability and to share responsibility for the safety of communities;
- Administer pipeline safety regulatory programs and develops regulatory policy involving pipeline safety;
- Oversee pipeline operator implementation of risk management and risk-based programs and administer a national pipeline inspection and enforcement program;

- Provide technical and resource assistance for state pipeline safety programs to ensure oversight of intrastate pipeline systems and educational programs at the local level; and,
- Support the development and conduct of pipeline safety training programs for federal and state regulatory and compliance staff and the pipeline industry.

49 CFR Parts 178 – 185 relates to the role of transportation, including pipelines, in the United States. 49 CFR Parts 186-199 establishes minimum pipeline safety standards. The Office of the State Fire Marshal works in partnership with the Federal Pipeline and Hazardous Materials Safety Administration to assure pipeline operators are meeting requirements for safe, reliable, and environmentally sound operation of their facilities for intrastate pipelines within California.

Chemical Facility Anti-Terrorism Standards: The Federal Department of Homeland Security is responsible for implementing the Chemical Facility Anti-Terrorism Standards that were adopted in 2007 (see 6 CFR Part 27). These standards establish risk-based performance standards for the security of chemical facilities and require covered chemical facilities to prepare Security Vulnerability Assessments, which identify facility security vulnerabilities, and to develop and implement Site Security Plans.

3.4.2.3 State Regulations

3.4.2.3.1 *Hazardous Materials and Waste Regulations*

Hazardous Waste Control Law: California's Hazardous Waste Control Law is administered by the California Environmental Protection Agency (CalEPA) to regulate hazardous wastes within the State of California. While the California Hazardous Waste Control Law is generally more stringent than RCRA, both the state and federal laws apply in California. The California Department of Toxic Substances Control (DTSC) is the primary agency in charge of enforcing both the federal and state hazardous materials laws in California. The DTSC regulates hazardous waste, oversees the cleanup of existing contamination, and pursues avenues to reduce hazardous waste produced in California. The DTSC regulates hazardous waste in California under the authority of RCRA, the Hazardous Waste Control Law, and the California Health and Safety Code. Under the direction of the CalEPA, the DTSC maintains the Cortese and Envirostor databases of hazardous materials and waste sites as specified under Government Code §65962.5.

The Hazardous Waste Control Law (22 CCR Chapter 11, Appendix X) also lists 791 chemicals and approximately 300 common materials which may be hazardous; establishes criteria for identifying, packaging, and labeling hazardous wastes; prescribes management controls; establishes permit requirements for treatment, storage, disposal, and transportation; and identifies some wastes that cannot be disposed of in landfills.

California Occupational Safety and Health Administration: The California Occupational Safety and Health Administration (CalOSHA) is the primary state agency responsible for worker safety in the handling and use of chemicals in the workplace.

CalOSHA requires employers to monitor worker exposure to listed hazardous substances and notify workers of exposure (8 CCR Sections 337-340). The regulations specify requirements for employee training, availability of safety equipment, accident-prevention programs, and hazardous substance exposure warnings. CalOSHA's standards are generally more stringent than federal regulations.

Hazardous Materials Release Notification: Many state statutes require emergency notification when a hazardous chemical is released, including:

- California Health and Safety Code §25270.7, §25270.8, and §25507;
- California Vehicle Code §23112.5;
- California Public Utilities Code §7673 (General Orders #22-B, 161);
- California Government Code §51018 and §8670.25.5 (a);
- California Water Code §13271 and §13272; and,
- California Labor Code §6409.1 (b)10.

California Accident Release Prevention (CalARP) Program: The California Accident Release Prevention Program (19 CCR Division 2, Chapter 4.5) requires the preparation of Risk Management Plans (RMPs). CalARP requires stationary sources with more than a threshold quantity of a regulated substance to be evaluated to determine the potential for and impacts of accidental releases from any processes subject to state risk management requirements. RMPs are documents prepared by the owner or operator of a stationary source containing detailed information including: 1) regulated substances held onsite at the stationary source; 2) offsite consequences of an accidental release of a regulated substance; 3) the accident history at the stationary source; 4) the emergency response program for the stationary source; 5) coordination with local emergency responders; 6) hazard review or process hazard analysis; 7) operating procedures at the stationary source; 8) training of the stationary source's personnel; 9) maintenance and mechanical integrity of the stationary source's physical plant; and, 10) incident investigation. The CalARP program is implemented at the local government level by Certified Unified Program Agencies (CUPAs) also known as Administering Agencies (AAs). Typically, local fire departments are the administering agencies of the CalARP program because they frequently are the first responders in the event of a release.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program: The Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program) as promulgated by CalEPA in Title 27 CCR Chapter 6.11 requires the administrative consolidation of six hazardous materials and waste programs (program elements) under one agency, a CUPA. The Unified Program administered by the State of California consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities for the state's environmental and emergency management programs, which include Hazardous Waste

Generator and On-Site Hazardous Waste Treatment Programs (“Tiered Permitting”); Above ground SPCC Program; Hazardous Materials Release Response Plans and Inventories (business plans); the CalARP Program; the UST Program; and the Uniform Fire Code Plans and Inventory Requirements. The Unified Program is implemented at the local government level by CUPAs.

Hazardous Materials Management Act: The State of California (California Health and Safety Code Division 20, Chapter 6.95) requires any business handling more than a specified amount of hazardous or extremely hazardous materials, termed a "reportable quantity," to submit a Hazardous Materials Business Plan to its CUPA. Business plans must include an inventory of the types, quantities, and locations of hazardous materials at the facility. Businesses are required to update their business plans at least once every three years and the chemical portion of their plans every year. Also, business plans must include emergency response plans and procedures to be used in the event of a significant or threatened significant release of a hazardous material. These plans need to identify the procedures to follow for immediate notification to all appropriate agencies and personnel of a release, identification of local emergency medical assistance appropriate for potential accident scenarios, contact information for all company emergency coordinators, a listing and location of emergency equipment at the business, an evacuation plan, and a training program for business personnel. The requirements for hazardous materials business plans are specified in the California Health and Safety Code and 19 CCR.

Hazardous Materials Transportation in California: California regulates the transportation of hazardous waste originating or passing through the State in Title 13, CCR. The California Highway Patrol (CHP) and Caltrans have primary responsibility for enforcing federal and State regulations and responding to hazardous materials transportation emergencies. The CHP enforces materials and hazardous waste labeling and packing regulations that prevent leakage and spills of material in transit and provide detailed information to cleanup crews in the event of an incident. Vehicle and equipment inspection, shipment preparation, container identification, and shipping documentation are all part of the responsibility of the CHP. Caltrans has emergency chemical spill identification teams at locations throughout California.

California Fire Code: While NFC Standard 45 and NFPA 704 are regarded as nationally recognized standards, the California Fire Code (24 CCR) also contains state standards for the use and storage of hazardous materials and special standards for buildings where hazardous materials are found. Some of these regulations consist of amendments to NFC Standard 45. State Fire Code regulations require emergency pre-fire plans to include training programs in first aid, the use of fire equipment, and methods of evacuation.

3.4.2.4 Local Regulations

SCAQMD Rule 1166 – Volatile Organic Compound Emissions from Decontamination of Soil: SCAQMD Rule 1166 establishes requirements to control the emission of VOCs from excavating, grading, handling, and treating soil contaminated from leakage, spillage, or other means of VOCs deposition. Rule 1166 stipulates that any parties planning on excavating, grading, handling, transporting, or treating soils contaminated with VOCs must

first apply for and obtain, and operate pursuant to, a mitigation plan approved by the Executive Officer prior to commencement of operation. BACT is required during all phases of remediation of soil contaminated with VOCs. Rule 1166 also sets forth testing, record keeping and reporting procedures that must be followed at all times. Non-compliance with Rule 1166 can result in the revocation of the approved mitigation plan, the owner and/or the operator being served with a Notice of Violation for creating a public nuisance, or an order to halt the offending operation until the public nuisance is mitigated to the satisfaction of the Executive Officer.

Other Local Agencies: In addition to the SCAQMD, other local agencies throughout the four counties in the district and their respective fire departments have a variety of local laws that regulate reporting, storage and handling of hazardous materials and wastes.

Los Angeles County: The Office of Emergency Management is responsible for organizing and directing the preparedness efforts of the Emergency Management Organization of Los Angeles County. Los Angeles County's policies towards hazardous materials management include enforcing stringent site investigations for factors related to hazards; limiting the development in high hazard areas, such as floodplains, high fire hazard areas, and seismic hazard zones; facilitating safe transportation, use, and storage of hazardous materials; supporting lead paint abatement; remediating brownfield sites; encouraging the purchase of homes on the FEMA Repeat Hazard list and designating the land as open space; enforcing restrictions on access to important energy sites; limiting development downslope from aqueducts; promoting safe alternatives to chemical-based products in households; and prohibiting development in floodways. The county has defined effective emergency response management capabilities to include supporting county emergency providers with reaching their response time goals; promoting the participation and coordination of emergency response management between cities and other counties at all levels of government; coordinating with other county and public agency emergency planning and response activities; and encouraging the development of an early warning system for tsunamis, floods and wildfires.

The County of Los Angeles Fire Department, Fire Prevention Guide #9 regulates spray application of flammable or combustible liquids. The guide requires no open flame, spark-producing equipment or exposed surfaces exceeding the ignition temperature of the material being sprayed within the area. For open spraying, as would be the case for the field application of the acetone-based coatings, no spark-producing equipment or open flame shall be within 20 feet horizontally and 10 feet vertically of the spray area. Anyone not complying with these guidelines would be in violation of the current fire codes. The fire department also limits the residential storage of flammable liquids to five gallons and recommends storage in a cool place. If the flammable coating container will be exposed to direct sunlight or heat, storage in cool water is recommended. Finally, all metal containers involving the transfer of five gallons or more should be grounded and bonded.

Orange County: The regulatory agency responsible for enforcement, as well as inspection of pipelines transporting hazardous materials, is the California State Fire Marshal's Office, Hazardous Liquid Pipeline Division. The Orange County Health Care Agency (OCHCA) has been designated by the Board of Supervisors as the agency to enforce the UST program.

The OCHCA UST Program regulates approximately 7,000 of the 9,500 underground tanks in Orange County. The program includes conducting regular inspections of underground tanks; oversight of new tank installations; issuance of permits; regulation of repair and closure of tanks; ensuring the mitigation of leaking USTs; pursuing enforcement action; and educating and assisting the industries and general public as to the laws and regulations governing USTs.

Under mandate from the California Health and Safety Code, the Orange County Fire Authority is the designated agency to inventory the distribution of hazardous materials in commercial or industrial occupancies, develop and implement emergency plans, and require businesses that handle hazardous materials to develop emergency plans do deal with these materials.

Orange County's Hazardous Materials Program Office is responsible for facilitating the coordination of various parts of the County's hazardous materials program; assisting in coordinating County hazardous materials activities with outside agencies and organization; providing comprehensive, coordinated analysis of hazardous materials issues; and directing the preparation, implementation, and modification of the county's Hazardous Waste Management Plan. With regard to San Onofre Nuclear Generating Station, in an effort to prepare those who live and work in areas outside, but adjacent to SONGS, the federal and state governments have established three levels of emergency zones. Orange County is responsible for its own emergency plans concerning a nuclear power plant accident, and the Incident Response Plan is updated regularly.

San Bernardino County: San Bernardino County's Hazardous Waste Management Plan (HWMP) serves as the primary planning document for the management of hazardous waste in San Bernardino County. The HWMP identifies the types and amounts of wastes generated; establishes programs for managing these wastes; identifies an application review process for the siting of specified hazardous waste facilities; identifies mechanisms for reducing the amount of waste generated; and identifies goals, policies, and actions for achieving effective hazardous waste management. One of the county's stated goals is to minimize the generation of hazardous waste and reduce the risk posed by storage, handling, transportation, and disposal of hazardous wastes. In addition, the county will protect its residents and visitors from injury and loss of life and protect property from fires by deploying firefighters and requiring new land developments to prepare site-specific fire protection plans.

Riverside County: Through its membership in the Southern California Hazardous Waste Management Authority (SCHWMA), the County of Riverside has agreed to work on a regional level to solve problems involving hazardous waste. SCHWMA was formed through a joint powers agreement between Santa Barbara, Ventura, San Bernardino, Orange, San Diego, Imperial, and Riverside Counties and the Cities of Los Angeles and San Diego. Working within the concept of "fair share," each SCHWMA county has agreed to take responsibility for the treatment and disposal of hazardous waste in an amount that is at least equal to the amount generated within that county. This responsibility can be met by siting hazardous waste management facilities (transfer, treatment, and/or repository) capable of processing an amount of waste equal to or larger than the amount generated within the

county, or by creating intergovernmental agreements between counties to provide compensation to a county for taking another county's waste, or through a combination of both facility siting and intergovernmental agreements. When and where a facility is to be sited is primarily a function of the private market. However, once an application to site a facility has been received, the county will review the requested facility and its location against a set of established siting criteria to ensure that the location is appropriate and may deny the application based on the findings of this review. The County of Riverside does not presently have any of these facilities within its jurisdiction and, therefore, must rely on intergovernmental agreements to fulfill its fair share responsibility to SCHWMA.

3.4.3 Emergency Response To Hazardous Materials And Waste Incidents

The California Emergency Management Agency (CalEMA) exists to enhance safety and preparedness in California through strong leadership, collaboration, and meaningful partnerships. The goal of CalEMA is to protect lives and property by effectively preparing for, preventing, responding to, and recovering from all threats, crimes, hazards, and emergencies. CalEMA under the Fire and Rescue Division coordinates statewide implementation of hazardous materials accident prevention and emergency response programs for all types of hazardous materials incidents and threats. In response to any hazardous materials emergency, CalEMA is called upon to provide state and local emergency managers with emergency coordination and technical assistance.

Pursuant to the Emergency Services Act, the State of California has developed an Emergency Response Plan to coordinate emergency services provided by federal, state, and local government agencies and private persons. Response to hazardous materials incidents is one part of this plan. The Plan is administered by CalEMA which coordinates the responses of other agencies. Six mutual aid and Local Emergency Planning Committee (LEPC) regions have been identified for California that are divided into three areas of the state designated as the Coastal (Region II, which includes 16 counties with 151 incorporated cities and a population of about eight million people.), Inland (Region III, Region IV and Region V, which includes 31 counties with 123 incorporated cities and a population of about seven million people), and Southern (Region I and Region VI, which includes 11 counties with 226 incorporated cities and a population of about 21.6 million people). The SCAQMD jurisdiction covers portions of Region I and Region VI.

In addition, pursuant to the Hazardous Materials Release Response Plans and Inventory Law of 1985, local agencies are required to develop "area plans" for response to releases of hazardous materials and wastes. These emergency response plans depend to a large extent on the business plans submitted by persons who handle hazardous materials. An area plan must include pre-emergency planning of procedures for emergency response, notification, coordination of affected government agencies and responsible parties, training, and follow-up.

3.4.4 Hazardous Materials Incidents

Hazardous materials move through southern California by a variety of modes including truck, rail, air, ship, and pipeline. The movement of hazardous materials implies a degree of

risk, depending on the materials being moved, the mode of transport, and numerous other factors (e.g., weather).

Hazardous materials move through the region by a variety of modes: Truck, rail, air, ship, and pipeline. According to the Office of Hazardous Materials Safety (OHMS) in the U.S. Department of Transportation, hazardous materials shipments can be regarded as equivalent to deliveries, but any given shipment may involve one or more movements or trip segments, that may occur by different routes (e.g., rail transport with final delivery by truck). According to the Commodity Flow Survey data (U.S. DOT, 2010), there were approximately 2.3 billion tons of hazardous materials shipments in the United States in 2007. Table 3.4-2 indicates that trucks move more than 50 percent of total hazardous materials shipped via all transportation modes from a location in the United States. By contrast, rail accounts of only six percent of total shipments of hazardous materials (U.S. DOT, 2010).

TABLE 3.4-2

Hazardous Material Shipments in the United States

Mode	Total Commercial Freight (thousand tons)	Hazardous Materials Shipped (thousand tons)	Percent of Hazardous Materials Shipped
Truck	8,778,713	1,202,825	13.7%
Rail	1,861,307	129,743	7.0%
Water	403,639	149,794	37.1%
Pipeline	650,859	628,905	96.6%
TOTAL	11,694,518	2,111,267	18.1%

Source: U.S. DOT, 2010.

The movement of hazardous materials through the U.S. transportation system represents almost 18 percent of total tonnage for all freight shipments as measured by the Commodity Flow Survey. The total commercial freight moved in 2007 in California by all transportation modes was 900,817 thousand tons, of which about 738,550 thousand tons were moved by truck (U.S. DOT, 2010).

The California Hazardous Materials Incident Reporting System (CHMIRS) is a post-incident reporting system to collect data on incidents involving the accidental release of hazardous materials in California. Information on accidental releases of hazardous materials are reported to and maintained by CalEMA. While information on accidental releases are reported to CalEMA, according to discussions with Mr. Greg Renick of Cal-EMA on July 25, 2012, CalEMA no longer conducts statistical evaluations of the releases (e.g., total number of releases per year) for the entire State, or data by county. The U.S. DOT Pipeline and Hazardous Materials Safety Administration provides access to retrieve data from the Incident Reports Database, which also includes non-pipeline incidents (e.g., truck and rail events). Incident data and summary statistics (e.g., release date, geographical location for state and county) and type of material released, are available online from the Hazardous Materials Incident Report Form 5800.1.

Table 3.4-3 provides a summary of the reported hazardous material incidents for Los Angeles, Orange, Riverside, and San Bernardino counties for 2010 and 2011 from the Hazardous Materials Incident Report Form 5800.1. Data presented is for the entire county and not limited to the portion of the county located within the jurisdiction of the SCAQMD.

In 2010, there were a total of 672 incidents reported for Los Angeles, Orange, Riverside and San Bernardino counties, and in 2011 a total of 698 incidents for these four counties. San Bernardino and Los Angeles counties accounted for the largest number of incidents, followed by Orange and Riverside counties.

TABLE 3.4-3

Reported Hazardous Materials Incidents for 2010 and 2011

County	2010	2011
Los Angeles	273	256
Orange	71	93
Riverside	46	51
San Bernardino	282	298
Total	672	698

3.4.5 Hazards Associated With Air Pollution Control, Coating Reformulations and Alternative Fuels

The SCAQMD has evaluated the hazards associated with previous AQMPs, proposed SCAQMD rules, and non-SCAQMD projects where the SCAQMD is the Lead Agency pursuant to CEQA. The analyses covered a range of potential air pollution control technologies and equipment. EIRs prepared for the previous AQMPs have specifically evaluated hazard impacts from: 1) add-on control equipment; 2) alternative coating methods; and, 3) alternative fuels.

Add-on pollution control technologies which have been previously analyzed for hazards include: carbon adsorption, incineration, post-combustion flue-gas treatment, SCR and selective non-catalytic reduction (SNCR), scrubbers, bag filters, and electrostatic precipitators. The use of add-on pollution control equipment may concentrate or utilize hazardous materials. A malfunction or accident when using add-on pollution control equipment could potentially expose people to hazardous materials, explosions, or fires. The SCAQMD has determined that the transport, use, and storage of ammonia, both aqueous and anhydrous, (used in SCR and SNCR systems) may have significant hazard impacts in the event of an accidental release. Further analyses have indicated that the use of aqueous ammonia (instead of anhydrous ammonia) can usually reduce the hazards associated with ammonia use in SCR and SNCR systems to less than significant.

The potential hazards associated with alternative coating reformulations have been analyzed including powder coatings, radiation-curable coatings, high solids coatings, and waterborne coatings. The greatest hazard associated with both current and alternative coating reformulations is flammability.

Alternative fuels may be used to reduce emissions from both stationary source equipment and motor vehicles. The alternative fuels which have been analyzed include reformulated gasoline, methanol, compressed natural gas, LPG or propane, and electrically charged batteries. Like conventional fossil fuels, alternative fuels may create fire hazards, explosions or accidental releases during fuel transport, storage, dispensing, and use. Electric batteries also present a slight fire and explosion hazards due to the presence of reactive compounds, which may be subjected to high temperatures.

Ammonia

Ammonia is the primary hazardous chemical identified with the use of air pollution control equipment (e.g., SCR and SNCR systems). Ammonia, though not a carcinogen, can have chronic and acute health impacts. Therefore, a potential increase in the use of ammonia may increase the current existing risk setting associated with deliveries (e.g., truck and road accidents) and onsite or offsite spills for each facility that currently uses or will begin to use ammonia. Exposure to a toxic gas cloud is the potential hazard associated with this type of control equipment. A toxic gas cloud is the release of a volatile chemical such as anhydrous ammonia that could form a cloud that migrates off-site, thus exposing individuals. Anhydrous ammonia is heavier than air such that when released into the atmosphere, would form a cloud at ground level rather than be dispersed “Worst-case” conditions tend to arise when very low wind speeds coincide with the accidental release, which can allow the chemicals to accumulate rather than disperse. Though there are facilities that may be affected by the proposed 2012 AQMP control measures that are currently permitted to use anhydrous ammonia, for new construction, however, current SCAQMD policy no longer allows the use of anhydrous ammonia. Instead, to minimize the hazards associated with ammonia used in the SCR or SNCR process, aqueous ammonia, 19 percent by volume, is typically required as a permit condition associated with the installation of SCR or SNCR equipment for the following reasons: 1) 19 percent aqueous ammonia does not travel as a dense gas like anhydrous ammonia; and, 2) 19 percent aqueous ammonia is not on any acutely hazardous material lists unlike anhydrous ammonia or aqueous ammonia at higher percentages.

LNG

LNG is essentially no different from the natural gas used in homes and businesses everyday, except that it has been refrigerated to minus 259 degrees Fahrenheit at which point it becomes a clear, colorless, and odorless liquid. LNG currently is used as a combustion fuel in both stationary and mobile sources. As a liquid, natural gas occupies only one six-hundredth of its gaseous volume and can be transported economically between continents in special tankers. LNG weighs slightly less than half as much as water, so it floats on fresh or sea water. However, when LNG comes in contact with any warmer surface such as water or air, it evaporates very rapidly ("boil"), returning to its original, gaseous volume. As the LNG vaporizes, a vapor cloud resembling ground fog will form under relatively calm atmospheric conditions. The vapor cloud is initially heavier than air since it is so cold, but as it absorbs more heat, it becomes lighter than air, rises, and can be carried away by the wind. An LNG vapor cloud cannot explode in the open atmosphere, but it could burn.

LNG is considered a hazardous material. The primary safety concerns are the potential consequences of an LNG spill. LNG hazards result from three of its properties:

- Cryogenic temperatures
- Dispersion characteristics
- Flammability characteristics

The extreme cold of LNG can directly cause injury or damage. Although momentary contact on the skin can be harmless, extended contact will cause severe freeze burns. On contact with certain metals, such as ship decks, LNG can cause immediate cracking. Although not poisonous, exposure to the center of a vapor cloud could cause asphyxiation due to the absence of oxygen. LNG vapor clouds can ignite within the portion of the cloud where the concentration of natural gas is between a five and a 15 percent (by volume) mixture with air. To catch fire, however, this portion of the vapor cloud must encounter an ignition source. Otherwise, the LNG vapor cloud will simply dissipate into the atmosphere. An ignited LNG vapor cloud is very dangerous, because of its tremendous radiant heat output. Furthermore, as a vapor cloud continues to burn, the flame could burn back toward the evaporating pool of spilled liquid, ultimately burning the quickly evaporating natural gas immediately above the pool, giving the appearance of a "burning pool" or "pool fire." An ignited vapor cloud or a large LNG pool fire can cause extensive damage to life and property.

Spilled LNG would disperse faster on the ocean than on land, because water spills provide very limited opportunity for containment. Furthermore, LNG vaporizes more quickly on water, because the ocean provides an enormous heat source. For these reasons, most analysts conclude that the risks associated with shipping, loading, and off-loading LNG are much greater than those associated with land-based storage facilities. Preventing spills and responding immediately to spills should they occur are major factors in the design of LNG facilities (CEC, 2003).

Beyond routine industrial hazards and safety considerations, LNG presents specific safety considerations. In the event of an accidental release of LNG, the safety zone around a facility protects neighboring communities from personal injury, property damage or fire. The one and only case of an accident that affected the public was in Cleveland, Ohio in 1944. Research stemming from the Cleveland incident has influenced safety standards used today. Indeed, during the past four decades, growth in LNG use worldwide has led to a number of technologies and practices that will be used in the U.S. and elsewhere in North America as the LNG industry expands. Generally, multiple layers of protection create four critical safety conditions, all of which are integrated with a combination of industry standards and regulatory compliance. The four requirements for safety – primary containment, secondary containment, safeguard systems and separation distance apply across the LNG value chain, from production, liquefaction and shipping, to storage and re-gasification. The term "containment" means safe storage and isolation of LNG (Foss, 2003).

LPG

More than 350,000 light-and medium-duty vehicles travel the nation's highways using liquefied petroleum gas (LPG or LP gas), while over 4 million vehicles use it worldwide. LPG is a mixture of several gases that is generally called "propane," in reference to the mixture's chief ingredient. LPG changes to the liquid state at the moderately high pressures found in an LPG vehicle's fuel tank. LPG is formed naturally, interspersed with deposits of petroleum and natural gas. Natural gas contains LPG, water vapor, and other impurities that must be removed before it can be transported in pipelines as a salable product. About 55 percent of the LPG processed in the U.S. is from natural gas purification. The other 45 percent comes from crude oil refining. Since a sizable amount of U.S. LPG is derived from petroleum, LPG does less to relieve the country's dependency on foreign oil than some other alternative fuels. However, because over 90 percent of the LPG used in the United States is produced here, LPG does help address the national security component of the nation's overall petroleum dependency problem.

Propane vehicles emit about one-third fewer reactive organic gases than gasoline-fueled vehicles. Nitrogen oxide and carbon monoxide emissions are also 20 percent and 60 percent less, respectively. Unlike gasoline-fueled vehicles, there are no evaporative emissions while LPG vehicles are running or parked, because LPG fuel systems are tightly sealed. Small amounts of LPG may escape into the atmosphere during refueling, but these vapors are 50 percent less reactive than gasoline vapors, so they have less of a tendency to generate smog-forming ozone. LPG's extremely low sulfur content means that the fuel does not contribute significantly to acid rain.

Many propane vehicles are converted gasoline vehicles. The relatively inexpensive conversion kits include a regulator/vaporizer that changes liquid propane to a gaseous form and an air/fuel mixer that meters and mixes the fuel with filtered intake air before the mixture is drawn into the engine's combustion chambers. Also included in conversion kits is closed-loop feedback circuitry that continually monitors the oxygen content of the exhaust and adjusts the air/fuel ratio as necessary. This device communicates with the vehicle's onboard computer to keep the engine running at optimum efficiency. LPG vehicles additionally require a special fuel tank that is strong enough to withstand the LPG storage pressure of about 130 pounds per square inch. The gaseous nature of the fuel/air mixture in an LPG vehicle's combustion chambers eliminates the cold-start problems associated with liquid fuels. In contrast to gasoline engines, which produce high emission levels while running cold, LPG engine emissions remain similar whether the engine is cold or hot. Also, because LPG enters an engine's combustion chambers as a vapor, it does not strip oil from cylinder walls or dilute the oil when the engine is cold. This helps LPG powered engines to have a longer service life and reduced maintenance costs. Also helping in this regard is the fuel's high hydrogen-to-carbon ratio (C₃H₈), which enables propane powered vehicles to have less carbon build-up than gasoline- and diesel powered vehicles. LPG delivers roughly the same power, acceleration, and cruising speed characteristics as gasoline. It does yield a somewhat reduced driving range, however, because it contains only about 70-75 percent of the energy content of gasoline. Its high octane rating (around 105) means, though, that an LPG engine's power output and fuel efficiency can be increased beyond what would be possible with a gasoline engine without causing destructive "knocking." Such fine-tuning

can help compensate for the fuel's lower energy density. Fleet owners find that propane costs are typically 5 to 30 percent less than those of gasoline. The cost of constructing an LPG fueling station is also similar to that of a comparably sized gasoline dispensing system. Fleet owners not wishing to establish fueling stations of their own may avail themselves of over 3,000 publicly accessible fueling stations nationwide.

Propane is an odorless, nonpoisonous gas that has the lowest flammability range of all alternative fuels. High concentrations of propane can displace oxygen in the air, though, causing the potential for asphyxiation. This problem is mitigated by the presence of ethyl mercaptan, which is an odorant that is added to warn of the presence of gas. While LPG itself does not irritate the skin, the liquefied gas becomes very cold upon escaping from a high-pressure tank, and may therefore cause frostbite, should it contact unprotected skin. As with gasoline, LPG can form explosive mixtures with air. Since the gas is slightly heavier than air, it may form a continuous stream that stretches a considerable distance from a leak or open container, which may lead to a flashback explosion upon contacting a source of ignition (U.S. DOE, 2003).

While LPG is classified as a fire hazard, it is not classified as a toxic or as a hazardous air pollutant. LPG is a regulated substance subject to both the California and Federal RMP programs in accordance with the CCR, Title 19, §2770.4.1 and Chapter 40 of the CFR Part 68, §68.126³. A RMP is a document prepared by the owner or operator of a stationary source containing detailed information including, but not limited to:

- Regulated substances held onsite at the stationary source;
- Offsite consequences of an accidental release of a regulated substance;
- The accident history at the stationary source;
- The emergency response program for the stationary source;
- Coordination with local emergency responders;
- Hazard review or process hazard analysis;
- Operating procedures at the stationary source;
- Training of the stationary source's personnel;
- Maintenance and mechanical integrity of the stationary source's physical plant; and
- Incident investigation.

The threshold quantity for LPG (as propane) as a regulated substance for accidental release prevention is 10,000 pounds. However, when LPG is used as a fuel by an end user (as is

³ The federal RMP program is administered in California through the California Accidental Release Prevention (CalARP) program (Health & Safety Code (H&SC), §§ 25531 to 25543.3 and California Code of Regulations, Title 19 (19 CCR or "Title 19"), §§ 2735.1 to 2785.1).

frequently the case with residential portable and stationary storage tanks), or when it is held for retail sale as a fuel, it is excluded from these RMP requirements, even if the amount exceeds the threshold quantity.

On June 1, 2012, SCAQMD adopted Rule 1177 - Liquefied Petroleum Gas Transfer and Dispensing to reduce fugitive VOC emissions released during the transfer and dispensing of LPG at residential, commercial, industrial, chemical, agricultural and retail sales facilities. Rule 1177 applies to the transfer of LPG to and from stationary storage tanks, cylinders and cargo tanks, including bobtails, truck transports and rail tank cars, and into portable refillable cylinders. In addition, Rule 1177 requires the use of low emission fixed liquid level gauges or equivalent alternatives during filling of LPG-containing tanks and cylinders, use of LPG low emission connectors, routine leak checks and repairs of LPG transfer and dispensing equipment, and recordkeeping and reporting to demonstrate compliance.

With respect to suppliers and sellers of LPG, Health and Safety Code §25506 specifically requires all businesses handling hazardous materials to submit a business emergency response plan to assist local administering agencies in the emergency release or threatened release of a hazardous material. Business emergency response plans generally require the following:

1. Identification of individuals who are responsible for various actions, including reporting, assisting emergency response personnel and establishing an emergency response team;
2. Procedures to notify the administering agency, the appropriate local emergency rescue personnel, and the California Office of Emergency Services;
3. Procedures to mitigate a release or threatened release to minimize any potential harm or damage to persons, property or the environment;
4. Procedures to notify the necessary persons who can respond to an emergency within the facility;
5. Details of evacuation plans and procedures;
6. Descriptions of the emergency equipment available in the facility;
7. Identification of local emergency medical assistance; and
8. Training (initial and refresher) programs for employees in:
 - a. The safe handling of hazardous materials used by the business;
 - b. Methods of working with the local public emergency response agencies;
 - c. The use of emergency response resources under control of the handler; and

- d. Other procedures and resources that will increase public safety and prevent or mitigate a release of hazardous materials.

In general, every county or city and all facilities using a minimum amount of hazardous materials are required to formulate detailed contingency plans to eliminate, or at least minimize, the possibility and effect of fires, explosion, or spills. In conjunction with the California Office of Emergency Services, local jurisdictions have enacted ordinances that set standards for area and business emergency response plans. These requirements include immediate notification, mitigation of an actual or threatened release of a hazardous material, and evacuation of the emergency area.

Lastly, operators who currently transfer and dispense LPG are well aware of the hazardous nature of LPG, including its flammability and receive periodic training for the safe handling of LPG for the following reasons. Facility operators with a dispensing system for LPG are required to comply with operating pressures pursuant to the standards developed by the American Society of Mechanical Engineers (ASME) Pressure Vessel Code, Section 8; NFPA 58 with regard to venting LPG to the atmosphere; and for LPG tanks that are subject to RMP requirements, the operators must obtain permits from, and submit RMPs to the local Certified Unified Program Agency (CUPA) which is typically the city or county fire department. For similar reasons, industrial and commercial customers on the receiving end of LPG deliveries are also well aware of the safety issues associated with LPG. Residential customers, through warning labels on the portable cylinders and on the units to which the portable cylinders connect, are notified of the flammability dangers associated with LPG.

HYDROLOGY AND WATER QUALITY

Regulatory Background

Hydrology

Water Demand and Forecasts

Water Supply

Water Conservation

Water Quality

Wastewater Treatment

3.5 HYDROLOGY AND WATER QUALITY

3.5.1 Regulatory Background

Water resources are regulated by an overlapping network of local, state, federal and international laws and regulations. As a result, the authority to address a given discharge or activity is not always clear. Therefore, the regulatory background is broken down by the following topics: Water Quality; Regional Water Quality Management; Watershed Management; Wastewater Treatment; Drinking Water Standards; and local regulations.

3.5.1.1 Water Quality

The principal laws governing water quality in southern California are the federal Clean Water Act (CWA) and the corresponding California law, the Porter-Cologne Water Quality Act. The United States Environmental Protection Agency (U.S. EPA) is the federal agency responsible for water quality management and administration of the federal CWA. The U.S. EPA has delegated most of the administration of the CWA in California to the California State Water Resources Control Board (SWRCB). The SWRCB was established through the California Porter-Cologne Water Quality Act of 1969, and is the primary State agency responsible for water quality management issues in California. Much of the responsibility for implementation of the SWRCB's policies is delegated to the nine Regional Water Quality Control Boards (RWQCBs).

3.5.1.1.1 NPDES Permit Program

§402 of the CWA established the National Pollutant Discharge Elimination System (NPDES) to regulate discharges into “navigable waters” of the United States. The U.S. EPA authorized the SWRCB to issue NPDES permits in the State of California in 1974. The NPDES permit establishes discharge pollutant thresholds and operational conditions for industrial facilities and wastewater treatment plants. For point source discharges (e.g., wastewater treatment facilities), the RWQCBs prepare specific effluent limitations for constituents of concern such as toxic substances, total suspended solids (TSS), bio-chemical oxygen demand (BOD), and organic compounds. The limitations are based on the Basin Plan objectives and are tailored to the specific receiving waters, allowing some discharges, for instance deep water outfalls in the Pacific Ocean, more flexibility with certain constituents due to the ability of the receiving waters to accommodate the effluent without significant impact.

Non-point source NPDES permits are also required for municipalities and unincorporated communities of populations greater than 100,000 to control urban stormwater runoff. These municipal permits include Storm Water Management Plans (SWMPs). A key part of the SWMP is the development of Best Management Practices (BMPs) to reduce pollutant loads. Certain businesses and projects within the jurisdictions of these municipalities are required to prepare Storm Water Pollution Prevention Plans (SWPPPs) which establish the appropriate BMPs to gain coverage under the municipal permit. On October 29, 1999, the U.S. EPA finalized the Storm Water Phase II rule which requires smaller urban communities

with a population less than 100,000 to acquire individual storm water discharge permits. The Phase II rule also requires construction activities on one to five acres to be permitted for storm water discharges. Individual storm water NPDES permits are required for specific industrial activities and for construction sites greater than five acres. Statewide general storm water NPDES permits have been developed to expedite discharge applications. They include the statewide industrial permit and the statewide construction permit. A prospective applicant may apply for coverage under one of these permits and receive Waste Discharge Requirements (WDRs) from the appropriate RWQCB. WDRs establish the permit conditions for individual dischargers. The Stormwater Phase II Rule automatically designates, as small construction activity under the NPDES stormwater permitting program, all operators of construction site activities that result in a land disturbance of equal to or greater than one and less than five acres. Site activities that disturb less than one acre are also regulated as small construction activity if they are part of a larger common plan of development or sale with a planned disturbance of equal to or greater than one acre and less than five acres, or if they are designated by the NPDES permitting authority. The NPDES permitting authority or U.S. EPA Region may designate construction activities disturbing less than one acre based on the potential for contribution to a violation of a water quality standard or for significant contribution of pollutants to waters of the United States (U.S. EPA, [20002005](#)).

3.5.1.1.2 Municipal Stormwater and Urban Runoff Discharge Permits

The Municipal Stormwater Permitting Program regulates stormwater discharges from municipal separate storm sewer systems (MS4s). The RWQCB, with oversight by U.S. EPA, administers the MS4 permitting program in the Los Angeles area. The MS4 permits require the municipal discharger (typically, a city or county) to develop and implement a SWMP with the goal of reducing the discharge of pollutants to the maximum extent practicable. The SWMP program specifies what BMPs will be applied to address certain program areas such as public education and outreach, illicit discharge detection and elimination, construction and port-construction, and good housekeeping for municipal operations. MS4 permits also generally include a monitoring program.

3.5.1.1.3 CWA Section 303 – Total Maximum Daily Loads

The CWA §303(d) requires the SWRCB to prepare a list of impaired water bodies in the State and determine total maximum daily loads (TMDLs) for pollutants or other stressors impacting water quality of these impaired water bodies. A TMDL is a quantitative assessment of water quality conditions, contributing sources, and the load reductions or control actions needed to restore and protect bodies of water in order to meet their beneficial uses. All sources of the pollutants that caused each body of water to be included on the list, including point sources and non-point sources, must be identified. The California §303 (d) list was completed in March 1999. On July 25, 2003, U.S. EPA gave final approval to California's 2002 revision of §303 (d) List of Water Quality Limited Segments. A priority schedule has been developed to determine TMDLs for impaired waterways. TMDL projects are in various stages throughout the district for most of the identified impaired water bodies. The RWQCBs will be responsible for ensuring that total discharges do not exceed TMDLs for individual water bodies as well as for entire watersheds.

3.5.1.1.4 *State Water Quality Certification Program*

The RWQCBs also coordinate the State Water Quality Certification program, or §401 of the CWA. Under §401, states have the authority to review any federal permit or license that will result in a discharge or disruption to wetlands and other waters under state jurisdiction to ensure that the actions will be consistent with the state's water quality requirements. This program is most often associated with §404 of the CWA which obligates the U.S. Army Corps of Engineers to issue permits for the movement of dredge and fill material into and from "waters of the United States".

3.5.1.2 Regional Water Quality Management

Water quality of regional surface water and groundwater resources is affected by point source and non-point source discharges occurring throughout individual watersheds. Regulated point sources, such as wastewater treatment effluent discharges, usually involve a single discharge into receiving waters. Non-point sources involve diffuse and non-specific runoff that enters receiving waters through storm drains or from unimproved natural landscaping. Common non-point sources include urban runoff, agriculture runoff, resource extraction (on-going and historical), and natural drainage. Within the regional Basin Plans, the RWQCBs establish water quality objectives for surface water and groundwater resources and designate beneficial uses for each identified water body.

The Basin Plan (Water Quality Control Plan: Los Regional Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties) (LARWQCB, 1994) is designed to preserve and enhance water quality and to protect beneficial uses of regional waters. The Basin Plan designates beneficial uses of surface water and ground water, such as contact recreation or municipal drinking water supply. The Basin Plan also establishes water quality objectives, which are defined as "the allowable limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance in a specific area." The Basin Plan specifies objectives for specific constituents, including bioaccumulation, chemical constituents, dissolved oxygen, oil and grease, pesticides, pH polychlorinated biphenyls, suspended solids, toxicity, and turbidity.

California Water Code, Division 7, Chapter 5.6 established a comprehensive program within the SWRCB to protect the existing and future beneficial uses of California's enclosed bays and estuaries. The Bay Protection and Toxic Cleanup Plan (BPTCP) has provided a new focus on the SWRCB and the RWQCBs' efforts to control pollution of the State's bays and estuaries by establishing a program to identify toxic hot spots and plans for their cleanup. In June 1999, the SWRCB published a list of known toxic hot spots in estuaries, bays, and coastal waters.

Other statewide programs run by the SWRCB to monitor water quality include the California State Mussel Watch Program and the Toxic Substances Monitoring Program. The Department of Fish and Game collects water and sediment samples for the SWRCB for both of these programs and provides extensive statewide water quality data reports annually. In addition, the RWQCBs conduct water sampling for Water Quality Assessments required

by the CWA and for specific priority areas under restoration programs such as the Santa Monica Bay Restoration Program.

3.5.1.3 Watershed Management

In February 1998, the Clean Water Action Plan (CWAP) was established to require states and tribes, with assistance from federal agencies and input from stakeholders and private citizens, to convene and work collaboratively to develop Unified Watershed Assessments (UWA). The CWAP designated watersheds to one of the following categories:

- Category I: Watersheds that are candidates for increased restoration because of poor water quality or the poor status of natural resources.
- Category II: Watersheds that have good water quality but can still improve.
- Category III: Watersheds with sensitive areas on federal, state, or tribal lands that need protection.
- Category IV: Watersheds for which there is insufficient information to categorize them.

Targeted watersheds and watershed priorities and activities were identified for each of California's nine RWQCBs. Examples of targeted watersheds include the Santa Monica Bay Restoration Commission and the Malibu Creek Watershed Non-Point Source Pilot Project.

3.5.1.4 Wastewater Treatment

The federal government enacted the CWA to regulate point source water pollutants, particularly municipal sewage and industrial discharges, to waters of the United States through the NPDES permitting program. In addition to establishing a framework for regulating water quality, the CWA authorized a multibillion dollar Clean Water Grant Program, which together with the California Clean Water Bond funding, assisted communities in constructing municipal wastewater treatment facilities. These financing measures made higher levels of wastewater treatment possible for both large and small communities throughout California, significantly improving the quality of receiving waters statewide. Wastewater treatment and water pollution control laws in California are codified in the CWC and CCR, Titles 22 and 23. In addition to federal and state restrictions on wastewater discharges, most incorporated cities in California have adopted local ordinances for wastewater treatment facilities. Local ordinances generally require treatment system designs to be reviewed and approved by the local agency prior to construction. Larger urban areas with elaborate infrastructure in place would generally prefer new developments to hook into the existing system rather than construct new wastewater treatment facilities. Other communities promote individual septic systems to avoid construction of potentially growth accommodating treatment facilities. The RWQCBs generally delegate management responsibilities of septic systems to local jurisdictions. Regulation of wastewater treatment includes the disposal and reuse of biosolids.

3.5.1.5 Drinking Water Standards

The federal Safe Drinking Water Act, enacted in 1974 and implemented by the U.S. EPA, imposes water quality and infrastructure standards for potable water delivery systems nationwide. The primary standards are health-based thresholds established for numerous toxic substances. Secondary standards are recommended thresholds for taste and mineral content. The California Safe Drinking Water Act enacted in 1976 is codified in Title 22 of the CCR. Potable water supply is managed through the following agencies and water districts: the State Department of Water Resources (DWR), the State Department of Health Services (DHS), the SWRCB, the U.S. EPA, and the U.S. Bureau of Reclamation. Water right applications are processed through the SWRCB for properties claiming riparian rights. The DWR manages the State Water Project (SWP) and compiles planning information on water supply and water demand within the state. Primary drinking water standards are promulgated in the CWA §304 and these standards require states to ensure that potable water retailed to the public meets these standards. Standards for a total of 88 individual constituents, referred to as Maximum Contaminant Levels (MCLs) have been established under the Safe Drinking Water Act as amended in 1986 and 1996. The U.S. EPA may add additional constituents in the future. The MCL is the concentration that is not anticipated to produce adverse health effects after a lifetime of exposure. State primary and secondary drinking water standards are codified in CCR Title 22 §§64431-64501. Secondary drinking water standards incorporate non-health risk factors including taste, odor, and appearance. The 1991 Water Recycling Act established water recycling as a priority in California. The Water Recycling Act encourages municipal wastewater treatment districts to implement recycling programs to reduce local water demands. The DHS enforces drinking water standards in California.

3.5.1.6 Local Regulations

In addition to federal and state regulations, cities, counties and water districts may also provide regulatory advisement regarding water resources. Many jurisdictions incorporate policies related to water resources in their municipal codes, development standards, storm water pollution prevention requirements, and other regulations.

3.5.2 Hydrology

3.5.2.1 Water Sources

The DWR divided California into ten hydrologic regions corresponding to the state's major water drainage basins. The hydrologic regions define a river basin drainage area and are used as planning boundaries, which allows consistent tracking of water runoff, and the accounting of surface water and groundwater supplies (DWR, [20102011](#)).

The Basin lies within the South Coast Hydrologic Region. The South Coast Hydrologic Region is California's most urbanized and populous region. More than half of the state's population resides in the region (about 19.6 million people or about 54 percent of the state's population), which covers 11,000 square miles or seven percent of the state's total land. The South Coast Hydrologic Region extends from the Pacific Ocean east to the Transverse and

Peninsular Ranges, and from the Ventura-Santa Barbara County line south to the international border with Mexico and includes all of Orange County and portions of Ventura, Los Angeles, San Bernardino, Riverside, and San Diego counties (DWR, 2010).

Topographically, most of the South Coast Hydrologic Region is composed of several large, undulating coastal and interior plains. Several prominent mountain ranges comprise its northern and eastern boundaries and include the San Gabriel and San Bernardino mountains. Most of the region's rivers drain into the Pacific Ocean, and many terminate in lagoons or wetland areas that serve as important coastal habitat. Many river segments on the coastal plain, however, have been concrete-lined and in other ways modified for flood control operations (DWR, [20102011](#)).

There are 19 major rivers and watersheds in the South Coast Hydrologic Region. Many of these watersheds have densely urbanized lowlands with concrete-lined channels and dams controlling floodflows. The headwaters for many rivers, however, are within coastal mountain ranges and have remained largely undeveloped (DWR, [20102011](#)).

The cities of Ventura, Los Angeles, Long Beach, Santa Ana, San Bernardino, and Big Bear Lake are among the many urban areas in this section of the state, which contain moderate-sized mountains, inland valleys, and coastal plains. The Santa Clara, Los Angeles, San Gabriel, and Santa Ana rivers are among the area's hydrologic features. In addition to water sources within the South Coast Hydrologic Region, imported water makes up a major portion of the water used in the Basin. Water is brought into the South Coast Hydrologic Region from three major sources: the Sacramento-San Joaquin Delta (Delta), Colorado River, and Owens Valley/Mono Basin. Most lakes in this area are actually reservoirs, made to hold water coming from the SWP, the Los Angeles Aqueduct (LAA), and the Colorado River Aqueduct (CRA) including Castaic Lake, Lake Mathews, Lake Perris, Silverwood Lake, and Diamond Valley Lake. In addition to holding water, Lake Casitas, Big Bear Lake, and Morena Lake regulate local runoff.

3.5.2.2 Surface Water Hydrology

Surface water hydrology refers to surface water systems, including watersheds, floodplains, rivers, streams, lakes and reservoirs, and the inland Salton Sea.

3.5.2.2.1 *Watersheds*

Watersheds refer to areas of land, or basin, in which all waterways drain to one specific outlet, or body of water, such as a river, lake, ocean, or wetland. Watersheds have topographical divisions such as ridges, hills or mountains. All precipitation that falls within a given watershed, or basin, eventually drains into the same body of water (SCAG, 2012).

There are 20 major watersheds within southern California region, all of which are outlined and shaped by the various topographic features of the region. Given the physiographic characteristics of the region, most of the watersheds are located along the Transverse and Peninsular Ranges, and only a small number are in the desert areas (Mojave and Colorado Desert) (SCAG, 2012). Figure 3.5-1 presents a map of the watersheds within the district.

FIGURE 3.5-1
USGS Watersheds within the South Coast Air Quality Management District

3.5.2.2.2 *Rivers*

Because the climate of Southern California is predominantly arid, many of the natural rivers and creeks are intermittent or ephemeral, drying up in the summer or flowing only after periods of precipitation. For example, annual rainfall amounts vary depending on elevation and proximity to the coast. Some waterways such as Ballona Creek and the Los Angeles River maintain a perennial flow due to agricultural irrigation and urban landscape watering (SCAG, 2012). Figure 3.5-2 presents a map of the major rivers within the district.

Major natural streams and rivers in the South Coast Hydrologic Region include the Ventura River, Santa Clara River, Los Angeles River, San Gabriel River, Santa Ana River, San Jacinto River, and upstream portions of the Santa Margarita River.

The Ventura River, located outside of the district, is fed by Lake Casitas on the western border of Ventura County and empties out into the ocean. It is the northern-most river system in Southern California, supporting a large number of sensitive aquatic species. Water quality decreases in the lower reaches due to urban and industrial impacts.

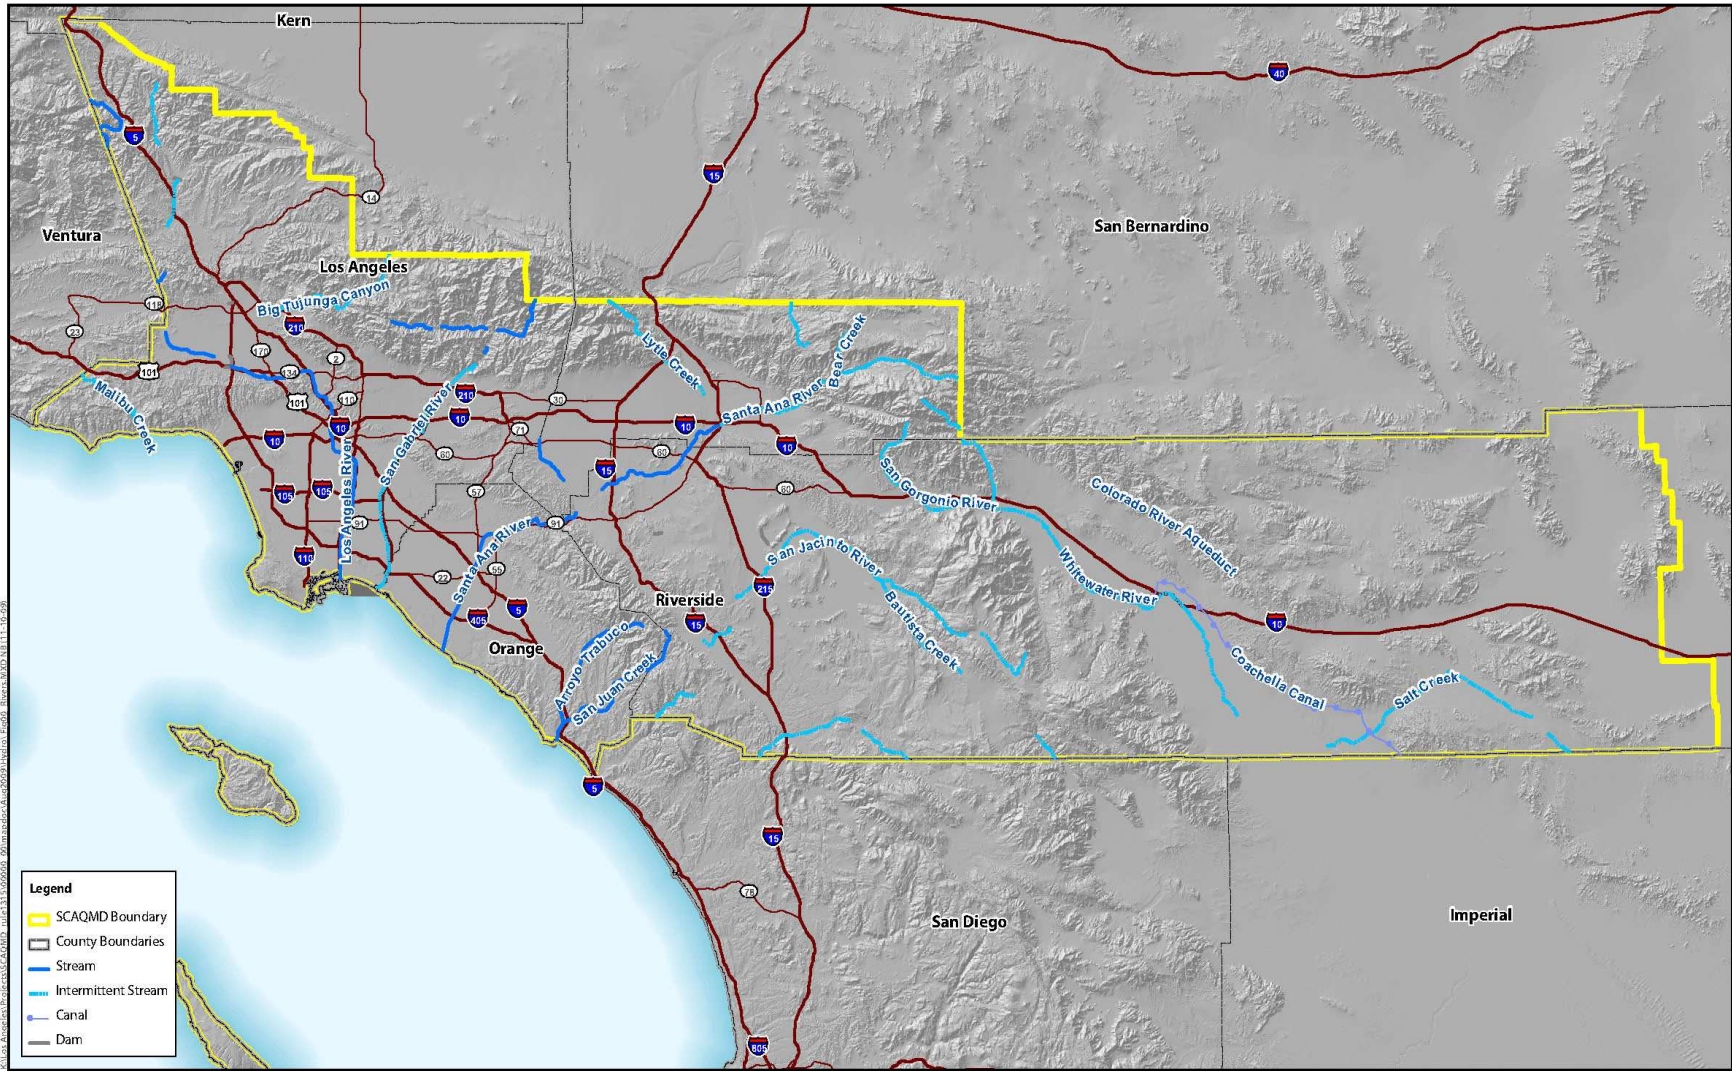

The Santa Clara River starts in Los Angeles County, flows through the center of Ventura County, and remains in a relatively natural state. Threats to water quality include increasing development in floodplain areas, flood control measures such as channeling, erosion, and loss of habitat.

The Los Angeles River is a highly disturbed system due to the flood control features along much of its length. Due to the high urbanization in the area around the Los Angeles River, runoff from industrial and commercial sources as well as illegal dumping contribute to reduce the channel's water quality.

The San Gabriel River is similarly altered with concrete flood control embankments and impacted by urban runoff.

The Santa Ana River drains the San Bernardino Mountains, cuts through the Santa Ana Mountains, and flows onto the Orange County coastal plain. Recent flood control projects along the river have established reinforced embankments for much of the river's path through urbanized Orange County.

The Santa Margarita River begins in Riverside County, draining portions of the San Jacinto Mountains and flowing to the ocean through northern San Diego County.

3.5.2.2.3 *Lakes and Reservoirs*

Since southern California is a semi-arid region, many of its lakes are drinking water reservoirs, created either through damming of rivers, or manually dug and constructed. Reservoirs also serve as flood control for downstream communities. Some of the most significant lakes, including reservoirs, in the Basin are Big Bear Lake, Lake Arrowhead, Lake Casitas, Castaic Lake, Pyramid Lake, Lake Elsinore, Diamond Valley Lake, and the Salton Sea (SCAG, 2012).

Big Bear Lake is a reservoir in San Bernardino County, in the San Bernardino Mountains. It was created by a granite dam in 1884, which was expanded in 1912, and holds back approximately 73,000 acre-feet¹ of water. The lake has no tributary inflow, and is replenished entirely by snowmelt. It provides water for the community of Big Bear, as well as nearby communities (SCAG, 2012).

Lake Arrowhead is also in San Bernardino County, at the center of an unincorporated community also called Lake Arrowhead. The lake is a man-made reservoir, with a capacity of approximately 48,000 acre-feet of water. In 1922, the dam at Lake Arrowhead was completed, with the intention of turning the area into a resort. It is now used for recreation and as a potable water source for the surrounding community (SCAG, 2012).

Lake Casitas is in Ventura County, and was formed by the Casitas Dam on the Coyote Creek just before it joins the Ventura River. The dam, completed in 1959, holds back nearly 255,000 acre-feet of water. The water is used for recreation, as well as drinking water and irrigation (SCAG, 2012).

Castaic Lake is on the Castaic Creek, and was formed by the completion of the Castaic Dam. The lake is in northwestern Los Angeles County. It is the terminus of the West Branch of the California Aqueduct, and holds over 323,000 acre-feet of water. Much of the water is distributed throughout northern Los Angeles County, though some is released into Castaic Lagoon, which feeds Castaic Creek. The creek is a tributary of the Santa Clara River (SCAG, 2012).

Pyramid Lake is just above Castaic Lake, and water flows from Pyramid into Castaic through a pipeline, generating electricity during the day. At night, when electricity demand and prices are low, water is pumped back up into Pyramid Lake. Pyramid Lake is on Piru Creek, and holds 180,000 acre-feet of water (SCAG, 2012).

Lake Elsinore is in the City of Lake Elsinore, in Riverside County. While the lake has been dried up and subsequently replenished throughout the last century, it now manages to maintain a consistent water level with outflow piped into the Temescal Canyon Wash (SCAG, 2012).

Diamond Valley Lake is Southern California's newest and largest reservoir. Located in Riverside County, it was a project of Metropolitan Water District (MWD) to expand surface

¹ One acre-foot is one acre of surface area of water to a depth of one foot and is equivalent to 360,000 gallons or 43,560 cubic feet of water.

storage capacity in the region. A total of three dams were required to create the lake. Completed in 1999, it was full by 2002, holding 800,000 acre-feet of water, effectively doubling MWD’s surface water storage in the region. The lake is connected to the existing water infrastructure of the SWP. The lake is situated at approximately 1,500 feet above sea level, well above most of the users of the lake’s water which enables the lake to also provide hydroelectric power, as water flows through the lowest dam (SCAG, 2012).

The Salton Sea is California’s largest lake, nearly 400 square miles in size. The lake is over 200 feet below sea level, and has flooded and evaporated many times over, when the Colorado overtops its banks during extreme flood years. This cycle of flooding and evaporation has re-created the Salton Sea several times during the last thousand years and has resulted in high levels of salinity. The lake’s most recent formation occurred in 1905 after an irrigation canal was breached and the Colorado River flowed into the basin for 18 months, creating the current lake (SCAG, 2012).

The principle inflow to the Salton Sea is from agricultural drainage, which is high in dissolved salts; approximately four million tons of dissolved salts flow into the Salton Sea every year. The evaporation of the Salton Sea’s water, plus the addition of highly saline water from agriculture, has created one of the saltiest bodies of water in the world. The Sea has been a highly successful fishery and is a habitat and migratory stopping and breeding area for 380 different bird species; however, the high, and ever-increasing, salinity of the Sea has resulted in declining fish populations that inhabit it, resulting in declining local and migratory bird that rely on the fish as a food source (SCAG, 2012).

The major surface waters in this section are presented in Table 3.5-1.

3.5.2.3 Groundwater Hydrology

Groundwater is the part of the hydrologic cycle representing underground water sources. Groundwater is present in many forms: in reservoirs, both natural and constructed; in underground streams; and, in the vast movement of water in and through sand, clay, and rock beneath the earth's surface. The place where groundwater comes closest to the surface is called the water table, which in some areas may be very deep, and in others may be right at the surface. Groundwater hydrology is, therefore, connected to surface water hydrology, and cannot be treated as a separate system. One example of how groundwater hydrology can directly impact surface water hydrology is when surface streams are partly filled by groundwater. When that groundwater is pumped out and removed from the system, the stream levels will fall, or even dry up entirely, even though no water was removed from the stream itself (SCAG, 2012).

Groundwater represents most of the Basin's fresh water supply, making up approximately 30 percent of total water use, depending on precipitation levels. Groundwater basins are replenished mainly through infiltration – precipitation soaking into the ground and making its way into the groundwater. Two threats to the function of this system are increases in impervious surface and overdraft (SCAG, 2012).

Impervious surface decreases the area available for groundwater recharge, as precipitation runoff flows off of streets, buildings, and parking lots directly into storm sewers, and straight into either river channels or into the ocean. This prevents the natural recharge of groundwater, effectively removing groundwater from the system without any pumping. Impervious surface also deteriorates the quality of the water, as it moves over streets and buildings, gathering pollutants and trash before entering streams, rivers, and the ocean (SCAG, 2012).

To prevent seawater intrusion in coastal basins in Orange County, recycled water is injected into the ground to form a mound of groundwater between the coast and the main groundwater basin. In Los Angeles County, imported and recycled water is injected to maintain a seawater intrusion barrier (SCAG, 2012).

VOCs and other non-organic contaminants such as perchlorates have created groundwater impairments in industrialized portions of the San Gabriel and San Fernando Valley groundwater basins, where some locations have been declared federal Superfund sites. Subsequently, perchlorate contamination was found in the San Gabriel Valley, and is being removed. The U.S. EPA continues to oversee installation of a groundwater cleanup system, components of which were installed beneath the cities of La Puente and Industry in 2006. Similar problems exist in the Bunker Hills sub-basin of the Upper Santa Ana Valley groundwater basin. Perchlorate contamination has also been found in wells in the cities of Rialto, Colton, and Fontana in San Bernardino County. The presence of contamination in the source water does not necessarily require the closure of a groundwater well. Water systems can implement water treatment accompanied by monthly monitoring for contaminants and/or may blend the problematic water with other “cleaner” water in order to reduce the concentration of the contaminants of concern in the water that is ultimately to be delivered to the end-users (SCAG, 2012). For these reasons, groundwater continues to be used as the predominant source of water supply in these areas (SCAG, 2012).

3.5.3 Water Demand and Forecasts

Estimating total water use in the district is difficult because the boundaries of supplemental water purveyors' service areas bear little relation to the boundaries of the district and there are dozens of individual water retailers within the district. Water demand in California can generally be divided between urban, agricultural, and environmental uses. In southern California, approximately 75 percent of potable water is provided from imported sources. Annual water demand fluctuates in relation to available supplies. During prolonged periods of drought, water demand can be reduced significantly through conservation measures, while in years of above average rainfall demand for imported water usually declines. In 2000, a ‘normal’ year in terms of annual precipitation, the demand for water in the State was between approximately 82 and 83 million acre-feet. Of this total, southern California accounted for approximately 9.8 million acre-feet (SCAG, 2012).

The increase in California’s water demand is due primarily to the increase in population. By employing a multiple future scenario analysis, the California Water Plan Update 2009 (DWR, 2010) provides a growth range for future annual water demand. According to the California Water Plan Update 2009, statewide future annual water demands range from an

increase of fewer than 1.5 million acre-feet for the Slow and Strategic Growth scenario, to an increase of about 10 million acre-feet under the Expansive Growth scenario by year 2050. If southern California maintains its share of 12 percent of the state's water demand, the region could be expected to require an additional 500,000 acre-feet by 2030 (SCAG, 2012).

On June 4, 2008, Governor Arnold Schwarzenegger issued Executive Order S-06-08 and declared an official drought for California². Further, California Water Code §71460 et seq. states that a water district may restrict the use of water during any emergency caused by drought, or other threatened or existing water shortage, and may prohibit the use of water during such periods for any purpose other than household uses or such other restricted uses as determined to be necessary. The water district may also prohibit the use of water during such periods for specific uses which it finds to be nonessential. On February 27, 2009, Governor Schwarzenegger proclaimed a state of emergency regarding the drought and the availability and future sustainability of California's water resources³. The proclamation directed all state government agencies to utilize their resources, implement a state emergency plan and provide assistance for people, communities and businesses impacted by the drought. The proclamation further requested that all urban water users immediately increase their water conservation activities in an effort to reduce their individual water use by 20 percent.

Water districts, in response to the drought, have also taken actions throughout the state such as: 1) asking for voluntary reductions; 2) imposing mandatory restrictions or declaring a local emergency; 3) imposing agricultural rationing; 4) imposing drought rates, surcharges and fines; 5) limiting new development and requiring water efficient landscaping; and, 6) implementing a conservation campaign. In addition, water shortages have prompted cities to begin infrastructure improvements to secure future water supplies.

Following substantial increases in statewide rainfall and mountain snowpack, on March 30, 2011, Governor Jerry Brown officially rescinded Executive Order S-06-08, issued on June 4, 2008 and ended the States of Emergency regarding the drought called on June 12, 2008, and on February 27, 2009. The fourth snow survey of the season was conducted by the DWR and found that water content in California's mountain snowpack was 165 percent of the April 1 full season average. At that time, a majority of the state's major reservoirs were also above normal storage levels. Based on this data, DWR estimated it will be able to deliver 70 percent of requested SWP water for 2011.

In 2012, a recent uptick in water use has occurred due to a dry winter and a below-normal snowpack. Statewide hydrologic conditions at the end of June 2012 showed 80 percent of average precipitation to date; runoff at 65 percent of average to date; and reservoir storage at 100 percent of average for the date. However, impacts of drought are typically felt first by those most reliant on annual rainfall such as small water systems lacking a reliable source, rural residents relying on wells in low-yield rock formations, or ranchers engaged in dryland grazing. As of mid-July 2012, 75-percent of California's pasture and range land is reported to be experiencing "poor" or "very poor" water conditions. So, some regions of California

² <http://gov.ca.gov/press-release/9796>

³ <http://gov.ca.gov/press-release/11556/>

may be experiencing a national trend toward drought. Over half of the contiguous U.S. is experiencing drought conditions, the largest percentage of the nation experiencing drought conditions in the 12-year record of the U.S. Drought Monitor.

3.5.3.1 Water Suppliers

Southern California is served by many water suppliers, both retail and wholesale with MWD being the largest. Created by the California legislature in 1931, MWD serves the urbanized coastal plain from Ventura in the north to the Mexican border in the south to parts of the rapidly urbanizing counties of San Bernardino and Riverside in the east. MWD provides water to about 90 percent of the urban population of southern California. MWD is comprised of 26 member agencies, with 12 supplying wholesale water to retail agencies and other wholesalers. The remaining 14 agencies are individual cities which directly supply water to their residents. A list of the major water suppliers operating within the district is provided in Table 3.5-2.

MWD's largest water customers are the San Diego County Water Authority (28 percent of MWD's supplies based on 2005-2009 average), the LADWP (15 percent) and the Municipal Water District of Orange County (13 percent). The reliance on MWD's water supplies varies by agency. For example, in recent years, Upper San Gabriel received as little as five percent (in fiscal year 2008/09) of its total water supply from MWD, while Beverly Hills received over 93 percent. However, this relative share of local and imported supplies varies from year to year based on supply and demand conditions (MWD, 2010).

MWD monitors demographics in its service area since water demand is heavily influenced by population size, geographical distribution, variation in precipitation levels, and water conservation practices. In 1990, the population of MWD's service area was approximately 14.8 million people. By 2010, it had reached an estimated 19.1 million, representing about 50 percent of the state's population. Growth has generally been around 200,000 persons per year since 2002. The MWD service area is estimated to reach an estimated population of 21.3 million in 2025, and 22.5 million by 2035 (MWD, 2010). Average per capita water usage generally ranges from 170 to 285 gallons per day (SCAG, 2012).

Actual retail water demands within MWD's service area have increased from 3.1 million acre-feet in 1980 to a projected 4.0 million acre-feet in 2010. This represents an estimated annual increase of about 1.0 percent. A similar gradual increase in estimated total retail water demand is expected between 2010 and 2035 (see Table 3.5-2) (MWD, 2010).

Of the estimated 4.0 million acre-feet of total retail water use in 2010, 93 percent is due to municipal and industrial uses, with agriculture accounting for the other seven percent. The relative share of municipal and industrial water use has increased over time at the expense of agricultural use which has declined due to urbanization and market factors. By 2035, it is estimated that agriculture will account for only about four percent of total MWD retail demands. It is estimated that total municipal and industrial water use will grow from an annual average of 4.0 million acre-feet in 2010 to 4.7 million acre-feet in 2035. All water demand projections assume normal weather conditions. Future changes in estimated water demand assumes continued water savings due to conservation measures such as water

savings resulting from plumbing codes, price effects, and the continuing implementation of utility-funded conservation Best Management Practices (BMPs) (MWD, 2010) (see Table 3.5-2).

3.5.3.2 Water Uses

While most land use in the region is urban, other land uses include national forest and a small percentage of irrigated crop acreage (DWR, 1998). The South Coast Hydrologic Region is the most populous and urbanized region in California. In some portions of the region, water users consume more water than is locally available, which has resulted in an overdraft of groundwater resources and increasing dependence on imported water supplies. The distribution of water uses, however, varies dramatically across the South Coast's planning areas. As a result of recent droughts, South Coast water users have generally become more water efficient. Municipal water agencies are engaged in aggressive water conservation and efficiency programs to reduce per capita water demand. As a result of changes in plumbing codes, energy and water efficiency innovations in appliances, and

trends toward more water efficient landscaping practices, urban water demand has become more efficient (DWR, 2010).

For the South Coast region, urban water uses are the largest component of the developed water supply, while agricultural water use is a smaller but significant portion of the total. Imported water supplies and groundwater are the major components of the water supply for this region, with minor supplies from local surface waters and recycled water (DWR, 2010).

Of the total water supply to the region, more than half is either used by native vegetation; evaporates to the atmosphere; provides some of the water for agricultural crops and managed wetlands (effective precipitation); or flows to the Pacific Ocean and salt sinks like saline groundwater aquifers. The remaining portion is distributed among urban and agricultural uses and for diversions to managed wetlands (DWR, 2010).

3.5.3.2.1 Residential Water Use

While single-family homes are estimated to account for about 61 percent of the total occupied housing stock in 2010, they are responsible for about 74 percent of total residential water demands. This is consistent with the fact that single-family households are known to use more water than multifamily households (e.g., those residing in duplexes, triplexes, apartment buildings and condo developments) on a per housing-unit basis. This is because single-family households tend to have more persons living in the household; they are likely to have more water-using appliances and fixtures; and they tend to have more landscaping (MWD, 2010).

3.5.3.2.2 Non-residential Water Use

Nonresidential water use represents an approximately 25 percent of the total municipal and industrial demands in MWD's service area. This includes water that is used by businesses, services, government, institutions (such as hospitals and schools), and industrial (or manufacturing) establishments. Within the commercial/institutional category, the top water users include schools, hospitals, hotels, amusement parks, colleges, laundries, and restaurants. In southern California, major industrial users include electronics, aircraft, petroleum refining, beverages, food processing, and other industries that use water as a major component of the manufacturing process (MWD, 2010).

3.5.3.2.3 Agricultural Water Use

Agricultural water use currently constitutes about seven percent of total regional water demand in MWD's service area. Agricultural water use accounted for 19 percent of total regional water demand in 1970, 16 percent in 1980, 12 percent in 1990 and five percent in 2008. Part of the reduction seen in 2008 was a 30 percent mandatory reduction in MWD's Interim Agricultural Water Program deliveries, which continued into 2009 and a 25 percent reduction in 2010 (MWD, 2010). Improved technology has allowed growers to more accurately distribute water to the individual trees. In addition, pressure compensating valves and emitters have enabled growers to irrigate on steep slopes with better precision. Maximizing agricultural irrigation systems lowers the growers' irrigation demands (DWR, 2010).

3.5.4 Water Supply

To meet current and growing demands for water, the South Coast region is leveraging all available water resources: imported water, water transfers, conservation, captured surface water, groundwater, recycled water, and desalination. Given the level of uncertainty about water supply from the Delta and Colorado River, local agencies have emphasized diversification. Local water agencies now utilize a diverse mixture of local and imported sources and water management strategies to adequately meet urban and agricultural demands each year (DWR, 2010).

Water used in MWD's service area comes from both local and imported sources. Local sources include groundwater, surface water, and recycled water. Sources of imported water include the Colorado River, the SWP, and the Owens Valley/Mono Basin. Local sources meet about 45 percent of the water needs in MWD's service area, while imported sources supply the remaining 55 percent (MWD, 2010).

The City of Los Angeles imports water from the eastern Owens Valley/Mono Basin in the Sierra Nevada through the LAA. This water currently meets about seven percent of the region's water needs based on a five-year average from 2005-2009, but is dedicated for use by the city of Los Angeles. Contractually and for planning purposes, MWD treats the LAA as a local supply, although physically its water is imported from outside the region. Other supplies come from local sources, and MWD provides imported water supplies to meet the remaining 47 percent of the region's water needs based on the same five-year period. These imported supplies are received from MWD's CRA and the SWP's California Aqueduct (MWD, 2010).

3.5.4.1 Imported Water Supplies

Water is brought into the South Coast region from three major sources: the Delta, Colorado River, and Owens Valley/Mono Basin. All three are facing water supply cutbacks due to climate change and environmental issues. Although historically imported water served to help the South Coast region grow, it is today relied upon to sustain the existing population and economy. As such, parties in the South Coast region are working closely with other regions, the State, and federal agencies to address the challenges facing these imported supplies. Meanwhile, the South Coast region is working to develop new local supplies to meet the needs of future population and economic growth (DWR, 2010).

Most MWD member agencies and retail water suppliers depend on imported water for a portion of their water supply. For example, Los Angeles and San Diego (the largest and second largest cities in the state) have historically (1995-2004) obtained about 85 percent of their water from imported sources. These imported water requirements are similar to those of other metropolitan areas within the state, such as San Francisco and other cities around the San Francisco Bay (MWD, 2010). A list of major water suppliers operating within the district region is given in Table 3.5-3.

TABLE 3.5-3
Major Water Suppliers in the District Region

Water Agency	Land Area (square miles)	Sources of Water Supply
Antelope Valley and East Kern District	2,350	SWP, groundwater, reclaimed water
Bard Irrigation District (and Yuma Project Reservation Division)	23	Colorado River
Castaic Lake Water Agency	125	SWP
Coachella Valley Water District	974	SWP, Colorado River, and local
Crestline Lake Arrowhead	53	SWP
Desert Water Agency	324	SWP and groundwater
Imperial Irrigation District	1,658	Colorado River
Littlerock Creek Irrigation District	16	SWP, groundwater, and surface water
Metropolitan Water District of Southern California	5,200	SWP, Colorado River
Mojave Water Agency	4,900	SWP and groundwater
Palmdale Water Agency	187	SWP and groundwater
Palo Verde Irrigation District	188	Colorado River
San Bernardino Municipal Water	328	SWP and groundwater

3.5.4.1.1 State Water Project

The SWP is an important source of water for the South Coast region wholesale and retail suppliers. SWP contractors in the region take delivery of and convey the supplies to regional wholesalers and retailers. Contractors in the region are MWD, Castaic Lake Water Agency, San Bernardino Valley Municipal Water District (MWD), Ventura County Watershed Protection District (formerly Ventura County Flood Control District), San Geronio Pass Water Agency, and San Gabriel Valley Municipal Water District (DWR, 2010).

The SWP provides imported water to the MWD service area. Since 2002, SWP deliveries have accounted for as much as 70 percent of its water. In accordance with its contract with the DWR, MWD has a Table A allocation of about 1.91 million acre-feet per year under contract from the SWP. Actual deliveries have never reached this amount because they depend on the availability of supplies as determined by DWR. The availability of SWP supplies for delivery through the California Aqueduct over the next 18 years is estimated according to the historical record of hydrologic conditions, existing system capabilities as may be influenced by environmental permits, requests from state water contractors and SWP contract provisions for allocating Table A, Article 21 and other SWP deliveries. The estimates of SWP deliveries to MWD are based on DWR's most recent SWP reliability

estimates contained in its SWP Delivery Reliability Report 200716 and the December 2009 draft of the biannual update (MWD, 2010). The amount of precipitation and runoff in the Sacramento and San Joaquin watersheds, system reservoir storage, regulatory requirements, and contractor demands for SWP supplies impact the quantity of water available to MWD (MWD, 2010).

MWD and 28 other public entities have contracts with the State of California for SWP water. These contracts require the state, through its DWR, to use reasonable efforts to develop and maintain the SWP supply. The state has constructed 28 dams and reservoirs, 26 pumping and generation plants, and about 660 miles of aqueducts. More than 25 million California residents benefit from water from the SWP. DWR estimates that with current facilities and regulatory requirements, the project will deliver approximately 2.3 million acre-feet under average hydrology considering impacts attributable to the combined Delta smelt and salmonid species biological opinions (MWD, 2010). Under the water supply contract, DWR is required to use reasonable efforts to maintain and increase the reliability of service to its users.

3.5.4.1.2 Colorado River System

Another key imported water supply source for the South Coast region is the Colorado River. California water agencies are entitled to 4.4 million acre-feet annually of Colorado River water. Of this amount, 3.85 million acre-feet are assigned in aggregate to agricultural users; 550,000 acre-feet is MWD's annual entitlement. Until a few years ago, MWD routinely had access to 1.2 million acre-feet annually because Arizona and Nevada had not been using their full entitlement and the Colorado River flow was often adequate enough to yield surplus water (DWR, 2010).

A number of water agencies within California have rights to divert water from the Colorado River. Through the Seven Party Agreement (1931), seven agencies recommended apportionments of California's share of Colorado River water within the state. Table 3.5-4 shows the historic apportionment of each agency, and the priority accorded that apportionment.

The water is delivered to MWD's service area by way of the CRA, which has a capacity of nearly 1,800 cubic feet per second or 1.3 million acre-feet per year. The CRA conveys water 242 miles from its Lake Havasu intake to its terminal reservoir, Lake Mathews, near the city of Riverside. Conveyance losses along the Colorado River Aqueduct of 10 thousand acre-feet per year reduce the amount of Colorado River water received in the coastal plain (MWD, 2010).

TABLE 3.5-4
Priorities of the Seven Party Agreement

Priority	Description	TAF ^(a) Annually
1	Palo Verde Irrigation District – gross area of 104,500 acres of land in the Palo Verde Valley	3,850
2	Yuma Project (Reservation Division) – not exceeding a gross area of 25,000 acres in California	
3(a)	Imperial Irrigation District and land in Imperial and Coachella Valleys ^b to be served by All American Canal

- (a) TAF = thousand acre-feet.
 (b) The Coachella Valley Water District now serves Coachella Valley
 (c) In 1946, the City of San Diego, the San Diego County Water Authority, Metropolitan, and the Secretary of the Interior entered into a contract that merged and added the City of San Diego's rights to store and deliver Colorado River water to the rights of MWD. The conditions of that agreement have long since been satisfied.

Since the date of the original contract, several events have occurred that changed the dependable supply that MWD expects from the CRA. The most significant event was the 1964 U.S. Supreme Court decree in *Arizona v. California* that reduced MWD's dependable supply of Colorado River water to 550 thousand acre-feet per year. The reduction in dependable supply occurred with the commencement of Colorado River water deliveries to the Central Arizona Project (MWD, 2010). The court decision led to a number of other contracts and agreements on how Colorado River water is divided among various users, the key ones of which are summarized below (MWD, 2010).

- In 1987, MWD entered into a contract with the United States Bureau of Reclamation (USBR) for an additional 180 thousand acre-feet per year of surplus water, and 85 thousand acre-feet per year through a conservation program with the Imperial Irrigation District.

- In 1979, the Present Perfected Rights of certain Indian reservations, cities, and individuals along the Colorado River were quantified.
- In 1999, California's Colorado River Water Use Plan (Plan) was developed to provide a framework for how California would make the transition from relying on surplus water supplies from the Colorado to living within its normal water supply apportionment. To implement these plans, the Quantification Settlement Agreement (QSA) and several other related agreements were executed. The QSA quantifies the use of water under the third priority of the Seven Party Agreement and allows for implementation of agricultural conservation, land management, and other programs identified in MWD's 1996 Integrated Water Resources Plan (IRP). The QSA has helped California reduce its reliance on Colorado River water above its normal apportionment.
- In October 2004, the Southern Nevada Water Authority and MWD entered into a storage and interstate release agreement. Under this program, Nevada can request that MWD to store unused Nevada apportionment in MWD's service area. The stored water provides flexibility to MWD for blending Colorado River water with SWP water and improves near-term water supply reliability.
- In December 2007, the Secretary of the Interior approved the adoption of specific interim guidelines for reductions in Colorado River water deliveries during declared shortages and coordinated operations of Lake Powell and Lake Mead.
- In May 2006, the MWD and the USBR executed an agreement for a demonstration program that allowed the MWD to leave conserved water in Lake Mead that MWD would otherwise have used in 2006 and 2007. As of January 1, 2010, MWD had nearly 80 thousand acre-feet of conservation water stored in Lake Mead (MWD, 2010).
- The December 2007 federal guidelines provided the Colorado River contractors with the ability to create system efficiency projects. By funding a portion of the reservoir projects at Imperial Dam, an additional 100 thousand acre-feet of water was allocated to MWD.

MWD is undertaking ongoing efforts to maintain and improve the flexibility and quality of its water supply from the Colorado River. MWD recognizes that in the short-term, programs are not yet in place to provide the full targeted amount, even with the programs adopted under the QSA and the opportunities to store conserved water in Lake Mead. The December 2007 federal guidelines concerning the operation of the Colorado River system reservoirs provide more certainty to MWD with respect to the determination of a shortage, normal, or surplus condition for the operation of Lake Mead (MWD, 2010).

3.5.4.1.3 *Owens Valley Mono Basin (Los Angeles Aqueduct)*

High-quality water from the Mono Basin and Owens Valley is delivered through the LAA to the City of Los Angeles. Construction of the original 233-mile aqueduct from the Owens Valley was completed in 1913, with a second aqueduct completed in 1970 to increase capacity. Approximately 480,000 acre-feet per year of water can be delivered to the City of

Los Angeles each year; however the amount of water the aqueducts deliver varies from year to year due to fluctuating precipitation in the Sierra Nevada Mountains and mandatory instream flow requirements (DWR, 2010).

Diversion of water from Mono Lake has been reduced following State Water Board Decision 1631. Exportation of water from the Owens Valley is limited by the Inyo-Los Angeles Long Term Water Agreement (and related Memorandum of Understanding) and the Great Basin Air Pollution Control District/City of Los Angeles Memorandum of Understanding (to reduce particulate matter air pollution from the Owens Lake bed) (DWR, 2010).

Over time, environmental considerations have required that the City reallocate approximately one-half of the LAA water supply to environmental mitigation and enhancement projects. As a result, the City of Los Angeles has used approximately 205,800 acre-feet of water supplies for environmental mitigation and enhancement in the Owens Valley and Mono Basin regions in 2010, which is in addition to the almost 107,300 acre-feet per year supplied for agricultural, stockwater, and Native American Reservations. Limiting water deliveries to the City of Los Angeles from the LAA has directly led to increased dependence on imported water supply from MWD. LADWP's purchases of supplemental water from MWD in FY 2008/09 reached an all-time high (LADWP, 2010).

LAA deliveries comprise 39 percent of the total runoff in the eastern Sierra Nevada in an average year. The vast majority of water collected in the eastern Sierra Nevada stays in the Mono Basin, Owens River, and Owens Valley for ecosystem and other uses (LADWP, 2010).

Annual LAA deliveries are dependent on snowfall in the eastern Sierra Nevada. Years with abundant snowpack result in larger quantities of water deliveries from the LAA, and typically lower supplemental water purchases from MWD. Unfortunately, a given year's snowpack cannot be predicted with certainty, and thus, deliveries from the LAA system are subject to significant hydrologic variability (LADWP, 2010).

The impact to LAA water supplies due to varying hydrology in the Mono Basin and Owens Valley is amplified by the requirements to release water for environmental restoration efforts in the eastern Sierra Nevada. Since 1989, when City water exports were significantly reduced to restore the Mono Basin's ecosystem, LAA deliveries from the Mono Basin and Owens Valley have ranged from 108,503 acre-feet in 2008/09 to 466,584 acre-feet in 1995/96. Average LAA deliveries since 1989/90 have been approximately 264,799 acre-feet, about 42 percent of the City of Los Angeles' total water needs (LADWP, 2010).

3.5.4.2 Local Water Supplies

Approximately 50 percent of the region's water supplies come from resources controlled or operated by local water agencies. These resources include water extracted from local groundwater basins, catchment of local surface water, non-MWD imported water supplied through the Los Angeles Aqueduct, and Colorado River water exchanged for MWD supplies (MWD, 2010).

Local sources of water available to the region include surface water, groundwater, and recycled water. Some of the major river systems in southern California have been developed into systems of dams, flood control channels, and percolation ponds for supplying local water and recharging groundwater basins. For example, the San Gabriel and Santa Ana rivers capture over 80 percent of the runoff in their watersheds. The Los Angeles River system, however, is not as efficient in capturing runoff. In its upper reaches, which make up 25 percent of the watershed, most runoff is captured with recharge facilities. In its lower reaches, which comprise the remaining 75 percent of the watershed, the river and its tributaries are lined with concrete, so there are no recharge facilities. The Santa Clara River in Ventura County is outside of MWD's service area, but it replenishes groundwater basins used by water agencies within MWD's service area. Other rivers in MWD's service area, such as the Santa Margarita and San Luis Rey, are essentially natural replenishment systems (MWD, 2010).

3.5.4.3 Surface Water

Local surface capture plays an important water resource role in the South Coast region. More than 75 impound structures are used to capture local runoff for direct use or groundwater recharge, operational or emergency storage for imported supplies, or flood protection. While precipitation contributes most of the annual volume of streamflow to the region's waterways, urban runoff, wastewater discharges, agricultural tailwater, and surfacing groundwater are the prime sources of surface flow during non-storm periods. The South Coast has experienced a trend of increasing dry weather flows during the past 30 years as the region has developed, due to increased imported water use and associated urban runoff (DWR, 2101).

Surface water runoff augments groundwater and surface water supplies. However, the regional demand far surpasses the potential natural recharge capacity. The arid climate, summer drought, and increased urbanization contribute to the inadequate natural recharge. Urban and agricultural runoff can contain pollutants, which decrease the quality of local water supplies. Local agencies maintain surface reservoir capacity to capture local runoff. The average yield captured from local watersheds is estimated at approximately 90 thousand acre-feet per year. The majority of this supply comes from reservoirs within the service area of the San Diego County Water Authority (MWD, 2010).

3.5.4.4 Groundwater

During the first half of the 20th century, groundwater was an important factor in the expansion of the urban and agricultural sectors in the South Coast region. Today, it remains important for the Santa Clara, MWD Los Angeles and Santa Ana planning areas, but only a small source for San Diego. Court adjudications recharge operations, and other management programs are helping to maintain the supplies available from many of the region's groundwater basins. Since the 1950s, conjunctive management and groundwater storage has been utilized to increase the reliability of supplies, particularly during droughts. Using the region's other water resources, groundwater basins are being recharged through spreading basins and injection wells. During water shortages of the imported supplies, more groundwater would be extracted to make up the difference. Water quality issues have

impacted the reliability of supplies from some basins. However, major efforts are underway to address the problems and increase supplies for these basins (DWR, 2010).

The groundwater basins that underlie the region provide approximately 86 percent of the local water supply in southern California. The major groundwater basins in the region provide an annual average supply of approximately 1.35 million acre-feet. Most of this water recharges naturally, but approximately 200 thousand acre-feet has historically been replenished each year through MWD imported supplies. By 2025, estimates show that groundwater production will increase to 1.65 million acre-feet (MWD, 2010).

Because the groundwater basins contain a large volume of stored water, it is possible to produce more than the natural recharge of 1.16 million acre-feet and the imported replenishment amount for short periods of time. During a dry year, imported replenishment deliveries can be postponed, but doing so requires that the shortfall be restored in wet years. Similarly, in dry years the level of the groundwater basins can be drawn down, as long as the balance is restored to the natural recharge level by increasing replenishment in wet years. Thus, the groundwater basins can act as a water bank, allowing deposits in wet years and withdrawals in dry years (MWD, 2010).

3.5.4.5 Recycled Water

Local water recycling projects involve further treatment of secondary treated wastewater that would be discharged to the ocean or streams and use it for direct non-potable uses such as landscape and agricultural irrigation, commercial and industrial purpose and for indirect potable uses such as groundwater recharge, seawater intrusion barriers, and surface water augmentation (MWD, 2010).

Within MWD's service area, there are approximately 355,000 acre-feet of planned and permitted uses of recycled water supplies. Actual use is approximately 209,000 acre-feet, which includes golf course, landscape, and cropland irrigation; industrial uses; construction applications; and groundwater recharge, including maintenance of seawater barriers in coastal aquifers. MWD projects the development of 500,000 acre-feet of recycled water supplies (including groundwater recovery) by 2025 (DWR, 2010).

Current average annual recycled water production in the MWD Los Angeles Planning Area is approximately 225 million gallons per day (mgd), which represents approximately 25 percent of the current average annual effluent flows. The Water Replenishment District (WRD) is permitted to recharge up to 50,000 acre-feet per year (45 mgd) of Title 22 recycled water for ground water replenishment of the Montebello Forebay. West Basin Municipal Water District's (WBMWD) Edward Little Water Recycling Facility in El Segundo, which produced approximately 24,500 acre-feet in 2004-2005, recently completed its Phase IV Expansion Project. Approximately 12,500 acre-feet per year of the water produced at this facility is purchased by WRD and injected into the West Coast Barrier. The use of recycled water by LADWP is projected to be approximately 50,000 acre-feet per year by 2019 (DWR, 2010).

Recycled water currently represents approximately four percent of the total water demands in the Santa Ana Planning Area. Eastern Municipal Water District (EMWD) recycles effluent from four wastewater treatment plants. EMWD is also investigating the feasibility of indirect potable reuse through groundwater recharge. The Irvine Ranch Water District (IRWD) has developed an extensive recycled water treatment and delivery system and will expand capacity through 2013 to meet expected recycled water demand. The Inland Empire Utilities Agency is expanding its water recycling with a goal of meeting 20 percent of their demand or 50,000 acre-feet with recycled water. The Western Water Recycling Facility, owned and operated by Western Municipal Water District, is currently being upgraded and expanded. As infrastructure is further developed, recycled water is projected to surpass surface water as a water supply source for the planning area. The Orange County Water District (OCWD) and Orange County Sanitation District's Groundwater Replenishment System provides 72,000 acre-feet per year of recycled water for groundwater recharge and injection along the seawater barrier (DWR, 2010).

The San Diego Planning Area contains a number of recycled water facilities. In Riverside County, water reclamation facilities include Santa Rosa and Temecula Valley which provide non-potable supplies for local use. Seventeen recycled water tertiary treatment facilities are located within San Diego County. The use of tertiary treated recycled water within the San Diego area is projected to increase from 11,500 acre-feet per year in 2005 to 47,600 acre-feet per year in 2030. In September 2008, the City of San Diego approved funding for a demonstration project that releases advanced treated wastewater to San Vicente Reservoir for blending and subsequent additional treatment prior to redistribution (DWR, 2010).

3.5.4.6 Desalination Plants

In the MWD Los Angeles Planning Area, the Robert W. Goldsworthy Desalter, owned and operated by the WRD, processes approximately 2.75 mgd of brackish groundwater desalination for the purpose of remediating a saline plume located within the West Coast sub-basin and providing a reliable local water source to Torrance (DWR, 2010).

The potential for groundwater banking in the Santa Ana Planning Area is substantial, but the volume of clean water that can be stored may be hindered by high salt concentrations in the existing groundwater. In the Santa Ana watershed, three groundwater desalination plants have been constructed and are producing a total of 24 mgd. The Temescal plant, constructed and operated by the City of Corona, has a capacity of 15 mgd. The Menifee and Perris Desalters, owned and operated by EMWD, are producing seven MGD. The Chino Basin Desalter Authority operates Chino I and Chino II Desalters, which are producing 24 mgd (26,000 acre-feet per year) (DWR, 2010).

The Irvine Desalter Project, a joint groundwater quality restoration project by Irvine Ranch Water District and Orange County Water District, yields 7,700 acre-feet per year of potable drinking water and 3,900 acre-feet per year of non-potable water. The Tustin Seventeenth Street Desalter, owned and operated by the City of Tustin yields approximately 2,100 acre-feet per year. The Arlington Desalter, managed by Western MWD, delivers approximately 6,400 acre-feet of treated groundwater annually to the City of Norco (DWR, 2010).

3.5.5 Water Conservation

In the MWD Los Angeles Planning Area, MWD assists member agencies with implementation of water conservation programs. MWD's conservation programs focus on two main areas: residential programs, and commercial, industrial and institutional programs.

Water conservation continues to be a key factor in water resource management in southern California. For MWD, water-use efficiency is anchored by the adopted Long-Term Conservation Plan (LTCP) (August 2011) and the Local Resources Program (LRP). The LTCP sets goals to help retailers achieve water conservation savings, and at the same time, support technology innovation and transform public perception about the value of water. This plan is market oriented and has both incentive and non-incentive drivers to ultimately change how water is used by southern California consumers. Additionally, the LRP encourages the development and increased use of recycled water through incentives (MWD, 2012).

Outdoor water use is a key focus as watering landscapes and gardens accounts for about half of household water use in MWD's service area. MWD will work with water agencies, landscape equipment manufacturers and other stakeholders to make proper irrigation control more effective and easier to understand. A similar effort will be made to reach out to the region's businesses, industries and agriculture to focus on process improvements that can save both money and water. The final focus will be on residential water use, where MWD will work with water agencies and energy utilities to better promote the choices that consumers have for water-efficient products like faucets, shower heads and high-efficiency clothes washers (MWD, 2012).

MWD's incentive programs aimed at residential, commercial and industrial water users make a key contribution to the region's conservation achievements. The rebate program is credited with water savings of 156,000 acre-feet annually. Funding provided by MWD to member agencies and retail water agencies for locally-administered conservation programs included rebates for turf removal projects, toilet distribution and replacement programs, high-efficiency clothes washer rebate programs and residential water audits (MWD, 2012).

3.5.5.1 Residential Programs

MWD's residential conservation consists of the following programs:

- **SoCal Water\$mart:** A region-wide program to help offset the purchase of water-efficient devices. MWD issued 54,000 rebates for residential fixtures in fiscal year 2008/09, resulting in approximately 2.3 thousand acre-feet of water to be saved annually.
- **Save Water, Save A Buck:** This program extends rebates to multi-family dwellings. More than 40,000 rebates were issued fiscal year 2008/09 for high-efficiency toilets and washers for multi-family units.
- **Member Agency Residential Programs:** member and retail agencies also implement local water conservation programs within their respective service areas

and receive MWD incentives for qualified retrofits and other water-saving actions. Typical projects include toilet replacements, locally administered clothes washer rebate programs, and residential water audits.

MWD has provided incentives on a variety of water efficient devices for the residential sector, including: 1) high-efficiency clothes washers; 2) high-efficiency toilets and ultra-low toilets; 3) irrigation evaluations and residential surveys; 4) rotating nozzles for sprinklers; 5) weather-based irrigation controllers; and, 6) synthetic turf.

3.5.5.2 Commercial, Industrial and Institutional Programs

MWD's commercial industrial and institutional conservation consists of three major programs:

- **Save Water, Save-A-Buck Program:** The Save-A-Buck program had its largest year in fiscal year 2008/09, providing rebates for approximately 145,000 device retrofits.
- **Water Savings Performance Program:** This program allows large-scale water users to customize conservation projects and receive incentives for five years of water savings for capital water-use efficiency improvements
- **Member Agency Commercial Programs:** Member and retail agencies also implement local commercial water conservation programs using MWD incentives.

A fourth program, the Public Sector Demonstration Program also resulted in water savings. From August 2007 through 2008, MWD offered a one-time program to provide up-front funding to increase water use efficiency in public buildings and landscapes within its service area. Participants included various special districts, school districts, state colleges and universities, municipalities, counties, and other government agencies.

- Enhanced incentives were provided to replace high water-use equipment including toilets, urinals, and irrigation controllers. Program incentives were often sufficient to cover the total cost of the equipment.
- Pay-for-performance incentives were also offered to reduce landscape irrigation water use by at least 10 percent through behavioral modifications.
- MWD's programs provide rebates for water-saving plumbing fixtures, landscaping equipment, food-service equipment, cleaning equipment, HVAC (heating, ventilating, air conditioning) and medical equipment (MWD).

LADWP implements public outreach and school education programs to encourage conservation ethics; seasonal water rates that are approximately 20 percent greater during the summer high use period; and free water conservation kits. In addition, LADWP implemented Mandatory Water Conservation measures in 2009, which are still in effect today. Mandatory Water Conservation restricts outdoor watering and prohibits certain uses of water such as prohibiting customers from hosing down driveways and sidewalks, requiring all leaks to be fixed, and requiring customers to use hoses fitted with shut-off nozzles. As a result of these conservation efforts by LADWP, the water demand for Los

Angeles is about the same as it was 25 years ago, despite a population increase of more than one million people. LADWP projects an additional savings of at least 50,000 acre-feet per year by 2030 through additional water conservation programs. The Central Basin Municipal Water District and the WBMWD recently completed water conservation master plans to coordinate and prioritize conservation efforts and identify enforcement protocols (DWR, 2010).

OCWD implements several water use efficiency programs in the Santa Ana Planning Area, including a hotel/motel water conservation program, an annual Children’s Water Festival, a Water Heroes program, and water saving tips and tools. Eastern Municipal Water District has a strategic goal to reduce per capita water use and has several programs to replace existing inefficient water devices and encourage water efficiency in new development. Inland Empire Utilities Agency provides multiple rebate programs, including turf removal and water efficient fixtures, and has established the Inland Empire Landscape Alliance to promote the use of water efficiency landscaping by its cities and retail agencies. Western Municipal Water District operates the preeminent water conservation demonstration center in the southland, Landscapes Southern California Style, which has been educating the public about water efficient planting and irrigation for over 15 years (DWR, 2010).

3.5.6 Water Quality

Water quality is a key issue in the South Coast region. Population and economic growth not only affect water demand, but add contamination challenges from increases in wastewater and industrial discharges, urban runoff, agricultural chemical usage, livestock operations, and seawater intrusion. Urban and agricultural runoff can contribute to local surface water sediment from disturbed areas; oil, grease, and toxic chemicals from automobiles; nutrients and pesticides from turf and crop management; viruses and bacteria from failing septic systems and animal waste; road salts; and heavy metals. Three areas that are receiving intense interest are nonpoint source pollution control, salinity management, and emerging contaminants (DWR, 2010).

Three Regional Water Quality Control Boards (Regional Water Boards) have jurisdiction in the South Coast: Los Angeles (Region 4), Santa Ana (Region 8), and San Diego (Region 9). Each Regional Water Board identifies impaired water bodies, establishes priorities for the protection of water quality, issues waste discharge requirements, and takes appropriate enforcement actions within its jurisdiction. Specific water quality issues within the South Coast include beach closures, contaminated sediments, agricultural discharges, salinity management, and port and harbor discharges. Outside the region, high salinity levels and perchlorate contamination contribute to degraded Colorado River supplies, while seawater intrusion and agricultural drainage threaten SWP supplies (DWR, 2010).

3.5.6.1 Non-Point Source Pollution Control

All non-point source pollution is currently regulated through either the NPDES Permitting Program or the Coastal Non-point Pollution Control Program. The Regional Water Boards issue municipal, industrial, and construction NPDES permits with the goal of reducing or eliminating the discharge of pollutants into the storm water conveyance system. The coastal

program requires the U.S. EPA and National Oceanic and Atmospheric Administration to develop and implement enforceable BMPs to control non-point source pollution in coastal waters. Further, the Los Angeles Regional Water Board has adopted conditional waivers for discharges from irrigated agricultural lands, which require farmers to measure and control discharges from their property (DWR, 2010).

South Coast agencies have recently begun to implement Low Impact Development (LID) as a way of improving water quality through sustainable urban runoff management. LID practices include: bioretention and rain gardens, rooftop gardens, vegetated swales and buffers, roof disconnection, rain barrels and cisterns, permeable pavers, soil amendments, impervious surface reduction, and pollution prevention. The Los Angeles and San Diego Regional Water Boards have both incorporated LID language into Standard Urban Storm Water Mitigation Plan requirements for municipal NPDES permits (DWR, 2010).

3.5.6.2 Salinity Management

Surface and groundwater salinity is an ongoing challenge for South Coast water supply agencies. Higher levels of treatment are needed following long-range import of water supplies, as TDS levels are increased during conveyance. Salinity sources in local supplies include concentration from agricultural irrigation, seawater intrusion, discharge of treated wastewater, and recycled water. MWD depends on blending the higher salinity CRA supply at Parker Dam with the lower salinity SWP supply to maintain 500 milligrams per liter (mg/L) TDS or lower. Further, seawater intrusion and agricultural drainage threatens to increase the salinity of SWP supplies. Reduced surface water quality would require additional or upgraded demineralization facilities. Increased salinity also reduces the life of plumbing fixtures and consequently increases replacement costs to customers (DWR, 2010).

Groundwater quality has also been degraded by a long history of groundwater overdrafting and subsequent seawater intrusion. Orange County Water District (OCWD), Water Replenishment District of Southern California (WRD), and Los Angeles County Department of Public Works (LACDPW) operate groundwater injection programs to form hydraulic barriers that protect aquifers from seawater intrusion. Brackish groundwater treatment occurs throughout the Santa Clara and Santa Ana planning areas. Various local agencies have developed salinity and nutrient management plans to reduce salt loading. For example, the Chino Basin Watermaster developed an Optimum Basin Management Plan ([Chino Basin Watermaster](#), 1999) to develop the maximum yield of the basin while protecting water quality. Further development of groundwater recharge programs within the South Coast may exacerbate groundwater salinity and require additional technological advances in desalination (DWR, 2010).

3.5.6.3 Potential Contaminants

Chemical and microbial constituents that have not historically been considered as contaminants are increasingly present in the environment due to municipal, agricultural, and industrial wastewater sources and pathways. Established and emerging contaminants of concern to the region's drinking water supplies include pharmaceuticals and personal care products; disinfection byproducts; those associated with the production of rocket fuel such

as perchlorate and nitrosodimethylamine; those that occur naturally such as arsenic; those associated with industrial processes such as hexavalent chromium and methyl tertiary butyl ether (MTBE). Wastewater treatment plants are not currently designed to remove these emerging contaminants (DWR, 2010).

3.5.6.4 Planning Area Impairments

Water quality issues within the MWD Los Angeles planning areas (Los Angeles Regional Water Board) stem from a range of sources, including industrial and municipal operations, flow diversion, channelization, introduction of non-native species, sand and gravel operations, natural oil seeps, dredging, spills from ships, transient camps, and illegal dumping. Over time, these practices have resulted in the bioaccumulation of toxic compounds in fish and other aquatic life, instream toxicity, eutrophication, beach closures, and a number of Clean Water Act 303(d) listings. Water bodies within this planning area have been listed for metals, pesticides, nitrates, trash, salinity, and pH. The Regional Water Board is developing TMDLs for nutrients, pathogens, trash, toxic organic compounds, and metals (DWR, 2010).

Key issues within the Santa Ana Planning Area (Santa Ana Regional Water Board) include: nitrogen/TDS due to flow diversion; nitrogen/TDS associated with past agricultural activities and dairies in the Chino Basin; and pathogen issues from urbanization impacting river and coastal beaches, and past contamination of groundwater basins from perchlorate which is related to rocket fuel disposal and fertilizer use. Water bodies within this planning area typically have nutrient issues, including organic enrichment, low dissolved oxygen, and algal blooms. These are particular problems in Big Bear Lake and Lake Elsinore. Water quality issues also include pathogens, metals, and toxic organic compounds in the lower watershed due to urbanization and agricultural activities. TMDLs have been developed throughout the Santa Ana River and San Jacinto River watersheds for nutrients and pathogens. Along the Newport coast, TMDLs are in place for metals, nutrients, pathogens, pesticides/priority organics, and siltation (DWR, 2010).

The Chino Basin maintains a large concentration of dairy operations along with livestock. Runoff from the dairies contributes nitrates, salts, and microorganisms to both surface water and groundwater. Since 1972, the Santa Ana Regional Water Board has issued waste discharge requirements to the dairies in this basin. Groundwater quality in this basin is integrally related to the surface water quality downstream in the Santa Ana River, which in turn serves as a source for groundwater recharge in Orange County.

3.5.7 Wastewater Treatment

The CWA requires wastewater treatment facilities discharging to waters of the U.S. to provide a minimum level of treatment commonly referred to as tertiary treatment. Modern wastewater treatment facilities consist of staged processes with the specific treatment systems authorized through NPDES permits. Primary treatment generally consists of initial screening and clarifying. Primary clarifiers are large pools where solids in wastewater are allowed to settle out over a period of hours. The clarified water is pumped into secondary clarifiers and the screenings and solids are collected, processed through large digesters to

break down organic contents, dried and pressed, and either disposed of in landfills or used for beneficial agricultural applications. Secondary clarifiers repeat the process of the primary clarifiers further, refining the effluent. Other means of secondary treatment include flocculation (adding chemicals to precipitate solids removal) and aeration (adding oxygen to accelerate breakdown of dissolved constituents). Tertiary treatment may consist of filtration, disinfection, and reverse osmosis technologies. Chemicals are added to the wastewater during the primary and secondary treatment processes to accelerate the removal of solids and to reduce odors. Hydrogen peroxide can be added to reduce odors and ferric chloride can be used to remove solids. Polymers are added to secondary effluent as flocculate. Chlorine is often added to eliminate pathogens during final treatment and sulfur dioxide is often added to remove the residual chlorine. Methane produced by the treatment processes can be used as fuel for the plant's engines and electricity needs. Recycled water must receive a minimum of tertiary treatment in compliance with DHS regulations. Water used to recharge potable groundwater supplies generally receives reverse osmosis and microfiltration prior to reuse. Microfiltration technologies have improved substantially in recent years and have become more affordable. As levels of treatment increase, greater volumes of solids and condensed brines are produced. These by-products of water treatment are disposed of in landfills or discharged to local receiving waters.

Wastewater flows and capacities of major treatment facilities are shown in Table 3.5-5. Much of the urbanized areas of Los Angeles and Orange Counties are serviced by three [agencies that operate](#) large publicly owned treatment works (POTWs): the City of Los Angeles Bureau of Sanitation's Hyperion [Treatment Plant in El Segundo](#), the City of Los Angeles Bureau of Sanitation's Terminal Island [Facility in San Pedro](#), ~~the Joint Outfall System of~~ the Los Angeles County Sanitation District's [\(LACSD\) Joint Water Pollution Control Plant \(JWPCP\) in Carson](#), and the Orange County Sanitation District's [\(OCSD\) treatment plants in Huntington Beach and Fountain Valley](#). These ~~three~~ facilities handle more than 70 percent of the wastewater generated in the entire SCAG region (SCAG, 2010).

In addition to these large facilities, medium sized POTWs (greater than 10 mgd) and small treatment plants (less than 10 mgd) service smaller communities in Ventura County, southern Orange County, and in the inland regions. Many of these treatment systems recycle their effluent through local landscape irrigation and groundwater recharge projects. Other treatment systems discharge to local creeks on a seasonal basis, effectively matching the natural conditions of ephemeral and intermittent stream habitats (SCAG, 2012).

Many rural communities utilize individually owned and operated septic tanks rather than centralized treatment plants. The RWQCB generally delegates oversight of septic systems to local authorities. However, water discharge requirements are generally required for multiple-dwelling units and in areas where groundwater is used for drinking water. These water discharge requirements are only issued to properties greater than one acre and are not required for properties greater than five acres in size (SCAG, 2012).

TABLE 3.5-5
Wastewater Flow and Capacity in the SCAG Region

WASTEWATER AGENCY	CURRENT FLOW (MGD)	CAPACITY FLOW (MGD)
Los Angeles County		
Los Angeles County Sanitation Districts		
Joint Water Pollution Control Plant Outfall System	406.1	590.2
Lancaster Water Reclamation Plant	12.0	16.0
Palmdale Water Reclamation Plant	8.0	15.0
Santa Clarita Water Reclamation Plant	20.0	28.6

SUBCHAPTER 3.6

LAND USE AND PLANNING

Introduction

Regulatory Setting

Environmental Setting

3.6 LAND USE AND PLANNING

3.6.1 Introduction

The environmental setting describes the land uses that may be affected by the proposed project. The environmental setting addresses residential, commercial, industrial, and institutional land uses across the district.

3.6.2 Regulatory Setting

3.6.2.1 Federal Agencies

3.6.2.1.1 *United States Bureau of Land Management (BLM)*

The BLM manages much of the undeveloped or unused land in the region, primarily in the eastern portion of the region. The California Desert Conservation Area Plan is used to manage BLM controlled areas. The BLM also implements biological resource management policies through its designation of Areas of Critical Environmental Concern.

3.6.2.1.2 *National Park Service (NPS)*

The NPS manages national parks and wilderness areas. One national park and one wilderness area are located in the district: Joshua Tree National Park and the Santa Monica Mountains National Recreation Area.

3.6.2.1.3 *United States Fish and Wildlife Service (USFWS)*

The USFWS administers the Federal Endangered Species Act (FESA) and designates critical habitat for endangered species. The USFWS manages the National Wildlife Refuges in the district such as the Seal Beach National Wildlife Refuge and the Coachella Valley National Wildlife Refuge.

3.6.2.1.4 *United States Forest Service (USFS)*

The USFS manages approximately 2.3 million acres of national forests in the district. The three national forests in the region are the Angeles National Forest, San Bernardino National Forest, and the Cleveland National Forest.

3.6.2.1.5 *United States Army Corps of Engineers (USACOE)*

Among its responsibilities, the USACOE administers §404 of the Clean Water Act (CWA), which governs specified activities in waters of the United States, including wetlands. In this role, the USACOE requires that a permit be obtained if a project would place structures, including dredged or filled materials, within navigable waters or wetlands, or result in alteration of such areas.

3.6.2.1.6 *U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS)*

The NRCS maps soils and farmland uses to provide comprehensive information necessary for understanding, managing, conserving and sustaining the nation's limited soil resources. The NRCS manages the Farmland Protection Program, which provides funds to help purchase development rights to keep productive farmland in agricultural uses.

3.6.2.2 State Agencies

3.6.2.2.1 *California Department of Conservation*

In 1982, the State of California created the Farmland Mapping and Monitoring Program within the California Department of Conservation to carry on the mapping activity from the NRCS on a continuing basis. The California Department of Conservation administers the California Land Conservation Act of 1965, also known as the Williamson Act, for the conservation of farmland and other resource-oriented laws.

3.6.2.2.2 *California Coastal Commission*

The California Coastal Commission plans for and regulates development in the coastal zone consistent with the policies of the California Coastal Act. The Commission also administers the federal Coastal Zone Management Act in California. As part of the Coastal Act, cities and counties are required to prepare a local coastal program (LCP) for the portion of its jurisdiction within the coastal zone. With an approved LCP, cities and counties control coastal development that accords with the local coastal plan. If no local coastal plan has been approved, the Coastal Commission controls coastal development.

3.6.2.2.3 *California Department of Transportation (Caltrans)*

The Caltrans jurisdiction includes rights-of-way of state and interstate routes within California. Any work within the right-of-way of a federal or state transportation corridor is subject to Caltrans regulations governing allowable actions and modifications to the right-of-way. Caltrans includes the Division of Aeronautics, which is responsible for airport permitting and establishing a county Airport Land Use Commission (ALUC) for each county with one or more public airports. ALUCs are responsible for the preparation of land use plans for areas near aviation facilities.

3.6.2.2.4 *California Department of Forestry and Fire Protection (CDF)*

The CDF reviews and approves plans for timber harvesting on private lands. In addition, through its responsibility for fighting wildland fires, the CDF plays a role in planning development in forested areas.

3.6.2.2.5 *California Department of Parks and Recreation (CDPR)*

The CDPR manages and provides sites for a variety of recreational and outdoor activities. The CDPR is a trustee agency that owns and operates all state parks and participates in land use planning that affects state parkland.

3.6.2.2.6 *California Department of Fish and Game (CDFG)*

The land use mandate of the CDFG is to protect rare, threatened, and endangered species by managing habitat in legally designated ecological reserves or wildlife areas. CDFG reserves located in the district include the Bolsa Chica Ecological Reserve (Orange County), among others.

3.6.2.3 Regional and Local

3.6.2.3.1 *Southern California Association of Governments (SCAG)*

Related to land use, SCAG is authorized to undertake intergovernmental review for federal assistance and direct federal development pursuant to Presidential Executive Order 12,372. Pursuant to CEQA (Public Resource Code §21083 and §21087 and CEQA Guidelines §15206 and §15125 (b)), SCAG reviews projects of regional significance for consistency with regional plans. SCAG is also responsible for preparation of the Regional Housing Needs Assessment (RHNA), pursuant to California Government Code Section 65584 (a). SCAG's RHNA provides a tool for providing local affordable housing development strategies.

The 2012–2035 *Regional Transportation Plan/Sustainable Communities Strategy* (2012–2035 RTP/SCS) provides a blueprint for improving quality of life for the residents of SCAG's area of jurisdiction, which includes the district, by providing a variety of choices regarding where they will live, work, and play, and how they will move around. Further, safe, secure, and efficient transportation systems is expected to provide improved access to opportunities, such as jobs, education, and healthcare.

3.6.2.3.2 *Local Agency Formation Commissions*

The Local Agency Formation Commission (LAFCO) is the agency in each county that has the responsibility to create orderly local government boundaries, with the goal of encouraging “planned, well-ordered, efficient urban development patterns,” the preservation of open-space lands, and the discouragement of urban sprawl. While LAFCOs have no direct land use authority, their actions determine which local government will be responsible for planning new areas. LAFCOs address a wide range of boundary actions, including creation of spheres of influence for cities, adjustments to boundaries of special districts, annexations, incorporations, detachments of areas from cities, and dissolution of cities.

3.6.2.3.3 *General Plans*

The most comprehensive land use planning for the district is provided by city and county general plans, which local governments are required by state law to prepare as a guide for

future development. General plans contain goals and policies concerning topics that are mandated by state law or which the jurisdiction has chosen to include. Required topics are land use, circulation, housing, conservation, open space, noise, and safety. Other topics that local governments frequently choose to address include air quality, public facilities, parks and recreation, community design, sustainability and growth management, among others. These plans provide general definitions and implementation methods for each land use designation in the district. City and county general plans must be consistent with each other. County general plans must cover areas not included by city general plans (e.g., unincorporated areas).

3.6.2.3.4 Specific and Master Plans

A city or county may also provide land use planning by developing community or specific plans for smaller, more specific areas within their jurisdiction. These more localized plans provide for focused guidance for developing a specific area, with development standards tailored to the area, as well as systematic implementation of the general plan.

3.6.2.3.5 Zoning and Land Use Permits

City and county zoning codes are the set of detailed requirements that implement the general plan policies at the level of the individual parcel. The zoning code presents standards for different uses and identifies which uses are allowed in the various zoning districts of the jurisdiction. Since 1971, state law has required the city or county zoning code to be consistent with the jurisdiction's general plan. Cities and counties typically implement their zoning codes through highly individualized land use ordinances that differ from jurisdiction to jurisdiction.

3.6.3 Environmental Setting

The district is comprised of the non-desert portion of Los Angeles County, all of Orange County, a portion of southwestern San Bernardino County, and the Salton Sea Air Basin and Mojave Desert Air Basin portions of Riverside County amounting to a jurisdiction of approximately 10,473 square miles and a population of approximately 17 million. Bounded by the Pacific Ocean to the west; the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east; and San Diego and Imperial Counties to the south, the district contains a vast network of cities and towns, ranging from small rural developments of a few thousand residents to bustling metropolitan centers of several million residents, interspersed between large expanses of open space and undeveloped land.

Urban development in the district tends to cluster around a well-defined network of state and federal highways which connect the regional populations of the district with other regions in California and across the nation. While most urban development has historically been based in the coastal regions of Los Angeles County and Orange County, there has been considerable urban growth eastward to the mountain and valley regions of Riverside County and San Bernardino County. Downtown Los Angeles is the largest urbanized center within the district. Other urbanized areas in Los Angeles County include Long Beach, Burbank, Glendale, Pasadena and Pomona. Office-based commercial centers have emerged in

Woodland Hills, Universal City, Westwood, around Los Angeles International Airport, and Century City. In the other three counties within the district, urban centers exist in the cities of Riverside, San Bernardino, Santa Ana, Anaheim, and Irvine. Much of the development in Riverside and San Bernardino Counties has taken place within unincorporated county land that both counties possess. Riverside County, in particular, has developed the Riverside County Integrated Project, which seeks to improve the quality of life for its citizens through a complementary array of development projects and programs aimed at creating a balanced and sustainable environment. As a result of Riverside County's efforts, the valley and mountain regions of the County have quickly developed over the past 20 years from small rural settlements to relatively large suburban commuter cities.

Within the older cities and communities in the district, development has taken more of a revitalization outlook. Without a vast surplus of open space, developers in Los Angeles County and Orange County have turned to different types of housing and commercial developments, including townhouses, condominiums, apartments, and mixed-use developments that combine commercial and office uses. Older buildings are often renovated or converted to accommodate new residential or commercial uses, and land use patterns in major developed cities have generally shifted from the traditional single-use pattern to more of a mixed use approach, where residential and commercial land uses are often found adjacent to one another, or within the same building.

Land uses across the district can typically be categorized into six general categories -- residential, commercial, industrial, institutional, open space and agricultural. Agricultural is discussed separately in Section 3.2.

3.6.3.1 Los Angeles County

3.6.3.1.1 *Residential*

Los Angeles County is the most populated and economically robust region in the district. As a result, high demand for housing is a consistent concern for the County. Residential land use patterns in the County, as well as the district, are dependent upon geography. Major concentrations of residential uses are found in the Los Angeles Basin, which is bounded on the north by the transverse mountain ranges of the Santa Monica Mountains and the San Gabriel Mountains. From the foothills of the transverse mountain ranges, large urban and sub-urban cities blanket the Los Angeles Basin southward to the Santa Ana Mountains and the Orange County Coast, and eastward to the San Bernardino Mountains. The County contains most of the high and medium density housing in the district, which is concentrated primarily in urban and sub-urban population centers, such as Downtown Los Angeles, East Los Angeles, Glendale, Burbank, and Long Beach. Surrounding these population centers are lower density suburbs located on the eastern and southern reaches of Los Angeles County and extending into Orange County and San Bernardino County. With the Los Angeles Basin almost completely built-out, the County is now in the process of directing residential land uses, population growth, and residential density to urbanized areas and promoting infill development to minimize sprawl and encourage sustainable growth (Los Angeles County Department of Regional Planning, 2012).

3.6.3.1.2 *Commercial*

In the same way that residential land use patterns are related to geography, commercial land use patterns tend to form around transportation facilities, such as highways, rail lines, and airports, particularly around major freeway intersections. Downtown Los Angeles, bounded in all directions by four different freeways, is the largest commercial and business center in the district, providing jobs to residents across the district. The County also projects tremendous employment growth in northern Los Angeles County as housing and transportation development continues northward.

3.6.3.1.3 *Industrial*

The largest concentration of industrial land uses and activities in the district is provided by the adjacent Ports of Los Angeles and Long Beach. Combined, the San Pedro Bay Ports anticipate cargo volumes to grow to 43 million twenty-foot equivalent unit containers by year 2035 – more than tripling from current levels (Los Angeles County Department of Regional Planning, 2012). Further, these adjacent ports handle approximately 40 percent of the volume imported into the country and approximately 24 percent of the nation's exports (SCAG, 2012). From the ports, industrial activity can be traced along cargo rail lines and major interstate highways, such as Route 110¹ and Interstate 710 (I-710), north to downtown Los Angeles and east to the Cities of Industry and Commerce. Significant air cargo and associated industrial land uses also are located around Los Angeles International Airport. Oil extraction and refining industries are also found in northern Los Angeles County near the City of Santa Clarita and in southern Los Angeles County surrounding the City of Long Beach.

3.6.3.1.4 *Institutional*

Institutional land uses, which include large government and private operations, such as military bases, airports, and universities, encompass a considerable footprint in the district. In the Antelope Valley, a large portion of land is dedicated to airport uses at Palmdale Airport, while Los Angeles International Airport (LAX) is the largest airport land use. Bob Hope Airport and Long Beach Airport are the other commercial airports in Los Angeles County. In addition, the Los Angeles Air Force Base, located just south of LAX is the major military land use in the County. University and college campuses are located in every county of the district, the largest of which are part of the University of California system. In Los Angeles County, the University of California, Los Angeles (UCLA), California Polytechnic University at Pomona and the University of Southern California are some of the largest universities. There are also numerous California State Universities (Northridge and Los Angeles), as well as community colleges located throughout the County.

¹ Route 110, consists of two segments of State Route 110 (SR-110) joined by Interstate 110 (I-110). The entire length of I-110 (which ends at I-10), as well as SR-110 south of the Four Level Interchange with US Highway (US 101), is the Harbor Freeway, and SR-110 north from US 101 to Pasadena is the historic Arroyo Seco Parkway. The entire Route 110 connects San Pedro and the Port of Los Angeles with Downtown Los Angeles and Pasadena.

3.6.3.1.5 *Open Space*

Over half of the total geography of Los Angeles County is comprised of open space and rural land. Most rural land is located in the Palmdale – Lancaster desert region, which is just northeast of the district’s boundaries. Most of the open space in the County is composed of the Angeles National Forest, which covers the entire northern region of the district. This land is administered by the National Forest Service and provides mainly outdoor recreation and wilderness conservation functions. Other major open space areas can be found in the Santa Monica Mountains and the Whittier Narrows located in the Puente Hills.

3.6.3.2 *Orange County*

Orange County is comprised of 34 cities (County of Orange Resources and Development Management Department, 2005) and also contains unincorporated areas. Orange County has an estimated population of 3,055,792 residents as of January 1, 2012 (California Department of Finance, 2012). Each of the 34 cities has its own General Plan while the unincorporated areas are covered by the Orange County General Plan. The Orange County General Plan states as its first policy that urban land uses within the County must be planned with a balanced mix of residential, commercial, industrial and public land uses. ~~Orange County comprises 34 cities (County of Orange Resources and Development Management Department, 2005) and has an estimated population of 3,055,792 residents as of January 1, 2012 (California Department of Finance, 2012).~~

3.6.3.2.1 *Residential*

In Orange County, residential development follows the coastline and is limited from inland expansion by the Santa Ana Mountains and the Cleveland National Forest (SCAG, 2012). The major population centers in northern Orange County are the Cities of Huntington Beach, Garden Grove, and Fullerton, which tend to be extensions of housing and commercial development from southern Los Angeles County, catering to a large commuter population. From these border cities, high and medium density housing development continues south through the major commercial cities of Anaheim, Santa Ana, and Orange. To the south of these cities are the Cities of Costa Mesa, Newport Beach, Irvine, Lake Forest, and Laguna Niguel, which are less densely populated with primarily single-family medium to low density housing developments. As such, residential land uses in the County can be described as following a similar pattern to that of Los Angeles County, where the major urban and sub-urban population centers align themselves with transportation resources, particularly Interstate 5 (I-5), and natural features, such as the “South Coast” and the Santa Ana Mountains.

3.6.3.2.2 *Commercial*

Commercial land use in the County is divided into two types of designations: community commercial and regional commercial land uses. Community commercial land uses include general commercial facilities providing convenience goods and retail trade to individual communities of 20,000 persons (County of Orange Resources and Development Management Department, 2005). Each city has its own community commercial

developments, mainly located along major arterial highways such as I-5, Interstate 405 (I-405), State Route 22 (SR-22), State Route 55 (SR-55), and Beach Boulevard, also known as State Route 39 (SR-39). Regional commercial land uses are of a higher intensity and serve a larger regional population usually in the form of malls, such as the South Coast Plaza in Costa Mesa and commercial office buildings. Orange County's commercial office activity is within close proximity to the intersection of I-5, SR-22, and State Route 57 (SR-57). ~~known as the "Orange Crush,"~~ [An additional commercial area in Orange County, the Irvine Business Complex \(IBC\), is the area surrounding John Wayne Airport, and the area surrounding the University of California, at Irvine \(UCI\), known as the Irvine Spectrum.](#) ~~Another major commercial office area centers in Orange County, the Irvine Spectrum, is include the area surrounding the "El Toro Y", which is the~~ intersection of I-5 and I-405 ~~freeways, known as the "El Toro Y"~~ (SCAG, 2012a).

3.6.3.2.3 *Industrial*

Relative to the district, Orange County has few industrial land uses. In fact, the [Orange County's General Plan, which only applies to unincorporated areas within Orange County,](#) does not distinguish industrial land uses from other employment providing land uses (SCAG, 2012a). Fifty years ago, Orange County was primarily agricultural and the major industries were based in supporting the rich farming resources of the County. Today, much of Orange County's industrial land uses are located along the coast and focused on oil extraction and refining, while most income in the County is provided by technical, aerospace, and information industries which are typically higher-paid white collar industries set in commercial office areas.

3.6.3.2.4 *Institutional*

The major military land uses in the County are the Seal Beach Naval Weapons Station and Los Alamitos Reserve Air Station. In addition, institutional land uses also include universities, such as UCI and California State University at Fullerton, John Wayne Airport, and three active regional landfills.

3.6.3.2.5 *Open Space*

The unincorporated territories of the County, consisting of approximately 321 square miles, are geographically diverse and spread throughout the County. The largest portion of unincorporated territory is mostly open space found in southeastern Orange County and includes the Cleveland National Forest, a number of planned communities, such as Coto de Caza, Las Flores, and Ladera Ranch, as well as large portions of undeveloped territory south of the Ortega Highway (SCAG, 2012a). [In addition, the Orange County Sustainable Communities Strategy identifies the preservation/open space programs located throughout all of Orange County, including the individual efforts of the County of Orange and the 34 local jurisdictions.](#)

3.6.3.3 Riverside County

3.6.3.3.1 *Residential*

In Riverside County, residential land uses are mainly located in the western valley portion of the county and makes up approximately 288 square miles of County land, of which 57 percent is located in unincorporated areas (Riverside County, 2003). Medium to high density residential developments can be found in northwestern Riverside County mainly in the two major Cities of Riverside and Corona. Farther inland, beginning in the Coachella Valley, the County is comprised almost entirely of low density or rural housing. Much of the development in Riverside County has been on unincorporated county land. Areas that were rural twenty years ago are quickly becoming suburban. Riverside County adopted the County General Plan that strives to create a high quality, balanced, and sustainable environment for the citizens of Riverside (SCAG, 2012a).

3.6.3.3.2 *Commercial*

Commercial land uses account for approximately 15,675 acres of county land, and commercial development is generally less vigorous and on a smaller scale than in Los Angeles County or Orange County (Riverside County, 2003). Commercial office developments would typically be found in the downtown areas of major cities, such as the City of Riverside. Other commercial developments in the County are typically large regional retail and convenience shopping centers typically located in major cities or along major highways such as Interstate 215 (I-215) and Interstate 10 (I-10).

3.6.3.3.3 *Industrial*

A total of over 24,000 acres of the County are devoted to industrial uses, which may include heavy industry, warehousing, and mineral extraction. With the exception of land devoted to mineral extraction (89 percent of which is within unincorporated territories), the majority of industrial land is located within the cities of Riverside County. The major industries within the County are agricultural and mineral extraction industries, most of which are located in eastern Riverside County in the Coachella Valley and Salton Sea Basin. Recently, manufacturing industries, distribution centers, and warehouses have established businesses in Riverside County making it a major distribution center for goods in the region, as well as the state. Riverside County also houses a major wind energy generation site in the San Gorgonio Pass and the County should be poised for further development of wind, solar, and other green energies in the eastern portion of the County.

3.6.3.3.4 *Institutional*

Approximately 106 square miles of land are devoted to various public facilities (utilities, schools, government offices, police and fire facilities, correctional facilities, military installations, museums, convention centers, libraries, theater facilities, rehabilitation facilities, short-and long-term custodial facilities, cemeteries, etc.) through the County. Major military uses include the Naval Warfare Assessment Station in Corona and the Chocolate Mountains Aerial Gunnery Range. Other major institutional land uses are Palm

Springs International Airport, March Inland Port, and the University of California at Riverside.

3.6.3.3.5 *Open Space*

A vast amount of land (1,313,073 acres or 28 percent of the county total) consists of open space use and provides for recreation, agriculture, scientific opportunity, and wild land preservation. The majority of open space in the County is located in eastern portion of the county in the Coachella Valley (part of the Salton Sea Air Basin and the Mojave Desert Air Basin, which house mostly agricultural and mineral extraction operations usually administered by the Bureau of Land Management and the California Department of Conservation. The largest major open space use in the County is the Joshua Tree National Park, which is administered by the National Parks Service and provides a variety of recreation and wild land preservation functions. Other major open space uses include Mount San Jacinto State Park, the Coachella Valley National Wildlife Refuge, the southern reaches of the San Bernardino National Forest, and numerous golf courses located throughout the Coachella Valley and southern Riverside County.

3.6.3.4 San Bernardino County

3.6.3.4.1 *Residential*

Similar to Riverside County, residential land use in San Bernardino County is mainly concentrated in the western valley and high-desert region; however, the unincorporated areas of the desert and mountain regions are populated with dispersed low-density rural residences. The portion of San Bernardino County located within the district, also known as the Valley Region, is perhaps the most densely populated portion of the County as the two largest cities in the County, San Bernardino and Ontario, are both located in this region. Almost half of the 51,766 acres of unincorporated County land in the Valley Region is existing single and multifamily residential uses, occupying 24,236 acres (County of San Bernardino, 2007). Most of the residential uses in the Valley Region are medium to low density uses mostly located in the major cities of the region.

3.6.3.4.2 *Commercial*

Commercial uses occupy almost 2,155 acres of the Valley Region (County of San Bernardino, 2007). The Valley Region can be characterized as the center for commerce in the County while the Desert Region assumes the role of industrial leader. Like other regions in the district, commercial land uses in San Bernardino County portion of the district tend to be retail and convenience shopping uses with some commercial office buildings located in downtown areas. Commercial uses follow similar land use patterns, usually located along major transportation corridors such as Interstate 15 (I-15), I-215, and State Route 60 (SR-60).

3.6.3.4.3 *Industrial*

The Valley Region has nearly 5,155 acres of industrial uses (County of San Bernardino, 2007). While most of San Bernardino County is geared toward agricultural and mineral

extraction industries, the Valley Region is geared toward supporting the Los Angeles County and Orange County economies. Like Riverside County, western San Bernardino County has become a major distribution point for the region with many manufacturing and warehouse facilities being built throughout the County. Adding to the goods coming by highway and rail through San Bernardino County are goods coming to the county by air through several airports that cater to air cargo, primarily Ontario International Airport.

3.6.3.4.4 Institutional

Institutional land uses in the Valley Region account for 2,875 acres of the region and are limited when compared to the rest of the County, which houses numerous military facilities in its Desert Region (County of San Bernardino, 2007). Accordingly, the Valley Region does include the San Bernardino International Airport and the Ontario International Airport, as well as California State University at San Bernardino.

3.6.3.4.5 Open Space

While San Bernardino County has the largest amount of open space and mineral resource conservation areas, the Valley Region contains very few of these land uses. The single major open space land use in the San Bernardino County portion of the district is the San Bernardino National Forest, which forms the northern and eastern boundaries of the Valley Region.

SUBCHAPTER 3.7

NOISE

Introduction

Regulatory Setting

Environmental Setting

3.7 NOISE

3.7.1 Introduction

The environmental setting section describes the noise, and noise sources in the Basin, which includes Orange County and portions of Los Angeles, Riverside and San Bernardino Counties.

Sound waves, traveling outward from a source, exert a sound pressure level (commonly called “sound level”), measured in decibels (dB). “Noise” is often defined as unwanted sound, and environmental noise is usually measured in “A-weighted” decibels, which is a decibel corrected for the variation in frequency response of the typical human ear at commonly-encountered noise levels. All noise levels discussed herein reflect A-weighted decibels. In general, people can perceive a two- to three-dB difference in noise levels; a difference of 10 dB is perceived as a doubling of loudness.

3.7.2 Regulatory Setting

The federal government sets noise standards for transportation-related noise sources that are closely linked to interstate commerce, such as aircraft, locomotives, and trucks, and, for those noise sources, the state government is preempted from establishing more stringent standards. The state government sets noise standards for those transportation noise sources that are not preempted from regulation, such as automobiles, light trucks, and motorcycles. Noise sources associated with industrial, commercial, and construction activities are generally subject to local control through noise ordinances and general plan policies.

3.7.2.1 Federal Agencies and Regulations

3.7.2.1.1 *Code of Federal Regulations (CFR)*

Federal regulations for railroad noise are contained in 40 CFR Part 201 and 49 CFR Part 210. The regulations set noise limits for locomotives and are implemented through regulatory controls on locomotive manufacturers.

Federal regulations also establish noise limits for medium and heavy trucks (more than 4.5 tons, gross vehicle weight rating) under 40 CFR Part 205, Subpart B. The federal truck pass-by noise standard is dB at 15 meters from the vehicle pathway centerline. These controls are implemented through regulatory controls on truck manufacturers. The Federal Highway Administration (FHWA) regulations for noise abatement must be considered for federal or federally-funded projects involving the construction of a new highway or significant modification of an existing freeway when the project would result in a substantial noise increase or when the predicted noise levels approach or exceed the “Noise Abatement Criteria.”

Under the regulations, a “substantial increase” is defined as an increase in Equivalent Continuous Level (Leq) of 12 dB during the peak hour of traffic noise. The Leq provides a time weighted average of the noise measured. For sensitive uses, such as residences,

schools, churches, parks, and playgrounds, the Noise Abatement Criteria for interior and exterior spaces is Leq 57 and 66 dB, respectively, during the peak hour of traffic noise.

3.7.1.1.2 Federal Transit Administration (FTA)

The Federal Transit Administration has prepared guidance noise and vibration impacts assessments for proposed mass transit projects: Transit Noise and Vibration Impact Assessment (U.S. FTA, 2006). The May 2006 version is the second edition of a guidance manual originally issued in 1995, which presented procedures for predicting and assessing noise and vibration impacts of proposed mass transit projects. The guidance is required to evaluate the noise and vibration impacts in environmental review process for project proponents seeking funding from FTA. All types of bus and rail projects are covered. The guidance contains procedures for assessing impacts at different stages of project development, from early planning before mode and alignment have been selected through preliminary engineering and final design. The focus is on noise and vibration impacts during operations, but construction impacts are also covered. The guidance describes a range of measures for controlling excessive noise and vibration.

3.7.2.1.3 Federal Aviation Administration (FAA)

Aircraft operated in the U.S. are subject to certain federal requirements regarding noise emissions levels. These requirements are set forth in Title 14 of the Code of Federal Regulations (14 CFR), Part 36. Part 36 establishes maximum acceptable noise levels for specific aircraft types, taking into account the model year, aircraft weight, and number of engines. Pursuant to the federal Airport Noise and Capacity Act of 1990, the FAA established a schedule for complete transition to Part 36 “Stage 3” standards by year 2000. This transition schedule applies to jet aircraft with a maximum takeoff weight in excess of 75,000 pounds and, thus, applies to passenger and cargo airlines but not to operators of business jets or other general aviation aircraft.

3.7.2.1.4 Federal Railroad Administration (FRA)

On March 24, 2009, the Federal Highway Administration (FHA) and the FTA final rule that modified FRA regulations to make certain changes mandated by the Safe, Accountable, Flexible, Efficient, Transportation, Equity Act: A Legacy for Users (SAFETEA-LU). The SAFETEA-LU prescribes requirements for environmental review and project decision making. This rule became effective April 23, 2009.

3.7.2.1.5 Department of Housing and Urban Development (HUD)

The noise regulation 24 CFR Part 51 Subpart B, Noise Abatement and Control presents the HUD noise program. Within the HUD Noise Assessment Guidelines, potential noise sources are examined for projects located within 15 miles of a military or civilian airport, 1,000 feet from a road or 3,000 feet from a railroad. HUD exterior noise regulations state that 65 dBA DNL noise levels or less are acceptable for residential land uses and noise levels exceeding 75 dBA DNL are unacceptable. HUD's regulations do not contain standards for interior noise levels. A goal of 45 decibels is set forth for interior noise and the attenuation requirements are based upon this level. HUD's standards assume that

internal noise levels would be met if exterior standard are met under standard construction practices.

3.7.2.1.6 *Federal Vibration Policies*

The FRA and FTA have published guidance relative to vibration impacts. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings. The root mean square (RMS) amplitude is most frequently used to describe the effect of vibration on the human body. The RMS amplitude is defined as the average of the squared amplitude of the signal. The decibel notation, VdB, is commonly used to measure RMS. The decibel notation acts to compress the range of numbers required to describe vibration.

According to the FRA, fragile buildings can be exposed to groundborne vibration levels of 0.5 inches per second PPV without experiencing structural damage. The FTA has identified the human annoyance response to vibration levels as 80 VdB (U.S. FTA, 2006).

3.7.2.2 State Agencies and Regulations

3.7.2.2.1 *California's Airport Noise Standards*

The State of California's Airport Noise Standards, found in Title 21 of the California Code of Regulations, identify a noise exposure level of Community Noise Equivalent Level (CNEL) 65 dB as the noise impact boundary around airports. CNEL measurements are a weighted average of sound levels gathered throughout a 24-hour period. The noise between 7:00 p.m. and 10:00 p.m. is increased by five dB and the hours of 10:00 p.m. and 7:00 a.m. is increased by 10 dB. This takes into account the decrease in community background noise of during evening and nighttime hours.

Within the noise impact boundary, airport proprietors are required to ensure that all land uses are compatible with the aircraft noise environment or the airport proprietor must secure a variance from the California Department of Transportation.

3.7.2.2.2 *California Department of Transportation (Caltrans)*

The State of California establishes noise limits for vehicles licensed to operate on public roads. For heavy trucks, the state pass-by standard is consistent with the federal limit of 80 dB. The state pass-by standard for light trucks and passenger cars (less than 4.5 tons gross vehicle rating) is also 80 dB at 15 meters from the centerline. For new roadway projects, Caltrans employs the Noise Abatement Criteria, discussed above in connection with the FHWA.

3.7.2.2.3 *California Noise Insulation Standards*

The California Noise Insulation Standards found in the California Code of Regulations, Title 24, set requirements for new multi-family residential units, hotels, and motels that may be subject to relatively high levels of transportation-related noise. For exterior noise, the noise insulation standard is DNL 45 dB in any habitable room and requires an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard where

such units are proposed in areas subject to noise levels greater than DNL 60 dB. DNL is the average noise level over a 24 hour period. The noise between the hours of 10:00 p.m. and 7:00 a.m. is artificially increased by 10 dB. This takes into account the decrease in community background noise during nighttime hours.

3.7.2.2.4 *State Vibration Policies*

There are no adopted state policies or standards for ground-borne vibration. However, Caltrans recommends that extreme care be taken when sustained pile driving occurs within 7.5 meters (25 feet) of any building, and 15 to 30 meters (50 to 100 feet) of a historic building or a building in poor condition.

3.7.2.3 Local Agencies and Regulations

To identify, appraise, and remedy noise problems in the local community, each county and city within the district has adopted a noise element as part of its General Plan. Each noise element is required to analyze and quantify current and projected noise levels associated with local noise sources, including, but not limited to, highways and freeways, primary arterials and major local streets, rail operations, air traffic associated with the airports, local industrial plants, and other ground stationary sources that contribute to the community noise environment. Beyond statutory requirements, local jurisdictions are free to adopt their own goals and policies in their noise elements, although most jurisdictions have chosen to adopt noise/land use compatibility guidelines that are similar to those recommended by the state. The overlapping DNL ranges indicate that local conditions (existing noise levels and community attitudes toward dominant noise sources) should be considered in evaluating land use compatibility at specific locations.

In addition to regulating noise through noise element policies, local jurisdictions regulate noise through enforcement of local ordinance standards. These standards generally relate to noisy activities (e.g., use of loudspeakers and construction) and stationary noise sources and facilities (e.g., air conditioning units and industrial activities). Two cities within the district, Los Angeles and Long Beach, operate port facilities. Noise from the Ports of Los Angeles and Long Beach are regulated by the noise ordinances and noise elements of the Los Angeles and Long Beach General Plans.

In terms of airport noise, some of the actions that airport proprietors have been allowed to take to address local community noise concerns include runway use and flight routing changes, aircraft operational procedure changes, and engine run-up restrictions. These actions generally are subject to approval by the FAA, which has the authority and responsibility to control aircraft noise sources, implement and enforce flight operational procedures, and manage the air traffic control system

3.7.3 Environmental Setting

3.7.3.1 Noise Descriptors

Environmental noise levels typically fluctuate across time of day; different types of noise descriptors are used to account for this variability, and different types of descriptors have

been developed to differentiate between cumulative noise over a given period and single noise events. Cumulative noise descriptors include the Leq, DNL, and CNEL. The Leq is the actual time-averaged, equivalent steady-state sound level, which, in a stated period, contains the same acoustic energy as the time-varying sound level during the same period. DNL and CNEL values result from the averaging of Leq values (based on A-weighted decibels) over a 24-hour period, with weighting factors applied to different periods of the day and night to account for their perceived relative annoyance. For DNL, noise that occurs during the nighttime period (10:00 p.m. to 7:00 a.m.) is “penalized” by 10 dB. CNEL is similar to DNL, except that it also includes a “penalty” of approximately five dB for noise that occurs during the evening period (7:00 p.m. to 10:00 p.m.). Cumulative noise descriptors, DNL and CNEL, are well correlated with public annoyance due to transportation noise sources. Table 3.12-1 shows the compatibility between various land uses and CNEL.

Individual noise events, such as train pass-bys or aircraft overflights, are further described using single-event and cumulative noise descriptors. For single events, the maximum measured noise level (Lmax) is often cited, as is the Sound Exposure Level (SEL). The SEL is the energy-based sum of a noise event of given duration that has been “squeezed” into a reference duration of one second and is typically a value that is five to 10 dB higher than the Lmax.

3.7.3.2 Vibration Measuring and Reporting

Vibration is an oscillatory motion through a solid medium in which the motion’s amplitude can be described in terms of displacement, velocity, or acceleration. The FTA Assessment states that background vibration velocity levels in residential areas is usually 50 VdB or lower, well below the threshold of perception for humans which is around 65 VdB. The upper range for rapid transit vibration is around 80 VdB and the high range for commuter rail vibration is 85 VdB (U.S. FTA, 2006).

The FTA Assessment states that in contrast to airborne noise, ground-borne vibration is not a common environmental problem. Although the motion of the ground may be noticeable to people outside structures, without the effects associated with the shaking of a structure, the motion does not provoke the same adverse human reaction to people outside. Within structures, the effects of ground-borne vibration include noticeable movement of the building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. The maximum vibration amplitudes of the floors and walls of a building often will be at the resonance frequencies of various components of the building. However, the FTA Assessment states that noticeable vibration inside a building is typically caused by equipment or activities within the building itself, such as heating and ventilation systems, footsteps or doors closing.

FTA Assessment states that it is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads. However, some common sources of vibration are trains, buses on rough roads, and construction activities, such as blasting, pile driving, and heavy earth-moving equipment.

TABLE 3.7-1
Noise Land Use Compatibility Matrix

Land Use Category	Community Noise Exposure (dBA, CNEL)					
	55	60	65	70	75	80
Residential - Low Density Single-Family, Duplex, Mobile Homes	Normally Acceptable	Conditionally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Residential - Multi-Family	Normally Acceptable	Conditionally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Transient Lodging - Motels Hotels	Normally Acceptable	Conditionally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Schools, Libraries, Churches, Hospitals, Nursing Homes	Normally Acceptable	Conditionally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Auditoriums, Concert Halls, Amphitheaters	Conditionally Acceptable	Conditionally Acceptable	Conditionally Acceptable	Clearly Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Sports Arena, Outdoor Spectator Sports	Conditionally Acceptable	Conditionally Acceptable	Conditionally Acceptable	Clearly Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Playgrounds, Neighborhood Parks	Normally Acceptable	Normally Acceptable	Normally Unacceptable	Clearly Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Golf Courses, Riding Stables, Water Recreation, Cemeteries	Normally Acceptable	Normally Acceptable	Normally Unacceptable	Clearly Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Office Buildings, Business Commercial and Professional	Normally Acceptable	Normally Acceptable	Conditionally Acceptable	Clearly Unacceptable	Clearly Unacceptable	Clearly Unacceptable
Industrial, Manufacturing, Utilities, Agriculture	Normally Acceptable	Normally Acceptable	Conditionally Acceptable	Clearly Unacceptable	Clearly Unacceptable	Clearly Unacceptable
	Normally Acceptable - Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.					
	Conditionally Acceptable - New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply system or air conditionally will normally suffice.					
	Normally Unacceptable - New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.					
	Clearly Unacceptable - New construction or development should generally not be undertaken.					
SOURCE: California Office of Noise Control, Department of Health Services.						

Vibration can be a serious concern, causing buildings to shake and rumbling sounds to be heard. Several different methods are used to quantify vibration. High levels of vibration may cause physical personal injury or damage to buildings. However, groundborne vibration levels rarely affect human health. Instead, most people consider groundborne vibration to be an annoyance that may affect concentration or disturb sleep. In addition, high levels of groundborne vibration may damage fragile buildings or interfere with equipment that is highly sensitive to groundborne vibration (e.g., electron microscopes).

3.7.3.3 Sensitive Receptors

Some land uses are considered more sensitive to ambient noise levels than others due to the amount of noise exposure (in terms of both exposure time and “insulation” from noise) and the types of activities typically involved. Residences, motels and hotels, schools, libraries, churches, hospitals, nursing homes, auditoriums, natural areas, parks and outdoor recreation areas are generally more sensitive to noise than are commercial and industrial land uses. Consequently, the noise standards for sensitive land uses are more stringent than those for less sensitive uses, such as commercial and industrial.

To protect various human activities and sensitive land uses (e.g., residences, schools, and hospitals) lower noise levels are needed. A noise level of 55 to 60 dB DNL outdoors is the upper limit for intelligible speech communication inside a typical home. In addition, social surveys and case studies have shown that complaints and community annoyance in residential areas begin to occur at 55 dB DNL. Sporadic complaints associated with the 55 to 60 dB DNL range give way to widespread complaints and individual threats of legal action within the 60 to 70 dB DNL range. At 70 dB DNL and above, residential community reaction typically involves threats of legal action and strong appeals to local officials to stop the noise.

3.7.3.4 Noise Sources

Many principal noise generators within the district are associated with transportation (e.g., airports, freeways, arterial roadways, seaports, and railroads). Additional noise generators include stationary sources, such as industrial manufacturing plants and construction sites. Local collector streets are not considered to be a significant source of noise since traffic volume and speed are generally much lower than for freeways and arterial roadways. Generally, transportation-related noise sources characterize the ambient noise environment of an area.

3.7.3.4.1 *Airports*

The Southern California Association of Governments (SCAG) region contains six established airports, including Los Angeles International (LAX), Bob Hope (formerly Burbank), John Wayne, Long Beach, Ontario, and Palm Springs. There are also four new and emerging airports in the Inland Empire and North Los Angeles County. These include San Bernardino International Airport (formerly Norton Air Force Base [AFB]), March Inland Port (joint use with March Air Reserve Base), Southern California Logistics Airport (formerly George AFB), and Palmdale Airport (joint use with Air Force Plant 42).

3.7.3.4.2 *Freeways and Arterial Roadways*

The SCAG region has over 20,717 centerline (route) miles and over 64,771 lane-miles of roadways, including one of the most extensive High-Occupancy Vehicle (HOV) lane systems in the country (U.S. FTA, 2006). Additionally, the SCAG region has a growing network of tolled lanes and High-Occupancy Toll (HOT) lanes. Regionally significant arterials provide access to the freeway system and often serve as parallel alternate routes; in some cases, they are the only major system of transportation available to travelers.

The extent to which traffic noise levels affect sensitive land uses depends upon a number of factors. These include whether the roadway itself is elevated above grade or depressed below grade, whether there are intervening structures or terrain between the roadway and the sensitive uses, and the distance between the roadway and such uses. For example, measurements show that depressing a freeway by approximately 12 feet yields a reduction in traffic noise relative to an at-grade freeway of seven to 10 dB at all distances from the freeway. Traffic noise from an elevated freeway is typically two to 10 dB less than the noise from an equivalent at-grade facility within 300 feet of the freeway, but beyond 300 feet, the noise radiated by an elevated and at-grade freeway (assuming equal traffic volumes, fleet mix, and vehicle speed) is the same (U.S. FTA, 2006).

Additionally, the SCAG region has an enormous number of arterial roadways. Typical arterial roadways have one or two lanes of traffic in each direction, with some containing as many as four lanes in each direction. Noise from these sources can be a significant environmental concern where buffers (e.g., buildings, landscaping, etc.) are inadequate or where the distance from centerline to sensitive uses is relatively small. Given typical daily traffic volumes of 10,000 to 40,000 vehicle trips, noise levels along arterial roadways typically range from 65 to 70 dB DNL at a distance of 50 feet from the roadway centerlines.

3.7.3.4.3 *Railroad Operations*

Railroad operations generate high, relatively brief, intermittent noise events. These noise events are an environmental concern for sensitive uses located along rail lines and in the vicinities of switching yards. Locomotive engines and the interaction of steel wheels and rails primarily generate rail noise. The latter source creates three types of noise: 1) rolling noise due to continuous rolling contact, 2) impact noise when a wheel encounters a rail joint, turnout or crossover, and 3) squeal generated by friction on tight curves. For very high speed rail vehicles, air turbulence can be a significant source of noise as well. In addition, use of air horns and crossing bell gates contribute to noise levels in the vicinity of grade crossings (U.S. FTA, 2006).

3.7.3.4.4 *Freight Trains*

Noise levels generated by freight train pass-by events reflect locomotive engine noise and rail car wheel rail interaction. The former depends upon track grade conditions (e.g., uphill versus downhill) and is largely independent of speed, whereas the latter is highly speed dependent, increasing approximately six dB for each doubling of train velocity (SCAG, 2008a). In addition to noise, freight trains also generate substantial amounts of ground-borne noise and vibration in the vicinity of the tracks. Ground-borne noise and vibration is a function of both the quality of the track and the operating speed of the vehicles.

The SCAG region has an extensive network of railroad lines belonging primarily to two major railroads: Union Pacific Railroad (Union Pacific) and Burlington Northern Santa Fe Railway (BNSF). SCAG's Inland Empire Railroad Main Line Study suggest that the number of freight trains on most BNSF and UP lines will more than double between 2000 and 2025 in response to a tripling of container volume at the San Pedro Bay Ports. A rail line supporting 40 freight trains per day generates approximately 75 dB DNL at 200 feet from the tracks. BNSF rail lines extend south from switching yards in eastern Los Angeles

to the Los Angeles and Long Beach ports complex and east to Arizona and points beyond via San Bernardino County. BNSF generates approximately 75 dB DNL at a distance of 200 feet from the tracks (SCAG, 2008a).

3.7.3.4.5 *Commuter and Inter-City Passenger Trains*

In general, the noise generated by commuter rail facilities (powered by either diesel or electric locomotives) is from the locomotives themselves. In the district, there are two commuter and inter-city passenger train operators: AMTRAK and the Southern California Regional Rail Authority/Metrolink. AMTRAK operates trains with destinations in Seattle, Chicago, Orlando, San Diego, and San Luis Obispo. A typical AMTRAK pass-by event generates 107 dB SEL at 50 feet (SCAG, 2008a); two such events during the daytime or evening periods generate approximately 61 dB DNL at 50 feet and approximately 52 dB DNL at 200 feet. Nine such events generate approximately 67 dB DNL at 50 feet and 58 dB DNL at 200 feet.

The Southern California Regional Rail Authority operates the Metrolink commuter rail system. This system currently includes seven rail lines, with destinations in Ventura, Los Angeles, San Bernardino, Riverside, Orange, and San Diego Counties. Noise levels generated by Metrolink are similar to those associated with AMTRAK.

3.7.3.4.6 *Steel Wheel Urban Rail Transit*

Heavy rail is generally defined as electrified rapid transit trains with dedicated guideway, and light rail as electrified transit trains that do not require dedicated guideway. In general, noise increases with speed and train length. Sensitivity to rail noise generally arises when there is less than 50 feet between the rail and sensitive receptors. A significant percentage of complaints about noise can be attributed to the proximity of switches, rough or corrugated track, or wheel flats. Within the district, the Los Angeles County Metropolitan Transit Authority (Metro) provides urban rail transit service on four lines within Los Angeles County. The Blue Line extends from Long Beach to the 7th Street Metro Center in downtown Los Angeles. The Red Line connects Union Station with North Hollywood via the Metro Center, the Gold Line connects Union Station with Pasadena, and the Green Line extends from Redondo Beach to Norwalk. Other Metro operated urban transit systems include the Orange Line which connects with the northern terminus of the Red Line in North Hollywood and serves much of the northwestern portion of Los Angeles County, and the Eastside Gold Line Extension, which provides rail transit service to East Los Angeles.

3.7.3.4.7 *Port Operations*

The Ports of Long Beach and Los Angeles are major regional economic development centers. These ports currently handle approximately 40 percent of the volume imported into the country and approximately 24 percent of the nation's exports. Noise is generated from four sources: ships using the port facilities, equipment associated with cargo activity within the port, and truck and rail traffic moving cargo to and from the ports. All sources affect the ambient noise levels in the port areas. Residential areas in San Pedro (City of Los Angeles) and West Long Beach are affected most by truck and rail traffic related to the ports.

The Alameda Corridor provides a substantial long-term reduction in noise and vibration associated with rail operations in the vicinities of the Ports of Long Beach and Los Angeles. The Alameda Corridor consolidates the operations of UP and BNSF on 90 miles of existing branch line tracks into one 20-mile corridor along Alameda Street. This corridor provides a direct connection between the ports of Long Beach and Los Angeles and the UP and BSNF switching yards in eastern Los Angeles. The Alameda Corridor includes four overpasses and three underpasses at intersections south of State Route 91 (SR-91) that allow vehicles to pass above the trains. North of SR-91, trains pass through a 10-mile, 33-foot-deep trench. The construction of tracks in a below-grade trench, track construction on new base materials, and the use of continuous welded track reduce noise impacts on adjacent uses from freight trains associated with the ports. Also, the Alameda Corridor includes sound walls in certain locations to mitigate vehicle noise along Alameda Street in residential neighborhoods and other sensitive areas.

3.7.3.4.8 *Industrial, Manufacturing, and Construction*

Noise from industrial complexes, manufacturing plants, and construction sites are characterized as stationary, or point, sources of noise even though they may include mobile sources, such as forklifts and graders. Local governments typically regulate noise from industrial, manufacturing, and construction equipment and activities through enforcement of noise ordinance standards, implementation of general plan policies, and imposition of conditions of approval for building or grading permits.

Industrial complexes and manufacturing plants are generally located away from sensitive land uses, and, as such, noise generated from these sources generally has less effect on the local community. In contrast to industrial and manufacturing plants, construction sites are located throughout the region and are often located within, or adjacent to, residential districts. In general, construction activities generate high noise levels intermittently on and adjacent to the construction sites, and the related noise impacts are short-term in nature. The dominant source of noise from most construction equipment is the engine, usually a diesel engine, with inadequate muffling. However, in a few cases, such as impact pile driving or pavement breaking, noise generated that activity dominates. Construction equipment can be considered to operate in two modes, stationary and mobile. Stationary equipment operates in one location for one or more days at a time, with either a fixed-power operation (pumps, generators, compressors) or a variable noise operation (pile drivers, pavement breakers). Mobile equipment moves around the construction site with power applied in cyclic fashion (bulldozers, loaders), or movement to and from the site (trucks) (SCAG, 2008a).

Construction-related noise levels generally fluctuate depending on the construction phase, equipment type and duration of use, distance between noise source and receptor, and presence or absence of barriers between noise source and receptor. Standard convention is that noise levels decrease by approximately six dB with each doubling of distance from the construction site (e.g., noise levels from excavation might be approximately 83 dB at 100 feet from the site, and so the noise level at 200 feet from the site would be about 77 dB). Interior noise levels from construction are approximately 10 dB (open windows) to 20 dB (closed windows) less than exterior noise levels due to the attenuation provided by building facades (SCAG, 2008a).

3.7.3.5 Existing Vibration Sources

Similar to the environmental setting for noise, the vibration environment is typically dominated by traffic from nearby roadways and activity on construction sites. Heavy trucks can generate groundborne vibrations that vary depending on vehicle type, weight, and road/pavement conditions. Heavy trucks typically operate on major streets. Nonetheless, vibration levels adjacent to roadways are typically not perceptible.

SUBCHAPTER 3.8

SOLID AND HAZARDOUS WASTE

Regulatory Background

Solid Waste Management

Hazardous Waste Management

3.8 SOLID AND HAZARDOUS WASTE

3.8.1 Regulatory Background

The Regulatory Background is divided into two sections: Solid Waste and Hazardous Waste.

3.8.1.1 Solid Waste

3.8.1.1.1 *Federal*

The U.S. EPA is the primary federal agency charged with protecting human health and with safeguarding the natural environment: air, water, and land. The U.S. EPA works to develop and enforce regulations that implement environmental laws enacted by Congress. The U.S. EPA is also responsible for researching and setting national standards for a variety of environmental programs, and delegates to states and tribes the responsibility for issuing permits and for monitoring and enforcing compliance. Since 1970, Congress has enacted numerous environmental laws including RCRA, CERCLA, and the Toxic Substances Control Act (TSCA). 40 CFR Part 258, Subpart D of the RCRA establishes minimum location standards for siting municipal solid waste landfills. Because California laws and regulations governing the approval of solid waste landfills meet the requirements of Subtitle D, the U.S. EPA delegated the enforcement responsibility to the State of California.

3.8.1.1.2 *State*

With regard to solid non-hazardous wastes, the California Integrated Waste Management Act of 1989 (AB 939), as amended, requires every city and county in the state to prepare a Source Reduction and Recycling Element (SRRE) with its Solid Waste Management Plan that identifies how each jurisdiction will meet the mandatory state waste diversion goals of 25 percent by the year 1995, and 50 percent by the year 2000. Senate Bill 2202 (SB 2202) mandates that jurisdictions continue 50 percent diversion on and after January 1, 2000. The purpose of AB 939 is to facilitate the reduction, recycling, and re-use of solid waste to the greatest extent possible. Penalties for non-compliance with the goals and timelines set forth within AB 939 can be severe, since the bill imposes fines of up to \$10,000 per day on cities and counties not meeting these recycling and planning goals (SCAG, 2012). AB 939 has recognized that landfills and transformation facilities are necessary components of any integrated solid waste management system and an essential component of the waste management hierarchy. AB 939 establishes a hierarchy of waste management practices in the following order and priority: 1) source reduction; 2) recycling and composting; and, 3) environmentally safe transformation/land disposal.

CalRecycle (formerly known as the California Integrated Waste Management Board) has numerous responsibilities in implementing the federal and state regulations summarized above. CalRecycle is the state agency responsible for permitting, enforcing and monitoring solid waste landfills, transfer stations, material recovery facilities (MRFs), and composting facilities within California. Permitted facilities are issued Solid Waste Facility Permits (SWFPs) by CalRecycle. CalRecycle also certifies and appoints Local Enforcement

Agencies (LEAs), county or city agencies which monitor and enforce compliance with the provisions of SWFPs. CalRecycle is also responsible for monitoring implementation of AB 939 by the cities and counties. In addition to these responsibilities, CalRecycle also manages the Recycled-Content Materials Marketing Program to encourage the use of specific recycled-content products in road applications, public works projects and landscaping. These products include recycled aggregate, tire-derived aggregate, rubberized asphalt concrete, and organic materials.

AB 939 requires that each county in the state of California prepare a countywide Integrated Waste Management Plan (CIWMP). The CIWMP is a countywide planning document that describes the programs to be implemented in unincorporated and incorporated areas of the county that will effectively manage solid waste, and promote and implement the hierarchy of CalRecycle. The CIWMPs consists of a Summary Plan, a SRRE, a Household Hazardous Waste Element, a Non-Disposal Facility Element, and a Countywide Siting Element.

3.8.1.1.3 Local

A Summary Plan is a solid waste planning document required by Public Resources Code §41751, in which counties or regional agencies provide an overview of significant waste management problems faced by the jurisdiction, along with specific steps to be taken, independently and in concert with cities within their boundaries (SCAG, 2012).

The SRRE consists of the following components: waste characterization, source reduction, recycling, composting, solid waste facility capacity, education and public information, funding, special waste and integration. Each city and county is required to prepare, adopt, and submit to CalRecycle an SRRE, which includes a program for management of solid waste generated within the respective local jurisdiction. The SRREs must include an implementation schedule for the proposed implementation of source reduction, recycling, and composting programs. In addition, the plan identifies the amount of landfill and transformation capacity that will be needed for solid waste which cannot be reduced, recycled, or composted (SCAG, 2012).

Each city and county is required to prepare, adopt and submit to CalRecycle a Household Hazardous Waste Element which identifies a program for the safe collection, recycling, treatment, and disposal of hazardous wastes that are generated by households. The Household Hazardous Waste Element specifies how household hazardous wastes generated within the jurisdiction must be collected, treated, and disposed. An adequate Household Hazardous Waste Element contains the following components: Evaluation of alternatives, program selection, funding, implementation schedule and education and public information (SCAG, 2012).

Each city and county is required to prepare, adopt and submit to CalRecycle, a Non-Disposal Facility Element which includes a description of new facilities and expansion of existing facilities, and all solid waste facility expansions (except disposal and transformation facilities) that recover for reuse at least five percent of the total volume. The Non-Disposal Facility Elements are to be consistent with the implementation of a local jurisdiction's

SRRE. Each jurisdiction must also describe transfer stations located within and outside of the jurisdiction, which recover less than five percent of the material received (SCAG, 2012).

Counties are required to prepare a Countywide Siting Element that describes areas that may be used for developing new disposal facilities. The element also provides an estimate of the total permitted disposal capacity needed for a 15-year period if counties determine that their existing disposal capacity will be exhausted within 15 years or if additional capacity is desired (PRC Sections 41700-41721.5) (SCAG, 2012).

Each county in the SCAG region has created a CIWMP in accordance with AB 939. Below is a brief description of the recent updates to these plans by county.

Los Angeles County

Los Angeles County is revising its Summary Plan and Siting Element to reflect changes in the county's policies and goals, including promotion of conversion technologies, formation of the Los Angeles Regional Agency, update of countywide jurisdiction assistance programs to meet diversion goals, expansion of existing disposal facilities, and development of additional non-disposal facilities for the use of out-of-county disposal facilities (SCAG, 2012).

The county's 2009 Annual Report details the revision process, assesses remaining permitted capacity for the mandated 15-year planning horizon, and outlines seven disposal capacity scenarios, two of which project sufficient capacity to meet future demand through the use of conversion technologies and out-of-county disposal facilities. The Annual Report outlines county solid waste management challenges, including a projected shortfall of permitted disposal capacity in the county, insufficient markets for recovered materials, and steps to promote and develop conversion technologies (SCAG, 2012).

Orange County

Orange County completed the first review of its CIWMP in April 2003. It found sufficient disposal capacity for the 15-year planning horizon, but identified other challenges, including the lack of an operational materials recovery facility in the southern portion of the county, changes in records management to comply with the Disposal Recovery System, and determination of accurate base year data (SCAG, 2012).

In addition to the CIWMP, Orange County's Integrated Waste Management Department has initiated a long-term strategic planning project, the Regional Landfill Options for Orange County, which assesses the solid waste disposal needs of Orange County for the next 40 years. The 2007 Strategic Plan Update for this planning project summarizes progress to maximize capacity at existing landfills, assess alternative technologies and potential out-of-county disposal sites, and expand the Frank R. Bowerman and Olinda Alpha landfills (SCAG, 2012).

Riverside County

Riverside County's CIWMP was approved in 1996, and its 2010 Annual Report found the original plan remained applicable, so no comprehensive update is planned. The Non-Disposal Facility Elements was updated in 2009 and includes plans for four possible solid waste material recovery and transfer facilities; two of which would include household hazardous waste disposal facilities. The Non-Disposal Facility Elements also includes an additional proposed solid waste material recovery facility with capacity for household hazardous waste disposal and one composting facility. The 2008 Five Year Review Report for the CIWMP concluded that the most effective allocation of available resources is to continue to utilize the existing CIWMP as a planning tool augmented by annual reports, and that a revision of the CIWMP is not warranted (SCAG, 2012).

San Bernardino County

San Bernardino County's CIWMP five-year review report was completed in 2007. The report reflects updates to the county's goals and policies, changes to its disposal facilities, and assesses disposal capacity for the mandated 15-year planning horizon. Updated policies include programs to help jurisdictions reach diversion goals, such as additional recycling and composting programs and the development of regional material recovery facilities. The 2007 review found that based on the remaining permitted refuse capacity and projected refuse generation for disposal, the landfills within the county have approximately 26 years of capacity (SCAG, 2012).

Regional Water Quality Control Boards (RWQCB)

New or expanded landfills must submit Reports of Waste Discharge to RWQCBs prior to landfill operations. In conjunction with CalRecycle's approval of SWFPs, RWQCBs issue Waste Discharge Orders which regulate the liner, leachate control and removal, and groundwater monitoring systems at Class III landfills (SCAG, 2012).

South Coast Air Quality Management District (SCAQMD)

The SCAQMD regulates emissions from landfills. Landfill owners/operators must obtain permits to construct and operate landfill flares, cogeneration facilities or other facilities used to combust landfill gas. Owner/operators also are subject to the provisions of SCAQMD Rule 1150.1 - Control of Gaseous Emissions from Landfills. This rule requires the submittal of a compliance plan for implementation of a landfill gas control system, periodic ambient monitoring of surface emissions and the installation of probes to detect the lateral migration of landfill gas (SCAG, 2012).

3.8.1.2 Hazardous Waste

3.8.1.2.1 Federal

Hazardous material, as defined in 40 CFR 261.20 and 22 CCR Article 9, is disposed of in Class I landfills. California has enacted strict legislation for regulating Class I landfills. The

California Health and Safety Code requires Class I landfills to be equipped with liners, a leachate collection and removal system, and a ground water monitoring system.

The HMTA is the federal legislation regulating the trucks that transport hazardous wastes. The primary regulatory authorities are the U.S. DOT, the FHWA, and the Federal Railroad Administration (FRA). The HMTA requires that carriers report accidental releases of hazardous materials to the Department of Transportation at the earliest practicable moment (49 CFR Part 171, Subpart ~~chapter~~ C).

RCRA gives the U.S. EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste by "large-quantity generators" (1,000 kilograms/month or more). Under RCRA regulations, hazardous wastes must be tracked from the time of generation to the point of disposal. At a minimum, each generator of hazardous waste must register and obtain a hazardous waste activity identification number. If hazardous wastes are stored for more than 90 days or treated or disposed at a facility, any treatment, storage, or disposal unit must be permitted under RCRA. Additionally, all hazardous waste transporters are required to be permitted and must have an identification number. RCRA allows individual states to develop their own program for the regulation of hazardous waste as long as it is at least as stringent as RCRA. In California, the U.S. EPA has delegated RCRA enforcement to the State of California.

3.8.1.2.2 *State*

Authority for the statewide administration and enforcement of RCRA rests with CalEPA's DTSC. While the DTSC has primary responsibility in the state for regulating the generation, transfer, storage and disposal of hazardous materials, DTSC may further delegate enforcement authority to local jurisdictions. In addition, the DTSC is responsible and/or provides oversight for contamination cleanup, and administers state-wide hazardous waste reduction programs. DTSC operates programs to accomplish the following: 1) deal with the aftermath of improper hazardous waste management by overseeing site cleanups; 2) prevent releases of hazardous waste by ensuring that those who generate, handle, transport, store, and dispose of wastes do so properly; and, 3) evaluate soil, water, and air samples taken at sites. The DTSC conducts annual inspections of hazardous waste facilities. Other inspections can occur on an as-needed basis.

Caltrans sets standards for trucks transporting hazardous wastes in California. The regulations are enforced by the CHP. Trucks transporting hazardous wastes are required to maintain a hazardous waste manifest. The manifest is required to describe the contents of the material within the truck so that wastes can readily be identified in the event of a spill.

The storage of hazardous materials in USTs is regulated by CalEPA's State Water Resources Control Board (SWRCB), which has delegated authority to the RWQCB and, typically at the local level, to the local fire department.

The Hazardous Waste Control Act (HWCA) created the State hazardous waste management program, which is similar to but more stringent than the federal RCRA program. The act is

implemented by regulations contained in Title 26 of the CCR, which describes the following required aspects for the proper management of hazardous waste: identification and classification; generation and transportation; design and permitting of recycling, treatment, storage, and disposal facilities; treatment standards; operation of facilities and staff training; and closure of facilities and liability requirements. These regulations list more than 800 materials that may be hazardous and establish criteria for identifying, packaging, and disposing of such waste. Under the HWCA and Title 26, the generator of hazardous waste must complete a manifest that accompanies the waste from generator to transporter to the ultimate disposal location. Copies of the manifest must be filed with DTSC.

The Unified Program required the administrative consolidation of six hazardous materials and waste programs (Program Elements) under one agency, a CUPA. The Program Elements consolidated under the Unified Program are: Hazardous Waste Generator and On-site Hazardous Waste Treatment Programs (also known as Tiered Permitting); Aboveground Petroleum Storage Tank SPCC; Hazardous Materials Release Response Plans and Inventory Program (also known as the Hazardous Materials Accidental Release Plan); UST Program; and Uniform Fire Code Plans and Inventory Requirements. The Unified Program is intended to provide relief to businesses complying with the overlapping and sometimes conflicting requirements of formerly independently managed programs. The Unified Program is implemented at the local government level by CUPAs. Most CUPAs have been established as a function of a local environmental health or fire department. Some CUPAs have contractual agreements with another local agency, a participating agency, which implements one or more Program Elements in coordination with the CUPA.

The Hazardous Waste Source Reduction and Management Review Act of 1989 requires generators of 12,000 kilograms per year of typical operational hazardous waste to conduct an evaluation of their waste streams every four years and to select and implement viable source reduction alternatives. This Act does not apply to non-typical hazardous waste such as asbestos and polychlorinated biphenyls.

3.8.1.2.3 Local

Fire departments and other agencies in the district have a variety of local laws that regulate reporting, storage and handling of hazardous materials and wastes. There are no hazardous waste disposal sites within the jurisdiction of the district. Hazardous waste generated at area facilities, which is not reused on-site, or recycled offsite, is disposed of at a licensed in-state hazardous waste disposal facility. Two such facilities are the Chemical Waste Management Inc. (CWMI) Kettleman Hills facility in King's County, and the Clean Harbors (formerly Safety-Kleen) facility in Buttonwillow (Kern County). Kettleman Hills has an estimated 2.5 million cubic yard capacity. Buttonwillow receives approximately 960 tons of hazardous waste per day and has an approximate remaining capacity of approximately nine million cubic yards.

3.8.2 Solid Waste Management

Permit requirements, capacity, and surrounding land use are three of the dominant factors limiting the operations and life of landfills. Landfills are permitted by the local enforcement

agencies with concurrence from CalRecycle. Local agencies establish the maximum amount of solid waste which can be received by a landfill each day and the operational life of a landfill. Landfills are operated by both public and private entities. Landfills in the district are also subject to requirements of the SCAQMD as they pertain to gas collection systems, dust and nuisance impacts.

Landfills throughout the region typically operate between five and seven days per week. Landfill operators weigh arriving and departing deliveries to determine the quantity of solid waste delivered. At landfills that do not have scales, the landfill operator estimates the quantity of solid waste delivered (e.g., using aerial photography). Landfill disposal fees are determined by local agencies based on the quantity and type of waste delivered.

Over the past thirteen years, disposal tonnage has decreased significantly in the SCAG region as the emphasis on recycling to meet the requirements of AB 939 has served to divert tonnage from landfills and conserve landfill capacity. Table 3.8-1 shows data from CalRecycle regarding the number of tons disposed in 2010 (the most recent year for which information is available), for each county within the jurisdiction of the district (SCAG, 2012).

TABLE 3.8-1

Solid Waste Disposed in 2010 by County

COUNTY	TOTAL TONNAGE
Los Angeles	6,516,738
Orange	3,522,125
Riverside	3,089,583 ^(a)
San Bernardino	1,236,744 ^(a)
Total	14,365,190

Source: CalRecycle, 2012

(a) Reflects landfills within the district; other landfills outside of the district have not been included.

In viewing facilities on a county-by-county basis, it is important to note that landfills in one county may import waste generated elsewhere. Currently, Orange County offers capacity to out-of-county waste at a “tipping fee” low enough to attract waste from Los Angeles and San Bernardino Counties. In Riverside County, the El Sobrante Landfill is licensed to accept up to 10,000 tons of waste per day from Riverside, Los Angeles, Orange, San Diego, and San Bernardino counties (SCAG, 2012).

Since the enactment of AB 939 in 1989, local governments have implemented recycling programs on a widespread basis, making efforts to meet the 25 percent and 50 percent diversion mandates of AB 939. Statewide, CalRecycle reports that diversion increased from 10 percent in 1989 to 42 percent in 2000 and to 48 percent in 2002. As of 2008, the counties in the SCAG region had met their disposal target rates for waste diversion (SCAG, 2012).

A total of 32 Class III active landfills and two transformation facilities are located within the district with a total capacity of 116,796 tons per day and 3,240 tons per day¹, respectively (see Tables 3.8-2 and 3.8-3). The status of landfills within each county in the district is described in Tables 3.8-6 through 3.8-9.

TABLE 3.8-2

Number of Class III Landfills Located and Related Landfill Capacity

3.8.2.1 Los Angeles County

The Los Angeles Countywide Siting Element addresses landfill disposal. The purpose of the Countywide Siting Element is to provide a planning mechanism to address the solid waste disposal capacity needed by the 88 cities in Los Angeles County and the unincorporated communities for each year of the 15-year planning period through a combination of existing facilities, expansion of existing facilities, planned facilities, and other strategies.

¹ This represents the sum of the permitted capacities of the Southeast Resource Recovery Facility at 2,240 tons per day and the Commerce Refuse-To-Energy Facility at 1,000 tons per day. <http://www.calrecycle.ca.gov/SWFacilities/Directory/19-AK-0083/Detail/>; <http://www.calrecycle.ca.gov/SWFacilities/Directory/19-AA-0506/Detail/>

In 2010, residents and businesses in the county disposed of 8.77 million tons of solid waste at Class III landfills and transformation facilities located in and out of the county (see Tables 3.8-4 and 3.8-5). In addition, the amount of inert waste disposed at permitted inert waste landfills totaled 124,820 tons (LACDPW, 2011).

TABLE 3.8-4

Annual Disposal Tonnage for 2010 (County of Los Angeles)

FACILITY TYPE	VOLUME	UNITS
In-County Class III Landfills	6,313,263	tons per year
Transformation Facilities	539,129	tons per year
Exports to Out-of-County Landfills	1,917,993	tons per year
Subtotal MSW^(a) Disposed	8,770,385	tons per year
Permitted Inert Waste Landfills	124,820	tons per year

(a) MSW = Municipal Solid Waste

3.8.2.1.1 Waste Generation

Based on each jurisdiction's approved diversion rate by CalRecycle, the 2006 countywide diversion rate is estimated at 58 percent. For the purpose of long-term disposal capacity planning, a conservative diversion rate of 55 percent will be assumed for 2010. Therefore, given 8.77 million tons were disposed, it is estimated that the county generates approximately 19.5 million tons or an average of 62,467 tpd based on six operating days per week. Translating it into per capita generation rate, each person in the county generated 10.86 lbs of solid waste each day (LACDPW, 2011).

The Los Angeles County Department of Public Works (LACDPW) conducted a survey requesting landfill operators in the county to provide updates to their estimated remaining disposal capacity based on permitted disposal levels and years of remaining operation. Based on the results of the survey, the total remaining permitted Class III landfill capacity in the county is estimated at 243 million tons (see Table 3.8-6).

(b) Source: SCAG, 2012

(c) Currently only accepting inert waste.

Because of community resistance to the extension of operating permits for existing facilities and to the opening of new landfills in the county, and the dwindling capacity of those landfills with operating permit time left, the exact date on which landfill capacity within the

county will be exceeded is uncertain. Landfill remaining life based on Solid Waste Facility Permits in the county ranges from one year at one facility, to as many as 44 years at another (LACDPW, 2011).

Several landfills have proposed facility expansions. The City of Palmdale approved the expansion of the Antelope Valley Landfill for an additional 8.96 million tons of capacity and approximately eight years of landfill life. The Chiquita Canyon Landfill was given approval to expand in February 2009. Finally, the Lancaster Landfill is proposing to increase the daily permitted disposal to 3,000 tons per day and extend the 2012 closure date.

The LACDPW has reviewed the county's ability to meet daily disposal demands under different scenarios (e.g., landfill expansions, alternative technologies, waste-by-rail systems, and reduction/recycling). Under some of the scenarios, the county will have a difficult time meeting future disposal demands. In order to ensure disposal capacity to meet the county needs, jurisdictions in Los Angeles County must continue to pursue all of the following strategies: 1) expand existing landfills; 2) study, promote, and develop conversion technologies; 3) expand transfer and processing infrastructure; 4) develop a waste-by-rail system; and, 5) maximize waste reduction and recycling.

3.8.2.2 Orange County

Orange County currently has three active Class III landfills. They include the following: Prima Deshecha, Frank R. Bowerman and Olinda Alpha. The Prima Deshecha Landfill has a permitted capacity of 4,000 tons per day and an expected closure date of 2067. The Frank R. Bowerman Landfill has a maximum capacity of 11,500 tons per day, and an expected closure date of 2053. The Olinda Alpha Landfill has a permitted capacity of 8,000 tons per day. The current permit expiration of the Olinda Alpha Landfill is 2021 (see Table 3.8-7).

TABLE 3.8-7

Orange County Landfill Status

LANDFILL	TOTAL YR 2010	PERMITTED TONS/DAY	REMAINING PERMITTED CAPACITY (CUBIC YARDS)	ESTIMATED YEAR OF CLOSURE
Frank R. Bowerman	1,395,735	11,500	205,000,000	2053
Olinda Alpha	1,728,854	8,000	38,578,383	2021
Prima Deshecha	397,536	4,000	87,384,799	2067

Source: CalRecycle, 2012

CalRecycle is responsible for ensuring that the county's waste is disposed of in a way that protects public health, safety and the environment. Long-range strategic planning is necessary to ensure that waste generated by the county is safely disposed of and that the county's future disposal needs are met. The Regional Landfill Options for Orange County (RELOOC) program was created for this reason. RELOOC is a 40-year strategic plan being

prepared by the IWMD. The purpose of RELOOC is to evaluate options for solid waste disposal for Orange County citizens. The plan was last updated in September 2007 (RELOOC, 2007)

Orange County cities and unincorporated areas have completed, adopted and implemented a Countywide Integrated Waste Management Plan. Orange County cities and unincorporated areas have residential curbside recycling programs in place.

3.8.2.3 Riverside County

Riverside County has six active sanitary landfills with a total capacity of 23,914 tons per day. Each of these landfills is located within the unincorporated area of the county and is classified as Class III. El Sobrante Landfill is a privately operated landfill open to the public. Assuming no expansion, the six major sites have closure dates projected from as early as 2011 to as late as 2186. The projected date of closure for each landfill is tentative and could be affected by engineering, environmental, and waste flow issues (see Table 3.8-8).

TABLE 3.8-8
Riverside County Landfill Status

LANDFILL	TOTAL TONS YR 2010	PERMITTED TONS/DAY	REMAINING PERMITTED CAPACITY (CUBIC YARDS)	ESTIMATED YEAR OF CLOSURE

Source: CalRecycle, 2012

(a) CalRecycle Solid Waste Information System database lists the Desert Center Landfill as active, but also lists a "ceased operation date" of January 1, 2011, which reflects the estimated closure date on the U.S. EPA permit. SWIS summary of report of inspection on August 2, 2012 states the facility is active.

3.8.2.4 San Bernardino County

The County of San Bernardino Solid Waste Management Division (SWMD) is responsible for the operation and management of the County of San Bernardino's solid waste disposal system which consists of five regional landfills and nine transfer stations.

San Bernardino County has seven public landfills within the district's boundaries with a combined permitted capacity of 18,129 tons per day. Mid-Valley/Fontana Landfill is

estimated to reach final capacity by the end of 2033, San Timoteo by 2016, Victorville by 2047, Barstow by 2071, Landers by 2018, California Street by 2042 and Colton Landfill by 2017 (see Table 3.8-9).

TABLE 3.8-9

San Bernardino County Landfill Status

LANDFILL	TOTAL TONS YR 2010	PERMITTED TONS/DAY	REMAINING PERMITTED CAPACITY (CUBIC YARDS)	ESTIMATED YEAR OF CLOSURE
Mid-Valley/Fontana	535,876	7,500	67,520,000	2033
San Timoteo	123,500	1,000	11,360,000	2016
Victorville Sanitary	249,657	3,000	81,510,000	2047

Total	1,236,744	18,129	171,579,499	

Source: CalRecycle, 2012

3.8.3 Hazardous Waste Management

Hazardous material, as defined in 40 CFR 261.20 and 22 CCR Article 9, is disposed of in Class I landfills. California has enacted strict legislation for regulating Class I landfills. The California Health and Safety Code requires Class I landfills to be equipped with liners, a leachate collection and removal system, and a ground water monitoring system.

There are no hazardous waste disposal sites within the jurisdiction of the SCAQMD. Hazardous waste generated at area facilities, which is not reused on-site, or recycled off-site, is disposed of at a licensed in-state hazardous waste disposal facility. Two such facilities are the Chemical Waste Management (CWM) Kettleman Hills facility in King's County, and the Laidlaw Environmental Services facility in Buttonwillow (Kern County).

The Kettleman Hills landfill is operating close to capacity, with reportedly less than one percent of capacity remaining or about 30,000 to 40,000 cubic yards and has reduced the amount of hazardous waste accepted at the landfill (Fresno Bee, 2012). CWM has applied to DTSC for a modification to its RCRA permit at Kettleman Hills to allow for the expansion of its hazardous waste landfill, Unit B-18, by 14 acres and about five million cubic yards. CWM has also applied to the U.S. EPA to both renew and modify its existing permits to allow for the expansion of the landfill. The expansion would provide another 12-14 years of life. DTSC has put approval of the landfill expansion on hold as additional environmental investigations, studies and monitoring have continued.

Buttonwillow is operated by Laidlaw Environmental Services and receives approximately 900 tons of hazardous waste per day. Buttonwillow has an approximate remaining capacity

of approximately 8,890,000 cubic yards. The expectant life of the Buttonwillow Landfill is approximately 40 years².

Hazardous waste also can be transported to permitted facilities outside of California. The nearest out-of-state landfills are U.S. Ecology, Inc., located in Beatty, Nevada; Laidlaw Environmental Services located in Lake Point, Utah; Envirosafe Services, in Grandview, Idaho; Chemical Waste Management Inc. in Carlyss, Louisiana, and Waste Control Specialists in Andrews, Texas. Incineration is provided at Laidlaw Environmental Services, Inc., located in Deer Park, Texas.

In 2011, less than 1.25 million tons of hazardous waste were generated in the four counties that comprise the district, and about two million tons of hazardous waste were generated in California (see Table 3.8-10). Those amounts are reduced from the totals in 2005 by approximately 17 and 34 percent respectively. The most common types of hazardous waste generated in the district include waste oil, inorganic solid waste, contaminated soils, organic solids, asbestos-containing waste, and unspecified oil-containing wastes. Because of the population and economic base in southern California, a large portion of hazardous waste is generated within the district. Not all wastes are disposed of in a hazardous waste facility or incinerator. Many of the wastes generated, including waste oil, are recycled within the Basin.

² Personal communication, Marianna Buoni, Laidlaw Environmental Services, August 2012.

^(a) (--) Not on list of top twenty waste totals generated in the county.

^(b) Data presented is for county total and not limited to the portion of the county within SCAQMD jurisdiction.

^(c) Smaller than restricted levels.

^(d) The data for this waste code is as reported in the California Hazardous Waste Tracking System database; however, one or more of the data entries for this waste category appear to be in error.

SUBCHAPTER 3.9

TRANSPORTATION AND TRAFFIC

Introduction

Transportation Regulatory Framework

Existing Traffic Setting

3.9 TRANSPORTATION AND TRAFFIC

3.9.1 Introduction

Some of the proposed 2012 AQMP control measures intended to improve overall air quality may have direct or indirect traffic impacts associated with their implementation. Traffic concerns are related to modifications to the existing transportation system that may generate significant impacts, primarily during the construction phases. This section describes the current transportation system in southern California.

Comments were received on the NOP/IS for the 2012 AQMP that potentially significant impacts could occur as a result of implementing §182 (e) Control Measure ADV-01 - Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission On-Road Heavy-Duty Vehicles. The comment suggested that constructing the overhead electrical catenary lines could adversely affect traffic. Therefore, this potential impact will be evaluated in this [Final](#) Program EIR.

3.9.2 Transportation Regulatory Framework

3.9.2.1 Federal Regulatory Framework

The Transportation Equity Act for the 21st Century (TEA-21), signed into law in 1998, provides the regulatory framework at the federal level for transportation planning in urban areas. This legislation requires that Metropolitan Planning Organizations (MPO) prepare long-range transportation plans. In federally designated air quality nonattainment and maintenance areas, the long-range transportation plan is to be updated every three years. The State of California has additional regulations for the preparation of long-range transportation plans. Otherwise, because transportation and traffic are generally local activities, there are no other federal regulations that are pertinent to the proposed project.

3.9.2.2 State Regulatory Framework

California Department of Transportation (Caltrans): Traffic management in the state of California is guided by policies and standards set at the state level, primarily by the California Department of Transportation (Caltrans). Caltrans is an executive department within California responsible for highway, bridge, and rail transportation planning, construction, and maintenance. Its purpose is to improve mobility across the state. Caltrans manages the state highway system (which includes the California Freeway and Expressway System) and is actively involved with public transportation systems throughout the state. For administrative purposes, Caltrans has divided the state of California into 12 districts supervised by district offices. In southern California, District 7 covers Los Angeles and Ventura counties, District 12 covers Orange County, and District 8 covers Riverside and San Bernardino counties.

Caltrans in conjunction with the California Highway Patrol (CHP) has created Transportation Management Centers (TMCs) to rapidly detect and respond to roadway incidents, while managing the resulting traffic congestion. With the help of intelligent

transportation system technologies, such as electronic sensors in the pavement, freeway call boxes, video cameras, ramp meter sensors, earthquake monitors, motorist cellular calls, and commercial traffic reports, as well as Caltrans highway crews, 911 calls and officers on patrol, each TMC provides coordinated transportation management for general commutes, special events and incidents affecting traffic. The TMCs are operated within each Caltrans district.

CARB’s Truck and Bus Regulation: CARB’s Truck and Bus Regulation was adopted in December 2008 to reduce PM and NOx emissions from existing diesel vehicles operating throughout California. The regulation applies to nearly all diesel fueled trucks and buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds that are privately or federally owned and for privately and publicly owned school buses. The regulation requires all trucks and buses to have 2010 model year engines by 2023. As of January 1, 2012, heavier trucks would be required to meet the engine model year phase-in schedule and fleets that comply with the schedule would install the best available PM filter on 1996 model year and newer engines and would replace the vehicle eight years later. Trucks with 1995 model year and older engines would be replaced starting 2015. Replacements with a 2010 model year or newer engines meet the final requirements, but fleets could also replace with used trucks that would have a future compliance date on the schedule. In addition, fleets that report and use the phase-in option for heavier trucks, could take advantage of credits to delay requirements for other heavier trucks in the fleet until 2017 for the following:

- PM filters installed before July 2011;
- Early purchase of cleaner engines before 2012 (originally equipped with PM filters) ;
- Reducing the number of trucks since 2006; and,
- Adding fuel-efficient hybrids or alternative fueled engines to the fleet.

As part of the analysis of the phase-in option, CARB’s projections at the time the Truck and Bus Regulation was adopted estimated the number of plug-in hybrid vehicles, battery electric vehicles, and fuel cell vehicles that will be driving on district roadways will substantially increase between year 2013 and year 2025, as shown in Table 3.9-1.

TABLE 3.9-1

CARB's Projected Populations of Near-Zero and Zero Emission Vehicles in the District

YEAR	PLUG-IN HYBRID VEHICLE (PHEV)	BATTERY ELECTRIC VEHICLE (BEV)	FUEL CELL VEHICLE (FCV)	TOTAL
2013	15,088	7,196	771	23,055
2014	22,626	7,476	1,058	31,160
2015	33,217	9,725	2,204	45,146
2016	44,442	12,114	3,420	59,976

Source: Communication with ARB Staff, Mobile Source Division, August 14, 2012.

3.9.2.3 Regional Regulatory Framework – Congestion Management Programs (CMPs)

In order to meet federal certification requirements, county Congestion Management Agencies (CMAs) have worked together to develop a congestion management process for the southern California area. In southern California, the Congestion Management System (CMS) is comprised of the combined activities of the Regional Transportation Plan (RTP), the CMP and the Regional Transportation Improvement Program (RTIP).

Under California law, CMPs are prepared and maintained by the CMAs. The Los Angeles County Metropolitan Transportation Authority (Metro), Orange County Transportation Authority (OCTA), Riverside County Transportation Commission (RCTC), and San Bernardino Associated Governments (SANBAG) are the designated CMAs of each county and are subject to State requirements.

In addition to the SCAG RTP and RTIP, the key elements of the federal Congestion Management Process are addressed through the counties' CMPs. Because the magnitude of congestion and degree of urbanization differ among the counties, each CMP differs in form and local procedure. By state law, all CMPs perform the monitoring and management functions summarized in the following bullet points, which also fulfill the federal CMP requirements:

- **Highway Performance:** The monitoring of the performance of an identified highway system as conducted by each CMA allows each county to track how their system, and

its individual components, is performing against established standards, and how performance changes over time.

- **Multi-Modal Performance:** Each CMP contains an element to evaluate the performance of other transportation modes including transit.
- **Transportation Demand Management:** Each CMP contains a Transportation Demand Management (TDM) component geared at reducing travel demand and promoting alternative transportation methods.
- **Land Use Programs and Analysis:** Each CMP incorporates a program for analyzing the effects of local land use decisions on the regional transportation system.
- **Capital Improvement Program:** Using data and performance measures developed through the activities identified above, each CMP develops a Capital Improvement Program (CIP) which is the first step in developing the RTIP. Under state law, projects funded through the RTIP must first be contained in the county CIP.
- **Deficiency Planning:** The CMP contains provisions for "deficiency plans" to address unacceptable levels of congestion. Deficiency plans can be developed for specific problem areas or on a system-wide basis. Projects implemented through the deficiency plans must, by statute, have both mobility and air quality benefits. In many cases, the deficiency plans capture the benefits of transportation improvements that occur outside the county TIPs and RTIP such as non-traditional strategies and/or non-regionally significant projects.
- **The regional transportation planning process and the county congestion management process should be compatible with one another.** To ensure consistency, SCAG and the CMAs have developed the Regional Consistency and Compatibility Criteria for CMPs. Information on the CMP activities and resulting data are updated on a biennial basis by each CMA and supplied to SCAG and air quality management districts.

3.9.2.4 Local Regulatory Framework – General Plans

Under state planning law, every city and county must adopt a General Plan that sets forth the goals, policies and implementation measures for future growth and development. General plans must include seven elements, among which is a circulation element. The circulation element must describe the existing transportation network and describes all planned future transportation improvements. Many local transportation elements, or their implementing ordinances, include criteria for measuring the functionality of current and future roadways, typically through a level-of-service (LOS) measurement system, a volume-to-capacity (VC) ratio, or other such approaches.

3.9.2.5 Transportation-related Policies in California

3.9.2.5.1 *METRANS Transportation Center*

The METRANS Transportation Center, a joint partnership between the University of Southern California and California State University Long Beach, is a University Transportation Center that was established in 1998 under the TEA-21 as a policy advocacy organization to foster independent, high quality research to solve the nation's transportation

problems. The mission of METRANS is to "solve transportation problems of large metropolitan regions through interdisciplinary research, education and outreach." METRANS conducts research in several areas relating to transportation, including safety, security, and vulnerability. In addition to performing research, one of the primary goals of METRANS is to disseminate the research information, as well as, best practices and technology to the professional community

3.9.2.5.2 *Intelligent Transportation System*

One way to incorporate safety and security into transportation planning is through greater collaboration between transportation planning and operations. An Intelligent Transportation System (ITS) is one method of establishing this collaborative relationship by creating an ITS Architecture. An ITS Architecture is a framework for ensuring institutional agreement and technical integration of technologies for the implementation of projects or groups of projects under an ITS strategy. ITS projects were originally designed to increase transportation efficiency and to enhance the safety, security and emergency response capabilities of the region.

Because the successful operation of ITS projects usually depend on multiple agencies and the systems they operate, a framework, made up of multiple ITS Architectures, has been developed at the state, regional, and local levels to help achieve cooperation, coordination and communication amongst participants in the most cost-effective manner. For example, at the state level, the California ITS Architecture and System Plan addresses those services that are managed at a state level or are interregional in nature. Project sponsors are responsible for ensuring that their projects maintain consistency with the regional architectures, regardless of which architecture applies, as a requirement for federally funded projects.

At the regional level, a Regional ITS Architecture provides a framework to address multi-county issues including those projects, programs, and services that require connectivity across county boundaries or are deployed at a multi-county level for ITS planning that promotes interoperability and communication across jurisdictional boundaries. Projects developed under a regional framework extend the usefulness of any single project by making information easily accessible for operators and users of the system. For example, the southern California ITS Regional Architecture is a Regional ITS Architecture that was developed specifically for all counties in the southern California area in order to document the ITS Architecture covering the region.

Local components to the ITS Architecture exist for Los Angeles County, Orange County, Riverside County, and San Bernardino County.

3.9.3 Existing Traffic Setting

The southern California transportation system is a complex intermodal network that consists of roads, highways, public transit, paratransit, bus, rail, airports, seaports and intermodal terminals designed to carry both people and goods. The regional highway system consists of an interconnected network of local streets, arterial streets, freeways, carpool lanes and toll roads. This highway network allows for the operation of private automobiles, carpools,

private and public buses, and trucks. Active transportation modes, such as bicycles and pedestrians share many of these facilities. The regional public transit system includes local shuttles, municipal and area-wide public bus operations, rail transit operations, regional commuter rail services, and interregional passenger rail service. The freight railroad network includes an extensive system of private railroads and several publicly owned freight rail lines serving industrial cargo and goods. The airport system consists of commercial, general, and military aviation facilities serving passenger, freight, business, recreational, and defense needs. The region's seaports support substantial international and interregional freight movement and tourist travel. Intermodal terminals consisting of freight processing facilities, which transfer, store, and distribute goods. The transportation system supports the region's economic needs, as well as the demand for personal travel.

Transit use is growing in southern California. As of 2009, transit agencies in the southern California area reported 747.3 million boardings (SCAG, 2012). This represents growth of nearly 20 percent in the ten years between 2000 and 2010, but only four percent growth in per capita trips due to population growth. Metrolink and Metro Rail (Los Angeles County) have seen ridership growth of six percent to eight percent per year.

3.9.3.1 Transportation Planning

Numerous agencies are responsible for transportation planning and investment decisions within the southern California area. SCAG helps integrate the transportation-planning activities in the region to ensure a balanced, multimodal plan that meets regional as well as county, subregional, and local goals.

Table 3.9-2 identifies local and state agencies that participate in the development of RTP. Seven major entities and agencies are involved including SCAG as the designated Metropolitan Planning Organization, the County Transportation Commissions, Subregional Councils of Governments, local and county governments, transit and transportation owners, operators and implementing agencies, resource/regulating agencies and other private non-profit organizations, interest groups and tribal nations.

TABLE 3.9-2

Stakeholders in Transportation Planning in the Southern California Area

COUNTY TRANSPORTATION COMMISSIONS
Los Angeles County Metropolitan Transportation Authority (Metro)
Orange County Transportation Authority (OCTA)
Riverside County Transportation Commission (RCTC)
SUBREGIONAL COUNCILS OF GOVERNMENTS
Southern California Association of Governments (SCAG)
San Bernardino Associated Governments (SANBAG)
City of Los Angeles
North Los Angeles County
Orange County Council of Governments
San Fernando Council of Governments
San Gabriel Valley Council of Governments
Western Riverside County Council of Governments
Westside Cities Council of Governments
OTHERS
Caltrans
Airport Authorities
Port Authorities
Transportation Corridor Agencies
Transit/Rail Operators

Each of the four counties within the jurisdiction of the SCAQMD has a Transportation Commission or Authority. These agencies are charged with countywide transportation planning activities, allocation of locally generated transportation revenues, and in some cases operation of transit services. In addition, there are many subregional Councils of Government within the southern California area. A Council of Government is a group of cities and communities geographically clustered (sometimes comprising an entire county, e.g., Orange County), which work together to identify, prioritize, and seek transportation funding for needed investments in their respective service areas.

3.9.3.2 Existing Circulation System

3.9.3.2.1 *Commute Patterns and Travel Characteristics*

The existing transportation network serving the southern California area supports the movement of people and goods. On a typical weekday in the four-county region, including those portions of the county not located within the jurisdiction of the SCAQMD, the transportation network supports a total of approximately 420 million vehicle miles of travel (VMT) and 12 million vehicle hours of travel (VHT). Of these totals, over half occur in Los Angeles County and less in Orange County, San Bernardino County, and Riverside County, respectively. Detailed summaries of the existing VMT and VHT for the area are presented in Table 3.9-3 and Table 3.9-4, respectively.

TABLE 3.9-3

Summary of Existing Daily Vehicle Miles

County	Vehicle Miles of Travel (VMT)					
	AM Peak Period		PM Peak Period		Daily	
	Miles	% of Region	Miles	% of Region	Miles	% of Region
Los Angeles	46,321,000	54%	74,635,000	54%	224,312,000	54%

Total	2,728,000	100%	5,114,000	100%	12,484,000	100%

Source: SCAG, 2012. Data presented are for the entire county and not limited to the portion of the county located within the jurisdiction of the SCAQMD.

Much of the existing travel in the southern California area takes place during periods of congestion, particularly during the morning (6:00 AM to 9:00 AM) and evening peak periods (3:00 PM to 7:00 PM). Congestion can be quantified as the amount of travel that takes place in delay (vehicle hours of delay or VHD), and alternately, as the percentage of all travel time that occurs in delay (defined as the travel time spent on the highway due to congestion, which is the difference between VHT at free-flow speeds and VHT at congested speeds). Table 3.9-5 presents the existing travel delays and percent of regional VHT in delay by County on freeways and arterials. As shown in Table 3.9-5, regional travel time in delay represents approximately 25 percent of all daily, 30 percent of all AM peak period, and 38 percent of all PM peak period travel times.

TABLE 3.9-5

Summary of Existing Vehicle Hours of Delay

County	Vehicle Hours of Delay			% of Travel in Delay		
	AM Peak Period	AM Peak Period	Daily	AM Peak Period	AM Peak Period	Daily
Los Angeles	554,000	1,387,000	2,204,000	34%	44%	4%
Orange	128,000	313,000	493,000	27%	36%	23%
Riverside	78,000	158,000	263,000	24%	29%	18%
San Bernardino	64,000	125,000	205,000	21%	24%	14%
Total	824,000	1,983,000	3,165,000	30%	38%	25%

Source: SCAG, 2012. Data presented are for the entire county and not limited to the portion of the county located within the jurisdiction of the SCAQMD.

The average vehicle home-to-work trip duration in each county is generally similar while a greater range of average work distances is found in the different counties of the region (from a low of 13 miles in Orange County to a high of 18 miles in San Bernardino and Riverside counties) (Table 3.9-6). Home-to-work trip duration and distance are both greater for the inland counties of Riverside and San Bernardino, reflecting regional housing and employment distribution patterns. A substantial portion of AM peak period travel in each county takes place in delay, ranging from a low of 21 percent in San Bernardino County to a high of 34 percent in Los Angeles County, as indicated in Table 3.9-5.

Based on average accident rates provided by Caltrans, transportation-related fatalities occur at an overall rate of 0.83 fatalities per 100 million vehicle miles traveled, taking into account the varying accident rates on different facility types (freeway, arterials) and travel modes (bus transit, rail transit) (SCAG, 2012). These specific accident rates and the resulting estimate of region-wide accidents are detailed in Table 3.9-7.

TABLE 3.9-6

Summary of Existing Vehicle Work Trip Length

County	Average Home to Work Trip Distance (miles)	Average Home to Work Duration (minutes)	
	Vehicle Trips (AM Only)	Vehicle Trips (AM Only)	Transit Trips (AM Only)
Los Angeles	14	26	69
Orange	13	21	78
Riverside	18	29	95
San Bernardino	18	29	116

San Bernardino	236	1.11	212

Source: SCAG 2012-2035 RTP/SCS Program Draft EIR.

Data presented are for the entire county and not limited to the portion of the county located within the jurisdiction of the SCAQMD.

A summary of home-to-work trip characteristics by county is presented in Table 3.9-8. Single passenger occupancy vehicles is still the most common form of transportation for home to work trips, accounting for 76 percent of the trips in Los Angeles County, 81 percent of the trips in Orange County, and 82 percent of the trips in Riverside and San Bernardino County. Public transit in all forms (including school buses) carries approximately 2.4 percent of all trips in the southern California area. Of these, the greatest number of travelers is carried by buses, with lesser patronage on Metro Rail, paratransit, commuter rail and other forms of public transit services. Work trips made via public transit account for about 6.1 percent of all home-to-work trips in the area.

TABLE 3.9-8

Existing Travel Mode Split (% of County Total)

County	Person Trip Type	Drive Alone	2 Person Carpool	3 Person Carpool	Auto Passenger Trip	Transit	Non-Motorized	Total

3.9.3.2.2 *Regional Freeway, Highway and Arterial System*

The regional freeway and highway system as shown in Figure 3.9-1 is the primary means of person and freight movement for the region. This system provides for direct automobile,

bus and truck access to employment, services and goods. The network of freeways and State highways serves as the backbone of the system offering very high capacity limited-access travel and serving as the primary heavy duty truck route system.

Major freeways that transverse Los Angeles County in a generally north/south direction include the San Diego Freeway (I-405), the Golden State Freeway (I-5), the Hollywood Freeway (I-101), Pasadena Freeway (I-110), the Long Beach Freeway (I-710), and the San Gabriel Freeway (I-605). Major freeways that transverse Los Angeles County in a generally east/west direction include the Santa Monica Freeway (I-10), Century Freeway (I-105), Foothill Freeway (I-210), Ronald Reagan Freeway (I-118), Pomona Freeway (I-60), and Riverside Freeway (I-91).

Major freeways that transverse Orange County in a generally north/south direction include I-405, I-5, the Orange Freeway (I-57), and the Newport Freeway (I-55), as well as toll roads located in the south-eastern portion of the County (I-241 and 261). Major freeways that transverse Orange County in a generally east/west direction include the I-91, Garden Grove Freeway (I-22), and Corona Del Mar Freeway (I-73).

Major freeways that transverse Riverside County in a generally north/south direction include the Chino Valley Freeway (I-71), Ontario Freeway (I-15), and Escondido Freeway (I-215). Major freeways that transverse Riverside County in a generally east/west direction include the I-91, I-60, and I-10.

Major freeways that transverse San Bernardino County in a generally north/south direction include the Ontario Freeway (I-15), and I-215. Major freeways that transverse San Bernardino County in a generally east/west direction include the Needles Freeway (I-40) (outside of the air Basin).

The components of the regional highway and freeway system are summarized in Table 3.9-9.

TABLE 3.9-9

Existing Regional Freeway Route Miles and Lane Miles by County

County	Freeway Route Miles	Freeway Lane Miles
Los Angeles	637	4,583
Orange	167	1,294
Riverside	309	1,722
San Bernardino	471	2,512
Total	1,584	10,111

Source: SCAG, 2012.

Data presented are for the entire county and not limited to the portion of the county located within the jurisdiction of the SCAQMD.

3.9.3.2.3 *Regional High Occupancy Vehicle System and Park & Ride System*

The regional high occupancy vehicle (HOV) system consists of exclusive lanes on freeways and arterials, as well as bus ways and exclusive rights-of-way dedicated to the use of HOVs. It includes lanes on freeways, ramps and freeway-to-freeway connectors. The regional HOV system is designed to maximize the person-carrying capacity of the freeway system through the encouragement of shared-ride travel modes. HOV lanes operate at a minimum occupancy threshold of either two or three persons. Many include on-line and off-line park and ride facilities, and several HOV lanes are full "transitways" including on-line and offline stations for buses to board passengers. The current system is described in Table 3.9-10.

TABLE 3.9-10

Existing Regional Freeway ~~Route Miles and Lane~~ HOV Total Lane Miles by County

County	HOV Total Lane Miles
Los Angeles	479
Orange	241
Riverside	83
San Bernardino	105

Source: SCAG, 2012.

Data presented is for the entire county and not limited to the portion of the county located within the jurisdiction of the SCAQMD.

Park and ride facilities are generally located at the urban fringe along heavily-traveled freeway and transit corridors and support shared-ride trips, either by transit, by carpool or vanpool. Most rail transit stations have park and ride lots nearby. There are currently 168 park and ride lots in the southern California area, including Metrolink station parking lots. These facilities include: 106 in Los Angeles County, 20 park and ride facilities in Orange County, 25 in Riverside County, and 17 in San Bernardino County.

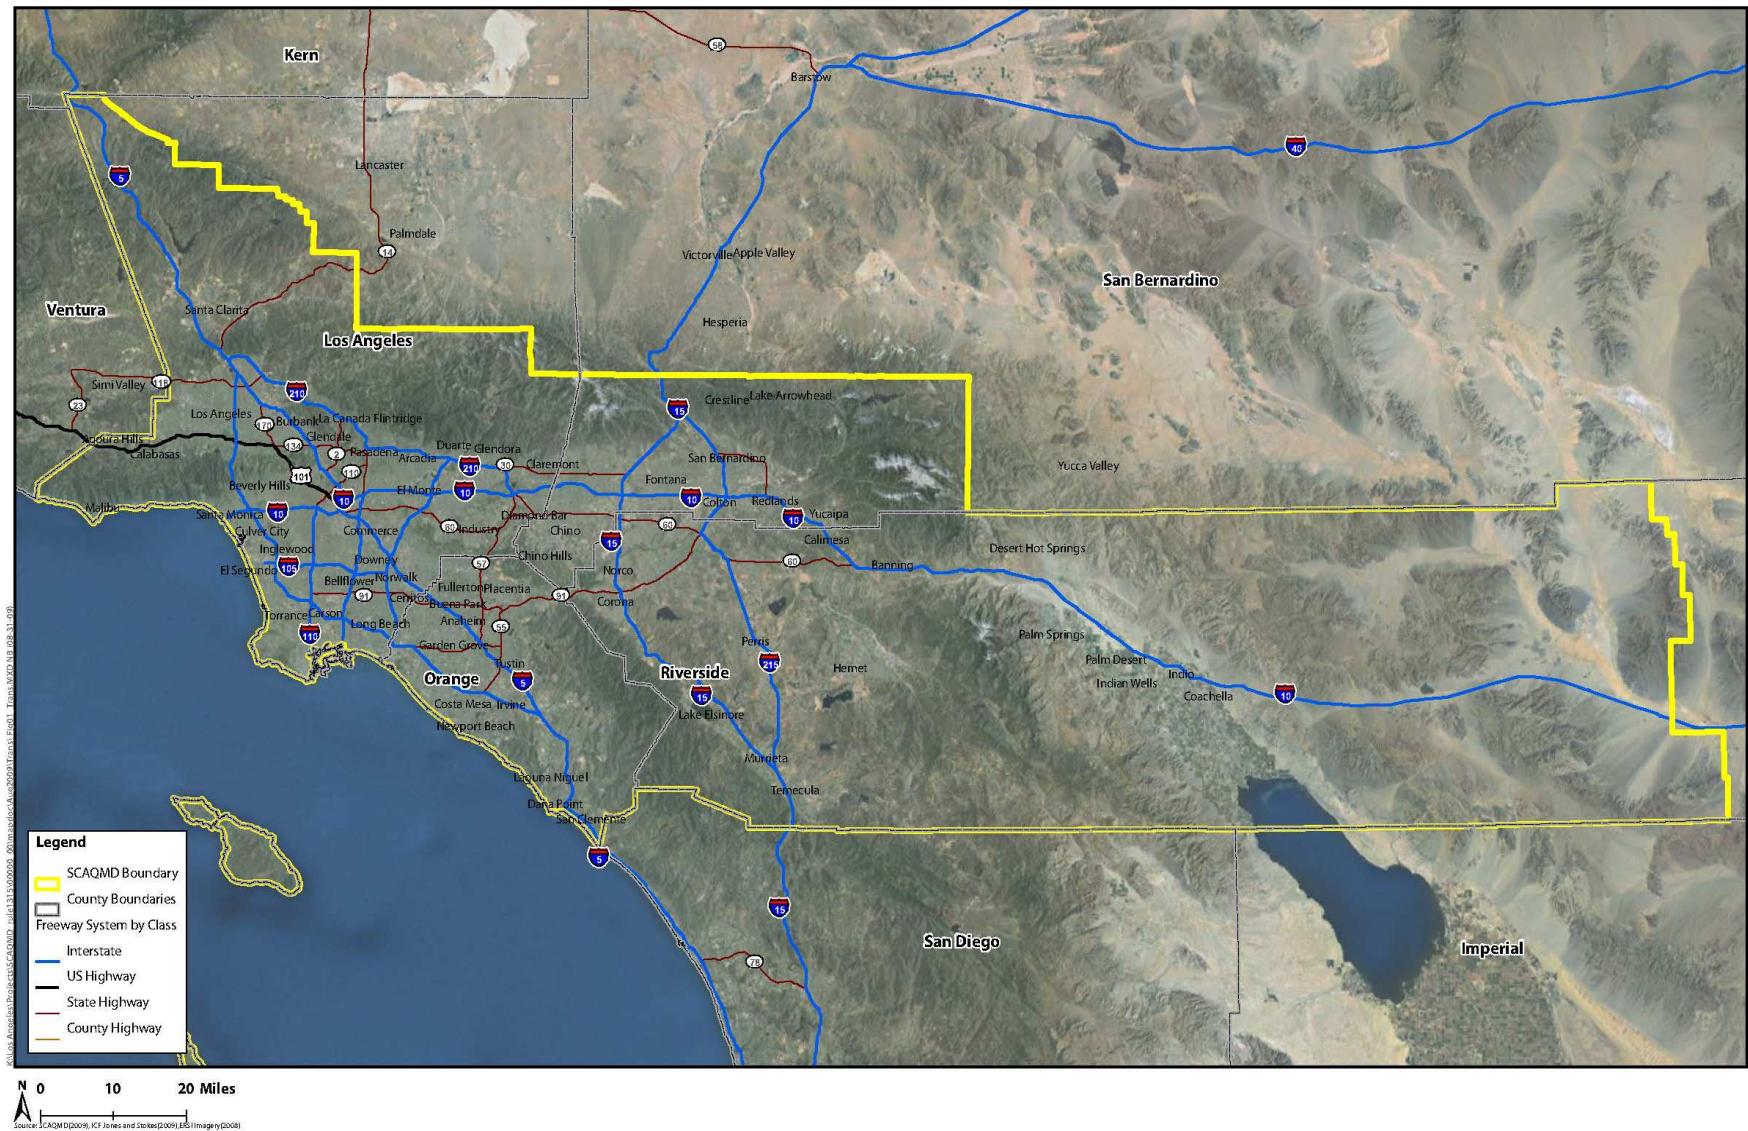

FIGURE 3.9-1

Major Freeway Routes within South Coast Air Quality Management District

3.9.3.2.4 Arterial Street System

The local street system provides access for local businesses and residents. Arterials account for over 80 percent of the total road network and carry a high percentage of total traffic. In many cases arterials serve as alternate parallel routes to congested freeway corridors. Peak period congestion on the arterial street system occurs generally in the vicinity of activity centers, at bottleneck intersections and near many freeway interchanges. The region's arterial street system is described in terms of number of miles in Table 3.9-11.

TABLE 3.9-11

Existing Regional Arterial Route Miles and Lane Miles by County

County	Arterials	Lane Miles
Los Angeles	Principal	8,843
	Minor	9,076
Orange	Principal	3,242
	Minor	3,147
Riverside	Principal	1,181
	Minor	3,235
San Bernardino	Principal	1,934
	Minor	4,365
Total	Principal	15,200
	Minor	19,823

Source: SCAG 2012-2035 RTP/SCS Program Draft EIR.

Data presented are for the entire county and not limited to the portion of the county located within the jurisdiction of the SCAQMD.

3.9.3.3 Goods Movement

Wholesale and retail trade, transportation, and manufacturing support over 3.3 million jobs in the region according to statistics provided by the California Employment Development Department. Goods movement includes trucking, rail freight, air cargo, marine cargo, and both domestic and international freight, the latter entering the country via the seaports, airports, and the international border with Mexico. Additionally, many cargo movements are intermodal (e.g., sea to truck, sea to rail, air to truck, or truck to rail). The goods movement system includes not only highways, railroads, sea lanes, and airways, but also intermodal terminals, truck terminals, railyards, warehousing, freight consolidation/de-consolidation terminals, freight forwarding, package express, customs inspection stations, truck stops, and truck queuing areas.

3.9.3.3.1 Railroads

The southern California area is served by two main line commercial freight railroads (e.g., the Burlington Northern/Santa Fe Railway Co. (BNSF) and the Union Pacific (UP) Railroad). These railroads link southern California with other United States regions, Mexico and Canada either directly or via their connections with other railroads. They also provide freight rail service within California. In 2011, railroads moved approximately 150 million

tons of cargo throughout California (SCAG, 2012). These railroads perform specific local functions and serve as feeder lines to the trunk line railroads for moving goods to and from southern California.

The two main line railroads also maintain and serve major facilities in the southern California area. Intermodal facilities in Commerce (BNSF-Hobart), East Los Angeles (UP), San Bernardino (BNSF), and Carson near the San Pedro Bay Ports (UP-ICTF), the Los Angeles Transportation Center (UP-LATC), and the UP-City of Industry yards serve on-dock rail capacity at the Port of Los Angeles (UP/BNSF) and Port of Long Beach (UP/BNSF).

BNSF and UP are both seeking approvals for new or expanded intermodal container facilities to help manage the estimated increase in container movements through the ports. BNSF is seeking approvals for the Southern California International Gateway facility, a new intermodal facility in the City of Los Angeles about four miles north of the Ports of Long Beach and Los Angeles and adjacent to the Alameda Corridor (LAHD, 2011). UP is seeking approvals to expand its existing Intermodal Container Transfer Facility near the City of Carson, adjacent to the Alameda Corridor (ICTF JPA, 2009)

All of the major rail freight corridors in the region have some degree of grade separation, but most still have a substantial number of at-grade crossings on major streets with high volumes of vehicular traffic. These crossings cause both safety and reliability problems for the railroads and for those in motor vehicles at the affected crossings. Trespassing on railroad rights-of-way by pedestrians is another safety issue affecting both freight and commuter railroads. As an example, the Colton Crossing, is an at-grade railroad crossing located south of I-10 between Rancho Avenue and Mount Vernon Avenue in the City of Colton, where BNSF's San Bernardino Line crosses UP's Alhambra/Yuma Lines. In 2008, the Colton Crossing saw on average 110 freight trains per day.

The southern California area is also served by two short line or switching railroads:

- The Pacific Harbor Line (formerly the Harbor Belt Railroad) handles all rail coordination involving the Port of Los Angeles and Port of Long Beach, including dispatching and local switching in the harbor area.
- Los Angeles Junction Railway Company, owned by BNSF, provides switching service in the Vernon area for both the BNSF and UP.

Another key component of the regional rail network is the Alameda Corridor, a 20-mile, four-lane freight rail expressway that began operations in April 2002. In 2010, approximately 14,177 intermodal trains transited the Alameda Corridor, an approximate increase of 8.6 percent since 2009 (SCAG, 2012).

3.9.3.3.2 *Marine Ports*

Southern California is served by three major deep-water seaports (e.g., Port of Los Angeles, Port of Long Beach, and Port of Hueneme). However, the Port of Hueneme is not within the jurisdiction of the SCAQMD. The Port of Los Angeles and Port of Long Beach handle trade

from Asia and North America, and are served by the two major railroads (e.g., BNSF and UP), as well as numerous trucking companies in southern California. The Port of Hueneme handles primarily automobile and agricultural products. Both the Port of Los Angeles and the Port of Long Beach are full service ports with facilities for containers, autos and various bulk cargoes. With an extensive landside transportation network, these three ports moved more than 310 million metric tons of cargo in 2010 (SCAG, 2012).

The Port of Los Angeles and Port of Long Beach dominate the container trade in the Americas by shipping and receiving more than 11.8 million twenty-foot Equivalent Units (TEUs) of containers in 2009. Together, these two ports rank third in the world, behind Rotterdam and Hong Kong, as the busiest maritime ports (SCAG, 2012).

3.9.3.4 Public Transit, Bicycle or Pedestrian Facilities

3.9.3.4.1 *Public Transit*

In southern California public transit service is comprised of local and express buses, transit ways, Rapid Bus, and urban rail, including subway and light rail, principally centered in the core of Los Angeles County. Transit service is provided by approximately 67 separate public agencies. Twelve of these agencies provide 91 percent of the existing public bus transit service. Local service is supplemented by municipal lines and shuttle services. Private bus companies provide additional regional service.

Transit ridership was approximately 708 million in 2010 in southern California (SCAG, 2012). The largest provider of public transit service in Los Angeles County is the Metro, which provides bus service and an urban light rail system and subway. In 2010, the Metro system experienced approximately 41.9 million average monthly boardings (SCAG, 2010).

The largest provider of public transit service in Orange County is OCTA, which operates 77 bus local and express routes and approximately 62,000 bus stops located throughout the urbanized portions of Orange County. In 2010, the OCTA system experienced approximately 4.8 million average monthly boardings (SCAG, 2010).

The largest provider of public transit service in Riverside County is the Riverside Transit Agency, which operates 231 buses on approximately 43 local and express routes. In 2010, the system experienced approximately 950,000 average monthly boardings (SCAG, 2010).

The largest provider of public transit service in San Bernardino County is Omnitrans, which operates 277 buses over approximately 27 routes. In 2010, the system experienced approximately 1.3 million average monthly boardings (SCAG, 2010).

3.9.3.4.2 *Metro Rail System*

Existing urban rail lines are located in Los Angeles County and operated by Metro. They include the Metro Blue Line (from Long Beach to downtown Los Angeles), the Metro Green Line (from Redondo Beach to Norwalk), the Metro Red Line subway (from Union Station to North Hollywood), Metro Purple Line (from Union Station to Western Avenue), the Metro Gold Line (from east Los Angeles to Pasadena), and the Metro Expo Line (from Union

Station to Culver City. The Metro Rail system has a total of 87 route miles that serve a total of 80 stations. Ridership on the system is about 303,000 boardings per day (SCAG, 2012)

3.9.3.4.3 *Regional Commuter Rail*

Metrolink is a commuter rail service that is governed and operated by the Southern California Regional Rail Authority (SCRRA), a joint powers authority that consists of five county agencies tasked with reducing highway congestion and improving mobility throughout southern California: Los Angeles County Metropolitan Transportation Authority (Metro), Orange County Transportation Authority, Riverside County Transportation Commission, San Bernardino Associated Governments and Ventura County Transportation Commission. Metrolink serves as the link between six Southern California counties by providing commuters seamless transportation connectivity options. Metrolink currently operates seven routes including five from downtown Los Angeles to Ventura, Lancaster, San Bernardino, Riverside and Oceanside; one from San Bernardino to Oceanside; and one from Riverside via Fullerton or City of Industry to downtown Los Angeles. The system operates about 144 trains on weekdays, 40 trains on Saturdays, and 26 trains on Sundays to 55 stations on 512 miles of track. Average weekday ridership is approximately 40,544 passengers (SCAG, 2012).

Amtrak provides regional and inter-regional service from San Diego to San Luis Obispo along the Pacific Surfliner corridor. Amtrak also operates four interstate routes within the region that on average have one daily trip.

3.9.3.4.4 *Bicycle and Pedestrian Facilities*

Biking and walking tend to play a bigger role in densely-populated, mixed land use areas of the region. However, in 2009, less than four percent of commuters within the SCAG region, of which the district is a subset, traveled to work via biking or walking (0.7 percent bicycled and 2.5 percent walked)¹. Current transit infrastructures provide 97 percent of residents in the SCAG region with access to transit via bicycle and 86 percent access to transit by walking.

The region's bikeways include Class I bikeways, which are shared-use paths that are also used by pedestrians. Class II bikeways are striped lanes in streets, and Class III bikeways are signed routes. Nearly 4,615 miles of Class I and II bikeways exist throughout the region, as well as mountain bike trails. The City of Los Angeles alone has more than 216 miles of Class I and II bikeways. In addition, local jurisdictions in the region have proposed an additional 4,980 miles of bikeways (SCAG, 2012).

Pedestrian access at and near public transit, in most major commercial areas, and many residential areas is facilitated by sidewalks, a number of pedestrian malls, and in some cases local jogging and pedestrian trails or paths.

¹ SCAG. 2012. 2012 – 2035 Regional Transportation Plan/Sustainable Communities Strategy, adopted April 2012, p. 53. <http://rtpscs.scag.ca.gov/Documents/2012/final/f2012RTPSCS.pdf>

CHAPTER 4.0

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Introduction

4.0 INTRODUCTION

The CEQA Guidelines require EIRs to identify significant environmental effects that may result from a proposed project [CEQA Guidelines §15126.2 (a)]. Direct and indirect significant effects of a project on the environment should be identified and described, with consideration given to both short- and long-term impacts. The discussion of environmental impacts may include, but is not limited to, the resources involved; physical changes; alterations of ecological systems; health and safety impacts caused by physical changes; and other aspects of the resource base, including water quality, public services, etc. If significant adverse environmental impacts are identified, the CEQA Guidelines require a discussion of measures that could either avoid or substantially reduce any adverse environmental impacts to the greatest extent feasible (CEQA Guidelines §15126.4).

The CEQA Guidelines indicate that the degree of specificity required in a CEQA document depends on the type of project being proposed (CEQA Guidelines §15146). The detail of the environmental analysis for certain types of projects cannot be as great as for others. For example, the EIR for projects, such as the adoption or amendment of a comprehensive zoning ordinance or a local general plan, should focus on the secondary effects that can be expected to follow from the adoption or amendment, but the analysis need not be as detailed as the analysis of the specific construction projects that might follow. As a result, this Program EIR analyzes impacts on a regional level, impacts on the subregional level, and impacts on the level of individual projects or individual facilities only where feasible.

Chapter 4 analyzes the potential environmental impacts of the 2012 AQMP. The primary purpose of the 2012 AQMP is for the [SCAQMD District](#) to demonstrate compliance with the federal 24-hour PM_{2.5} standard. As shown in Table 2-3, the [2012 AQMP](#) includes the following short-term PM_{2.5} Control Measures emissions: CMB-01, BCM-01, BCM-02, BCM-03, BCM-04, IND-01, EDU-01, and MCS-01. The 2012 AQMP also provides an update to the Basin's projections in making expeditious progress in attaining the federal 1-hour and 8-hour ozone standards. As shown in Table 2-3, the following control measures (referred to as [CAA](#) Section 182 (e)(5) implementation measures) are proposed to demonstrate expeditious progress in attaining ozone standards: CTS-01, CTS-02, CTS-03, CTS-04, CMB-02, CMB-03, FUG-01, FUG-02, FUG-03, MSC-01, MCS-02, MCS-03, INC-01, INC-02, EDU-01, ONRD-01, ONRD-02, ONRD-03, ONRD-04, ONRD-05, OFFRD-01, OFFRD-02, OFFRD-03, OFFRD-04, OFFRD-05, ADV-01, ADV-02, ADV-03, ADV-04, ADV-05, ADV-06, and ADV-07.

This chapter is subdivided into the following sections based on the area of potential impacts: aesthetics, air quality, energy, hazards, hydrology and water quality, land use, noise, traffic and transportation, and solid and hazardous waste. Included for each impact category is a discussion of project-specific impacts, project-specific mitigation (if necessary and available), remaining impacts, and a summary of impacts for each resource. Also, included within each resource evaluation is a summary of impacts that would be expected for the short-term PM_{2.5} Control Measures and a summary of impacts for the ozone Control Measures.

In order to address the full range of potential environmental impacts several assumptions were made for purposes of evaluation. First, to provide a “worst-case” analysis, the environmental analysis contained herein assumes that the control measures contained in the AQMP apply to the entire district (e.g., the Basin and those portions of the MDAB and SSAB under the SCAQMD’s jurisdiction). If control equipment which has secondary adverse environmental impacts could be used to comply with a particular control measure, it was assumed that such equipment would be used even if it may not be the most appropriate technology or method of compliance. For example, the analysis assumes that all vehicles in ONRD-01 were assumed to be electrified in the analysis of energy impacts. However, they were also included in the analysis of alternative fuels, as alternative fuels (e.g., natural gas) could also be used to implement ONRD-01. This approach was taken for each environmental topic. In practice, there are typically a number of ways to comply with requirements of SCAQMD rules, but only one type of compliance option will actually be implemented. This approach has the potential to substantially overestimate impacts because only a single type of control equipment will be used.

Every control measure in the 2012 AQMP was evaluated to determine whether or not it has the potential to generate adverse environmental impacts. Each environmental topic subchapter in Chapter 4 contains a table identifying those control measures that have the potential to generate significant adverse impacts to that environmental topic. Table 4.0-1 lists the various control measures, which were evaluated and determined not to have significant adverse impacts on the environment and, therefore, were not evaluated further.

TABLE 4.0-1

Control Measures With No Expected Impacts

Control Measures	Control Measure Title (Pollutant)	Control Methodology	Reason Not Significant
BCM-01	Further Reductions from Residential Wood Burning Devices	The current mandatory wood burning curtailment threshold would be lowered, resulting in increased days when wood burning would be prohibited.	Increase in no burn days, no physical modifications.
BCM-02	Further Reductions from Open Burning	Prohibit open burning whenever PM _{2.5} concentrations are expected to exceed specific concentrations.	Increase in no burn days, no physical modifications.
FUG-03	Further VOC Reductions from Fugitive VOC Emissions	Require at least a self-inspection program and/or optical gas imaging-assisted leak detection and repair program and explore the use of new technologies to detect and verify VOC fugitive emissions.	Increased Inspection and monitoring.
EDU-01	Further Criteria Pollutant Reductions from Education, Outreach and Incentives	Voluntary program that provides outreach to consumers, business owners and residences on clean air practices.	Education

There are several reasons why the control measures in Table 4.0-1 are not expected to generate significant adverse impacts. First, the primary control methods of compliance do not involve control equipment that would generate any adverse secondary or cross media impacts. For example, BCM-01 and BCM-02 would limit wood burning and open burning activities during days when PM_{2.5} concentrations exceed specific thresholds. Since the

burning would likely be shifted to other days, no physical impacts are expected to occur. FUG-03 would largely control VOC emissions through enhanced inspection and maintenance practices to reduce fugitive emissions from material transfer, storage, and processing. Inspection and maintenance practices are not expected to generate secondary impacts because these are procedures to ensure proper operation of equipment. Finally, EDU-01 involves outreach and education so that consumers can make informed choices in purchases, conducting efficiency upgrades, installing clean energy sources, and approaches to energy conservation. EDU-01 is a voluntary measure that would educate the public in general. Any impacts are expected to be positive in terms of changing behavior, but are not expected to result in physical, adverse impacts.

In addition, one control measures proposed in the 2012 AQMP for which there is insufficient information regarding compliance options or how they would be implemented to determine the potential impacts (see Table 4.0-2). OFFRD-05 would impose fees but does not indicate how the fees would be used. The fees could be used for educational purposes or purchasing control equipment. Because the control measure is general in nature, it is difficult to determine what, if any, impacts could be expected from this control measure. Therefore, the impacts of OFFRD-05 would be considered speculative and no further environmental analysis is required (CEQA Guidelines §15145).

TABLE 4.0-2
Control Measures Whose Impacts Are Speculative

Control Measures	Control Measure Title (Pollutant)	Control Methodology	Reason Not Significant
OFFRD-05	Emission Reductions from Ocean-Going Marine Vessels	Would enhance Ports' existing financial incentive programs for early deployment of Tier 3 vessels calling at the Ports.	Economic Incentives

SUBCHAPTER 4.1

AESTHETICS

Introduction

2012 AQMP Control Measures with Potential Aesthetics Impacts

Significance Criteria

Potential Aesthetics Impacts and Mitigation Measures

Project-Specific Mitigation Measures

Summary of Aesthetics Impacts

4.1 AESTHETICS

4.1.1 Introduction

This subchapter examines impacts of the proposed control measures in the 2012 AQMP on aesthetic resources. All control measures in the 2012 AQMP were evaluated to determine whether or not they could generate aesthetic impacts based on the anticipated methods of control. Three control measures were determined to result in potential aesthetic impacts.

4.1.2 2012 AQMP Control Measures with Potential Aesthetics Impacts

The aesthetic impact analysis in this [Final](#) Program EIR identifies the net effect on aesthetic resources from implementing the 2012 AQMP. Implementing some of the 2012 AQMP control measures could potentially result in aesthetic impacts. Specifically, several control measures promote the use of zero and near-zero emission trucks and locomotives powered by electricity. In addition to electricity stored in batteries or produced onboard through a fuel cell, these control measures contemplate the use of “wayside” electricity from outside sources such as overhead catenary power lines, as currently used for transit buses, which could impact scenic highways and vistas.

Evaluation of control methods for each control measure indicated that there are three ozone control measures that could have potential aesthetic impacts, as shown below in Table 4.1-1.

TABLE 4.1-1

Control Measures with Potential Aesthetics Impacts

CONTROL MEASURES	CONTROL MEASURE DESCRIPTION (POLLUTANT)	CONTROL METHODOLOGY	AESTHETIC IMPACT
OZONE CONTROL MEASURES			
ONRD-05	Further Emission Reductions from Heavy-Duty Vehicles Serving Near-Dock Railyards	Accelerated use of hybrid electric or fuel cells	Potential increase in amount of overhead power lines.
ADV-01	Actions for the Deployment of Zero and Near-Zero Emission On-Road Heavy-Duty Vehicles	Development and use of “wayside” electric or magnetic infrastructure.	Potential impacts from construction of “wayside” electric or magnetic infrastructure.
ADV-02	Actions for the Deployment of Zero and Near-Zero Emission Locomotives	Development and use of “wayside” electric or magnetic infrastructure.	Potential impacts from construction of “wayside” electric or magnetic infrastructure.

4.1.3 Significance Criteria

Implementation of the 2012 AQMP will be considered to have significant adverse aesthetic impacts if any of the following conditions occur:

- Substantially adversely affect a scenic vista;

- Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway;
- Substantially degrade the existing visual character or quality of a site and its surroundings; or
- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

4.1.4 Potential Aesthetics Impacts and Mitigation Measures

PROJECT SPECIFIC IMPACTS: Control measures ONRD-05, ADV-01 and ADV-02 included in the 2012 AQMP relate primarily to emission reductions through the incorporation of electrically powered trucks and locomotives. To power this equipment, catenary lines (overhead power lines) could be constructed and could potentially result in aesthetic impacts. These lines are similar to “trolley car lines” associated with electrically powered trollies and buses common in metropolitan transportation.

The areas affected by the proposed zero and near-zero emission control measures that could result in the installation of catenary lines are expected to be located in commercial areas, industrial areas, along existing transportation corridors in areas within and adjacent to the Port of Los Angeles (e.g., Navy Way, and Port of Long Beach), around container transfer facilities (truck/train) near the Terminal Island Freeway and East Sepulveda Boulevard intersection, along the Alameda Corridor, as well as the railyards near downtown Los Angeles (East Washington Boulevard in the City of Commerce, which are located within three miles of the northern terminus of the Alameda Corridor and east of I-710). It is not expected that residential areas will be impacted by the installation of catenary lines.

Construction Activities: Construction activities may result in a temporary effect on businesses and residents along transportation corridors. Construction activities in these areas would be conducted with typical roadway construction equipment (bulldozers, graders, backhoes, cranes, etc.), which are not generally considered high profile, thus affecting views or visibility. Potential impacts would be temporary and would cease after completion of construction.

As shown in Table 3.1-2, the nearest officially designated Scenic Highway to either the Ports, the cargo transfer facilities serving the ports, along the Alameda Corridor, or the cargo transfer facilities in the City of Commerce, would be Route 2 (Angeles Crest Scenic Byway) near La Canada/Flintridge, in the northeastern portion of Los Angeles County. It is approximately 14 miles from the northern terminus of the Alameda Corridor and the cargo transfer railyards in the City of Commerce to the most southern portion of Route 2. The port area, Alameda Corridor or downtown railyards are not visible from Route 2 due to the distance, presence of numerous large buildings in downtown Los Angeles, and the intervening topography (hills and mountains) between downtown Los Angeles and the beginning of Route 2 near La Canada/Flintridge.

As shown in Table 3.1-3, the nearest roadway which is eligible for State Scenic Highway Designation, to either the Ports, the cargo transfer facilities serving the ports, along the Alameda Corridor, or the cargo transfer facilities in the City of Commerce, would be Route 1 (Pacific Coast Highway at State Route 19 – Lakewood Boulevard, in Long Beach) in the southernmost portion of Los Angeles County. It is approximately five miles from the cargo transfer facilities serving the Ports to the intersection of State Route 19 and Route 1 where it becomes eligible to become a State Scenic Highway. The potential locations for catenary overhead power lines (near Port facilities, transportation corridors and railyards) would not be visible to Route 1 at State Route 19 due to the numerous structures and topography between the two locations. There are no officially designated Scenic Highways or highways eligible for State Scenic Highway Designation in areas affected by construction of zero or near-zero emission equipment associated with the 2012 AQMP, therefore construction impacts on aesthetic impacts are considered to be less than significant.

Operational Activities: As discussed under construction activities, control measures associated with potential aesthetics impacts in the 2012 AQMP relate primarily to the potential installation of catenary lines (overhead power lines) to power zero and near-zero emission trucks and locomotives.

Aesthetic impacts from zero or near-zero emission equipment are primarily associated with the installation of catenary poles and overhead wires. The areas within the district where such equipment is being considered are primarily heavily industrialized areas and major transportation corridors. As noted in the previous section (Construction Activities), the heavily industrialized areas around the Ports, near the cargo transfer facilities serving the Ports, along existing transportation corridors such as the Alameda Corridor, and the cargo transfer railyards in the City of Commerce, are not near an officially designated Scenic Highway or a roadway eligible for State Scenic Highway Designation, i.e., the overhead lines would be at least five miles away. The overhead power lines and catenary system would not be visible from this distance to an officially designated Scenic Highway or to a roadway eligible for designation as a Scenic Highway. As such, implementation of the 2012 AQMP would not result in significant aesthetic impacts to scenic highways. Further, the catenary poles and overhead electric wires would largely be located in industrial areas and would be consistent with the existing industrial and urbanized visual setting. It is expected that electrical substations would also be located in industrial/commercial areas or near transportation corridors and would be appropriately designed (e.g., wood cladding on the exterior of substations, so that the substations would blend in with the existing environment).

Based on the above, implementation of the 2012 AQMP is not expected to result in a substantial adverse effect on scenic vistas, substantially damage any scenic resources, substantially degrade the existing visual character or quality of a site and its surroundings, or create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

4.1.5 Project-Specific Mitigation Measures

No significant aesthetic impacts were identified for the installation of catenary or overhead power lines associated with the 2012 AQMP so no mitigation measures are required.

REMAINING AESTHETIC IMPACTS: There are no remaining aesthetic impacts since no significant impacts are expected due to the installation of catenary or overhead power lines associated with the 2012 AQMP and, therefore, no mitigation measures are required.

4.1.6 Summary of Aesthetics Impacts

The following is the summary of the conclusions of the analysis of aesthetic impacts associated with implementation of the 2012 AQMP:

- The construction and operation of the catenary or overhead power lines that could be used to power zero and near-zero emission vehicles and locomotives are not expected to be visible to any Scenic Highway or any roadway eligible as a Scenic Highway. Additionally, the construction and operation of catenary or overhead power lines is not expected to result in substantial adverse effects on scenic vistas, substantially damage any scenic resources, substantially degrade the existing visual character or quality of a site and its surroundings, or create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Therefore, aesthetics impacts associated with the 2012 AQMP are less than significant.

Summary of PM_{2.5} Control Measure Impacts: PM_{2.5} Control Measures were evaluated in the NOP/IS and it was determined that the PM_{2.5} Control Measures would not generate any potentially significant aesthetic impacts.

Summary of Ozone Control Measure Impacts: Three Ozone Control Measures could result in the construction of overhead catenary lines. However, the potential aesthetic impacts associated with the Ozone Control Measures were determined to be less than significant, as no scenic resources, scenic vistas, or scenic highways would be adversely impacted.

SUBCHAPTER 4.2

AIR QUALITY

Introduction

2012 AQMP Control Measures with Potential Secondary Air Quality Impacts

Significance Criteria

Future Air Quality Emission Inventories

2012 AQMP Air Quality Modeling Results

Potential Secondary Air Quality Impacts and Mitigation Measures

Summary of Air Quality Impacts

4.2 AIR QUALITY

4.2.1 Introduction

The purpose of the 2012 AQMP is to establish a comprehensive program to lead the region into compliance with the federal 24-hour PM_{2.5} air quality standard, and to provide an update of the Basin's projections in meeting the federal 8-hour ozone standards. The 2012 AQMP proposes potential attainment demonstration of the federal PM_{2.5} standard by 2014 through adoption of all feasible measures. In addition, the 2012 AQMP would update specific elements of the previously approved 8-hour ozone SIP: 1) an updated emissions inventory and, 2) new control measures and commitments for emissions reductions to help fulfill the [CAA](#) Section 182 (e)(5) portion of the 8-hour ozone SIP.

This subchapter examines the secondary air pollutant emissions that could occur as a consequence of efforts to improve air quality (e.g., emissions from control equipment such as afterburners). The analysis is divided into the following sections: 2012 AQMP Control Measures with Secondary Air Quality Impacts, Future Air Quality Emission Inventories, 2012 AQMP Air Quality Modeling Results, Significance Criteria, Potential Impacts and Mitigation, Ambient Air Quality, and Summary of Secondary Air Quality Impacts.

4.2.2 2012 AQMP Control Measures with Potential Secondary Air Quality Impacts

The air quality impact analysis in this [Final](#) Program EIR identifies the net effect on air quality from implementing the 2012 AQMP. All control measures were analyzed to identify adverse impacts.

Evaluation of control measures was based on examination of the impact of the control measures and technologies focusing on potential secondary air quality impacts. Evaluation of control methods for each control measure indicated that there are 27 control measures that could have potential secondary air quality impacts. As shown in Table 4.2-1, four control measures are to reduce short-term PM_{2.5} emissions and 23 control measures are to reduce ozone formation.

TABLE 4.2-1

Control Measures with Potential Secondary Air Quality Impacts

CONTROL MEASURE	CONTROL MEASURE TITLE (POLLUTANT)	CONTROL METHODOLOGY	AIR QUALITY IMPACT
SHORT-TERM PM_{2.5} CONTROL MEASURES			
BCM-03 <i>(formerly BCM-05)</i>	Emission Reductions from Under-Fired Charbroilers	Add-On Control Equipment with Ventilation Hood Requirements (e.g., ESPs, HEPA filters, wet scrubbers, and thermal oxidizers).	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant, GHG emissions from operation of control technology and electricity generation.

TABLE 4.2-1 (CONTINUED)

Control Measures with Potential Secondary Air Quality Impacts

CONTROL MEASURE	CONTROL MEASURE TITLE (POLLUTANT)	CONTROL METHODOLOGY	AIR QUALITY IMPACT
OZONE CONTROL MEASURES			
BCM-04 (formerly MCS-04B)	Further Ammonia Reductions from Livestock Waste (NH ₃)	Reducing pH level in manure through the application of acidifier sodium bisulfate to	Potential increase in diesel fuel use for delivery and application of acidifier.
CMB-01	Further NO _x Reductions from RECLAIM – <i>Phase I and Phase II</i> (NO _x)	Cement kilns, glass furnaces, and gas turbines were not subject to reduction in the 2005 RECLAIM rule amendment. These sources will be examined for further reductions in this control measure and potential rule making. Selective catalytic reduction, low NO _x burners, NO _x reducing catalysts, oxy-fuel furnaces, and selective non-catalytic reduction.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from operation of control technology and electricity generation. Potential increase in ammonia emissions.
IND-01 ^a	Backstop Measure for Indirect Sources of Emissions from Ports and Port-Related Facilities (NO _x , SO _x , PM _{2.5})	Environmental lease conditions, port rules, tariffs or incentives.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from and electricity generation. Additional emission controls could result in increased electricity use. Increased use of alternative fuels. Potential decrease in engine efficiency could reduce fuel economy. Potential increase in ammonia emissions.
MCS-01 ^a	Application of All Feasible Measures Assessment (All Pollutants)	District would adopt and implement new retrofit technology control standards as new BARCT standards become available.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from operation of control technology and electricity generation.
MCS-02	Further Emission Reductions from Green Waste Processing (Chipping and Grinding Operations not associated with composting) (VOC)	Require chipped or ground greenwaste material to be covered after chipping or grinding or removed from site; and seasonal covering of chipped or ground greenwaste material.	Potential increase in truck trips.
CMB-02	NO _x Reductions from Biogas Flares (NO _x)	Replacement of existing biogas flares with more efficient biogas flares	Potential criteria pollutant and GHG emissions from construction.
CMB-03	Reductions from Commercial Space Heating (NO _x)	This control measure seeks emission reductions from unregulated commercial fan-type central furnaces used for space heating.	Potential criteria pollutant and GHG emissions from construction

Control Measures with Potential Secondary Air Quality Impacts

CONTROL MEASURE	CONTROL MEASURE TITLE (POLLUTANT)	CONTROL METHODOLOGY	AIR QUALITY IMPACT
OZONE CONTROL MEASURES			
CTS-01	Further VOC Reductions from Architectural Coatings (R1113) (VOC)	Reduce the allowable VOC content in product formulations by using alternative low-VOC products & use application techniques with greater transfer efficiency.	Potential change in use of VOC and toxic air contaminants from reformulation.
CTS-02	Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants (VOC)	Reduce the allowable VOC content in product formulations by using alternative low-VOC products or non-VOC product/equipment.	Potential change in use of VOC and toxic air contaminants from reformulation.
CTS-03	Further VOC Reductions from Mold Release Products (VOC)	Limitation of VOC content for mold release products.	Potential change in use of VOC and toxic air contaminants from reformulation.
CTS-04	Further VOC Reductions from Consumer Products (VOC)	Eliminate or revise the exemption for low vapor pressure solvents in consumer products.	Potential change in use of VOC and toxic air contaminants from reformulation.
FUG-01	Further VOC Reductions from Vacuum Trucks (VOC)	VOC control devices such as carbon adsorption systems, internal combustion engines, thermal oxidizers, refrigerated condensers, liquid scrubbers and positive displacement (PD) pumps.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from operation of control technology and catalyst replacement.
FUG-02	Emission Reduction from LPG Transfer and Dispensing – Phase II (VOC)	Expand applicability of rule to LPG transfer and dispensing at facilities other than those that offer LPG for sale to end users included currently exempted facilities.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from vehicles used for inspection and monitoring.
FUG-03	Further VOC Reductions from Fugitive VOC Emissions (VOC)	Upgrade inspection/maintenance rules to at least a self-inspection program, or to an optical gas imaging-assisted LDAR program where feasible; use of new technologies to detect and verify VOC fugitive emissions	Potential criteria pollutant and GHG emissions from construction and monitoring/inspections.
MCS-01	Application of All Feasible Measures Assessment (All Pollutants)	SCAQMD would adopt and implement new retrofit technology control standards as new BARCT standards become available.	Potential criteria pollutant and GHG emissions from construction.

TABLE 4.2-1 (CONTINUED)

Control Measures with Potential Secondary Air Quality Impacts

CONTROL MEASURE	CONTROL MEASURE TITLE (POLLUTANT)	CONTROL METHODOLOGY	AIR QUALITY IMPACT
OZONE CONTROL MEASURES			
MCS-02	Further Emission Reductions from Green Waste Processing (Chipping and Grinding Operations not associated with composting) (VOC)	Require chipped or ground greenwaste material to be covered after chipping or grinding or removed from site, and seasonal covering of chipped or ground greenwaste material.	Potential criteria pollutant and GHG emissions from construction.
MCS-03	Improved Start-up, Shutdown and Turnaround Procedures (All Pollutants)	Diverting or eliminating process streams that are vented to flares, and installing redundant equipment to increase operational reliability	Potential criteria pollutant and GHG emissions from construction.
INC-01	Economic Incentive Programs to Adopt Zero and Near-Zero Technologies (NOx)	Installation of cleaner, more efficient combustion equipment, such as boilers, water heaters and commercial space heating or installation of control technologies including fuel cells, diesel particulate filters (DPF), NOx reduction catalysts, alternative electricity generation, such as wind and solar, battery electric, hybrid electric, and usage of low NOx and alternative fuels such as natural gas	Potential criteria pollutant and GHG emissions from construction and related filter and/or catalyst replacement.
ONRD-01	Accelerated Penetration of Partial Zero-Emission and Zero Emission Vehicles (VOC, NOx, PM)	Incentives to replace older vehicles with electric or hybrid vehicles.	Potential criteria pollutant, toxic air pollutant and GHG emissions from and electricity generation.
ONRD-02	Accelerated Retirement of Older Light-Duty and Medium-Duty Vehicles (VOC, NOx, PM)	Incentives to replace older light- and medium-duty vehicles with new or newer low-emitting vehicles.	Potential criteria pollutant, toxic air pollutant and GHG emissions from and electricity generation.
ONRD-03	Accelerated Penetration of Partial Zero-Emission and Zero Emission Medium Heavy-Duty Vehicles (NOx, PM)	Incentives to replace older medium-duty vehicles with low-emitting vehicles. Highest priority would be given to zero-emission vehicles and hybrid vehicles with a portion of their operation in an "all electric range" mode.	Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation.

TABLE 4.2-1 (CONTINUED)

Control Measures with Potential Secondary Air Quality Impacts

CONTROL MEASURE	CONTROL MEASURE TITLE (POLLUTANT)	CONTROL METHODOLOGY	AIR QUALITY IMPACT
OZONE CONTROL MEASURES			
ONRD-04	Accelerated Retirement of Older On-Road Heavy-Duty Vehicles (NOx, PM)	Incentives replace heavy-duty vehicles with newer or new vehicles. Priority would be placed on replacing older diesel trucks in Mira Loma.	Potential emissions from demolition of retired vehicles.
ONRD-05	Further Emission Reductions from Heavy-Duty Vehicles Serving Near-Dock Railyards (NOx, PM)	Incentives to replace up to 1,000 heavy-duty vehicles with low-emitting vehicles or zero-emission container movement systems.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation.
OFFRD-01	Extension of the SOON Provision for Construction/Industrial Equipment (NOx)	Accelerate equipment replacement, use of air pollution control technologies (e.g., advanced fuel injection, air induction, and after-treatment technologies).	Potential increase in the use of alternative fuels.
OFFRD-02	Further Emission Reductions from Freight Locomotives (NOx, PM)	Replace existing engines with Tier 4 engines with control equipment (e.g., SCRs, DPM filters, electric batteries, and alternative fuels).	Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation. Potential increased use of alternative fuels. Potential decrease in engine efficiency could reduce fuel economy. Potential increase in ammonia emissions.
OFFRD-03	Further Emission Reductions from Passenger Locomotives (NOx, PM)	Repower existing engines with Tier 4 engines with control equipment (e.g., SCRs, DPM filters, electric batteries, and alternative fuels).	Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation. Potential increased use of alternative fuels. Potential decrease in engine efficiency could reduce fuel economy. Potential increase in ammonia emissions.
OFFRD-04	Further Emission Reductions from Ocean-Going Marine Vessels at Berth (VOC, NOx, PM)	Shore power of vessels at berth, use of air pollution control technologies on exhaust gases from auxiliary engines and boilers (e.g., SCRs, DPM filters, electric batteries, and alternative fuels).	Potential increase in electricity associated with increased use of shore-side power and additional air pollution control technologies. Construction emissions. Potential decrease in engine efficiency could reduce fuel economy and increase emissions. Potential ammonia emissions.

TABLE 4.2-1 (CONTINUED)

Control Measures with Potential Secondary Air Quality Impacts

CONTROL MEASURE	CONTROL MEASURE TITLE (POLLUTANT)	CONTROL METHODOLOGY	AIR QUALITY IMPACT
OZONE CONTROL MEASURES			
ADV-01	Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission On-Road Heavy-Duty Vehicles (NOx)	Construct "wayside" electric or magnetic infrastructure, construction battery charging and fueling infrastructure.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation. Potential increased use of alternative fuels.
ADV-02	Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission Locomotives (NOx)	Construct "wayside" electric, magnetic, battery-hybrid system, or fuel cell infrastructure, construct battery charging or fueling infrastructure.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation. Potential increased use of alternative fuels.
ADV-03	Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission Cargo Handling Equipment (NOx)	Construct electric gantry cranes, construct battery charging or fueling infrastructure, and use of alternative fuels.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation.
ADV-04	Actions for the Deployment of Cleaner Commercial Harborcraft (NOx)	Construct battery charging or fueling infrastructure, use of air pollution control equipment (e.g., SCR, and use of alternative fuels).	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation. Potential increased use of alternative fuels. Potential decrease in engine efficiency could reduce fuel economy. Potential increase in ammonia emissions.
ADV-05	Proposed Implementation Measures for the Deployment of Cleaner Ocean-Going Marine Vessels (NOx)	Employ after treatment control technologies such as SCR and sea water scrubbers, and use of alternative fuels.	Potential criteria pollutant and GHG emissions from construction. Potential criteria pollutant, toxic air pollutant and GHG emissions from electricity generation. Potential increased use of alternative fuels. Potential decrease in engine efficiency could reduce fuel economy. Potential increase in ammonia emissions.

TABLE 4.2-1 (CONCLUDED)

Control Measures with Potential Secondary Air Quality Impacts

CONTROL MEASURE	CONTROL MEASURE TITLE (POLLUTANT)	CONTROL METHODOLOGY	AIR QUALITY IMPACT
OZONE CONTROL MEASURES			
ADV-06	Proposed Implementation Measures for the Deployment of Cleaner Off-Road Equipment (NO _x)	Construct battery charging or fueling infrastructure, and increased use of alternative fuels.	Potential criteria pollutant, toxic air pollutant and GHG emissions from and electricity generation. Potential increased use of alternative fuels. Potential decrease in engine efficiency could reduce fuel economy. Potential increase in ammonia emissions.
ADV-07	Proposed Implementation Measures for the Deployment of Cleaner Aircraft Engines (NO _x)	Use alternative fuels, lean combustion burners, high rate turbo bypass, advanced turbo-compressor design, and engine weight reduction.	Potential increased use of alternative fuels.

^a The specific actions associated with the control measure are unknown and, therefore, the impacts are speculative. In order to provide a conservative analysis, it is assumed that the control measure could require air pollution control technologies that are similar to those that are currently required (e.g., SCR, electrification, use of alternative fuels, etc.), and would have the potential to require construction activities that would generate noise).

4.2.3 Significance Criteria

To determine whether or not air quality impacts from the 2012 AQMP are significant, impacts will be evaluated and compared to the significance criteria in Table 4.2-2. If impacts equal or exceed any of the criteria in Table 4.2-2, they will be considered significant.

TABLE 4.2-2

Air Quality Significance Thresholds

MASS DAILY THRESHOLDS^(a)		
POLLUTANT	CONSTRUCTION^(b)	OPERATION^(c)
NO_x	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM10	150 lbs/day	150 lbs/day
PM2.5	55 lbs/day	55 lbs/day
SO_x	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day

TABLE 4.2-2 (CONCLUDED)
Air Quality Significance Thresholds

TOXIC AIR CONTAMINANTS, ODOR, AND GHG THRESHOLDS	
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk ≥ 10 in 1 million Chronic and Acute Hazard Index ≥ 1.0 (project increment) Cancer Burden ≥ 0.5 excess cancer cases (in areas ≥ 1 in 1 million)
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402
GHG	10,000MT/yr CO ₂ eq for industrial facilities
Ambient Air Quality for Criteria Pollutants^(d)	
NO₂ 1-hour average annual average	In attainment; significant if project causes or contributes to an exceedance of any standard: 0.18 ppm (state) 0.03 ppm (state) and 0.0534 ppm (federal)
PM₁₀ 24-hour annual average	10.4 $\mu\text{g}/\text{m}^3$ (construction) ^(e) and 2.5 $\mu\text{g}/\text{m}^3$ (operation) 1.0 $\mu\text{g}/\text{m}^3$
PM_{2.5} 24-hour average	10.4 $\mu\text{g}/\text{m}^3$ (construction) ^(e) and 2.5 $\mu\text{g}/\text{m}^3$ (operation)
SO₂ 1-hour average 24-hour average	0.255 ppm (state) and 0.075 ppm federal – 99 th percentile) 0.04 ppm (state)
Sulfate 24-hour average	25 $\mu\text{g}/\text{m}^3$ (state)
CO 1-hour average 8-hour average	In attainment; significant if project causes or contributes to an exceedance of any standard: 20 ppm (state) and 35 ppm (federal) 9.0 ppm (state/federal)
Lead 30-day average Rolling 3-month average Quarterly average	1.5 $\mu\text{g}/\text{m}^3$ (state) 0.15 $\mu\text{g}/\text{m}^3$ (federal) 1.5 $\mu\text{g}/\text{m}^3$ (federal)

e) Ambient air quality threshold based on SCAQMD Rule 403.

KEY: ppm = parts per million; $\mu\text{g}/\text{m}^3$ = microgram per cubic meter; lbs/day = pounds per day; MT/yr CO₂eq = metric tons per year of CO₂ equivalents; \geq greater than or equal to; $>$ = greater than

4.2.4 Future Air Quality Emission Inventories

Figure 4.2-1 and 4.2-2 show baseline and future projected emissions, respectively, by major source categories. These figures are included here to show projected air quality trends through 2023. Baseline emissions for major source categories (e.g., point, area, on-road, and off-road) in 2008 are provided in Figure 4.2-1. Figure 4.2-2 shows the projected future 2023 emission inventory that would be expected if no new AQMP control measures are promulgated as rules. It does, however, reflect emission reductions for existing rules with future compliance dates. A comparison of Figures 4.2-1 and 4.2-2 indicates the following:

- Consumer products continue to be the major contributor of VOC emissions with on-road vehicles declining from 19 percent in 2008 (121 tons per day) to 25 percent in 2023 (110 tons per day). The contribution to VOC emissions from off-road equipment decreases from 26 percent in 2008 (166 tons per day) to 25 percent in 2023 (110 tons per day). The on-road vehicle emissions decrease from 33 percent in 2008 (211 tons per day) to 16 percent (70 tons per day) due to more-stringent on-road standards in the future. Overall, on-road and off-road source combined contribution decreases from 59 percent (377 tons per day) in 2008 to 41 percent (180 tons per day) in 2023.
- The contribution of SO_x emissions from off-road sources including marine vessels decreases from 71 percent in 2008 (38 tons per day) to 32 percent in 2023 (six tons per day) due to more-stringent fuel standards.
- The contribution to NO_x emissions from off-road equipment increases from 29 percent in 2008 (~~209-208~~ tons per day) to ~~43-42~~ percent in 2023 (~~435-133~~ tons per day) as the on-road vehicle emissions decrease from 59 percent in 2008 (~~425-426~~ tons per day) to ~~37-36~~ percent (~~416-117~~ tons per day) due to more-stringent on-road standards in the future. It is important to note that the contribution of total NO_x emissions increases for off-road equipment, but the NO_x emissions from off-road equipment still decreases. Overall, on-road and off-road source combined contribution decreases from 88 percent (634 tons per day) of the emissions in 2008 to ~~80-82~~ percent in 2023 (250 tons per day).
- The contribution to CO emissions from off-road equipment decreases from 68 percent in 2008 (1,959 tons per day) to 52 percent in 2023 (823 tons per day). The on-road vehicle emissions increases from 27 percent in 2008 (778 tons per day) to 38 percent (602 tons per day) due to more-stringent on-road standards in the future. Overall, on-road and off-road source combined contribution decreases from 95 percent (2,737 tons per day) of the emissions in 2008 to 90 percent in 2023 (1,425 tons per day).

FIGURE 4.2-1

Relative Contribution by Source Category to 2008 Emission Inventory
(VOC & NOx – Summer Planning; CO, SOx, & PM2.5 – Annual Average Inventory)

FIGURE 4.2-2

Relative Contribution by Source Category to 2023 Emission Inventory
(VOC & NOx – Summer Planning; CO, SOx, & PM2.5 – Annual Average Inventory)

- The major contributor of PM_{2.5} emissions is area sources at 39 percent in 2008 (31 tons per day), which increases to 51 percent in 2023 (36 tons per day) primarily due to the reduction in on- and off-road source emissions. The contribution to PM_{2.5} emissions from off-road equipment decreases from 17 percent in 2008 (14 tons per day) to nine percent in 2023 (six tons per day). The on-road vehicle emissions decrease from 23 percent in 2008 (18 tons per day) to 16 percent (11 tons per day) due to more-stringent on-road standards in the future. Overall, on-road and off-road source combined contribution decreases from 40 percent (32 tons per day) in 2008 to 25 percent (18 tons per day) in 2023.
- Emission reductions from the 2008 to 2023 are expected due to the effect of more-stringent on-road standards in the future.

4.2.5 2012 AQMP Air Quality Modeling Results

The objective of the 2012 AQMP is to attain and maintain ambient air quality standards. The purpose of the 2012 AQMP is to set forth a comprehensive and integrated program that will lead the Basin into compliance with the federal 24-hour PM_{2.5} air quality standard, and to provide an update of the Basin's projections in meeting the federal 8-hour ozone standards. The 2012 AQMP demonstrates attainment of the federal 24-hour PM_{2.5} standard by 2014 in the Basin through adoption of all feasible measures (see Table 4.2-3).

The Basin is currently designated nonattainment for PM_{2.5}, and extreme nonattainment for ozone. Table 4.2-3 shows the attainment designation and date when attainment would be achieved.

4.2.5.1 PM_{2.5} Air Quality

Within the Basin, PM_{2.5} particles are either directly emitted into the atmosphere (primary particles), or are formed through atmospheric chemical reactions from precursor gases (secondary particles). Primary PM_{2.5} includes road dust, diesel soot, combustion products, and other sources of fine particles. Secondary products, such as sulfates, nitrates, and complex carbon compounds are formed from reactions with oxides of sulfur, oxides of nitrogen, VOCs, and ammonia.

The U.S. EPA supported Community Multiscale Air Quality (CMAQ) (version 4.7) modeling platform with SAPRC99 chemistry and Weather Research and Forecasting Model (WRF) meteorology is used as the primary tool to demonstrate future year attainment of the 24-hour average PM_{2.5} standard in the 2012 AQMP. A detailed discussion of the features of the CMAQ approach is presented in Appendix V of the 2012 AQMP. The analysis was also conducted using the Comprehensive Air Quality Model with Extensions (CAMx) modeling platform using the "one atmosphere" approach comprised of the SAPRC99 gas phased chemistry and a static two-mode particle size aerosol module as the particulate modeling platform. Parallel testing was conducted to evaluate the CMAQ performance against CAMx and the results indicated that the two model/chemistry packages had similar performance. The CAMx results are provided in Appendix V of the 2012 AQMP as a component of the weight of evidence discussion.

TABLE 4.2-3

Expected Year of Compliance with Federal Ambient Air Quality Standards

CRITERIA POLLUTANT	AVERAGING TIME	DESIGNATION^a	ATTAINMENT DATE^b
1979 1-Hour Ozone^c	1-Hour (0.12 ppm)	Nonattainment (Extreme)	11/15/2010 (Not Attained) ^c
1997 8-Hour Ozone^d	8-Hour (0.08 ppm)	Nonattainment (Extreme)	6/15/2024
2008 8-Hour Ozone	8-Hour (0.075 ppm)	Nonattainment (Extreme)	12/31/2032
CO	1-Hour (35 ppm) 8-Hour (9 ppm)	Attainment (Maintenance)	6/11/2007 (Attained)
NO₂^e	1-Hour (100 ppb)	Unclassifiable/Attainment	Attained
	Annual (0.053 ppm)	Attainment (Maintenance)	9/22/1998
SO₂^f	1-Hour (75 ppb)	Designations Pending	Pending
	24-Hour (0.14 ppm) Annual (0.03 ppm)	Unclassifiable/Attainment	3/19/1979 (Attained)
PM10	24-hour (150 µg/m ³)	Nonattainment (Serious) ^g	12/31/2006 (Redesignation request submitted) ^g
PM2.5	24-Hour (35 µg/m ³)	Nonattainment	12/14/2014 ^h
	Annual (15.0 µg/m ³)	Nonattainment	4/5/2015
Lead	3-Months Rolling (0.15 µg/m ³)	Nonattainment (Partial) ⁱ	12/31/2015

U.S. EPA often only declares Nonattainment areas; everywhere else is listed as Unclassifiable/Attainment or Unclassifiable

- A design value below the NAAQS for data through the full year or smog season prior to the attainment date is typically required for attainment demonstration
- 1-hour O₃ standard (0.12 ppm) was revoked, effective June 15, 2005 ; however, the Basin has not attained this standard based on 2008-2010 data and has some continuing obligations under the former standard
- The 1997 8-hour O₃ standard (0.08 ppm) was reduced (0.075 ppm), effective May 27, 2008; the 1997 O₃ standard and most related implementation rules remain in place until the 1997 standard is revoked by U.S. EPA
- New NO₂ 1-hour standard, effective August 2, 2010; attainment designations January 20, 2012; annual NO₂ standard retained
- The 1971 annual and 24-hour SO₂ standards were revoked, effective August 23, 2010; however, these 1971 standards will remain in effect until one year after U.S. EPA promulgates area designations for the 2010 SO₂ 1-hour standard. Area designations are expected in 2012, with Basin designated Unclassifiable /Attainment
- Annual PM10 standard was revoked, effective December 18, 2006; redesignation request to Attainment of the 24-hour PM10 standard is pending with U.S. EPA
- Attainment deadline for the 2006 24-Hour PM2.5 NAAQS is December 14, 2014
- Partial Nonattainment designation – Los Angeles County portion of Basin only

The 2012 AQMP modeling attainment demonstrations using the CMAQ (and CAMx) platform were conducted in a vastly expanded modeling domain compared with the analysis conducted for the 2007 AQMP modeling attainment demonstration. In this analysis, the PM_{2.5} and ozone base and future simulations were modeled simultaneously. The simulations were conducted using a Lambert Conformal grid projection where the western boundary of the domain was extended to 084 UTM, over 100 miles west of the ports of Los Angeles and Long Beach. The eastern boundary extended beyond the Colorado river, while the northern and southern boundaries of the domain extend to the San Joaquin Valley and the Northern portions of Mexico (3543 UTM). The grid size has been reduced from five kilometers squared to four kilometers squared and the vertical resolution has been increased from 11 to 18 layers.

The final WRF meteorological fields were generated for the identical domain, layer structure and grid size. The WRF simulations were initialized from National Centers for Environmental Prediction (NCEP) analyses and run for three-day increments with the option for four dimensional data assimilation (FDDA). Horizontal and vertical boundary conditions were designated using a “U.S. EPA clean boundary profile.”

PM_{2.5} data measured as individual species at six-sites in the SCAQMD’s air monitoring network during 2008 provided the characterization for evaluation and validation of the CMAQ annual and episodic modeling. The six sites include the historical PM_{2.5} maximum location (Riverside- Rubidoux), the stations experiencing many of the highest county concentrations (among the four-county jurisdiction including Fontana, North Long Beach and Anaheim) and source oriented key monitoring sites addressing goods movement (South Long Beach) and mobile source impacts (Central Los Angeles). It is important to note that the close proximity of Mira Loma to Rubidoux and the common in-Basin air flow and transport patterns enable the use of the Rubidoux speciated data as representative of the particulate speciation at Mira Loma. Both sites are directly downwind of the dairy production areas in Chino and the warehouse distribution centers located in the northwestern corner of Riverside County. Speciated data monitored at the selected sites for 2006-2007 and 2009-2010 were analyzed to corroborate the applicability of using the 2008 profiles.

Day-specific point source emissions were extracted from the [SCAQMD’s District](#) stationary source and RECLAIM inventories. Mobile source emissions included weekday, Saturday and Sunday profiles based on CARB’s EMFAC2011 emissions model, CALTRANS weigh-in-motion profiles, and vehicle population data and transportation analysis zone (TAZ) data provided by SCAG. The mobile source data and selected area source data were subjected to daily temperature corrections to account for enhanced evaporative emissions on warmer days. Gridded daily biogenic VOC emissions were provided by CARB using BEIGIS biogenic emissions model. The simulations benefited from enhancements made to the emissions inventory including an updated ammonia inventory, improved emissions characterization that split organic compounds into coarse, fine, and primary particulate categories, and updated spatial allocation of primary paved road dust emissions.

Model performance was evaluated against speciated particulate PM_{2.5} air quality data for ammonium, nitrates, sulfates, secondary organic matter, elemental carbon, primary and total

particulate mass for the six monitoring sites (Rubidoux, Central Los Angeles, Anaheim, South Long Beach, Long Beach, and Fontana).

4.2.5.2 Ozone Air Quality

The 2007 AQMP provided a comprehensive 8-hour ozone analysis that demonstrated future year attainment of the 1997 federal ozone standard (80 ppb) by 2023 with implementation of short-term measures and CAA Section 182 (e)(5) long term emissions reductions. The analysis concluded that NO_x emissions needed to be reduced approximately 76 percent and VOC 22 percent from the 2023 baseline in order to demonstrate attainment. The 2023 base year VOC and NO_x summer planning emissions inventories included 536 and 506 tons per day, respectively.

As presented in Chapter 3 of the 2012 AQMP, the 2012 AQMP controlled 2023 emissions of both precursor pollutants are estimated to be lower than the 2023 baseline established in the 2007 AQMP. The 2023 baseline VOC and NO_x emission summer planning emissions have been revised to 434 and 313 tons per day, respectively. The emissions revision incorporated changes made to the on-road truck and off-road equipment categories that resulted from CARB rulemaking. The new emissions inventory also reflects the impact of the economic slowdown and revisions to regional growth estimates. As a consequence, it is important to revisit the projections of 2023 baseline ozone to investigate the impact of the inventory revision on the attainment demonstration and equally important, what is the impact on the size of the proposed long term NO_x emissions reduction commitment.

4.2.6 Potential Secondary Air Quality Impacts and Mitigation Measures

Secondary air quality impacts are potential increases in air pollutant that can occur directly or indirectly from implementation of control measures in the 2012 AQMP. SCAQMD evaluated all 2012 AQMP control measures to identify those control measures that have the potential to generate secondary adverse air quality impacts. Table 4.2-1 identifies all control measures that have the potential to generate secondary air quality impacts. All air quality impacts identified in this subchapter are based on impacts from control measures identified in Table 4.2-1.

4.2.6.1 Criteria Pollutants - Construction Activities

Regulation of Port and Port-Related Sources: In 2006 the Ports of Los Angeles and Long Beach, with the participation and cooperation of the staff of the SCAQMD, CARB, and U.S. EPA, adopted the San Pedro Bay Ports Clean Air Action Plan (CAAP). The CAAP was further amended in 2010, updating many of the goals and implementation strategies to reduce air emissions and health risks associated with port operations while allowing port development to continue. In addition to addressing health risks from port-related sources, the CAAP sought the reduction of criteria pollutant emissions to the levels that assure port-related sources decrease their “fair share” of regional emissions to enable the Basin to attain state and federal ambient air quality standards. The IND-01 control measure is the “backstop” for the CAAP.

IND-02 would establish enforceable nonattainment pollutant emission reduction goals for the ports in order to ensure attainment of the 24-hr PM_{2.5} attainment strategy in the 2012 AQMP. IND-02 would be implemented if aggregate emissions from port-related sources exceed specified emissions targets. If emissions do not exceed such targets, the ports would have no further control obligations and this control measure would not need to be implemented.

The overall impact of the CAAP is beneficial to air quality; however, implementation of some of the control measures in the CAAP will generate secondary impacts to air quality from infrastructure projects construction, increased electricity usage, and increased production of alternative fuels. Although the secondary air quality impacts from construction of infrastructure projects cannot be quantified from data in the CAAP, it is expected that construction to install the electrical distribution network in the Ports of Long Beach and Los Angeles as well as implement other control measures will require an intensive effort and is expected to have short-term significant air quality impacts.

4.2.6.1.1 *General Construction Emissions from Control Measures*

While implementing the 2012 AQMP control measures is expected to reduce operational emissions, construction-related activities associated with installing or replacing equipment, for example, are expected to generate emissions from construction worker vehicles, trucks, and construction equipment. Implementation of some of the measures in the 2012 AQMP would require constructing the following types of new infrastructure including: 1) additional infrastructure to support alternative-fueled vehicles (electric, hydrogen, natural gas); 2) additional infrastructure to support electrification of new sources (e.g., additional on-road vehicles and marine vessels, "wayside" electric or magnetic power such as catenary lines); and, 3) construction of controls at stationary sources (e.g., SCRs, particulate controls, and vapor recovery systems). The following control measures in the 2012 AQMP may require construction activities in connection with implementing the emission control requirements, BCM-03 - Emission Reductions from Under-Fired Charbroilers, CMB-01 - Further NO_x Reductions from RECLAIM – *Phase I and Phase II*, CMB-02 - NO_x Reductions from Biogas Flares, CMB-03 - Reductions from Commercial Space Heating, IND-01 - Backstop Measure for Indirect Sources of Emissions from Ports and Port-Related Facilities, FUG-01 - ~~Further~~ VOC Reductions from Vacuum Trucks, FUG-02 - Emission Reduction from LPG Transfer and Dispensing – Phase II, FUG-03 - Further ~~VOC~~ VOC Reductions from Fugitive VOC Emissions, MCS-01 - Application of All Feasible Measures Assessment, MCS-03 - Improved Start-up, Shutdown and Turnaround Procedures, INC-01 - Economic Incentive Programs to Adopt Zero and Near-Zero Technologies, OFFRD-01 - Extension of the SOON Provision for Construction/Industrial Equipment, OFFRD-04 - Further Emission Reductions from Ocean-Going Marine Vessels at Berth, ONRD-03 - Accelerated Penetration of Partial Zero-Emission and Zero Emission Medium Heavy-Duty Vehicles, ONRD-05 - Further Emission Reductions from Heavy-Duty Vehicles Serving Near-Dock Railyards, ADV-01 - Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission On-Road Heavy-Duty Vehicles, ADV-02 - Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission Locomotives, ADV-03 - Proposed Implementation Measures for the Deployment of Zero- and Near-Zero Emission Cargo Handling Equipment, ADV-04 - Actions for the Deployment

of Cleaner Commercial Harborcraft, ADV-05 - Proposed Implementation Measures for the Deployment of Cleaner Ocean-Going Marine Vessels, and ADV-06 - Proposed Implementation Measures for the Deployment of Cleaner Off-Road Equipment.

The inventory prepared for the 2012 AQMP includes emissions estimates associated with construction activities, which are summarized in Table 4.2-4 for the key years of 2014 and 2023. It is assumed that the following types of construction activities to implement AQMP control measures contribute to construction activities emission inventories: 1) additional infrastructure to support electric and alternative fuel vehicles; 2) additional infrastructure for stationary source controls; and, 3) additional infrastructure to support electrification of new sources. Table 4.2-4 also presents comparisons of the future construction emission inventories to the year 2008 baseline emissions inventory. For 2023, emissions of CO and PM10 are expected to be significant without an estimate of construction associated with the proposed control measures. The scope of the construction to implement the proposed control measures is not known at this time. However, additional construction to implement the proposed measures could potentially increase the construction emissions and, therefore would be considered potentially significant.

TABLE 4.2-4

Annual Average Construction Emissions by Source Category in the District
(tons/day)

Source Category	VOC	CO	NO _x	SO _x	PM10	PM2.5
2008 Emission Inventory

Significant?	NO	YES	NO	NO	YES	NO

Source: SCAQMD, 2012

Note: Negative numbers represent emissions reductions.

The SCAQMD has developed localized significance thresholds for criteria pollutant emissions to determine whether or not a project may generate significant adverse localized air quality impacts. An analysis of localized air quality impacts for criteria pollutant emissions is not applicable to regional projects such as local general plans, specific plans, or AQMPs (SCAQMD, 2008) because the details of the individual projects to implement these types of plans and their locations are not known at this time. Therefore, a localized air quality impact analysis has not been performed for the 2012 AQMP in this [Final](#) Program EIR.

PROJECT-SPECIFIC MITIGATION: Mitigation measures are required to minimize the significant air quality impacts associated with the potential significant construction impacts on air quality. The following feasible mitigation measures are required:

On-Road Mobile Sources:

AQ-1 Develop a Construction Emission Management Plan for the proposed project. The Construction Emission Management Plan shall be submitted to SCAQMD CEQA for approval prior to the start of construction. The Plan shall include measures to minimize emissions from vehicles including, but not limited to consolidating truck deliveries, description of truck routing, description of deliveries including hours of delivery, description of entry/exit points, locations of parking, and construction schedule. At a minimum the Construction Emission Management Plan would include the following types of mitigation measures.

Off-Road Mobile Sources:

AQ-2 Maintain construction equipment tuned up and with two to four degree retard diesel engine timing or tuned to manufacturer's recommended specifications that optimize emissions without nullifying engine warranties.

AQ-3 The project proponent shall survey and document the proposed project's construction areas and identify all construction areas that are served by electricity. This documentation shall be provided as part of the Construction Emissions Management Plan. Electric welders shall be used in all construction areas that are demonstrated to be served by electricity.

AQ-4 The project proponent shall survey and document the proposed Project's construction areas and identify all construction areas that are served by electricity. This documentation shall be provided as part of the Construction Emissions Management Plan. Onsite electricity rather than temporary power generators shall be used in all construction areas that are demonstrated to be served by electricity.

AQ-5 The project proponent shall use cranes rated 200 hp or greater equipped with Tier 3 or equivalent engines. Engines equivalent to Tier 3 may consist of Tier 2 engines retrofitted with diesel particulate filters and oxidation catalysts, selective catalytic reduction, or other equivalent NOx control equipment. Retrofitting cranes rated 200 hp or greater with PM and NOx control devices must occur before the start of construction. If cranes rated 200 hp or greater equipped with Tier 3 engines are not available or cannot be retrofitted with PM and NOx control devices, the project

proponent shall use cranes rated 200 hp or greater equipped with Tier 2 or equivalent engines. The project proponent shall provide documentation that cranes rated 200 hp or greater equipped with Tier 3 or equivalent engines are not available in the Construction Emissions Management Plan.

- AQ-6 For off-road construction equipment rated 50 to 200 hp that will be operating for eight hours or more, the project proponent shall use equipment rated 50 to 200 hp equipped with Tier 3 or equivalent engines. Engines equivalent to Tier 3 may consist of Tier 2 engines retrofitted with diesel particulate filters and oxidation catalysts, selective catalytic reduction, or other equivalent NOx control equipment. Retrofitting equipment rated 50 to 200 hp with PM and NOx control devices must occur before the start of construction. If equipment rated 50 to 200 hp equipped with Tier 3 engines are not available or cannot be retrofitted with PM and NOx control devices, the project proponent shall use equipment rated 50 to 200 hp equipped with Tier 2 or equivalent engines. The project proponent shall provide documentation that equipment rated 50 to 200 hp equipped with Tier 3 or equivalent engines are not available in the Construction Emissions Management Plan or associated subsequent status reports as information becomes available.
- AQ-7 Suspend use of all construction activities that generate air pollutant emissions during first stage smog alerts.

As improved emission reduction technologies become available, construction mitigation measures will be updated and implemented as specific control measures are developed and projects proposed.

REMAINING CONSTRUCTION AIR QUALITY IMPACTS: The air quality analysis concluded that significant adverse construction air quality impacts could be created by the proposed project because future construction inventories for CO and PM10 emissions indicate these pollutants would exceed the SCAQMD's applicable significance thresholds of 550 and 150 pounds per day, respectively. Since it is expected that construction activities to implement 2012 AQMP control measures would contribute to these exceedances, construction air quality impacts were concluded to be significant. In spite of implementing the above mitigation measures, construction CO and PM10 air quality impacts would likely remain significant.

4.2.6.2 Criteria Pollutants - Operational Activities

4.2.6.2.1 *Secondary Impacts from Increased Electricity Demand*

PROJECT-SPECIFIC IMPACTS Electricity is often used as the power source to operate various components of add-on control equipment, such as electrostatic precipitators, ventilation systems, fan motors, vapor recovery systems, etc. Increased demand for electrical energy may require generation of additional electricity, which in turn could result in increased indirect emissions of criteria pollutants in the district and in other portions of California. The stationary source measures that may result in increased demand for electrical energy due to operation of add-on control equipment are included in Table 4.2-1.

Control Measure BCM-03 calls for emission reductions from PM control devices (e.g., electrostatic precipitators (ESP)) for under-fired charbroiler restaurant operations, which could increase electricity demand. Other control measures that could result in an increase in electricity include measures that would require add-on controls or retrofit and replacement of equipment, including CMB-01, IND-01, INC-01, FUG-01, and MCS-01. The required emissions reduction may be achieved through various types of add-on control equipment such as selective catalytic reduction (SCR) technology, PM filters, refrigerated condensers, liquid scrubbers, and positive displacement pumps. Each of the possible control types may have potential adverse energy impacts because the control technology uses electricity. The analysis of the effect of energy resources and electricity demand due to implementation of the 2012 AQMP can be found in Subchapter 4.3 of this [Final Program EIR](#).

Several of the control measures would require support facilities and potentially increased use of electricity for on-road vehicles and off-road vehicles (e.g., ONRD-01, ONRD-02, ONRD-03, ONRD-05, OFFRD-02, OFFRD-03, OFFRD-04, ADV-01, ADV-02, ADV-03, ADV-04, ADV-05, and ADV-06). An increase in electric vehicles would require the generation of additional electricity in the district and other areas of California. In addition, shore-side electricity may be required associated with “cold ironing” of marine vessels (e.g., use of shore-side electricity while at berth, instead of use of diesel-fired auxiliary engines). As detailed in Subsection 4.3 of this [Final Program EIR](#), the potential increase in the amount of electricity is expected to be 1,691.2 gigawatt-hours (GWh). The criteria pollutant emissions associated with the increase in energy demand is shown in Table 4.2-5 for the control measures which can be quantified.

TABLE 4.2-5

Estimated Criteria Pollutant Emissions from Increased Electricity Demand

CONTROL MEASURE	ESTIMATED EMISSIONS INCREASE (lbs/day) ^(a)					
	VOC	CO	NO _x	SO _x	PM10	PM2.5
ONRD-01	0.71	6.9	2.1	0.24	0.83	0.82
ONRD-02	1.4	14	4.2	0.48	1.7	1.6
ONRD-03	1.5	15	4.5	0.51	1.8	1.8
ONRD-05	0.91	8.9	2.7	0.31	1.1	1.1
ADV-01	10	101	31	3.5	12	12
ADV-02	16	158	48	5.5	19	19
Total Emissions Increase	31	303	92	10	36.	36

(a) The emission estimates are ratioed from the 2008 inventory emissions reported for Electric Utilities and Cogeneration from Appendix III of the 2012 AQMP (SCAQMD, 2012).

Two of the on-road control measures, ONRD-01 and ONRD-02, target emission reductions from transportation measures that would accelerate the penetration and deployment of partial zero-emission vehicles in the light- and medium-duty vehicles categories. One on-road control measure, ONRD-03, targets early deployment of partial zero-emission and zero-emission light- and medium-heavy duty vehicle. One on-road control measure,

ONRD-05, seeks emission reductions at near-dock railyards through the deployment of zero-emission heavy-duty vehicles. All four of these control measures are expected to increase the use of electric and advanced hybrid electric vehicles, which would increase the demand for electricity and result in the increase in indirect emissions associated with electricity production. The amount of electricity generated is described in the energy impact Subchapter 4.3 of this [Final Program](#) EIR.

Electrification of motor vehicles and other commercial and industrial equipment would greatly reduce fossil fuel usage in the district. At that time, there may be an increase in emissions due to increased electric power generation due to increased demand. Although the control measures include projections regarding the penetration rate of electric vehicles, the actual number of electric vehicles is unknown and would need to be calculated during any rule development for these control measures. An incremental increase in electricity demand is not expected to create significant adverse air quality impacts compared to emission reductions from mobile and stationary sources. However, if electricity demand exceeds available power, additional sources of electricity would be required. Additional power plants would be required to supply the projected electricity due to general population growth, both in California and outside of California. Currently, there are a number of power plant projects planned in southern California to meet future needs. Relative to the existing electricity use and the projected future peak electricity demand, implementation of all the control measures is expected to result in an overall worst-case increase from the year 2008 baseline of approximately 1.5 percent (see Subsection 4.3 of this [Final Program](#) EIR).

Electricity generation within the district is subject to applicable SCAQMD rules such as Rule 1134 – Emissions Oxides of Nitrogen from Stationary Gas Turbines, Rule 1135 – Emissions of Oxides of Nitrogen from Stationary Gas Turbines, and Regulation XX – RECLAIM. These rules and regulations regulate NO_x emissions (the primary pollutant of concern from natural gas combustion to generate electricity) from existing power generating equipment. Although emissions from electric utilities in the district are capped under the RECLAIM program (and under Rule 1135), any new power generating facilities in the district to accommodate increased electricity demand would be subject to SCAQMD Regulation XIII – New Source Review, or Rule 2005 which requires installation of BACT, air quality modeling would be required to demonstrate that new emissions would not result in significant ambient air quality impacts (so there would be no localized impacts), and emission offsets (through either emission reduction credits or RECLAIM trading credits) before permits could be issued emissions offsets, which for NO_x emissions, for example, would be at a ratio of 1.2 to 1.0, or 1.2 pounds of emission reduction credits required for every new pound of NO_x emitted from the power generating source or a ratio of 1.0 to 1.0 for RECLAIM sources. Any new power generating projects would be incorporated into the emission inventories used in future AQMPs and additional control measures would be identified if necessary and feasible. While the control measures may cause an increase in NO_x emissions from power plants, overall the 2012 AQMP is expected to achieve net NO_x emission reductions to maintain attainment of all NO₂ ambient air quality standards and continue making expeditious progress in achieving the federal one-hour and eight-hour standards. Further, emissions from the combustion of gasoline or diesel fuels are generally the emissions that would be reduced when electrification is proposed and replaced with emissions from the combustion of natural gas (as would generally occur from electricity

generating facilities in the district). Emissions from diesel combustion (e.g., marine vessel engines) are orders of magnitude higher than emissions from the combustion of natural gas. So, overall emissions are expected to decrease. No significant adverse impacts to air quality are expected from control measures requiring increased demand for electricity.

There could be an increase in emissions from generators that may be used to charge batteries in remote locations where no grounded power source is available. Generators are regulated sources in the district. Existing SCAQMD regulations that apply to generators and emergency generators would apply to generators used to charge batteries. New generators would be subject to Regulation XIII or Rule 2005. Existing generators are subject to SCAQMD Rule 1110.2 – Emissions from Gaseous and Liquid Fueled Internal Combustion Engines. Rule 1110.2 does not establish a facility emission cap, but establishes a stringent NO_x emission rate. Truly portable equipment may also be regulated under the state registration program, which establishes emission limitations on NO_x, VOCs, and CO.

The emissions from electrical generation have been included in the emissions inventory prepared for the 2012 AQMP. Table 4.2-6 summarizes the emissions associated with electric generation in the key years 2104 and 2023.

TABLE 4.2-6

Annual Average Operational Emissions for Electric Generation in the District (tons/day)

Source Category	VOC	CO	NO _x	SO _x	PM10	PM2.5
2008 Emission Inventory

Source: SCAQMD, 2012

Note: Negative numbers represent emissions reductions.

The inventory prepared for the 2102 AQMP includes estimates for electric utilities and cogeneration facilities in key years 2014 and 2023. It is assumed that the emissions associated with electrical generation that are part of the [2012 AQMP](#) control measures would contribute to the emission changes identified in the emission inventories. The inventory also accounts for growth in population. It has been estimated that implementation of all the control measures is expected to result in an overall increase in electricity in 2023 of approximately 1.5 percent, relative to the projected peak electricity demand in 2008. As shown in Table 4.2-6, the estimated VOC, CO, NO_x, SO_x, PM10, and PM2.5 emissions are expected to decline between 2014 and 2023.

Table 4.2-7 shows total emissions from 2012 AQMP. As shown in Table 4.2-7, overall, emissions from 2012 AQMP control measures are not expected to exceed the SCAQMD's daily regional significance thresholds and, ultimately, would provide an emission reduction benefit.

Source: SCAQMD, 2012

Note: Negative numbers represent emissions reductions.

The SCAQMD does not regulate electricity generating facilities outside of the district so the rules and regulations discussed above do not apply to electricity generating facilities outside of the district. In 2010, about 71 percent of the electricity used in California was generated in-state and about 29 percent was imported (see Section 3.2.3). While these electricity generating facilities would not be subject to SCAQMD rules and regulations, they would be subject to the rules and regulations of the local air pollution control district and the U.S. EPA. These agencies also have established New Source Review regulations for new and modified facilities that generally require compliance with BACT or lowest achievable emission reduction technology. Most in-state electricity generating plants use natural gas, which provides a relatively clean source of fuel (as compared to coal- or diesel-fueled plants). The emissions from these power plants would also be controlled by local, state, and federal rules and regulations, minimizing overall air emissions. These rules and regulations may differ from the SCAQMD rules and regulations because the ambient air quality and emission.

Power plants in California provided approximately 71 percent of the total in-state electricity demand in 2010 of which 15 percent came from renewable sources such as biomass, geothermal, small hydro, solar, and wind, which are clean sources of energy. These sources of electricity generate little, if any, air emissions. Increased use of these and other clean technologies will continue to minimize emissions from the generation of electricity. State law requires increasing the use of renewable energy to 20 percent by 2017 (modified from 2010 as presented in the 2007 AQMP) and to 33 percent by 2020. Further, adopted state laws will prohibit using electricity produced by coal-fired plants.

PROJECT-SPECIFIC MITIGATION: To the extent that electricity demand from 2012 AQMP control measures, no significant secondary air quality impacts from increased electricity demand were identified so mitigation measures are not required.

REMAINING SECONDARY AIR QUALITY IMPACTS: The air quality analysis concluded that potential secondary air quality impacts from increased electricity demand would be less than significant, no mitigation measures were required, so secondary air quality impacts remain less than significant.

4.2.6.2.2 *Secondary Impacts from Control of Stationary Sources*

PROJECT-SPECIFIC IMPACTS: Emission reductions from the control of emissions at several stationary sources could result in secondary emissions.

Control Measure CMB-01 includes further NO_x reduction such as reducing the NO_x allocation for some NO_x RECLAIM facilities. Under the RECLAIM regulations, operators of affected facilities are currently able to choose how to reduce NO_x emissions. Options to further reduce NO_x emissions could include addition of control equipment (e.g., SCR, low-NO_x Burners, NO_x reducing catalysts, oxy-fuel furnaces, and selective non-catalytic reduction) by focusing on periodic best available retrofit control technology (BARCT) evaluation.

While some control measures may cause small increases in NO_x emissions, the 2012 AQMP would achieve enough NO_x reductions overall to continue making expeditious progress in attaining the federal one-hour and eight-hour ambient air quality standards for ozone. Selective catalytic reduction (SCR) has been used to control NO_x emissions from stationary sources for many years. Like an oxidation catalyst, SCR promotes chemical reactions in the presence of a catalyst. However, unlike oxidation catalysts, a reductant (e.g., ammonia) is added to the exhaust stream in order to convert NO_x to elemental nitrogen and oxygen in an oxidizing environment. As exhaust gases along with the reductant pass over the catalyst, 75 to 90 percent of NO_x emissions, 50 to 90 percent of the VOC emissions, and 30 to 50 percent of the PM₁₀ emissions are reduced.

There is the potential for secondary particulate formation from ammonia slip in sources that use SCR for control. Anticipating that SCR units would become widespread to comply with the NO_x control rules under development over 20 years ago, the CEQA documents prepared by the SCAQMD for these new NO_x control rules evaluated the potential for secondary PM₁₀ formation from SCR systems. As part of analyses prepared for the EIRs for the NO_x

control rules, the SCAQMD conducted an extensive literature review and contacted a number of SCR manufacturers and vendors. The results of this data collection effort indicated that ammonia slip depends on a variety of factors including space velocity, ammonia to NO_x molar ratio, temperature, and NO_x inlet concentration.

The analysis also indicated that, SCRs in use at that time typically had an ammonia slip level ranging from approximately ten to 20 ppm. Ammonia slip levels in this range were the result of the following factors. First, to ensure maximum NO_x reduction efficiency, SCR operators at that time typically injected excess ammonia (e.g., a higher ammonia to NO_x molar ratio, into the flue gas to ensure achieving the appropriate NO_x reduction reaction). The excess ammonia that does not react with the NO_x passes or “slips” through the reactor vessel and is released into the atmosphere. With a decline in catalyst activity, to achieve the same NO_x reductions, it often became necessary to increase the amount of ammonia injected into the flue gas, which in turn increases ammonia slip. Similarly, the analysis found that one of the main operational problems that contributed to ammonia slip was the uneven distribution of NO_x in the duct ahead of the catalyst, creating a non-uniform mixture of ammonia and NO_x over the entire cross-section of the duct and resulting in high levels of ammonia slip. Finally, the early NO_x control EIRs prepared by the SCAQMD indicated that formation of ammonium nitrate (NH₄NO₃) could be a problem if temperatures were less than 169 °C.

The SCAQMD’s early NO_x control EIRs concluded that ammonium nitrate (NH₄NO₃) formation would not be a significant adverse air quality impact if ammonia slip is reduced to ten ppm or less by maintaining uniform ammonia injection. Ensuring adequate mixing of ammonia in the flue gas can alleviate this problem. Ammonia slip can also be reduced by maintaining the proper ammonia to NO_x molar ratio, decreasing the exhaust gas flow rate, maintaining consistent exhaust velocity, and maintaining an optimal temperature regime.

The SCR technology has progressed such that ammonia slip can now be limited to five ppm. For example, SCR vendors have developed better injection systems that result in a more even distribution of NO_x ahead of the catalyst so that the potential for ammonia slip has been reduced. Similarly, ammonia injection rates are more precisely controlled by model control logic units that are a combination of feed-back control and feed forward control using a proportional/integral controller that sets flow rates by predicting SCR outlet ammonia concentrations and calibrating them to a set reference value.

Subsequent to the preparation of the early EIRs for the SCAQMD’s NO_x control rules, catalyst research has focused on reducing SO₂ oxidation. Even over 20 years ago, SCR vendors reported that SO₂ oxidation of their catalyst was less than one to four percent (SCAQMD, 1990). SO₂ to SO₃ conversion has been reduced by decreasing the amount of active ingredient (typically vanadium pentoxide), adding an active element as a promoter and improving the dispersion of active elements. SCR vendors have indicated that problems with ammonium particulates tend to be minimal if the amount of ammonia slip in the flue gas averages less than five to ten ppm. Particulate problems with ammonium bisulfate (NH₄H₂SO₄), and ammonium sulfate ((NH₄)₂SO₄), can be alleviated by reducing ammonia slip (SCAQMD, 1990).

In summary, in the early EIRs for the SCAQMD's NO_x control rules (e.g., the EIR for Rule 1135), SCAQMD staff determined that the impacts related to secondary PM₁₀ formation would be less than significant if ammonia slip were limited to five to ten ppm because ammonia would then be a limiting factor in producing secondary particulates. Based on substantial improvements in the SCR control technology, as well as improvements in ammonia monitoring equipment, minimizing ammonia slip to five ppm or less is feasible and is now a standard design parameter for SCR and catalyst manufacturers and secondary particulate emissions from SCR units has ceased to be a potentially significant adverse air quality impact with the standard imposition of ammonia limits less than ten ppm.

The SCAQMD has permitted numerous SCR systems within the district since the early 1990's and, therefore, has a longstanding practice of imposing permit conditions limiting ammonia slip. The current SCAQMD limit for ammonia slip for new, modified, or relocated equipment is five ppm, thus, minimizing the potential formation of secondary particulates, ammonium nitrate, in particular.

Based on the above, no new or substantially more severe significant air quality impacts related to ammonia emissions and secondary PM₁₀ formation from the increased use of SCR systems is expected. The five ppm ammonia limit would be included as an enforceable permit condition on the SCAQMD permit to construct/operate. Operators would be required to monitor ammonia slip by conducting an annual source test and maintain a continuous monitoring system to accurately indicate the ammonia-to-emitted-NO_x mole ratio at the inlet of the SCR.

Control Measure FUG-01 may result in an increase in natural gas used to combust VOC emissions from vacuum trucks used to remove materials from storage tanks, vessels, sumps, boxes and pipelines. VOC emissions may be controlled by using carbon adsorption systems, internal combustion engines, thermal oxidizers, refrigerated condensers, liquid scrubbers and positive displacement (PD) pumps. SCAQMD staff estimates that 27 million cubic feet per year of natural gas (thermal oxidizers) and 2,100 gallons of gasoline (internal combustion engines) may be used per year to combust fugitive VOCs from storage tanks, vessels, sumps, boxes and pipelines pulled by a vacuum truck. Criteria emissions from FUG-01 are included in Table 4.2-7.

Control Measure FUG-02 would require emission reductions from fugitive emissions associated with the transfer and dispensing of liquefied petroleum gas (LPG). FUG-02 would be implemented in two phases: Phase I, which was implemented with the adoption of Rule 1177 on June 1, 2012 and required the use of low emission fixed liquid level gauges (FLLGs) and low emission connectors for transfer and dispensing; and Phase II, which would expand the applicability of Rule 1177 to include LPG transfer and dispensing at other facilities, including currently exempted facilities. Implementation of Phase I of Rule 1177 is expected to result in a reduction of VOC emissions of 6.1 tons per day with an additional one to two tons per day with the implementation of Phase II. No significant secondary air quality impacts associated with VOC reductions from Control Measure FUG-02 are expected.

Control Measure BCM-03 would reduce PM_{2.5} emissions from under-fired charbroilers. Under-fired charbroilers are comprised of three main components: a heating source, a high temperature radiant surface, and a slotted grill. The grill holds the meat or other food while exposing it to the radiant heat. PM and VOC emissions occur when grease from the meat falls onto the high temperature radiant surface. Most under-fired charbroilers burn natural gas; however, solid fuels, such as charcoal or wood with or without the addition of ceramic stones, are sometimes used. This category includes: broilers, grill charbroilers, flamebroilers, and direct-fired barbecues. Potential control technologies that could generate secondary air quality impacts include the following.

- HEPA filters trap small particles by one of three mechanisms: interception (particles come within one radius of a fiber and adhere to it); impaction (particles are forced to embed in one of the fibers), or diffusion (an enhancing mechanism resulting from gas molecules collision with small particles which slows their flow). Diffusion is the predominate mechanism below the 0.1 ([micrometer](#)) μm diameter particle size. Impaction and interception predominate above 0.4 μm . In the 0.3 μm range, diffusion and interception predominate. Currently, there are no HEPAs with SCAQMD permits to control emissions from charbroilers in the Basin.
- Wet scrubbers rely on a finely atomized stream of liquid to capture particulate and gaseous pollutants from an exhaust stream, such as from a restaurant charbroiler. Heat and mass transfer are accomplished by direct contact of the exhaust gas with finely atomized droplets of the scrubbing liquid. The gas stream is cooled and moistened as the scrubbing liquid evaporates. PM removal efficiencies of 90 percent or higher have been achieved in service depending on particle size, load, flows and pressure drop. Presently, there are nine wet scrubbers permitted at restaurants located in the Basin.
- ESPs rely on imparting a 220-volt AC power supply transformed to high voltage direct current (DC) charge to the particulate materials while simultaneously ionizing the carrier gas, producing an electric corona. The particles, either negatively or positively charged, are attracted to the ESP electrode of the opposite charge and finally removed from the electrodes by rapping or washing the electrodes. An after filter is sometimes used to provide back pressure and ensure good gas distribution in the ESP. Collection efficiencies exceeding 90 percent are common in many applications. At present, there are 27 ESPs permitted and operating at restaurants located in the Basin.
- Regenerative thermal oxidizers (RTOs) consist of a combustion chamber located adjacent to several energy recovery chambers. The VOC-laden air enters an inlet header and is directed to one of the energy recovery chambers through the inlet control valve. The air passes through the heat exchange media, adsorbing heat from the media. It then enters the combustion chamber at a temperature close to the oxidation temperature. The oxidation process is completed in the combustion chamber. At least one chamber is always on inlet mode and another on outlet mode to allow the RTO to continuously process a VOC-laden air stream.

Based on the above information, installation of various types of control devices to comply with the requirements of 2012 AQMP control measure. HEPA filter and ESP technologies

may result in increased demand for electricity, resulting in secondary emissions from electricity production. RTOs could increase demand for natural gas, producing secondary combustion emissions.

Control Measure MCS-01 would require the SCAQMD to adopt and implement new retrofit technology control standards (BARCT) as new BARCT standards become available. Although it is currently unknown what the new BARCT standards would be, to the extent that they require installation of control technologies, potential secondary air quality impacts could be generated. For example, potential construction air quality impacts from construction activities to install future BARCT equipment, from on-road vehicles (e.g., worker commute trips, haul truck delivery trips, etc.) and off-road construction equipment could be generated. Similarly, to the extent that BARCT technologies operate using electricity to run the equipment or natural gas combustion as part of the control process, secondary emissions from electricity generation or natural gas combustion could be generated. Although SCR is BARCT for controlling NO_x emissions from a variety of combustion sources, if it is determined to be BARCT for other types of combustion sources ammonia slip emissions could be generated. However, since the source of emissions and the BARCT is unknown at this time, SCAQMD staff is unable to estimate secondary emission from Control Measure MCS-01.

Control Measure INC-01 may result in the replacement of existing combustion equipment with more efficient or zero emission technologies. INC-01 may also result in the installation of control technologies or the use of alternative fuels. Zero emission technologies are likely to be powered by electricity. Control technology may include diesel particulate filters and NO_x reduction catalysts. However, since the source of emissions, control technology and energy requirements are unknown at this time; SCAQMD staff is unable to estimate secondary emission from Control Measure INC-01.

PROJECT-SPECIFIC MITIGATION: Based on the above information, potential secondary air quality impacts from control technologies associated with stationary sources were concluded to be less than significant so no mitigation measures are required.

REMAINING SECONDARY AIR QUALITY IMPACTS: The air quality analysis concluded that potential secondary air quality impacts from control technologies associated with stationary sources would be less than significant, no mitigation measures were required, so secondary air quality impacts remain less than significant.

4.2.6.2.3 *Secondary Impacts from Change in Use of Lower VOC Materials*

PROJECT-SPECIFIC IMPACTS: Several control measures are aimed at reducing VOC emissions by reformulating certain products including architectural coatings (CTS-01); miscellaneous coating adhesives, solvents, and lubricants (CTS-02); and, mold release products (CTS-03). An additional control measure, CTS-04, would further reduce VOC emissions by revising or eliminating the exemption for low vapor pressure solvents in consumer products. Consumer products include, but are not limited to: detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products such as

antiperspirants and hairsprays; home, lawn, and garden products; disinfectants; sanitizers; automotive specialty products; and, aerosol paints.

The analysis of secondary emissions from changes in use of lower VOC materials is focused on emissions from reducing the VOC from reformulated coatings (such as flat, non-flat, and primer sealer undercoaters (PSU)). To obtain further VOC emission reductions from these products it is expected the products would be reformulated with water-based or exempt compound formulations. The following subsections identify potential secondary air quality impacts from lowering the VOC content limit further. Although the following discussion focused primarily on coatings, some of its topics (e.g., substitution, more reactivity, and low vapor pressure), could apply to other types of consumer products.

Control Measure CTS-01 is expected to lower the VOC content from 50 grams per liter to 25 grams per liter. It is expected that this reduction would not substantially change the primary components of the coatings. As a result, the issues discussed below may no longer be applicable. Control Measures CTS-02 and CTS-03 are expected to lower the VOC content in miscellaneous coatings, adhesives, solvents, and lubricants as well as mold release products by requiring the lowering the VOC-content of the products. Control Measure CTRS-04 is expected to reduce VOC emissions from consumer products by revising the exemptions for the use of low vapor pressure VOC solvents. The following issues have raised with regard to reformulated coatings in both the 2003 and 2007 AQMPs.

The potential secondary air quality impacts associated with reformulation of coatings has been extensively evaluated in both the 2003 and 2007 AQMPs, as well as in a number of amendments to existing coatings rules. At the time, reformulations were shifting coatings from primarily solvent-based to water-based and exempt-solvent formulations. Secondary air quality impacts discussed previously in the 2007 AQMP were relative to more thickness of the coating, illegal thinning to reduce the viscosity of the reformulated coatings, more priming, more topcoats, more touch-ups and repair work, more frequent recoating, substitution, more reactivity, and synergistic effects of the eight issues. Each issue is summarized in the following bullet points along with the associated conclusions reached in the 2007 AQMP for each issue:

- **More thickness** - reformulated compliant water- and solvent-borne coatings are very viscous (e.g., are formulated using a high-solids content) and, therefore, are difficult to handle during application, tending to produce a thick film when applied directly from the can. A thicker film indicates that a smaller surface area is covered with a given amount of material, thereby increasing VOC emissions per unit of area covered.

Response - Compliant low-VOC coatings are not necessarily formulated with higher solids content than conventional coatings. A low-VOC coating is expected to cover the same or larger surface area than a high-VOC coating. Further, there is no evidence that there is an inverse correlation between solids content and coverage area (SCAQMD, 2007).

- **Illegal thinning** - thinning occurs in the field in excess of what is allowed by the SCAQMD rule limits. It is asserted that, because reformulated compliant water- and

solvent-borne coatings are more viscous (e.g., high-solids content), painters have to adjust the properties of the coatings to make them easier to handle and apply. In particular for solvent-borne coatings this adjustment consists of thinning the coating as supplied by the manufacturer by adding solvent to reduce its viscosity. The added solvent increases VOC emissions back to or sometimes above the level of older formulations.

Response - SCAQMD staff conducted extensive research prior to 1998 to determine whether or not thinning of materials beyond the allowable levels occurred in the field. SCAQMD staff conducted unannounced site visits to evaluate contractor practices, collected samples as applied and supplied from contractors, analyzed paint samples from retail outlets. No thinning beyond SCAQMD rule limits was identified. In addition, the CARB 2005 Architectural Coating Survey provided results of compliance with the CARB Suggested Control Measure for Architectural Coatings. In most cases the percent of complying market share from the 2005 survey improved or was approximately the same as the 2001 CARB survey. Therefore, the 2007 Final [Program](#) EIR concluded that widespread thinning does not happen often; when it does occur, it is unlikely to occur at a level that would lead to a substantial emissions increase when compared to emissions from higher VOC coatings (SCAQMD, 2007).

Currently, the majority of the architectural coatings currently available in the marketplace are waterborne. Thinning is not an issue for waterborne coatings as thinning with water would not increase the VOC content of those coatings. Of the total coatings sold in 2008, only seven percent of were solvent-based which equates to approximately three million gallons. Architectural Coatings sold in small containers with a VOC content greater than the VOC limits for those categories represented 15 percent of the total volume or slightly more than 0.4 million gallons. The proposed elimination of the small container exemption would therefore result in more waterborne coatings, further lessening the potential adverse impact of thinning with solvent. In addition, large containers would already comply with applicable VOC content limits so there would be no widespread thinning of small container coatings to meet small container needs. For the years between 2009 and 2011, the overall volume of solvent-based coatings was reduced by an additional 22 percent, and the potential for thinning was reduced by an equivalent amount. Further, adoption and implementation of Rule 1143 – Consumer Paint Thinner and Multi-Purpose Solvents, requires the use of paint thinners that have a VOC content of less than or equal to 25 grams per liter, resulting in paint thinners that are based on exempt solvents, further reducing the impacts from thinning of solvent-based architectural coatings.

- **More priming** - reformulated compliant low-VOC water- and solvent-borne topcoats do not adhere as well as higher-VOC solvent-based topcoats to unprimed substrates. Therefore, the substrates must be primed with typical solvent-based primers to enhance the adherence quality. Industry representatives have testified that the use of water-borne compliant topcoats could require more priming to promote adhesion. Additionally, it has been asserted that water-borne sealers do not penetrate and seal porous substrates like wood, as well as traditional solvent-borne sealers. This allegedly results in three or four

coats of the sealer per application compared to one coat for a solvent-based sealer would be necessary, resulting in an overall increase in VOC emissions for the coating system.

Response - SCAQMD staff evaluated surface preparation in coating product data sheets and recent studies on the topic. It was determined that low-VOC coatings do not require substantial different surface preparation than conventional coatings. Both low-VOC and conventional coatings for both architectural and industrial maintenance applications were demonstrated to have the ability to adhere to a variety of surfaces. Based on the coating sheets, the material needed and the tie necessary to prepare a surface for coating was approximately equivalent for low-VOC and conventional coatings (SCAQMD, 2007).

In addition, a recent trend for coating manufacturers is to produce ultra low-VOC coatings that are primer and topcoat in one, hence eliminating an entire step in the coating process. Most major coatings manufacturers now offer such products, some of which are as low as 5.0 grams per liter. Therefore, any impacts from priming have been significantly reduced.

- **More topcoats** - reformulated compliant water- and low-VOC solvent-borne topcoats may not cover, build, or flow-and-level as well as the solvent-borne formulations. Therefore, more coats are necessary to achieve equivalent cover and coating build-up.

Response - Based on information in product data sheets, SCAQMD staff found that the average drying time for lower-VOC coatings did increase compared to conventional coatings; however, with the development of non-volatile, reactive diluents combined with hypersurfactants, performance of the lower-VOC coatings equaled or outperformed traditional, solvent containing coatings. Resistance to chemicals, corrosion, chalk, impact and abrasion, adhesion and the ability to retain gloss and color was found to be similar in lower-VOC and conventional coatings. Coating manufacturer data indicated that low-VOC and conventional coatings for both architectural and industrial maintenance applications are durable and long lasting. More frequent recoating was not found for low-VOC coatings when compared to conventional coatings (SCAQMD, 2007).

- **More touch-ups and repair work** - reformulated compliant water- and low-VOC solvent-borne formulations dry slowly, and are susceptible to damage such as sagging, wrinkling, alligatoring, or becoming scraped and scratched. Claims have been made that the high-solids solvent-borne alkyd enamels tend to yellow in dark areas, and that water-borne coatings tend to blister or peel, and also result in severe blocking problems. All of these problems were reported to require additional coatings for repair and touch-up.

Based on SCAQMD staff's evaluation of the durability characteristics information contained in the coating product data sheets, low-VOC coatings and conventional coatings have comparable durability characteristics. These conclusions are supported by the UMR, NTS and other coating studies. As a result, it is not anticipated that more touch up and repair work will need to be conducted with usage of low-VOC coatings.

- **More frequent recoating** - the durability of the reformulated compliant water- and low-VOC solvent-based coatings is inferior to the durability of the traditional solvent-borne coatings. Durability problems include cracking, peeling, excessive chalking, and color fading, which all typically result in more frequent recoating. As a result, they claim more frequent recoating would be necessary resulting in greater total emissions than would be the case for conventional coatings.

Response - The latest data from coating manufacturers obtained by SCAQMD staff indicate that the new generation of waterborne coatings is performing as well if not better than their solvent-based counterparts. These commercialized products are formulated with better performing raw materials, including superior resin chemistry and higher performing pigments, resulting in better hiding and coverage and overall durability, therefore, a reduction in coating usage is expected.

- **Substitution** - reformulated compliant water- and low-VOC solvent-borne coatings are inferior in durability and are more difficult to apply, so consumers and contractors will substitute better performing high VOC coatings in other categories for use in categories with low compliance limits. An example of this substitution could be the use of a higher VOC product (e.g., clear wood coatings) currently sold under the small container exemption, which has a higher VOC content limit requirement, in place of a lower-VOC clear wood coatings.

Response - SCAQMD staff determined that substitution would not occur because based on product data sheets and studies, there are, generally a substantial number of low-VOC coatings in a wide variety of coating categories that are currently available; and CARB and SCAQMD rules prohibit the application of certain coatings in specific settings.

In the rare event that substitution does occur, it is expected that future coatings would still achieve overall VOC emission reductions. Substitution would only result in lesser emission reductions than expected, it would not increase emissions compared to the existing setting. Consequently, it is not expected that control measures requiring a lower overall VOC content of coatings will result in significant adverse air quality impacts from the substitution of low-VOC coatings with higher-VOC coatings (SCAQMD, 2007).

- **Reactivity** - reformulated compliant low-VOC water- and solvent-borne coatings contain solvents that are more reactive than the solvents used in conventional coating formulations. Water-borne coatings perform best under warm, dry weather conditions, and are typically recommended for use between May and October. Since ozone formation is also dependent on the meteorological conditions, use of waterborne coatings during this period increases the formation of ozone.

Response - SCAQMD staff has continued to monitor all reactivity-related research since the 2007 AQMP. However, based on the latest research and analysis, as well as the recommendations of the research, staff supports the continuation of a mass-based ozone control strategy, with future consideration for a reactivity-based approach.

- **Synergetic Effects of the Eight Issues** – Individually each of the eight issues does not result in a significant adverse air quality impact; therefore, the synergistic effect of all eight issues were determined not to result in a significant air quality impact. The Final [Program EIR](#) for the 2007 AQMPD stated that even if it is assumed that some of the alleged activities do occur, the net overall effect of reducing the VOC content of coatings and other consumer products is expected to be a reduction in VOC emissions.

Based on the preceding analysis of potential air quality impacts from implementing future coatings rules, it is concluded that the overall air quality effects would be a VOC emission reduction and beneficial to air quality in the district.

PROJECT-SPECIFIC MITIGATION: Potential secondary adverse air quality impacts from future coating or consumer product regulations were evaluated and it was concluded that impacts would be less than significant, so no mitigation measures are required.

REMAINING SECONDARY AIR QUALITY IMPACTS: The air quality analysis concluded that potential secondary air quality impacts from future reformulated coatings and solvent products would be less than significant, no mitigation measures were required, so secondary air quality impacts remain less than significant.

4.2.6.2.4 *Secondary Impacts from Mobile Sources*

PROJECT-SPECIFIC IMPACTS: Three control measures, ONRD-01, ONRD-02, and ONRD-03, are aimed at reducing emissions from mobile sources by accelerating the penetration of partial zero-emission and zero emission vehicles. These control measures do not directly generate secondary air quality impacts, but generate indirect air quality impacts from the generation of electricity required to operate the additional partial zero-emission and zero emission vehicles. The secondary air quality impacts associated with the increase in electrical demand have been discussed in the beginning of this subsection under “Secondary Impacts for Increased Electricity Demand”.

Control Measure ONRD-04 accelerates the replacement of heavy duty diesel vehicles (26,001 pounds and greater gross vehicle weight) with newer, lower-emissions vehicles. The early replacement of these vehicles could potentially increase the number of vehicles being scrapped. Scrapping activities generate secondary air quality impacts from the shredding of the vehicle and the electricity to perform the scrapping. During the Rule 1610 rulemaking, emissions associated with vehicle scrapping were estimated to be 0.088 pound of PM10 emissions per vehicle scrapped (SCAQMD, 1992). The actual number of vehicles scrapped would depend on the actual number of vehicles participating in the program. Emissions impacts would also depend on the number of vehicles scrapped instead of relocated outside the district, the number of vehicles scrapped at facilities within the district, and the available capacity within the district to scrap the vehicle at the time it is retired. Based on the number of factors that affect the quantification of the secondary emissions, quantification of the secondary air quality impacts would be speculative. However, the quantity of PM10 generated per vehicle scrapped is approximately the same as a diesel truck driving 50 miles.

Control Measure ONRD-05 would accelerate the replacement of up to 1,000 older heavy-duty vehicles with zero-emission vehicles or zero-emissions container movement systems. This control measure does not directly generate secondary air quality impacts, but generates indirect air quality impacts from the generation of electricity required to operate the additional partial zero-emission and zero emission vehicles. The secondary air quality impacts associated with the increase in electrical demand have been discussed in the beginning of this subsection under “Secondary Impacts for Increased Electricity Demand.” As with ONRD-04, retirement of the older heavy-duty vehicles could potentially increase the vehicle scrapping and the same uncertainties as to the disposition of the retired vehicle would occur. A conservative estimate of the emissions associated with retirement of 1,000 vehicles would be if all 1,000 were scrapped in a single day within the district (e.g., 0.088 pound of PM10 per vehicle x 1,000 vehicles = 88 pound of PM10, which is less than the PM10 significance threshold of 150 pounds per day). Using the CEIDARS profile 900 ratio of 0.6 pound of PM2.5 per pound of PM10, results in 52.8 pounds per day of PM2.5 emissions, which is below the PM2.5 significance threshold of 55 pounds per day. Therefore, secondary air quality impacts associated with the vehicle scrapping would be less than significant.

Control Measure OFFRD-01 would accelerate the replacement or retrofit of approximately 1,200 pieces of older construction equipment. As with ONRD-04, retirement of the older heavy-duty vehicles could potentially increase the vehicle scrapping and the same uncertainties as to the disposition of the retired vehicle would occur. However, construction equipment is typically refurbished and a new engine installed, so no scrapping of construction equipment is expected. Therefore, quantification of the secondary air quality impacts would be speculative. Retrofit methods could include add-on devices such as, particulate filters and SCRs.

Add-on devices, such as particulate filters have an increase in fuel use, typically estimated at less than one percent, associated with the decrease in fuel economy associated with the type of device. Therefore, there is a potential for an increase in emissions from the increase in fuel use. It is not known how much construction equipment will be retrofitted with particulate filters versus replaced. Therefore, quantification of the secondary air quality impacts would be speculative.

In the case of exhaust pollutants, Manufacturers of Emission Controls Association (MECA) reports that the use of oxidization catalysts to reduce PM10 emissions from diesel-fueled vehicles should not increase other exhaust pollutants. In fact, combining an oxidation catalyst with engine management techniques can be used to reduce NOx emissions from diesel engines. This is achieved by adjusting the engine for low NOx emissions, which is typically accompanied by increased CO, VOC, PM10, and PM2.5 emissions. An oxidation catalyst can be added to offset these increases, thereby lowering the exhaust levels for all of the pollutants. Often, the increases in CO, VOCs, and PM10 can be reduced to levels lower than otherwise could be achieved. In fact, a system which uses an oxidation catalyst combined with proprietary ceramic engine coatings and injection timing retard can achieve significant NOx reductions (e.g., greater than 40 percent) while maintaining low PM10 and PM2.5 emissions (MECA, 1999).

In the case of the use of SCRs, potential adverse air quality impacts associated with the use of SCRs in diesel-fueled vehicles could occur if this technology resulted in the increase of other exhaust pollutants at the expense of reducing PM10 and PM2.5 or a reduction in fuel economy. However, applying SCR to diesel-powered vehicles provides simultaneous reductions of NOx, PM10, PM2.5, and VOC emissions.

Like an oxidation catalyst, SCR promotes chemical reactions in the presence of a catalyst. However, unlike oxidation catalysts, a reductant is added to the exhaust stream in order to convert NOx to elemental nitrogen and oxygen in an oxidizing environment. The reductant can be ammonia but in mobile source applications, urea is normally preferred. As exhaust gases along with the reductant pass over the catalyst, 75 to 90 percent of NOx emissions, 50 to 90 percent of the VOC emissions, and 30 to 50 percent of the PM10 and PM2.5 emissions are reduced. SCR also reduces the characteristic odor produced by a diesel engine and the diesel smoke.

In the case of exhaust pollutants, the catalyst composition of SCR and its mode of operation are such that sulfates could form. However, with the use of ultra-low sulfur diesel fuel, which has been required for stationary and on-road applications since September 2006, sulfate formation is expected to be negligible. In particular, even at temperatures in excess of 500 degrees Centigrade, only five percent of the sulfur in the fuel would be converted to sulfate, which still allows for significant net PM10 and PM2.5 emission reductions. Applying SCR to diesel-powered vehicles also provides simultaneous reductions of NOx, PM10, PM2.5, and VOC emissions.

As to a reduction in fuel economy, because of the large NOx reductions afforded by SCR, it is possible that low NOx emissions can be achieved with an actual fuel economy benefit. Compared to internal engine NOx abatement strategies like exhaust gas recirculation and timing retard, SCR offers a fuel economy benefit in the range of three to 10 percent as a result of being able to optimize engine timing for fuel economy and relying on the SCR system to reduce NOx emissions. Therefore, no significant adverse air quality impacts were identified from the use of particulate filters or SCRs in conjunction with ultra-low sulfur diesel fuel to potentially comply with the applicable control measures.

Control Measures OFFRD-02 and OFFRD-03 would accelerate the replacement of 440 and 52 locomotive engines in freight and passenger service, respectively, or employ add-on devices to meet the lower emission standard, as such, the potential secondary air quality impacts from add-on devices. Therefore, the impacts of the replacement of locomotives and use of add-on devices are similar to those discussed for OFFRD-01. Similar to Control Measure OFFRD-01, locomotives are typically refurbished and a new engine installed so no scrapping of the locomotives are expected. Add-on devices, such as particulate filters have an increase in fuel use associated with the decrease in fuel economy associated with the type of add-on device, which is estimated to be less than one percent. Therefore, there is a potential for an increase in emissions from the increase in fuel use. However, the number of locomotives to be equipped with add-on devices versus replaced is not known. Therefore, quantification of the secondary air quality impacts would be speculative.

Control Measure OFFRD-04 would increase the amount of shorepower used for “cold ironing” by 25 percent. However, the demand for electricity varies based on the type of vessel. Therefore, the increase in electricity demand cannot be quantified. However, stationary power generating facilities can use alternative fuels such as natural gas, reducing emissions to low levels when compared to marine diesel. Therefore, the overall impact of using shorepower is expected to be a beneficial impact on air quality.

Control Measure ADV-07 would accelerate the replacement of aircraft engines with cleaner burning engines. Aircraft engines when retired from service are typically returned to the engine manufacturer for recycling. The early retirement and recycling of aircraft engines is not expected to generate secondary air quality impacts as no “shredding” like automobiles is necessary.

Control Measures OFFRD-02, OFFRD-03, ADV-04, ADV-05, ADV-06, and ADV-07 have the potential to use alternative fuels such as biodiesel, LNG, CNG, methanol, ethanol, and hydrogen. The availability of the producers of alternative fuels to meet the increase in demand has the potential for an increase in air emissions associated with the increased production. Production of the alternative fuels such as LNG, CNG require little processing with less air emissions than the production of refined petroleum products such as gasoline, diesel, and jet fuel. While biodiesel, ethanol, and methanol production do require more processing than LNG and CNG, the production processes are less complicated than petroleum refining. Biodiesel and methanol are made from a catalytic chemical process similar to one or two processes in a typical refinery, which will have many units to produce refined products from crude oil. Ethanol is produced by fermentation. Biodiesel, methanol, and ethanol can be made from renewable sources such as vegetable oils, sugar cane, corn, and animal fats. Therefore, the production of alternative fuels typically produces less air emissions. The increase in air emissions from the increase in production of alternative fuels would be offset by the reduction in the production of petroleum fuels and the transport reduced of crude oil primarily from overseas, as diesel and gasoline demand decreases. Therefore, no increase air emissions associated with meeting the increase in demand for alternative fuels is expected and no significant secondary air quality impacts are expected.

Mobile source control measures are expected to result in changes in emissions related to mobile sources. The inventory prepared for the 2012 AQMP include emissions estimates associated with mobile sources discussed in this section, which are summarized in Table 4.2-7.

The inventory prepared for the 2012 AQMP includes estimates for on-road vehicles in 2008, 2014, and 2023. The inventory also accounts for growth in population that also includes growth in the number of mobile sources and an increase in the vehicle miles traveled. The estimated VOC, CO, NO_x, SO_x, PM₁₀, and PM_{2.5} emissions associated with on-road mobile sources in the Basin are expected to be reduced between the 2008 and the 2014, and 2023 inventories. Therefore, the overall impact of mobile source control measures is expected to be a beneficial impact on air quality.

PROJECT-SPECIFIC MITIGATION: The overall impact of mobile source control measures is expected to be beneficial by providing large emission reductions from mobile

sources. Therefore, air quality impacts associated with mobile source control measures are expected to be less than significant and no mitigation measures are required.

REMAINING SECONDARY AIR QUALITY IMPACTS: The air quality analysis concluded that potential secondary air quality impacts from mobile sources would be less than significant, no mitigation measures were required, so secondary air quality impacts remain less than significant.

Secondary Impacts from Miscellaneous Sources

PROJECT-SPECIFIC IMPACTS: Miscellaneous source control measures would regulate a variety of different types of emissions sources including both area and point sources. As a result, these control measures are expected to reduce VOC, criteria pollutant, and precursor emissions. The following control measures were identified to as having the potential to generate secondary air quality impacts.

TABLE 4.2-8

Annual Average Emissions for On-Road and Other Mobile Sources in the District
(tons/day)

Source Category	VOC	CO	NO _x	SO _x	PM ₁₀	PM _{2.5}
2008 Emission Inventory						
On-Road Motor Vehicles	209	1,966	462	2.1	32	19
Other Mobile Sources ^(a)	127	778	204	38	15	13
2008 Total	336	2,744	666	40	47	32
2014 Emission Inventory						
On-Road Motor Vehicles	117	1,165	272	2.1	25	12

Note: Negative numbers represent emissions reductions.

(a) Other Mobile Sources include aircraft, trains, ocean going vessels, commercial harbor crafts, recreational boats, off-road recreational vehicles, off-road equipment, farm equipment, and fuel storage and handling.

Control Measure MCS-02 would implement all feasible mitigation measures including: 1) requiring cover of chipped or ground greenwaste material as early as operationally possible; 2) requiring chipped or ground greenwaste material to remain covered until it is removed from the site within the required 48 hours pursuant to Rule 1133.1; 3) potential requiring season covering of chipped or ground greenwaste material during the summer months; and, 4) strengthening the reporting requirements in Rule 1133 Registration/Annual Update and Rule 1133.1 Recordkeeping. MCS-02 would be implemented in two phases: Phase 1 would be a re-evaluation of greenwaste material handling operations and inventory, and Phase 2 would be development of a rule to incorporate technically feasible and cost-effective best management practices (BMPs). MCS-02 is expected to reduce VOC emissions by 1.0 to 1.34 tons per day by 2014. However, to comply with covering requirements, early movement of the material may occur. While there is a potential for additional shipments to be made in lieu of covering, it is not expected to be a preferred, cost effective approach over covering of the material. Therefore, MCS-02 is expected not to generate additional vehicle trips that could create significant secondary air quality impacts.

Control Measure BCM-04 could require the application of sodium bisulfate (SBS), an acidifier, on livestock waste. SBS is being considered for use in animal housing areas where high concentrations of fresh manure are located. Research indicates best results with the use of SBS on “hot spots.” SBS can also be applied to manure stock piles and at fence lines, and upon scraping manure to reduce ammonia spiking from the leftover remnants of manure and urine. SBS application may be required seasonally or episodically during times when high

ambient PM_{2.5} levels are of concern. Additional delivery truck trips would be required to deliver SBS and SBS may be applied by hand or by tractor.

Control Measure FUG-03 may require additional vehicle trips to detect, verify or repair equipment with fugitive emissions at oil and gas production facilities, petroleum and chemical products processing, storage and transfer facilities, marine terminals, and other sources. Most of these facilities already have utilize self-inspection program for Inspection/Maintenance or leak detection and repair (LDAR) that involve individual screening of all of their piping components. The control measure would explore the use of new technologies to detect and verify VOC fugitive emissions in order to supplement existing programs in achieving additional emission reductions. Work practices for Rule 462 – Organic Liquid Loading, Rule 1142 - Marine Vessel Tank Operations and Rule - 1148.1 Oil Well Enhanced Drilling would be upgraded to a self-inspection program that requires repairs and maintenance to be documented with records and, where appropriate, reported. LDAR elements may also be added to Rules 1142 and 1148.1. LDAR elements may also be added to Rule 463 - Storage of Organic Liquids and 1178 - Further Reductions of VOC Emissions from Storage Tanks at Petroleum Facilities, Rule 1173 - Control of Volatile Organic Compound Leaks and Releases from Components at Petroleum and Chemical Plants and Rule 1176 - Sumps and Wastewater Separators. Since control measure would enhance existing self-inspection programs, few additional vehicle trips associated with additional detection, verification and repairing of leaking are likely.

As indicated above, Control Measures MSC-02 and FUG-03 are not expected to generate a substantial number of new vehicle trips, if any, related to control requirements. Control Measure BCM-04 could require additional vehicle travel to deliver and apply acidifier. At this time, it is not known what controls may be applied, which facilities may require additional trips or how often these trips may be necessary. Therefore, no emission estimates could be prepared at this time. However, while these trips routine, they are not expected to be frequent; therefore, these emissions are not expected to be significant.

PROJECT-SPECIFIC MITIGATION: Overall, potential secondary air quality impacts from miscellaneous source control measures, in particular increased vehicle trips, are not expected to increase substantially. Therefore, potential secondary air quality impacts associated with miscellaneous source control measures are expected to would be less than significant and no mitigation measures are required.

REMAINING SECONDARY AIR QUALITY IMPACTS: The air quality analysis concluded that potential secondary air quality impacts from miscellaneous sources would be less than significant, no mitigation measures were required, so secondary air quality impacts remain less than significant.

4.2.6.3 Toxic Air Contaminants

PROJECT-SPECIFIC IMPACTS: A number of control measures that are proposed in the 2012 AQMP may result in the use of ammonia in SCR. Ammonia slip from SCR units is restricted to five ppm or less, which has been shown through source-specific permit modeling to have no significant impact on surrounding communities. Therefore, the impact

from the use of ammonia as proposed in the 2012 AQMP is expected to be less than significant.
