Section 1

Stationary Source Control Measures

INTRODUCTION

This Appendix describes the South Coast Air Quality Management District (District) staff's proposed stationary and indirect source control measures to be included in the Draft Final 2012 AQMP. Control measures presented in this appendix are short-term PM_{2.5} control measures and 8-hour ozone measures designed to reduce the reliance on long-term CAA Section 182(e)(5) emissions reductions in the 2007 AQMP. The proposed 8-hour ozone measures are designed to further implement the 8-hour ozone plan, but also will help to reduce PM_{2.5} levels and aid attainment with current and future PM_{2.5} NAAQS. The measures are based on a variety of incentive programs and control strategies that are likely commercially available and/or technologically feasible in the next several years.

SHORT-TERM PM_{2.5} CONTROL MEASURES

The Draft Final 2012 AQMP includes eight short-term control measures (including five stationary source, one indirect source, and one education and outreach measure) developed by the District staff that are to be adopted and implemented prior to 2014. Table IV-A-1 provides the expected adoption date, implementation date and expected emission reductions achieved. There are four measures that were carried over from the 2007 AQMP and denoted with "formerly" under the new control measure number. The remaining 3 control measures are newer ideas or strengthening of existing rules.

TABLE IV-A-1

Short-Term PM_{2.5} Control Measures

TABLE IV-A-1 (concluded)

Short-Term PM2.5 Control Measures

NUMBER	TITLE	ADOPTION	IMPLEMENTATION PERIOD	REDUCTION (TPD)
IND -01 <i>(formerly MOB-03)</i>	Backstop Measures for Indirect Sources of Emissions from Ports and Port-Related Sources [NOx, SOx, PM2.5]	2013	12 months after trigger	N/A ^f
EDU-01 <i>(formerly MCS-02, MCS-03)</i>	Further Criteria Pollutant Reductions from Education, Outreach and Incentives [All Pollutants]	Ongoing	Ongoing	N/A ^f
MCS-01 <i>(formerly MCS-07)</i>	Application of All Feasible Measures Assessment [All Pollutants]	Ongoing	Ongoing	TBD ^e

- a. Emission reductions are included in the SIP as a contingency measure.
- b. Winter average day reductions based on episodic conditions and 75 percent compliance rate.
- c. Reduction based on episodic day conditions.
- d. Will submit into SIP once technically feasible and cost effective options are confirmed.
- e. TBD are reductions to be determined once the technical assessment is complete, and inventory and control approach are identified.
- f. N/A are reductions that cannot be quantified due to the nature of the measure (e.g., outreach, incentive programs) or if the measure is designed to ensure reductions that have been assumed to occur will in fact occur.

It should be noted that the emission reduction targets for the proposed control measures (those with quantified reductions) are established based on available or anticipated control methods or technologies. However, emission reductions associated with implementation of these and other control measures or rules in excess of the AQMP’s projected reductions can be credited toward the overall emission reduction targets for the proposed control measures in this appendix.

Emission reductions associated with the District’s SIP commitment to adopt and implement emission reductions from sources under the District’s jurisdiction are being proposed. Once the SIP commitment is accepted, should there be emission reduction shortfalls in any given year, the District would identify and adopt other measures to make up the shortfall. Similarly, if excess emission reductions are achieved in a year, they can be used in that year or carried over to subsequent years if necessary to meet reduction goals. More detailed discussion on the District’s SIP commitment is included in Chapter 4 of the Draft Final 2012 AQMP.

The following sections provide a brief overview of the specific source category types targeted by short-term PM2.5 control measures.

Combustion Sources

This category includes one control measure that seeks further NOx emission reductions from RECLAIM sources.

PM Sources

This source category has four control measures being considered to reduce the PM_{2.5} emissions. The first two measures are designed to address those areas with high PM_{2.5} ambient concentrations by use of episodic controls to reduce emissions from residential wood combustion and open burning. One measure considers Basin-wide curtailment of wood burning devices (wood stoves and wood burning fireplaces) and the other open burning (i.e., prescribed or agricultural burning) when areas of historically high PM_{2.5} concentration are forecast to exceed the PM_{2.5} 24-hour standard. One measure would seek further reductions from restaurant charbroiling operations and another measure would also reduce ammonia emissions from livestock waste, specifically dairies. These latter two measures require a phased approach with a technological feasibility assessment as the first phase.

Multiple Component Systems

The measure reduces emissions by applying all feasible control measures to the various source categories, should any new control measure become available prior to the next AQMP revision.

Indirect Sources

This measure will be designed to ensure emissions at the ports and port-related sources are meeting the targets projected in the 2012 AQMP for the PM_{2.5} attainment demonstration.

Educational Programs

A proposed educational control measure seeks to provide outreach and incentives for consumers to contribute to clean air efforts. Examples include the usage of energy efficient products, new lighting technology, “super compliant” coatings, tree planting, and the use of lighter colored roofing and paving materials which reduce energy demand by lowering the ambient temperature. In addition, this proposed measure intends to increase the effectiveness of energy conservation programs through public education and awareness as to the environmental effects and benefits from conservation. Finally, educational and incentive tools to be used include social comparison of energy usage and efficiency, social media, public/private partnerships. Detailed descriptions of each measure can be found in Section 2 of this appendix.

8-HOUR OZONE MEASURES

There are 16 stationary source 8-hour ozone measures with the majority anticipated to be adopted in the next 2 – 3 years and implemented after 2015, thus assisting in further implementation of the 8-hour ozone plan by 2024. These measures include two incentive programs and one educational measure. Section 182(e)(5) of the Clean Air Act allows “extreme” ozone areas to include measures in their Plan that rely on the

development of new technology or advancement of existing technology. These are commonly referred to as “black box” measures. The 8-hour ozone measures in the 2012 AQMP specify current opportunities for emissions reductions and thus are designed to reduce the reliance on the “black box” commitments in the 2007 AQMP.

There are two measures that were continued from the 2007 AQMP. The remaining 14 control measures are new ideas or revised previous measures (e.g., further reductions from an existing rule). Table IV-A-2 provides the expected adoption date, implementation date and expected emission reduction achieved.

TABLE IV-A-2
8-hour Ozone Measures

NUMBER	TITLE	ADOPTION	IMPLEMENTATION PERIOD	REDUCTION (TPD)
CTS-01	Further VOC Reductions from Architectural Coatings (R1113) [VOC]	2015 – 2016	2018 - 2020	2-4
CTS-02	Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]	2013 – 2016	2015 - 2018	1-2
CTS-03	Further VOC Reductions from Mold Release Products [VOC]	2014	2016	0.8 – 2
CTS-04	Further VOC Reductions from Consumer Products [VOC]	2013 – 2015	2018	N/A ^a
CMB-01	Further NOx Reductions from RECLAIM [NOx] – <i>Phase II</i>	2015	2020	1-2 ^b
CMB-02	NOx Reductions from Biogas Flares [NOx]	2015	Beginning 2017	Pending ^c
CMB-03	Reductions from Commercial Space Heating [NOx]	Phase I – 2014 (Tech Assessment) Phase II - 2016	Beginning 2018	0.18 by 2023 0.6 (total)
FUG-01	VOC Reductions from Vacuum Trucks [VOC]	2014	2016	1 ^d
FUG-02	Emission Reduction from LPG Transfer and Dispensing [VOC] – <i>Phase II</i>	2015	2017	1-2
FUG-03	Further Reductions from Fugitive VOC Emissions [VOC]	2015 -2016	2017-2018	1-2
MCS-01 <i>(formerly MCS-07)</i>	Application of All Feasible Measures Assessment [All Pollutants]	Ongoing	Ongoing	TBD ^e
MCS-02	Further Emission Reductions from Greenwaste Processing (Chipping and Grinding Operations not associated with composting) [VOC]	2015	2016	1 ^d

TABLE IV-A-2 (concluded)

8-hour Ozone Measures

NUMBER	TITLE	ADOPTION	IMPLEMENTATION PERIOD	REDUCTION (TPD)
MCS-03 <i>(formerly MCS-06)</i>	Improved Start-up, Shutdown and Turnaround Procedures [All Pollutants]	Phase I – 2012 <i>(Tech Assessment)</i> Phase II – TBD	Phase I – 2013 <i>(Tech Assessment)</i> Phase II - TBD	TBD ^e
INC-01	Economic Incentive Programs to Adopt Zero and Near-Zero Technologies [NOx]	2014	Within 12 months after funding availability	TBD ^e
INC-02	Expedited Permitting and CEQA Preparation Facilitating the Manufacturing of Zero and Near-Zero Technologies [All Pollutants]	2014-2015	Beginning 2015	N/A ^a
EDU-01 <i>(formerly MCS-02, MCS-03)</i>	Further Criteria Pollutant Reductions from Education, Outreach and Incentives [All Pollutants]	Ongoing	Ongoing	N/A ^a

- N/A are reductions that cannot be quantified due to the nature of the measure (e.g., outreach, incentive programs) or if the measure is designed to ensure reductions that have been assumed to occur will in fact occur.
- If Control Measure CMB-01, RECLAIM Phase I, contingency measure emission reductions are not triggered and implemented, Phase II will target a cumulative 3-5 TPD of NOx emission reductions.
- Pending because emission reductions will be provided prior to the Final Draft.
- Reductions submitted in SIP once emission inventories are included in the SIP.
- TBD are reductions to be determined once the inventory and control approach are identified.

The following sections provide a brief overview of the specific source category types for the 8-hour ozone measures. Detailed descriptions of each measure can be found in Section 3 of this appendix.

Coating and Solvents

The category of coatings and solvents is primarily targeted at reducing VOC emissions from VOC-containing products such as coatings and solvents. This category includes one control measure that seeks further VOC emission reductions from architectural coatings and another from mold release products. The third control measure would further reduce VOC emissions from a number of existing rules that regulate miscellaneous coatings, adhesives, solvents and lubricants.

Combustion Sources

This category includes three measures targeting stationary combustion equipment. There is one control measure that seeks further NOx emission reductions from RECLAIM sources. In addition, there is one new control measure that reduces NOx emissions from landfill and wastewater treatment flares. The last measure seeks to reduce NOx emissions from commercial space heaters.

Petroleum Operations and Fugitive VOC Emissions

This category pertains primarily to operations and materials associated with the petroleum, chemical, and other industries. Within this category, there is one control measure targeting fugitive VOC emissions with improved leak detection and repair. Other measures include reductions from vacuum truck venting and LPG transfer and dispensing.

Multiple Component Sources

There are a total of three 8-hour ozone measures in this category. One measure will achieve further VOC emission reductions from greenwaste processing such as chipping and grinding operations not associated with composting. Another control measure seeks to minimize emissions during equipment start up and shut down and the last measure reduces emissions by applying all feasible control measures to a variety of source categories.

Incentive Programs

This category includes two control measures that incentivize early reductions and advancement of zero and near-zero technologies. One measure promotes and encourages the installation of cleaner, more efficient combustion equipment through economic incentive programs, subject to the availability of public funding. Incentives may include grants for new purchases of equipment as well as loan programs in areas where long-term cost savings from increased efficiency are achieved. Another measure is aimed at providing incentives for companies to manufacture zero and near-zero emission technologies locally, thus populating the market, potentially lowering the purchase cost, and increasing demand. With availability and usage of such technologies, air quality benefits will be achieved. This proposed measure focuses on two elements: 1) process the required air permit(s) in an expedited manner; and 2) assistance in the preparation of the applicable CEQA document. A stakeholder process will be initiated to design the program and collaborate with other existing AQMD or local programs.

Educational Programs

A proposed educational control measure seeks to provide outreach and incentives for consumers to contribute to clean air efforts. Examples include the usage of energy efficient products, new lighting technology, “super compliant” coatings, tree planting, and the use of lighter colored roofing and paving materials which reduce energy demand by lowering the ambient temperature. In addition, this proposed measure intends to increase the effectiveness of energy conservation programs through public education and awareness as to the environmental effects and benefits from conservation. Finally, educational and incentive tools to be used include social comparison of energy usage and efficiency, social media, public/private partnerships.

District’s Mobile Source Control Measures

The District is proposing control measures for mobile sources that can be found in Appendix IV (B).

RULE EFFECTIVENESS

The 1990 federal Clean Air Act requires that emissions inventories be adjusted to reflect the rule effectiveness. As defined by EPA, rule effectiveness reflects how emission reductions, due to implementation of a regulatory program, are estimated. It describes a method to account for the reality that not all facilities covered by a rule are in compliance with the rule 100 percent of the time. In 1992, EPA suggested a default value of 80 percent¹ if emission reductions are estimated based on projected control device efficiencies. If a higher rule effectiveness value is used, the District needs to demonstrate how these emission reductions will be achieved. In 2005, EPA revised its policy² in recognition that rule effectiveness can vary widely between different types of industry. So, instead of assuming a broad 80 percent default value for rule effectiveness, a list of factors should be considered that are most likely to affect rule effectiveness when developing emission inventories and attainment demonstrations. According to the EPA³, it is not necessary to adjust the rule effectiveness when emissions can be calculated by means of a direct determination because the emissions estimate is not contingent on the effectiveness of controls. A direct determination is the one in which emissions are calculated directly (e.g., based on explicit records of coating or solvent types used) rather than from estimates of uncontrolled emissions and level of control. In a recent EPA response⁴ to a comment on this issue, requiring stringent compliance

² “Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter National Ambient Air Quality Standards (NAAQS) and Regional Haze Regulations,” EPA-454/R-05-001, August 2005, Appendix B

³ “Rule Effectiveness Guidance: Integration of Inventory, Compliance and Assessment Applications,” EPA 452/R-94-001, January 2004

⁴ “Approval of Air Quality Implementation Plans; California; South Coast; Attainment Plan for 1997 8-Hour Ozone Standards,” EPA-R09-OAR-2011-0622, Final Rule, March 1, 2012

monitoring and reporting requirements also supports the use of the highest range of rule effectiveness factors in projecting emissions.

As described below under Rule Compliance and Test Methods, the compliance demonstration for each proposed control measure, where the District accounted for emission reductions, identifies the compliance mechanisms such as recordkeeping, inspection and maintenance activities, etc., and test methods such as District, ARB, and EPA approved test methods. In some cases, such as emission reductions from architectural coatings, the emissions are calculated by means of direct determination. The District's ongoing source testing and on-site inspection programs also strengthen the status of compliance verification. In addition, the District conducts workshops, and compliance education programs to inform facility operators on rule requirements and assist them in performing recordkeeping and self inspections. These compliance tools are designed to ensure rule compliance would be achieved on a continued basis. As a result, the majority of control measures proposed in this appendix with quantifiable emission reductions are based on a rule effectiveness of 100 percent. With respect to implementation of existing rules, emissions reported through the District's AER program are based on actual emissions, substantiated by source testing or manufactured data. Otherwise, more conservative default emission factors are used. Any upset conditions or emissions under variance were also included in the AER. Where there was known non-compliance, emissions were adjusted to reflect the conditions. For example, only 75 percent compliance rate is assumed for gas stations (Rule 461) and metal coating applications (Rule 1107).

FORMAT OF CONTROL MEASURES

Included in each control measure description is a title, summary table, description of source category (including background and regulatory history), proposed method of control, estimated emission reductions, rule compliance, test methods, cost effectiveness, and references. The type of information that can be found under each of these subheadings is described below.

Control Measure Number

Each control measure is identified by a control measure number such as "CM #CTS-01" located at the upper right hand corner of every page. "CM #" is the abbreviation for the "control measure number" and is immediately followed by the three-letter designation, "CTS" represents the abbreviation for a source category or specific programs. For example "CTS" is an abbreviation for "Coatings and Solvents." The following provides a description of the abbreviations for each of the measures.

- BCM Best Available Control Measures for Fugitive Dust Sources
- CMB Combustion Sources

- CTS Coatings and Solvents
- FUG Fugitive VOC Emissions
- MCS Multiple Component Sources
- IND Indirect Sources
- INC Incentive Programs
- EDU Educational Programs

If the measure is based on a control measure from the 2007 AQMP, the former control measure number appears in parentheses after the 2012 AQMP number. For example, 2012 AQMP Control Measure CM #BCM-03 – Emission Reductions from Under-Fired Charbroilers would also have the designation (*formerly BCM-05*).

Title

The title contains the control measure name and the major pollutant(s) controlled by the measure. Titles that state “Control of Emissions from...” indicate that the measure is regulating a new source category, not presently regulated by an existing source- specific District rule. Titles that state “Further Emission Reductions of” imply that the measure would result in an amendment to an existing District rule.

Summary Table

Each measure contains a table that summarizes the measure and is designed to identify the key components of the control measure. The table contains a brief explanation of the source category, control method, baseline emissions, emission reductions, control costs, and implementing agency.

Description of Source Category

This section provides an overall description of the source category and the intent of the control measure. The source category is presented in two sections, background and regulatory history. The background has basic information about the control measure such as the number of sources in the Basin, description of emission sources, and pollutants.

The regulatory history contains information regarding existing regulatory control of the source category such as applicable District rules or regulations and whether the source category was identified in prior AQMPs.

Proposed Method of Control

The purpose of this section is to identify potential control options an emission source can use to achieve emission reductions. If an expected performance level for a control option is provided, it is intended for informational purposes only and should not be interpreted as the targeted overall control efficiency for the proposed control measure. To the extent feasible, the overall control efficiency for a control measure should take into account achievable controls in the field by various subcategories within the control measure. A more detailed type of this analysis is typically conducted during rulemaking, not in the planning stage. It has been the District's long standing policy not to exclude any control technology and to intentionally identify as many control options as possible to spur further technology development.

In addition to the proposed control methods discussed in each control measure, affected sources may have the option of partially satisfying the emission reduction requirements of each control measure with incentive programs that will become available in the future from the implementation of control measure CM #INC-01. Examples of incentive programs currently available and future enhancements to those incentive programs would be described in this section.

Emissions Reduction

The emission reductions are estimates based on the baseline inventories prepared for the 2012 AQMP and are provided in the Control Measure Summary Table. For PM_{2.5} measures, the emissions data are based on the annual average inventory. For the ozone strategy, the summer planning inventory is used. The emissions section of the summary table includes the 2008, 2014, 2019 and 2023 inventory. The 2014, 2019 and 2023 emission projections reflect implementation of existing adopted rules. Based on the expected reductions associated with implementing the control measure, emission data are calculated for 2019 and 2023 assuming the implementation of the control measure in the absence of other competing control measures.

The emission reductions listed in the summary table represent the current best estimates, which are subject to change during rule development. As demonstrated in previous rulemaking, the District is always seeking maximum emission reductions when proven technically feasible and cost-effective. For emission accounting purposes, a weighted average control efficiency is calculated based on the targeted controls. The concept of weighted average acknowledges the fact that a control measure or rule may consist of several subcategories, and the emission reduction potential for each subcategory is a function of proposed emission limitation and the associated emission inventory. Therefore, the use of control efficiency to estimate emission reductions does not represent a commitment by the District to require emission reductions uniformly across source categories. In addition, due to the current structure of emission inventory reporting system, a control measure may partially affect an inventory source category (e.g., certain size of equipment or certain level material usage). In this case, an impact

factor is incorporated into the calculation of a control efficiency to account for the fraction of inventory affected. During the rule development, the most current inventory will be used. However, for tracking rate-of-progress on the SIP emission reduction commitment, the approved AQMP inventory will be used. More specifically, emission reductions due to mandatory or voluntary, but enforceable, actions will be credited under SIP obligations.

Rule Compliance

This section was designed to satisfy requirements in the 1990 Clean Air Act in which EPA has indicated that it is necessary to have a discussion of rule compliance with each control measure. This section discusses the recordkeeping and monitoring requirements envisioned for the control measure. In general the District would continue to verify rule compliance through site inspections, recordkeeping, and submittal of compliance plans (when applicable).

Test Methods

In addition to requiring recordkeeping and monitoring requirements, EPA has stated that “An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance.” This section of the control measure write-up identifies appropriate approved District, ARB, and EPA source test methods.

Cost-Effectiveness

The Discounted Cash Flow (DCF) method is a Governing Board approved cost-effectiveness method used to calculate the cost-effectiveness of each control measure. This method was approved by the District and has been consistently used over the past decades. It provides an effective tool to compare with past regulatory actions. As control measures undergo the rule making process, more detailed control costs will be developed.

The cost effectiveness values contained herein represent the best available information at this time. As additional information on technology improvement over time, more accurate numbers of affected facilities, and existing processes become available, the cost effectiveness will be revised and analyzed during actual rulemaking.

Implementing Agency

This section identifies the agency(ies) responsible for implementing the control measure. Also included in this section is a description of any jurisdictional issues that may affect the control measure’s implementation.

References

This section identifies directly cited references, or those references used for general background information.

Section 2

Short-Term PM_{2.5} Control Measures

CMB-01: FURTHER NO_x REDUCTIONS FROM RECLAIM - PHASE I [NO_x]

CONTROL MEASURE SUMMARY			
SOURCE CATEGORY:		VARIOUS RECLAIM NO _x SOURCES	
CONTROL METHODS:		VARIOUS CONTROL TECHNOLOGIES AND METHODS	
EMISSIONS (TONS/DAY):			
ANNUAL AVERAGE	2008	2014	2023
NO _x INVENTORY	23.05	26.48	26.48
NO _x REDUCTION – PHASE I		2*-3	2* - 3
NO_x REMAINING		24.48 – 23.48	24.48 – 23.48
CONTROL COST:		\$7,950 PER TON NO _x REDUCED	
IMPLEMENTING AGENCY:		SCAQMD	

*The lower end of the emission reduction range will be committed in the SIP as a contingency measure.

DESCRIPTION OF SOURCE CATEGORY

There were approximately 284 facilities in the Regional Clean Air Incentives Market (RECLAIM) program, as of July 1, 2010. The RECLAIM program includes facilities with NO_x or SO_x emissions greater than or equal to four tons per year in 1990 or any subsequent year. A wide range of equipment such as fluid catalytic cracking units, boilers, heaters, furnaces, ovens, kilns, coke calciner, internal combustion engines, and turbines are major sources of NO_x or SO_x emissions at the RECLAIM facilities. This control measure identifies a series of control approaches that can be implemented to further reduce NO_x emissions at the RECLAIM facilities.

Background

The RECLAIM program was first adopted in 1993 to further reduce emissions from the largest NO_x and SO_x emitting stationary sources by providing an alternative regulatory mechanism to the command and control regulatory structure. Under this program, facilities are issued NO_x and SO_x allocations, also known as RECLAIM Trading Credits (RTCs) or facility emission caps, which are declined annually. To meet the declining annual facility caps, RECLAIM facilities have the option of installing pollution control equipment, changing operations, or purchasing RTCs from the RECLAIM market.

The RECLAIM program is subject to several legal mandates. The Health and Safety Code requires the District to monitor the advancement in Best Available Control Retrofit Technology (BARCT), and if BARCT advances, the District is required to periodically re-

assess the overall facility caps, and reduce the RTC holdings, as if the equipment located at the facilities would be subject to applicable equivalent command-and-control BARCT levels. The emission reductions resulting from the programmatic RTC reductions will help the basin attain the National Ambient Air Quality Standards (NAAQS) for ozone and PM_{2.5} as expeditiously as practicable. The BARCT evaluation must include an evaluation of the maximum degree of reduction achievable with advanced control technologies taking into account the environmental, energy, and economic impacts for each class or category of source.

A review of the emissions profile of the RECLAIM universe shows that the NO_x emissions are not evenly distributed among the RECLAIM facilities: the top 10% of the universe (24 facilities) comprised mainly of refineries, power plants, cement, glass, and steel manufacturing, emitted about 80% of the NO_x emissions.

Regulatory History

On October 15, 1993, the AQMD's Governing Board adopted Regulation XX – RECLAIM. The RECLAIM program at its inception included 392 NO_x facilities. RECLAIM Regulation XX includes 11 rules that specify the applicability, definitions, allocations, trading and operational requirements, as well as monitoring, reporting, and recordkeeping requirements. The NO_x RECLAIM regulation has been revised several times, and one significant amendment (2005) reflected a BARCT re-assessment. The January 2005 amendment resulted in a NO_x RTC reduction of 7.7 tons per day (tpd), approximately 22.5% reduction of the RTC holdings, which was implemented in 5 phases: 4 tpd by 2007 and an additional 0.925 tpd in each of the following 4 years.

PROPOSED METHOD OF CONTROL

The proposed Phase I reductions are designed to serve as a contingency measure. It will be implemented if the Basin does not attain the 24-hr PM_{2.5} standard by 2014. Currently there are approximately 8 tpd of excess RTC in the market. A shave of 2 tpd of NO_x RTCs should not cause a significant impact to the market. RTCs were traded on average of \$4 a pound for compliance year 2011. In an effort to further minimize the impact on the majority of the RECLAIM universe, staff will work with stakeholders to evaluate various shaving methodologies (e.g., sector-specific or across-the-board).

EMISSIONS REDUCTION

Phase I reductions target a range of 2-3 TPD NO_x. During the rule development phase, staff may refine the emission reductions to include growth and other unforeseen issues. Phase I is expected to be adopted in 2013 and the shave will be implemented/triggered for compliance year 2015, if the attainment of 24-hr PM_{2.5} standard is not met by 2014.

According to the RECLAIM Annual Audit Reports, NO_x emissions were reduced from 2008 to 2010, and the vast majority of the RECLAIM facilities complied with their RTC allocations. The audited annual NO_x emissions for the entire RECLAIM universe were reported as 22.9, 20, and 19.5 tpd for compliance year 2008, 2009, and 2010, respectively.

The NO_x RTCs allocated for the universe were reported as 29.4, 28.4, and 27.5 tpd for compliance year 2008, 2009, and 2010, respectively. Data in the audit reports reflected an excess of 6.5, 8.4, and 8.0 tpd of RTCs holdings for compliance year 2008, 2009, and 2010, respectively, or approximately a 22–30% excess in RTC holdings in the most recent three years. Being cognizant that the 2008 emission profile may reflect a period of the economic downturn, the RTC reduction range of 2-3 tpd estimated by staff (approximately 25 - 38 percent of the unused RTC holdings) appears to be achievable.

RULE COMPLIANCE AND TEST METHODS

Compliance with the provisions of this control measure would be based on monitoring, recordkeeping, and reporting requirements that have been established in either the RECLAIM program or existing source specific rules and regulations. In addition, compliance would be verified through inspections and other recordkeeping and reporting requirements.

COST EFFECTIVENESS

It is expected that the cost effectiveness for this control measure would be in the neighborhood of \$7950 per ton for Phase I based on the most recent RTC trading prices.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from RECLAIM facilities.

CONTROL COST:		NOT DETERMINED		
IMPLEMENTING AGENCY:		SCAQMD		

* Winter average day reduction based on episodic conditions and on 75% rule effectiveness.

DESCRIPTION OF SOURCE CATEGORY

The purpose of this measure would be to seek further particulate matter (PM) emissions reductions from residential wood burning fireplaces and wood stoves whenever key areas in the South Coast Air Basin are forecast to approach the federal 24-hour PM2.5 standard.

Background

The types of devices used to burn wood in a typical residence are fireplaces and wood heaters (e.g., fireplace inserts and free-standing wood stoves). Since fireplaces are very inefficient heat sources, they are used primarily for aesthetic purposes. Fireplace inserts and wood stoves are much more efficient and in some residences, are used as the primary source of heating (U.S. EPA, 1996).

Pollutant emissions from residential wood burning devices are caused primarily by incomplete combustion and include PM, CO, NO_x, SO_x, and VOC. Particulate emissions, however, have been the focus of most state and local control programs for wood smoke. Studies indicate that the vast majority of particulate emissions from residential wood combustion are in the fine (2.5 micrometers or less) fraction (Naehrer, 2007). Additionally, incomplete combustion of wood produces polycyclic organic matter (POM), a group of compounds classified as hazardous air pollutants under Title III of the federal Clean Air Act.

In 2011, the California Air Resources Board (CARB) conducted a Statewide evaluation of emissions from residential wood combustion based on the most recent emission factors, activity data, and data (where available) from the American Housing Survey, U.S. Census Bureau (CARB, 2011). The results of the updated residential wood combustion emissions inventory,

including reductions from existing control programs (i.e., construction restrictions and curtailments), are factored into the baseline inventory provided in the summary table above.

Regulatory History

Control Measure #MSC-06 (Emission Reductions from Wood-Burning Fireplaces and Stoves) from the 2007 AQMP was implemented in March 2008 through adoption of AQMD Rule 445 - Wood Burning Devices (AQMD, 2008). Under the Rule provisions, only gaseous-fueled hearth devices are allowed in new developments. For existing residential and commercial developments, Rule 445 requires wood burning devices sold or installed in the Basin to be U.S. EPA Phase II-certified or equivalent. Rule 445 prohibits the burning of any product not intended for use as a fuel (e.g., trash) in a wood burning device and requires commercial firewood facilities to only sell seasoned firewood (20% or less moisture content) from July through February. Rule 445 also establishes a mandatory wood burning curtailment program that extends from November 1 through the end of February each winter season. During a wood burning curtailment period, the public is required to refrain from both indoor and outdoor solid fuel burning in specific areas where PM_{2.5} air quality is forecast to exceed 35 µg/m³ (federal 24-hour standard).

In conjunction with the implementation of Rule 445, the District has conducted an incentive program for a discount off of the purchase and installation of a gaseous-fueled device to encourage non-wood burning alternatives. To date the program has resulted in nearly 10,000 installations throughout the Basin and is an ongoing program. In addition, the District is exploring a potential wood stove change-out incentive program whereby certain residences will be offered an incentive to replace their older non-EPA certified wood stove or other non-certified wood burning appliance with an EPA certified wood stove. This will aid in emission reductions by providing a cleaner burning option to those who burn wood as their primary source of heat or otherwise do not have natural gas service for a centralized heating system. These residences are currently exempt from the AQMD Rule 445 residential wood burning curtailment.

PROPOSED METHOD OF CONTROL

Wood smoke reduction programs have been implemented in other jurisdictions for many years. The stringency of each air district's program depends on the region's PM air quality and the relative contribution of wood smoke to ambient fine particulate. While it is acknowledged the overall contribution of residential wood smoke to regional particulate pollution is relatively small (<10%) in the South Coast Basin, its significance can be greater on an episodic basis in the winter months. The severity of the region's PM air quality problem has necessitated a review of wood smoke reduction programs to determine if additional, cost-effective emissions reductions can be achieved.

A review of other California air district regulations and modeling sensitivity analyses have indicated that further reductions in residential wood burning during high PM_{2.5} days would be an effective way to achieve attainment early. It is recommended that the current mandatory wood burning curtailment threshold be lowered from 35 µg/m³ to a more conservative 30 µg/m³. This threshold is used in two other California air districts' wood smoke reduction programs (Sacramento Metropolitan AQMD, 2009; San Joaquin Valley APCD, 2008), and

would provide for a margin of safety given the uncertainties in the air quality forecasts. In addition to the existing sub-regional curtailment program of Rule 445 (based on areas forecast to exceed the existing PM_{2.5} standard), this measure would implement a curtailment that would apply Basin-wide whenever a PM_{2.5} level of greater than 30 µg/m³ is forecast at any monitoring station which has recorded violations of the design value for the current PM_{2.5} 24-hour standard of 35 µg/m³ for either of the two previous three-year design value periods. The design value is the 3-year average of the annual 98th percentile of the 24-hour average values of monitored ambient PM_{2.5} data. For example, for a 2014 implementation year, the three-year average design value would be based on the average of the 98th percentile of ambient PM_{2.5} monitoring for years 2011 through 2013. Therefore, in 2014 under this criteria, either the 2014 (2011-2013) or a 2013 (2010-2012) design value above 35 µg/m³ at any monitoring station would lead to Basin-wide curtailment if a 30 µg/m³ or greater is forecast there. Mira Loma is the only monitoring station that is projected to trigger this Basin-wide curtailment. Current exemptions (e.g., high elevation, sole source of heat, etc.) in Rule 445 will be maintained under this measure. Based on current air quality data, it is expected that there could be up to 20 such curtailment days. It should be noted that, as with the current mandatory program, the Basin-wide curtailment criteria will apply for the entire winter season, which is November through February. Under this measure, consideration will also be given to expanding the defined winter season to potentially include October and/or March.

Key to the success of the control measure is a high level of rule compliance, including consideration of the exemptions provided in Rule 445, such as low-income households, wood burning as the sole source of heat, and a lack of natural gas service. During development of Rule 445 in 2008 AQMD staff reviewed the emissions reduction methodologies for existing wood burning curtailment programs in the San Joaquin Valley and for Sacramento Metropolitan AQMD. The San Joaquin Valley methodology presumed an 80 percent compliance rate while Sacramento Metropolitan presumed a 78 percent compliance rate. Recognizing that the Rule 445 curtailment program contained similar exemptions (e.g., sole source of heat) as the other air district's regulations, a compliance rate of 75 percent was assumed for Rule 445 emissions reductions. Subsequent to adoption of AQMD Rule 445, survey work has been conducted to evaluate the public's knowledge of mandatory wood burning curtailment programs in other California air districts. For the San Joaquin Valley a 2010 survey indicated 83 percent of respondents were aware of the mandatory wood burning curtailment program and a 2009 Sacramento survey documented 92 percent respondent awareness. In the Bay Area, a 2012 survey showed that 75 percent of residents support the no-burn policy and 89 percent stated that they would not burn wood even if a no-burn day was not forecasted for a holiday. Given this information and the fact that the Rule 445 mandatory curtailment notification system is at least equivalent to programs throughout the State, AQMD staff believes that the 75 percent rule effectiveness assumption for this control measure continues to be reasonable.

In order to complement this measure, staff will seek continuation and enhancement of the District's gas log buy-down incentive program

EMISSIONS REDUCTION

Based on historical data from 2009 to 2011, it is estimated that decreasing the existing Rule 445 curtailment threshold from 35 to 30 µg/m³ could result in an approximate 50% increase in the

number of no-burn days (approximately 20 days total) during the November through February winter season. Lowering the wood burning curtailment threshold and applying the curtailment to the entire Basin when triggered could potentially reduce Basin-wide ambient PM_{2.5} concentrations on these episodic no-burn days by about 7.1 tons per winter day (assuming 75% rule effectiveness).

It should be noted that while controlling emissions from residential wood burning is primarily intended to reduce PM_{2.5} emissions, there is an added benefit of also reducing emissions of CO, VOC, NO_x, SO_x, and hazardous air pollutants.

RULE COMPLIANCE AND TEST METHODS

Rule compliance is monitored by AQMD compliance staff on no-burn days in the affected areas. A compliance program has been developed for existing Rule 445, including outreach and education, enhanced surveillance and a progressive warning and fine scheme for violators. Lowering the wood-burning curtailment threshold would represent an increase in no-burn days that are currently monitored by AQMD compliance staff under the current Rule 445 “Check Before You Burn” program. As the program would be expanded to Basin-wide, additional compliance resources may need to be reallocated during no-burn days. A 75% rule effectiveness for this source category is assumed, which accounts for both rule exemptions (i.e. if wood combustion is used as the primary heating source) and expected rule compliance rates.

COST EFFECTIVENESS

The cost effectiveness of this control measure has not been determined. Increasing the number of curtailment days would result in relatively few cost increases to the impacted community. The costs for the district to implement outreach and potentially an incentive program would be approximately \$500,000 beyond current Rule 445 implementation. The District will continue to analyze the potential cost impact associated with implementing this control measure and will provide cost effectiveness information as it becomes available.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from residential wood combustion sources.

BCM-02: FURTHER REDUCTIONS FROM OPEN BURNING [PM2.5]

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		OPEN BURNING		
CONTROL METHODS:		BASIN-WIDE EPISODIC RESTRICTIONS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023
PM2.5 INVENTORY	2.2	4.6	4.6	4.6
PM2.5 REDUCTION*		4.6	4.6	4.6
PM2.5 REMAINING		0	0	0
CONTROL COST:		TBD		
IMPLEMENTING AGENCY:		SCAQMD		

** Reduction based on episodic implementation. Overall annual average emissions will remain unchanged as open burning will shift to non-episodic days.*

DESCRIPTION OF SOURCE CATEGORY

Rule 444 outlines the criteria and guidelines for agricultural and prescribed burning, as well as training burns to minimize PM emissions and smoke in a manner that is consistent with state and federal laws. Agricultural burning is open burning of vegetative materials produced from the growing and harvesting of crops, as well as fields preparation in agricultural operations. Prescribed burning is a planned open burning of vegetative materials, usually conducted by a fire protection agency and/or department of forestry, to promote a healthier habitat for plants and animals, and to prevent plant disease and pest, as well as fire episodes and destruction. Training burns are hands-on trainings conducted by fire protection agencies on methods of preventing and/or suppressing fire.

Background

Currently, Rule 444 allows open burning on permissive burn days, provided that permit and event authorization are obtained, and that such burning events are not prohibited by a fire protection agency. A permissive burn day is declared by the District when certain meteorological conditions are met in one or more of the defined source/receptor areas. Rule 444 also includes general requirements (i.e., burning time window and ignition device) for open burning, as well as particular requirements, such as moisture level and firing methods for agricultural burning, and a Smoke Management Plan for prescribed burning. In addition, Rule 444 sets District-wide maximum daily burn acreage for agricultural and prescribed burning, but is lenient toward training burns if the duration is less than 30 minutes and clean fuel is utilized.

The rule establishes administration and compliance streamlining of the burn program, as well as additional and/or alternative controls to further reduce PM emissions and smoke from open burning.

Regulatory History

Rule 444 – Open Burning, (previously Open Fires) was adopted October 1976. It has been amended three times, first in 1981. The rule was amended in 1987 to incorporate provisions of California Code of Regulations, Title 17 addressing wildland vegetative management burns. The rule was amended in 2001 to incorporate the Smoke Management Guideline requirement of the amended Title 17 and implement 1999 AQMP Control Measure WST-03. It was again amended in November 2008 to implement 2007 AQMP Control Measure BCM-04.

PROPOSED METHOD OF CONTROL

The restriction for no burn days is based on a PM_{2.5} daily forecast. Rule 444 currently contains requirements that a no-burn day may be called under a combination of geographical, meteorological, and air quality conditions. This control measure would potentially increase the number of no-burn days by lowering the air quality forecast threshold. This measure would implement a curtailment that would apply Basin-wide whenever a PM_{2.5} level of greater than 30 $\mu\text{g}/\text{m}^3$ is forecast at any monitoring station which has recorded violations of the design value for the current PM_{2.5} 24-hour standard of 35 $\mu\text{g}/\text{m}^3$ for either of the two previous three-year design value periods. The design value is the 3-year average of the annual 98th percentile of the 24-hour average values of monitored data ambient PM_{2.5} data. For example, for a 2014 implementation year, the three-year average design value would be based on the average of the 98th percentile of ambient PM_{2.5} monitoring for years 2011 through 2013. Therefore, in 2014 under this criteria, either the 2014 (2011-2013) or a 2013 (2010-2012) design value above 35 $\mu\text{g}/\text{m}^3$ at a monitoring station would lead to Basin-wide curtailment if a 30 $\mu\text{g}/\text{m}^3$ or greater is forecast there. As with Control Measure BCM-01, the burn restriction criteria will apply for the entire winter season, which is November through February. Consideration will also be given to expanding the defined winter season to potentially include October and/or March.

For this measure, the rule effectiveness is assumed to be 100% as the open burning activities will be shifted to other permissible burn days, and the full participation of effected entities under the current Rule 444 curtailment program. This measure will also seek to determine economically and technologically feasible alternatives to burning.

EMISSIONS REDUCTION

Enhancing the open burning restrictions with this revised threshold criteria and applying a curtailment to the entire Basin could potentially reduce Basin-wide ambient PM_{2.5} concentrations on these episodic no-burn days by about 4.6 tons per winter day. Since the burning would likely be shifted to other days, the total annual emissions would remain the same, but would not occur on days where high PM_{2.5} levels are forecast.

RULE COMPLIANCE

The measure will be implemented through the existing burn authorization process and field inspectors to ensure rule compliance.

COST EFFECTIVENESS

The cost effectiveness of this control measure has not been determined. Increasing the number of curtailment days would result in changes in operations. The District will continue to analyze the potential cost impacts associated with this measure during rulemaking.

IMPLEMENTING AGENCY

The District has the authority to implement this measure.

**BCM-03: FURTHER PM REDUCTIONS FROM UNDER-FIRED
CHARBROILERS
[PM2.5]**

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		UNDER-FIRED CHARBOILERS		
CONTROL METHODS:		ADD-ON CONTROL EQUIPMENT WITH VENTILATION HOOD REQUIREMENTS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023
PM2.5 INVENTORY	9.06	9.15	9.69	10.05
PM2.5 REDUCTION			1.0*	1.0*
PM2.5 REMAINING		9.15	8.69	9.05
CONTROL COST:		\$15,000 PER TON REDUCED		
IMPLEMENTING AGENCY:		SCAQMD		

* Reductions will be submitted into the SIP once feasible controls are identified.

DESCRIPTION OF SOURCE CATEGORY

This control measure is carried over from the 2007 AQMP/SIP. Restaurant operations emit PM and VOCs. Both of these pollutants contribute to the region's exceedances of State and federal PM2.5 and ozone air quality standards.

Background

Restaurant operations include charbroilers (chain-driven and under-fired), griddles, deep fat fryers, ovens, and other equipment. Based on information from the 2007 AQMP, under-fired charbroilers are responsible for 84 percent of the PM emissions from this source category (2007, AQMD). The emissions summary table above presents PM2.5 emissions from under-fired charbroilers. The emission profile at the Mira Loma station showed a high concentration of organic carbon and cooking ranks as the top source category for directly emitted PM2.5 emissions.

Regulatory History

The 1997 AQMP included Control Measure PRC-03 - Emission Reductions from Restaurant Operations. AQMD Rule 1138, adopted in November 1997, implemented Phase I of this control measure, reducing 0.5 tons per day of PM10 emissions from chain-driven charbroilers.

The 1999 Amendment to the 1997 Ozone State Implementation Plan for the South Coast Air Basin included control measure PRC-03 – Emission Reductions from Restaurant Operations – Phase II, with a goal of reducing 0.9 tons per day VOC and 7.0 tons per day of PM10 (AQMD, 1999).

In August 2000, staff reported that cost-effective controls for under-fired charbroilers were limited and recommended substituting the remaining 0.9 tons/day of VOC emissions reductions assigned to this source category with reductions from another control measure (AQMD, 2000). However, because of the significant contribution of PM emissions from under-fired charbroilers the 2003 AQMP included Control Measure PRC-03 – Emission Reductions from Restaurant Operation to reduce PM10 emissions by 1 ton per day by 2010. This represented a conservative reduction from a baseline of approximately 10 tons per day as cost-effective controls for the majority of under-fired charbroilers had not yet been developed.

A report to the Board was made in December 2004 recommending findings of infeasibility be made for control measure PRC-03, and substitute emission reductions from other adopted rules, as required by the 2003 AQMP (AQMD, 2004). AQMD staff also recommended funding for demonstration projects. In December 2004, the Board authorized up to \$200,000 from mitigation fees collected pursuant to Rule 1309.1 – Priority Reserve, to fund six to eight new or retrofit demonstration sites on large restaurants. However, no applications were received for this project.

The 2007 AQMP carried over a control measure intended to reduce emissions from under-fired charbroilers (AQMD, 2007). The 2007 control measure (#BCM-05) described Bay Area AQMD rule development efforts that identified use of electrostatic precipitators (ESP), high-efficiency particulate arresting (HEPA) filters, wet scrubbers, and thermal oxidizers at high-volume restaurants with under-fired charbroilers.

In 2008-2009, staff reinitiated rule development for restaurants with under-fired charbroilers and held a series of working group meetings and a Public Workshop (AQMD, 2009). Due to lack of demonstrable cost-effective and affordable control technologies: however, AQMD staff determined rule adoption at that time was not feasible.

Control Technology Research

In 2011, AQMD staff requested an amendment to an existing University of California at Riverside – Center for Environmental Research and Technology (CE-CERT) contract to re-establish a test kitchen and test potential under-fired charbroiler control devices (AQMD, 2011). In October 2011, the Board approved an additional \$216,000 for control device testing and authorized release of a Program Opportunity Notice (PON) to solicit proposals from control device vendors. As described in the PON, the District proposed to fund screening tests for up to three devices per manufacturer. Recognizing that any feasible control device must be affordable to the restaurant operator, one focus of the testing program was to evaluate potential control devices that have a capital and installation cost below \$30,000 and annual operating costs below \$10,000. It is intended that any control installation will not affect the cooking process; therefore the focus is for in-hood or rooftop/duct work placement of the device so as not to impact the taste or appearance of the charbroiled meat. Equipment showing promise in achieving desirable emission reduction rates during the screening tests would be tested using the full AQMD Test Protocol for Determining PM Emissions from Under-fired Charbroilers paid for by the District. An additional action was approved by the AQMD Governing Board in 2011 to develop a sole-source contract with CE-CERT, not to exceed \$150,000, to provide a detailed speciation and toxicity analysis of emissions from under-fired charbroilers.

Five manufacturers responded to the PON with control technologies that include a catalytic oxidation device, filtration systems (one with activated charcoal), and a centrifuge system with an aerosol mist nebulizer. Under the PON process all submittals were subsequently reviewed by a technical evaluation panel comprised of AQMD staff and representatives from CE-CERT, Bay Area AQMD, and San Joaquin Valley APCD. The panel determined that all PON applications had technical merit and recommended that each manufacturer participate in the screening evaluations which began in May of 2012. Screening tests for other control devices are ongoing and full AQMD protocol testing will be initiated on control device technologies that pass the screening test.

PROPOSED METHOD OF CONTROL

Restaurant operations continue to be a significant contributor to the PM_{2.5} emission inventory. To date, a variety of control device technologies have been proposed for testing under the PON process. Results from these evaluations will guide future Rule development efforts. The following paragraph describes an under-fired charbroiler control program implemented by another California air district.

In 2007, the Bay Area AQMD adopted Regulation 6, Rule 2 for commercial cooking equipment (Bay Area AQMD, 2007). While this regulation mirrors the District's Rule 1138 requirements for chain driven charbroilers, it also contains control requirements for new and existing under-fired charbroilers with a facility-wide cooking surface of greater than or equal to 10 square feet. The rule exempts those operations cooking less than 800 lbs of beef per week. The regulation identifies a list of feasible control technologies available to reach an emissions limit of 1.9 pounds of PM₁₀ per 1,000 pounds of meat cooked. Control options include ESPs, HEPA filters, wet scrubbers, and thermal oxidizers. The rule also requires ventilation hoods on new installations to meet standards of the Underwriters Laboratory (UL). There are currently several restaurants operating under-fired charbroilers which will be required to comply with the Bay Area AQMD's Rule in 2013. AQMD staff continues to evaluate the Bay Area AQMD's technical assessment and is monitoring rule implementation.

This control measure will be implemented in two phases. Phase I will be the completion of the technical assessment at CE-CERT, including considerations for compatibility with existing restaurants and all applicable building and safety codes (e.g. fire suppression). Evaluation of cost and affordability associated with the purchase, installation, and operation and maintenance (e.g., cleaning and/or replacing filters) of the equipment will also be assessed.

The findings from the control technology research currently being conducted will be the basis for potential future control requirements. Phase II will be the final technical and economic feasibility analysis in conjunction with potential rule development to establish requirements for under-fired charbroilers, if Phase I results suggest the feasibility of controls.

EMISSIONS REDUCTION

Control measure #BCM 05 - PM Emission Reductions from Under-Fired Charbroilers estimated that requiring large volume restaurants to install either ESP or HEPA control devices with at least 85 percent control could achieve a PM_{2.5} reduction of 1.1 tons per day from this source category (AQMD, 2007).

A subsequent review of potential emissions reductions was developed during preparation of the 2009 Proposed Amended Rule 1138 Preliminary Draft Staff Report (AQMD, 2009). This analysis was based on restaurant counts and activity data from a locally-developed survey (Rogozen, 1999) and PM emissions factors from a cooking device test report (CE-CERT, 1997). The Preliminary Draft Staff Report indicated potential emission reductions of filterable/condensable PM_{2.5} of 1.8 to 2.1 tons per day, based on an overall control efficiency of 85 percent, for restaurants cooking 1,250 pounds of hamburger per week. These potential emissions reductions, however, were determined to be infeasible due to a lack of affordable control technologies. Currently, several new control technologies are beginning to be demonstrated. If any of them turn out to be feasible, this measure will require emission reductions equivalent to the use of such technologies.

Emissions reductions specific to this control measure are unknown at this time, however, preliminary evaluation of control technologies indicates the potential to reduce PM_{2.5} emissions by approximately one ton per day from larger under-fired charbroiler operations. Any future rulemaking efforts would be based on technical and economic feasibility analysis as derived from the ongoing CE-CERT/AQMD research effort.

RULE COMPLIANCE AND TEST METHODS

Compliance requirements for this control measure would depend on the control strategy implemented. In conjunction with the rule development process for Rule 1138 and associated source testing, the document “Protocol – Determination of Particulate and Volatile Organic Compound Emissions from Restaurant Operations” was published November 14, 1997. These test methods are currently being used for testing and potential certification of charbroiler control devices. The test methods are used by qualified labs to certify the emissions level of specific control systems but have not been employed to test emissions at individual restaurants.

COST EFFECTIVENESS

The cost-effectiveness estimate associated with control measure implementation is preliminary at \$15,000 per ton PM_{2.5} reduced and is based on the control technologies currently under evaluation. The District would analyze industry cost impacts as part of potential future Rule development.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from restaurant operations.

**BCM-04: FURTHER AMMONIA REDUCTIONS FROM
LIVESTOCK WASTE
[NH3]**

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		FRESH LIVESTOCK WASTE		
CONTROL METHODS:		EPISODIC APPLICATION OF ACIDIFICATION OF MANURE TO REDUCE AMMONIA EMISSIONS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023
NH3 INVENTORY	12.4	11.0	7.7	5.7
NH3 REDUCTION		TBD*	TBD*	TBD*
<i>POLLUTANT REMAINING</i>		TBD	TBD	TBD
CONTROL COST:		TBD		
IMPLEMENTING AGENCY:		SCAQMD		

* TBD are reductions to be determined once the technical assessment is complete and the control approach are identified.

DESCRIPTION OF SOURCE CATEGORY

The purpose of the control measure is to reduce ammonia emissions from livestock operations with emphasis on dairies.

Background

The SCAB is exceeding both State and federal health-based air quality standards for PM_{2.5} and is currently designated by the U.S. EPA as non-attainment area for PM_{2.5}. The AQMD is required to attain the 24-hour PM_{2.5} standards by 2014-2019. Ammonia contributes to formation of PM_{2.5} and mixes with transport emissions, particularly to form aerosol ammonium nitrate and ammonium sulfate. Livestock waste produces appreciable amounts of ammonia emissions.

In 2008/2009, there were approximately 208,000 dairy cattle, 7.9 million poultry, and 5,500 swine in the South Coast Air Basin. In general, with existing regulatory (i.e., Proposition 2 – known as cage-free proposition that passed in 2008), economic, and product demand climate, the livestock industry in the South Coast jurisdiction is not considered a growth industry into the future. However, with findings from recent research that freshly excreted manure in the animal housing areas is the major source of ammonia emissions and each cow produces approximately 60 kg of manure daily, selection of effective measures to minimize ammonia emissions from fresh manure is the focus of this control measure.

Regulatory History

Rule 1133.2 – Emission Reductions from Co-Composting Operations which was adopted in 2003 requires existing and new co-composting (including manure composting) facilities to comply with proper composting and control in order to achieve a minimum of 70% and 80% VOC reductions, respectively, and similar reductions for ammonia.

The 2007 AQMP Control Measure MCS-05 - Emission Reductions from Livestock Waste sought additional emission reductions from confined animal facilities (CAFs), beyond those achieved by current Rules 223 and 1127. Control Measure MCS-05 suggested adding control requirements for swine operations to meet the objectives of California Senate Bill (SB) 700 – Agriculture & Air Quality Summary and Implementation. The control measure aimed to require more stringent controls (Class Two Mitigation Measures) for large CAFs, including core measures across the board, and lesser controls (Class One Mitigation Measures) for smaller CAFs not currently subject to Rule 223 by bringing them into the District permit system. The control measure also aimed to further expand the scope of Rule 1127 and its Best Management Practices based on anticipated results of on-going and future scientific research regarding manure management. Overall, MCS-05 estimated 20% emissions reduction from each of the dairy, poultry, and swine categories.

Currently, Rule 223 – Emission Reduction Permits for Large Confined Animal Facilities requires a written Permit to Operate for all large CAFs, which are defined as facilities with (1): 1,000 or more milking cows; or 3,500 or more beef cattle; or 7,500 or more calves, heifers, or other cattle; or (2): 650,000 or more laying hens; or (3): 3,000 or more swine. In addition, the rule also requires these large facilities to submit and implement an emission mitigation plan which can be developed based on different classes of mitigation measures to mainly minimize VOC emissions from housing, feed operations, and manure handling.

Rule 1127 – Emission Reductions from Livestock Waste requires best management practices for dairies and specific requirements regarding manure removal, handling, and composting; however, the rule does not focus on fresh manure, which is one of the largest dairy sources of ammonia emissions.

In 2011, staff conducted the Technology Assessment that included a revised emissions inventory for all pollutants, including ammonia, to reflect new emission factors as well as current and future livestock animal headcounts which were higher than anticipated in the 2007 AQMP. Based on the revised emissions inventory, industry-level projections (i.e., mostly negative growth), and current regulatory requirements, staff recommended that Rule 1127 amendments not be pursued at that time. Staff also recommended that the 2014 VOC emission reduction shortfall be made up with excess VOC emission reductions generated from the implementation of Rule 1143 – Consumer Paint Thinners and Multi-Purpose Solvents. However, this category remains a significant source of ammonia emissions.

Emission Control Research

The acidifier sodium bisulfate (SBS) has been used to reduce pH and therefore bacterial level in dairy bedding, as well as to prevent environmental mastitis (a potentially fatal mammary gland infection) and calf respiratory stress. In California, SBS has been used by dairies in Tulare,

Fresno, Merced, Stanislaus, San Joaquin, Kings, Kern, San Bernardino, Riverside, San Benito, and Sacramento, mainly to prevent cow lameness and nuisance flies. It has also been used by dairies in Walla Walla, Columbia, and Whitman (Washington), Wallowa (Oregon), and Wisconsin.

SBS is a hygroscopic acid salt and is an effective ammonia-reducing agent for fresh manure. SBS dissociates into Na^+ , H^+ , and SO_4^{2-} upon application to the manure, bedding, or dry lot surface. H^+ reduces the pH and protonates ammonia, converting it to ammonium. The ammonium is then bound by sulfate to form ammonium sulfate, which is retained in the manure in its solid form. Theoretically, 100 lbs of SBS would bind 14 lbs NH_3 .

Research indicates that most ammonia reduction from dairy slurry (up to 84%) occurred during the first day of SBS application and that ammonia emissions decreased with increasing levels of SBS application. However, after 24 hrs, the reduction rates decreased and by day 3, the reduction rates were no longer different between dosages. On the average, SBS application was able to achieve a 60% ammonia emissions reduction with a 0.375 kg/m^2 ($76.8 \text{ lb/1,000 ft}^2$) SBS application rate. Other findings reveal that SBS most effectively reduced ammonia emissions from dairy corrals at either an application rate of 50 lbs/1,000 ft^2 , 3 times/week, or 75 lbs/1,000 ft^2 , 2 times/week.

Recent research findings also indicate the effectiveness of SBS in alcohol control (up to 61% methanol reduction and 58% ethanol reduction), as well as fly control (up to 99% reduction) and bacteria reduction (68%) in dairies, depending on the application rates.

Currently, there is no research regarding the effects of SBS on odors at dairies; however, since pH reduction inhibits bacterial decomposition of nitrogenous compounds in the manure, it is believed that odors would also be reduced.

There is no research on the effects of topical application of SBS on cow milk production. Currently, there is one publication indicating a 5% to 15% increase in milk yield (depending on the lactation stages) for cows on the SBS-treated silage (as silage additive) with no adverse effects on the cows' blood biochemistry.

SBS is safe to be used for water treatment. According to the published findings by EPA, SBS can be used as a disinfectant to prevent damage of the membrane used in reverse osmosis. SBS is certified by the NSF/ANSI for treating drinking water (chlorine removal, corrosion & scale control, and pH adjustment) and has been used in California, Pennsylvania, and Oregon. It has also been used to remediate high pH soil at a construction site in California. Although the Chino area has an on-going desalting project, as with other salt-containing products, the use of SBS should be carefully considered in areas that are sensitive to salts and/or with existing high salt loading in soil. Application at high rates could form nitrous oxide. In addition, SBS must be applied at 50 to 75 lbs/1,000 ft^2 , 2 times per week to manure to maintain constant emission reductions as the substance loses its effectiveness over time.

PROPOSED METHOD OF CONTROL

Reducing pH level in manure through the application of acidulant additives (acidifier) is one of the potential mitigations for ammonia. SBS is being considered for use in animal housing areas where high concentrations of fresh manure are located. Research indicates best results with the use of SBS on “hot spots”. SBS can also be applied to manure stock piles and at fencelines, and upon scraping manure to reduce ammonia spiking from the leftover remnants of manure and urine. SBS application may be required seasonally or episodically during times when high ambient PM_{2.5} levels are of concern.

This control measure will be implemented in two phases. Phase I will be to conduct a technical assessment of the aforementioned method of control. The technical assessment will evaluate the application of SBS at local dairies so as to evaluate the direct technical and economic feasibility of application, including episodic application only. The technical assessment will also examine potential impacts to animal and worker health and safety associated with uses of SBS. Staff intends to work with stakeholders at the Regional Water Quality Control Board relative to potential ground water impacts from the land spreading of manure treated with SBS.

If deemed feasible and effective, Phase II would implement the measure as needed to address future PM_{2.5} standards. Rule requirements would be specific to dairies in the AQMD jurisdiction and may be unique to localized operations only. As such, the requirements may not be applicable to dairies elsewhere where a site-specific assessment would need to be made relative to those particular conditions. Each air district will likely need to conduct their own assessment as to the feasibility of SBS application in their jurisdiction.

EMISSIONS REDUCTION

The emission reductions associated with SBS application are unknown at this time. Based on historical data, application may only be required for 8 weeks out of the year. Research indicates emission reduction potential in the range of 60%; however, SBS application timing and manure coverage variables require further consideration. Existing information regarding SBS application at dairies in the South Coast Air Basin, and indicates an overall emission reduction potential of about 50%. Current use of SBS and application coverage volume and rates, along with cost, will be examined in conjunction with the above referenced Phase I pilot program and assessment.

RULE COMPLIANCE AND TEST METHODS

TBD

COST EFFECTIVENESS

SBS can be applied by hand application or by tractor-driven fertilizer spreader; therefore, the operating costs would be minimal.

For dairies, SBS application at 50 to 75 lbs/1,000 ft², 2 times per week would cost \$33 to \$49.50/1,000 ft²/week. For treatment of heavy-traffic areas only, the estimated cost would be \$2.48 to \$3.71/cow/week (assuming 4 cows/1,000 ft²).

Costs to livestock facilities could be less when accounting for the fact that many dairies may already be using SBS for other purposes. If dairy operators already have the application equipment and only need to increase the amount and/or frequency of SBS application, they may already be seeing some potential co-benefits of increased milk yield and healthier animals. As discussed under Emission Reductions above, due to the unknown frequency of episodic applications, exact cost per facility or cost-effectiveness will vary by year.

IMPLEMENTING AGENCY

The District has the authority to regulate ammonia emissions from livestock waste.

CONTROL COST:	TBD			
IMPLEMENTING AGENCY:	SCAQMD			

* The purpose of this control measure is to ensure the emissions from port-related sources are at or below the AQMP baseline inventories for PM_{2.5} attainment demonstration. The emissions presented herein were used for attainment demonstration of the 24-hr PM 2.5 standard by 2014.

DESCRIPTION OF SOURCE CATEGORY

This control measure is carried over from the 2007 AQMP/SIP.

Background

The ports of Los Angeles and Long Beach are the largest in the nation in terms of container throughput, and collectively are the single largest fixed sources of air pollution in Southern California. Emissions from port-related sources, such as marine vessels, locomotives, trucks, harbor craft and cargo handling equipment, adversely affect air quality in the local port area as well as regionally. Without substantial control of emissions from port-related sources, it will not be possible for this region to attain federal ambient air quality standards for ozone or PM_{2.5}. Port sources also contribute to cancer risks.

In 2006 the Ports of Los Angeles and Long Beach, with the participation and cooperation of the staff of the SCAQMD, CARB, and U.S. EPA, adopted the San Pedro Bay Ports Clean Air Action Plan (CAAP). The CAAP was further amended in 2010, updating many of the goals and implementation strategies to reduce air emissions and health risks associated with port operations while allowing port development to continue. In addition to addressing health risks from port-related sources, the CAAP sought the reduction of criteria pollutant emissions to the levels that assure port-related sources decrease their “fair share” of regional emissions to enable the Basin to attain state and federal ambient air quality standards.

The CAAP focuses primarily on reducing diesel particulate matter (DPM), along with NO_x and SO_x. The CAAP includes proposed strategies on port-related sources that are implemented through new leases or Port-wide tariffs, Memoranda of Understanding (MOU), voluntary action, grants or incentive programs.

The goals set forth in the CAAP include:

- Health Risk Reduction Standard: 85% reduction in population-weighted cancer risk by 2020
- Emission Reduction Standards:
 - By 2014, reduce emissions by 72% for DPM, 22% for NO_x, and 93% for SO_x
 - By 2023, reduce emissions by 77% for DPM, 59% for NO_x, and 93% for SO_x

In addition to the CAAP, the Ports have completed annual inventories of port-related sources since 2005. These inventories have been completed in conjunction with a technical working group composed of the SCAQMD, CARB, and U.S. EPA. Based on the latest inventories, it is estimated that the emissions from port-related sources will meet the 2012 AQMP emission targets necessary for meeting the 24-hr PM_{2.5} ambient air quality standard.

While many of the emission reduction targets in the CAAP result from implementation of federal and state regulations, some are contingent upon the Ports taking further actions which are voluntary in nature. These voluntary actions include the Expanded Vessel Speed Reduction Incentive Program, Green Flag Program, Clean Truck Program, Oceangoing Vessel Low Sulfur Fuel Program, and the Shore-side power and Auxiliary Marine Power Program. This control

measure is designed to provide an “insurance policy” that provides a “backstop” to the Ports’ actions, and ensures that the emission targets from port-related sources are met in a timely manner.

Regulatory History

The CAAP sets out the emission control programs and plans that will help mitigate air quality impacts from port-related sources. The CAAP relies on a combination of regulatory requirements and voluntary control strategies which go beyond U.S. EPA or CARB requirements, or are implemented faster than regulatory rules. The regulations which the CAAP relies on include international, federal and state requirements controlling port-related sources such as marine vessels, harbor craft, cargo handling equipment, locomotives, and trucks.

The International Maritime Organization (IMO) MARPOL Annex VI, which came into force in May 2005, set new international NO_x emission limits on Category 3 (>30 liters per cylinder displacement) marine engines installed on new vessels retroactive to the year 2000. In October 2008, the IMO adopted an amendment which places a global limit on marine fuel sulfur content of 0.1 percent by 2015 for specific areas known as Emission Control Areas (ECA). The South Coast District waters of the California coast are included in an ECA and ships calling at the Port of Los Angeles and Long Beach have to meet this new fuel standard. In addition, the 2008 IMO amendment required new ships built after January 1, 2016 which will be used in an Emission Control Area (ECA) to meet a Tier III NO_x emission standard which is 80 percent lower than the original emission standard.

To reduce emissions from switch and line-haul locomotives, the U.S. EPA in 2008 established a series of increasingly strict emission standards for new or remanufactured locomotive engines. The emission standards are implemented by “Tier” with Tier 0 as the least stringent and Tier 4 being the most stringent. U.S. EPA also established remanufacture standards for both line haul and switch engines. For Tiers 0, 1, and 2, the remanufacture standards are more stringent than the new manufacture standards for those engines for some pollutants.

To reduce emissions from on-road, heavy-duty diesel trucks, U.S. EPA established a series of cleaner emission standards for new engines, starting in 1988. The U.S. EPA promulgated the final and cleanest standards with the 2007 Heavy Duty Highway Rule. Starting with model year 2010, all new heavy-duty trucks have to meet the final emission standards specified in the rule.

On December 8, 2005, CARB approved the Regulation for Mobile Cargo-Handling Equipment (CHE) at Ports and Intermodal Rail Yards (Title 13, CCR, Section 2479), which is designed to use best available control technology (BACT) to reduce diesel PM and NO_x emissions from mobile cargo-handling equipment at ports and intermodal rail yards. The regulation became effective December 31, 2006. Since January 1, 2007, the regulation imposes emission performance standards on new and in-use terminal equipment that vary by equipment type.

In 1998, the railroads and CARB entered into an MOU to accelerate the introduction of Tier 2 locomotives into the SCAB. The MOU includes provisions for a fleet average in the SCAB, equivalent to U.S. EPA's Tier 2 locomotive standard by 2010. The MOU addressed NO_x emissions from locomotives. Under the MOU, NO_x levels from locomotives are reduced by 67 percent.

On June 30, 2005, Union Pacific Railroad (UP) and Burlington Northern Santa Fe Railroad (BNSF) entered into a Statewide Rail Yard Agreement to Reduce Diesel PM at California Rail Yards with the CARB. The railroads committed to implementing certain actions from rail operations throughout the state. In addition, the railroads prepared equipment inventories and conducted dispersion modeling for Diesel PM.

In December 2007, CARB adopted a regulation which applies to heavy-duty diesel trucks operating at California ports and intermodal rail yards. This regulation eventually will require all drayage trucks to meet 2007 on-road emission standards by 2014.

Areas where the CAAP went beyond existing regulatory requirements or accelerated the implementation of current IMO, U.S. EPA, or CARB rules include emissions reductions from ocean-going vessels through lowering vessel speeds, accelerating the introduction of 2007/2010 on-road heavy-duty drayage trucks, maximizing the use of shore-side power for ocean-going vessels while at berth, early use of low-sulfur fuel in ocean-going vessels, and the restriction of high-emitting locomotives on port property. Each of these strategies is highlighted below.

HDVI – Performance Standards for On-Road Heavy Duty Vehicles (Clean Truck Program)

This control measure requires that all on-road trucks entering the ports comply with the Clean Truck Program. Several milestones occurred early in the program implementation, but the current requirement bans all trucks not meeting the 2007 on-road heavy-duty truck emission standards from port property. This program has the effect of accelerating the introduction of clean trucks sooner than would have occurred under the state-wide drayage truck regulation framework.

OGVI – Vessel Speed Reduction Program (VSRP): Under this voluntary program, the Port requested that ships coming into the Ports reduce their speed to 12 knots or less within 20nm of the Point Fermin Lighthouse. The program started in May 2001. The Ports expanded the program out to 40 nm from the Point Fermin Lighthouse in 2010.

OGV3/OGV4 – Low Sulfur Fuel for Auxiliary and Main Engines and Auxiliary Boilers: OGV3 reduces emissions for auxiliary engines and auxiliary boilers of OGVs during their approach and departure from the ports, including hoteling, by switching to MGO or MDO with a fuel sulfur content of 0.2 percent or less within 40 nm from Point Fermin. OGV4 Control measure reduces emissions from main engines during their approach and departure from the ports. OGV3 and OVV4 are implemented as terminal leases are renewed.

RL-3 – New and Redeveloped Near-Dock Rail Yards: The Ports have committed to support the goal of accelerating the natural turnover of line-haul locomotive fleet to at least 95 percent Tier 4 by 2020. In addition, this control measure establishes the minimum standard goal that the Class 1 (UP and BNSF) locomotive fleet associated with new and redeveloped near-dock rail yards use 15-minute idle restrictors and ULSD or alternative fuels, and as part of the environmental review process for upcoming rail projects, 40% of line-haul locomotives accessing port property will meet a Tier 3 emission standard and 50% will meet Tier 4.

PROPOSED METHOD OF CONTROL

The goal of this measure is to ensure that NO_x, SO_x and PM_{2.5} emissions reductions from port-related sources are sufficient to attain the 24-hr federal PM_{2.5} ambient air quality standard. Based on current and future emission inventory projections, anticipated emission reductions from port-related sources will be sufficient to achieve attainment of the 24-hr federal PM_{2.5} ambient air quality standard. This measure is divided into two phases. The Phase I requirements are triggered if emission levels projected to result from the current regulatory requirements and voluntary reduction strategies that are assumed and relied upon in the 2012 AQMP are not realized. Once triggered, the ports will be required to develop and implement a plan to reduce emissions from their sources to meet the emission targets. This control measure is designed to ensure that the necessary emission reductions from port-related sources projected in the 2012 AQMP milestone years are achieved. The Phase II is designed to reduce emissions if it is later determined through a SIP amendment that additional region-wide reductions are needed due to the change in Basin-wide carrying capacity for PM_{2.5} attainment. In this case, the ports will be required to develop and implement a plan to further reduce their emissions on a “fair-share” basis.

This control measure will be implemented through a District rule. This control measure applies to the Port of Los Angeles and the Port of Long Beach, acting through their respective Boards of Harbor Commissioners. The ports may have the option to comply separately or jointly with provisions of the “backstop” rule.

Elements of Backstop Rule

Summary: This control measure will establish enforceable nonattainment pollutant emission reduction goals for the ports in order to ensure attainment of the 24-hr PM_{2.5} attainment strategy in the 2012 AQMP. The “backstop” rule will be implemented if aggregate emissions from port-related sources exceed specified emissions targets. If emissions do not exceed such targets, the ports will have no control obligations under this control measure.

Emissions Targets: The emissions inventories projected for the port-related sources in the 2012 AQMP are an integral part of the 24-hr PM_{2.5} attainment demonstration by 2014 and its maintenance in 2019. These emissions serve as emission targets for meeting the 24-hr PM_{2.5} standard. Future targets will be developed for the ozone standards in future SIP revisions.

Scope of Emissions Included: Emissions from all sources associated with each port, including equipment on port property, marine vessels traveling to and from the port while in California Coastal Waters, locomotives and trucks traveling to and from port-owned property while within the South Coast Air Basin. This analysis will make use of the Port’s annual emission inventory, either jointly or individually, as the basis for the emission targets. The inventory methodology to estimate these emissions is consistent with the CAAP methodology.

Trigger Causing Backstop Rule Regulatory Requirements to Come Into Effect: The Phase 1 of the “backstop” requirements will be triggered if the reported emissions for 2014 for port-related sources exceed the 2014 target milestone. The Phase II requirements will be triggered after a

two-step evaluation. First, the Basin fails to meet the 24-hr PM_{2.5} standard as demonstrated in the 2012 AQMP and there is a change in Basin-wide carrying capacity, in which case a new reduction target for each pollutant will be established. The second step will evaluate the feasibility of further emission reductions from port-related sources using a “fair-share” methodology. District staff will work with the ports, other stakeholders, CARB and U.S. EPA to perform such a feasibility analysis and present it to the the Governing Board at a regularly scheduled public meeting.

Requirements if Backstop Triggered: If the “backstop” rule is triggered, the Ports would submit an Emission Control Plan to the District. The plan should include measures sufficient to bring the Ports back into compliance with the 2014 emission targets (Phase I) and to further reduce their emissions to the new target based on their contribution to the total inventories, necessary in meeting the 24-hr PM_{2.5} standard through a SIP amendment (Phase II). The Ports may choose any number of implementation tools that can achieve the necessary reduction. These may include environmental lease conditions, port rules, tariffs or incentives. Failure to implement the plan would be a violation of this control measure.

RULE COMPLIANCE AND TEST METHODS

Compliance with this control measure will depend on the type of control strategy implemented. Compliance will be verified through compliance plans, and enforced through submittal and review of records, reports, and emission inventories.

COST EFFECTIVENESS

The cost effectiveness will be determined based on the control option selected. A maximum cost-effectiveness threshold will be established for each pollutant during rule development. The rule will not require any additional control strategy to be implemented which exceeds the threshold.

IMPLEMENTING AGENCY

The District has authority to adopt regulations to reduce or mitigate emissions from indirect sources, i.e. facilities such as ports that attract on- and off-road mobile sources, and has certain authorities to control emissions from off-road mobile sources themselves. These authorities include the following:

Indirect Source Controls. State law provides the District authority to adopt rules to control emissions from “indirect sources.” The Clean Air Act defines an indirect source as a “facility, building, structure, installation, real property, road or highway which attracts, or may attract, mobile sources of pollution.” 42 U.S.C. § 7410(a)(5)(C); CAA § 110(a)(5)(C). Districts are authorized to adopt rules to “reduce or mitigate emissions from indirect sources” of pollution. (Health & Safety Code § 40716(a)(1)). The South Coast District is also required to adopt indirect source rules for areas where there are “high-level, localized concentrations of pollutants or with respect to any new source that will have a significant impact on air quality in the South Coast Air Basin.” (Health & Safety Code § 40440(b)(3)). The federal Court of Appeals has

held that an indirect source rule is not a preempted “emission standard.” *National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District*, 627 F.3d. 730 (9th Cir. 2010)

Nonvehicular (Off-Road) Source Emissions Standards. Under California law “local and regional authorities,” including the ports and the District, have primary responsibility for the control of air pollution from all sources other than motor vehicles. (Health & Safety Code § 40000). Such “nonvehicular” sources include marine vessels, locomotives and other non-road equipment. CARB has concurrent authority under state law to regulate these sources. The federal Clean Air Act preempts states and local governments from adopting emission standards and other requirements for new locomotives (Clean Air Act § 209(e); 42 U.S.C. § 7543(e)), but California may establish and enforce standards for other non-road sources upon receiving authorization from EPA (*Id.*). No such federal authorization is required for state or local fuel, operational, or mass emission limits for marine vessels, locomotives or other non-road equipment. (40 CFR Pt. 89, Subpt. A, App.A; *Engine Manufacturers Assn. v. Environmental Protection Agency*, 88 F.3d. 1075 (DC Cir. 1996)).

Fuel Sulfur Limits. With respect to non-road engines, including marine vessels and locomotives, the District and CARB have concurrent authority to establish fuel limits, such as those on sulfur content. As was noted above, fuel regulations for non-road equipment are not preempted by the Clean Air Act and do not require EPA authorization.

Operational Limits. The District has authority under state law to establish operational limits for nonvehicular sources such as marine vessels, locomotives, and cargo handling equipment (to the extent cargo handling equipment is “nonvehicular”). As was discussed above, operational limits for non-road equipment are not preempted by the Clean Air Act. In addition, the District may adopt operational limits for motor vehicles such as indirect source controls and transportation controls without receiving an authorization or waiver from U.S. EPA.

* Emissions inventory and reductions cannot be quantified due to the nature of the measure (e.g., outreach, incentive programs).

DESCRIPTION OF SOURCE CATEGORY

This control measure is carried over from the 2007 AQMP/SIP.

Background

Energy efficiency and conservation have been included in the District's Air Quality Management Plans since 1991. The District continues to implement incentive and education programs to help promote clean air purchases, efficiency projects, and conservation techniques that provide criteria pollutant emissions benefits. The District has since adopted policies such as the Air Quality Related Energy Policy, Climate Change Policy, and Green Policy that help further define the District's efforts in these areas.

This measure seeks to increase awareness of the benefits of purchasing low emitting products and promote further implementation of efficiency and conservation projects. When making purchases such as new cars, yard equipment, or household products, there are several factors consumers consider, but emissions and health benefits are typically not considerations. To help make emissions an important factor in purchasers' decision-making process, the District has several existing outreach and education programs in place such as Clean Air Connections, Clean Air Choices, Air Quality Institute, educational materials, conferences, and outreach to specific communities throughout the District. Providing additional outreach and education regarding clean air choices will help consumers consider the emission benefits of their purchases. In some

instances, these purchases include efficiency gains that will decrease longer term operating costs, and thus provide a built-in financial incentive. Providing specific outreach and education on these potential cost savings will help increase penetration of such low emitting technologies and practices.

Furthermore, there are several existing incentive programs to help promote higher efficiency and lower emitting technologies such as the utility administered rebate programs for purchases of high efficiency appliances. Some of these existing programs are established for reasons other than emissions benefits. For instance, the electric utility rebate program was established to reduce electricity demand to help decrease the need for additional generation plants. However, this program also provides emission benefits that might be implemented faster with further education and outreach by the District.

The outreach and education regarding these existing programs will include information on co-benefits such as emission reductions and cost savings to promote accelerated implementation of these existing programs. The District will also offer additional incentive programs to complement existing programs or promote specific efficient low emitting technologies. For instance, the District's Lawn Mower Exchange program provides a good example of the significant impacts incentive programs can have. Over the past nine years over 43,000 gasoline lawnmowers have been exchanged for electric mowers.

The District will also help to promote potential efficiency benefits for existing equipment and structures. There are several reasons why many efficiency projects are not undertaken. In many instances tools, incentive programs, and loan programs for efficiency upgrades are not adequately described, advertised, or consolidated. Certain projects require high initial capital costs, despite relatively fast payback periods, which serves as a barrier to implementation. In addition, technical barriers prevent many system operators, home owners, and building maintenance crews from utilizing existing tools and implementing efficiency projects. The District will help develop technical outreach to residents and businesses to help implement projects that have emission benefits and short payback periods. The District may also examine ways to provide assistance through additional incentive programs and/or loan products to defray or amortize capital costs on certain efficiency projects.

Regulatory History

As this measure is not a regulatory item that will be implemented via rulemaking, there is no relevant regulatory history in this area. However, as mentioned above, the District has developed and implemented a wide array of education, outreach, technical assistance, and incentive programs designed to achieve emission reductions on a voluntary basis.

PROPOSED METHOD OF CONTROL

This control measure is a voluntary program that provides education and outreach to consumers, business owners, and residences regarding the benefits of making clean air choices in purchases, conducting efficiency upgrades, installing clean energy sources, and approaches to conservation. These efforts will be complemented with helping implement currently available incentive programs and developing additional incentive programs. Lastly the District may develop

programs to offer technical assistance to help implement efficiency measures and other low emission technologies.

EMISSIONS REDUCTION

Predicting emission reductions from these activities is not possible at this time. Outreach and education components will have benefits on emissions that can perhaps be quantified later based on program evaluation, technology penetration, and other assessment and inventory methods. Implementing additional incentive programs will provide a means to quantify these benefits as they are developed. Emission reductions achieved from these activities will be incorporated into the subsequent SIP revisions once projects are implemented.

RULE COMPLIANCE AND TEST METHODS

Not applicable.

COST EFFECTIVENESS

The cost effectiveness of this measure cannot be determined, given the variety of programs and projects that will be developed. The District will continually analyze costs associated for with education and outreach, and where possible quantify resulting emissions reductions. The cost effectiveness for specific incentive programs can be determined as they are developed and implemented by the District.

IMPLEMENTING AGENCY

The implementing agency will be the District, in cooperation with other local governments, agencies, technology manufacturers and distributors, and utility service providers.

MCS-01: APPLICATION OF ALL FEASIBLE MEASURES ASSESSMENT [ALL POLLUTANTS]

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		ALL SOURCE CATEGORIES		
CONTROL METHODS:		ALL AVAILABLE CONTROL METHODS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE*	2008	2014	2019	2023
<i>POLLUTANT INVENTORY</i>	TBD	TBD	TBD	TBD
<i>POLLUTANT REDUCTION</i>		TBD	TBD	TBD
<i>POLLUTANT REMAINING</i>		TBD	TBD	TBD
CONTROL COST*:		NOT DETERMINED		
IMPLEMENTING AGENCY:		SCAQMD		

* *Emission reductions and cost-effectiveness will be determined after a source category and feasible controls are identified.*

DESCRIPTION OF SOURCE CATEGORY

Background

This control measure serves as a placeholder for any future control measures that may become feasible, prior to subsequent SIP revisions, through technology advances and/or cost decreases. The District continually monitors evolving control technologies, pricing changes, and the actions of other air quality agencies to determine the feasibility of implementing additional controls to achieve emissions reductions.

Regulatory History

The California Clean Air Act (CCAA) requires districts to achieve and maintain state standards by the earliest practicable date and for extreme non-attainment areas, to include all feasible measures Health and Safety (H&S) Code (H&S §§40913, 40914, and 40920.5). While this statute is not applicable to PM, the District believes it is appropriate and necessary to seek all feasible reductions from PM as well. The term “feasible” is defined in the 14 California Code of Regulations, section 15364, as a measure “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.” CARB guidance states that this definition, found in the CEQA Guidelines, applies to the requirements under air pollution laws. The required use of best available retrofit control technology (BARCT) for existing stationary sources is one of the specified feasible measures. H&S Code §40440 (b)(1) requires the District to adopt rules requiring best available retrofit control technology for existing sources. H&S Code §40406 specifically defines BARCT as “...best available retrofit technology means an emission

limitation that is based on the maximum degree of reduction achievable taking into account environmental, energy, and economic impacts by each class or category of source.”

Existing rules and regulations on VOC coatings and solvents as well as regulations for pollutants such as NO_x, SO_x and PM reflect current BARCT. However, BARCT is ever evolving as new BARCT becomes available that is feasible and cost-effective. Through this control measure, the District commits to the adoption and implementation of new retrofit control technology standards as technology develops.

PROPOSED METHOD OF CONTROL

The District will continue to review new emission limits introduced through federal, state or other local regulations to determine if District regulations remain equivalent or more stringent than other regions. If not, a rulemaking process will be initiated to perform a BARCT analysis with potential rule amendments if deemed feasible. In addition, the District will adopt and implement new retrofit technology control standards, based on research & development and other information, that are feasible and cost-effective as new BARCT standards become available in the future.

EMISSIONS REDUCTION

Further emission reductions would be sought from the amendment of existing rules and regulations to reflect new BARCT standards that may become available in the future prior to subsequent Plan revisions.

RULE COMPLIANCE AND TEST METHODS

Compliance with this measure would be based on monitoring, recordkeeping, and reporting requirements that have been established in existing source specific rules and regulations. In addition, compliance would be verified through inspections and other recordkeeping and reporting requirements.

COST EFFECTIVENESS

Cost-effectives for this control measure cannot be determined because the future set of “all feasible” measures are not known. However, the most cost-effective control strategy using the newest control technologies would be sought. The District will continue to analyze the potential cost impact associated with implementing this control measure, conduct research on the newest control technologies, and provide cost effectiveness information as it becomes available.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from stationary sources.

8-hour Ozone Measures

**CTS-01: FURTHER VOC REDUCTIONS FROM ARCHITECTURAL
COATINGS (RULE 1113)
[VOC]**

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		ARCHITECTURAL COATINGS		
CONTROL METHODS:		REDUCE THE VOC LIMITS FOR CERTAIN COATINGS TO 25 G/L, REMOVE OR FURTHER RESTRICT SMALL CONTAINER EXEMPTION, &/OR INCLUDE TRANSFER EFFICIENCY REQUIREMENTS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023 (2023-2007 SIP)*
VOC INVENTORY	21.9	15.8	17.5	19.3 (23.7)
VOC REDUCTION			2 - 4	2.2 -4.4 (3.1- 6.2)
VOC REMAINING			13.5 - 15.5	14.9 – 17.1 (17.5 - 20.6)
CONTROL COST:		\$10,000 TO \$20,000 PER TON VOC REDUCED		
IMPLEMENTING AGENCY:		SCAQMD		

* Emission reductions provided are based on the 2012 AQMP emissions inventory. Values provide in parenthesis are based on the 2007 SIP inventory projections for 2023.

DESCRIPTION OF SOURCE CATEGORY

The proposed control measure seeks to reduce the VOC emissions from large volume coating categories such as flat, non-flat and primer sealer undercoaters (PSU) and/or from the use of high-VOC architectural coatings sold in one liter containers or smaller. Additional emission reductions could be achieved from the application of architectural coatings by use of application techniques with greater transfer efficiency.

Background

Rule 1113 - Architectural Coatings, was originally adopted by the AQMD on September 2, 1977, to regulate the Volatile Organic Compound (VOC) emissions from the application of architectural coatings, and has since undergone numerous amendments. The last amendment, which was adopted on June 3, 2011, achieves 4.4 tons per day (tpd) emissions reduction by 2015.

Regulatory History

VOC Reductions

There have been several amendments to Rule 1113 which reduced the VOC limits for the high volume coating categories.

- November 8, 1996 – Flats Coatings were reduced from 250 g/L to an interim limit of 100 g/L effective July 1, 2001 and finally down to the current 50 g/L limit effective July 1, 2008.
- December 6, 2002
 - Non-Flat Coatings were reduced from 250 g/L to an interim limit of 150g/L effective January 1, 2003 and finally down to the current 50 g/L limit effective July 1, 2006.
 - PSU were reduced from 350 g/L to an interim limit of 200 g/L effective January 1, 2003 and finally down to the current 100g/L limit effective July 1, 2006.

Staff conducted technical assessments prior to each VOC limit reduction which demonstrated that the lower-VOC coatings performed as well as or better than the higher-VOC counterparts.

Small Container Exemption

The Small Container Exemption was adopted during the September 6, 1991 Rule 1113 amendment and allows manufacturers to sell coatings over the VOC limits in liter containers or smaller, provided they report those sales to the AQMD. Staff has been monitoring the use of the exemption.

Transfer Efficiency

Architectural coatings can be applied by brush, roller, sponge or trowel, that all achieve transfer efficiency greater than 90%. However, Rule 1113 – Architectural Coatings currently does not have a provision for transfer efficiency for spray application, as found in other coating rules focused on facility use. Another method used to reduce emissions from applying coatings is to improve the technique of the coating applicator. While HVLP and electrostatic paint spray application equipment can improve transfer efficiency up to a minimum of 65% when used properly, many painters hold the spray gun too close or too far away which also decreases transfer efficiency. A laser paint targeting system has been shown to improve transfer efficiency on average by 30% over equipment not using a targeting system, depending on the size, shape and configuration of the substrate (Iowa, 2010). Other retrofit technology is also available to increase transfer efficiency.

PROPOSED METHOD OF CONTROL

VOC Reductions

Staff will evaluate further reducing the VOC emissions from large volume coating categories such as flat, non-flat and primer sealer undercoaters (PSU), with consideration for appropriate implementation dates and potential creation of new subcategories (e.g., primers for metals) that retain current VOC limits. This approach may require inclusion of alternative test methods and approaches for measuring VOCs.

Small Container Exemption

Staff will evaluate the potential for a complete phase out of the small container exemption currently embedded in Rule 1113.

Transfer Efficiency

Staff will evaluate the feasibility of a two-phase approach to achieve greater transfer efficiency from application of architectural coatings. The first phase will be to incorporate (retrofit by a certain date and incorporate into the design by a certain date) laser paint targeting or other available technology into spray guns. The second phase will be the inclusion of transfer efficiency provisions requiring that architectural coatings be applied by hand applications such as brush, roller, sponge, or trowel; or by High-Volume, Low-Pressure (HVLP) Spray or other technology capable of achieving a transfer efficiency equivalent or better to HVLP spray.

EMISSIONS REDUCTION

VOC Reductions

Staff estimated the VOC reduction based on the data that manufacturers reported under Rule 314 – Fees for Architectural Coatings for the 2008 calendar year, which does not include volume of coatings sold under the averaging compliance option, sell through or under the small container exemption. From the large volume categories, staff estimates baseline emissions and potential reductions to be 4.5 and up to 1.7 tpd, respectively.

Small Container Exemption

Depending on the approach implemented, there is the potential for reducing VOC emissions up to 1.9 tpd.

Transfer Efficiency

The first phase would incorporate the laser targeted technology, commercially proven to reduce coating usage by 30%. The second phase of incorporating transfer efficiency requirement of 65% may potentially reduce coating usage by up to an additional 30%. The emission reductions will primarily come from professional paint contractors who account for an estimated 65% of coating application and could result in VOC reductions up to 1 tpd.

RULE COMPLIANCE AND TEST METHODS

VOC Reductions

Rule compliance would be achieved by amending Rule 1113. In order to enforce the 25g/L VOC limit, Rule 1113 would have to include alternative VOC test methods to EPA Reference Method 24 for measuring VOCs in a reproducible and repeatable manner, especially for coatings with very low-VOC content. SCAQMD Method 313 *Determination of Volatile Organic Compounds (VOC) by Gas Chromatography* and/or ASTM Method D6886 *Standard Test Method for Speciation of the Volatile Organic Compounds (VOCs) in Low VOC Content Waterborne Air-Dry Coatings by Gas Chromatography* are two alternatives currently available for inclusion into Rule 1113. These methods directly measure the VOC content of a coating yielding better precision for waterborne coatings than currently used methods.

In addition to the change in the test method, staff would also propose changing the metric that is used to regulate architectural coatings. The formula for the regulatory VOC, also referred to as the VOC of coating, removes the water and any exempt solvents in the VOC calculation. This calculation was hypothesized to prevent manufacturers from simply adding water to a coating to meet the VOC limit; therefore, requiring additional coats of paint to achieve the same coverage. Unfortunately, the calculation of the regulatory VOC magnifies any error in the VOC analysis, making the value unreliable especially for high-water, low-VOC coatings. Regulating coatings based on either the actual VOC, also referred to as the VOC of material, or the weight percent VOC would eliminate this source of error and allow for VOC limits less than 50g/L in the coatings rules. Further, staff does not believe that diluting waterborne coatings in order to achieve VOC compliance is a valid concern. Consumers have come to expect the type of coverage that today's coatings achieve; the marketplace will not accept coatings with poor coverage.

Small Container Exemption

Rule compliance would be achieved by amending Rule 1113.

Transfer Efficiency

Rule compliance would be achieved by amending Rule 1113 to require transfer efficiency requirements for spray applications.

COST EFFECTIVENESS

The cost-effectiveness of this control measure is estimated to be up to \$20,000 per ton of VOC reduced. The District will continue to analyze the potential cost impacts associated with implementing this control measure and will provide specific cost-effectiveness as it becomes available.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from area sources.

**CTS-02: FURTHER EMISSION REDUCTION FROM MISCELLANEOUS
COATINGS, ADHESIVES, SOLVENTS AND LUBRICANTS
[VOC]**

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		MISCELLANEOUS COATINGS, ADHESIVES, SOLVENTS AND LUBRICANTS		
CONTROL METHODS:		REDUCE THE ALLOWABLE VOC CONTENT IN PRODUCT FORMULATIONS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023 (2023 – 2007 SIP)*
VOC INVENTORY	14.1	11.5	13.5	14.5 (10.8)
VOC REDUCTION			1 - 2	1.1 – 2.2 (0.9 - 1.8)
VOC REMAINING	14.1	11.5	11.5 – 12.5	12.3 – 13.4 (9 - 9.9)
CONTROL COST:		\$8,000 TO \$12,000 PER TON VOC REDUCED		
IMPLEMENTING AGENCY:		SCAQMD		

* Emission reductions provided are based on the 2012 AQMP emissions inventory. Values provide in parenthesis are based on the 2007 SIP inventory projections for 2023.

DESCRIPTION OF SOURCE CATEGORY

The proposed control measure seeks to reduce the VOC emissions from miscellaneous coatings, adhesive, solvent and lubricant categories by lowering certain product VOC limits. Examples of the miscellaneous categories to be considered include, but are not limited to, coatings used in aerospace; adhesives used in a variety of sealing applications; solvents for cleaning and preservation cleaning or graffiti abatement activities; fountain solutions for printing operations; and lubricants used as metalworking fluids to reduce heat and friction to prolong life of the tool, improve product quality and carry away debris.

Background

Over the years, the AQMD has developed numerous rules to reduce the Volatile Organic Compound (VOC) emissions from the use of coatings, adhesives, solvents and lubricants in commercial and industrial applications. Subsequent amendments to these rules achieved further VOC emission reductions primarily through product reformulations using low-VOC technologies including alternative resin chemistries, aqueous and bio-based products, and exempt solvents.

Regulatory History

The VOC rules that may be affected by this control measure are as follows:

- Rule 1124 – Aerospace Assembly and Component Manufacturing Operations
- Rule 1144 - Metalworking Fluids and Direct-Contact Lubricants
- Rule 1168 - Adhesive and Sealant Applications
- Rule 1171 - Solvent Cleaning Operations

PROPOSED METHOD OF CONTROL

Reductions would be achieved by lowering the VOC content of select few categories within the above-mentioned source-specific rules rather than relying on across the board lowering of VOC limits. For solvents, reductions could be achieved with the use of alternative low-VOC products or non-VOC product/equipment at industrial facilities. The proposal is anticipated to be accomplished with a multi-phase adoption and implementation schedule.

EMISSIONS REDUCTION

Current estimates are that there is a potential VOC emission reduction of about 1.0-2.0 tons per day.

RULE COMPLIANCE AND TEST METHODS

Rule compliance would be achieved by amending AQMD rules on coatings, adhesives, solvents and lubricants.

COST EFFECTIVENESS

The cost-effectiveness of this control measure is estimated at \$8,000 to \$12,000 per ton of VOC reduced.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from area sources and stationary point sources.

Product and Technical Data Sheets

**CTS-03: FURTHER VOC REDUCTIONS FROM MOLD RELEASE
PRODUCTS
[VOC]**

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:	FACILITIES/PROCESSES USING MOLDS (EXCLUDING AEROSPACE)			
CONTROL METHODS:	LIMITATION OF VOC CONTENT FOR MOLD RELEASE PRODUCTS			
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023 (2023-2007 SIP)*
VOC INVENTORY	2.3 - 3.6	2.4 - 3.8	2.7 - 4.2	3.0 - 4.7 (2.4)
VOC REDUCTION			0.6 - 2.0	0.8 - 2.2 (0.7)
VOC REMAINING			1.9 - 2.2	2.4 - 2.5 (1.7)
CONTROL COST:	\$4,000 TO \$8,000 PER TON VOC REDUCED			
IMPLEMENTING AGENCY:	SCAQMD			

* Emission reductions provided are based on the 2012 AQMP emissions inventory. Values provide in parenthesis are based on the 2007 SIP inventory projections for 2023.

DESCRIPTION OF SOURCE CATEGORY

The purpose of this control measure is to reduce VOC emissions associated with the use of mold release products used in composite, fiberglass, metal and plastic manufacturing operations.

Background

Thousands of companies in the U.S. and California make metal, fiberglass, composite and plastic products. These products are often manufactured using molds which form the part into a particular configuration. Mold release agents are used to ensure that the parts, as they are made, can be released easily and quickly from the molds. Mold release agents are also used for concrete stamping operations to keep the mold from adhering to the fresh concrete. Mold release agents often contain waxes, silicone and lubricant compounds and many of them are blended with solvent carriers. The solvents used in the formulations are generally petroleum or other volatile organic compound (VOC) solvents and may also contain toxic components such as toluene and xylene. Mold cleaners may contain chlorinated solvents like trichloroethylene (TCE), petroleum solvents, n-methyl pyrrolidone (NMP) and hexane.

Regulatory History

Mold release agents and cleaners are extensively used by a variety of different industrial sources. Residential and commercial concrete stamping is a rapidly growing industry, and overall VOC emissions are estimated to be significant. In some cases, particularly for mold

release agents used in fiberglass, non-aerospace composite manufacturing and concrete stamping, there are currently no regulations on the VOC content of these products. Aside from general facility toxicity restrictions, such as Rule 1402, there are no limits on the toxic components that can be used in these products. The few applications of these products that are regulated are often subject to outdated, high-VOC limitations that do not reflect the state of the technology. As a result, most of the current mold release agent product formulations are high-VOC, upwards of 600 g/L. However, alternative low-VOC formulations are available. The District regulates mold release agents in architectural coatings, specifically form release compounds. Those products have a current VOC limit of 250 g/L with the limit being lowered to 100 g/L effective in 2014. Similar water-based, bio-based and powder formulations are available for industrial applications, often at competitive pricing. The California Air Resources Board (CARB) currently surveys consumer product mold release sales volume, but does not regulate mold release coatings.

PROPOSED METHOD OF CONTROL

This control measure seeks to reduce emissions from mold release products on metal, fiberglass, composite and plastic products, as well as concrete stamping operations, by requiring the use of low-VOC mold release products that are currently available in the market.

EMISSIONS REDUCTION

The emissions inventory is estimated at 2.3 to 3.6 tons per day based on the 2011 Annual Emission Report data for fiberglass facilities and estimates for the concrete stamping industry. Requiring the use of low-VOC mold release products is estimated to result in emission reductions in the range of 0.8 to 2.0 tons per day.

RULE COMPLIANCE AND TEST METHODS

Compliance with this control measure would be achieved by similar compliance requirements under the existing Regulation XI rules.

COST EFFECTIVENESS

Based on data from similar types of aqueous and bio-based technologies, the cost effectiveness of this control measure is approximately \$4,000 to \$8,000 per ton of VOC reduced.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from stationary and area sources.

REFERENCES

South Coast Air Quality Management District, "Final Staff Report For Proposed Amended Rule 1113 – Architectural Coatings," June, 2011 <http://www.aqmd.gov/hb/attachments/2011-2015/2011Jun/2011-Jun3-024.pdf>

CTS-04: FURTHER VOC REDUCTIONS FROM CONSUMER PRODUCTS [VOC]

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		CONSUMER PRODUCTS		
CONTROL METHODS:		REVISE THE EXEMPTION FOR LOW VAPOR PRESSURE SOLVENTS IN CONSUMER PRODUCTS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023
VOC INVENTORY	98	85	87	89
VOC REDUCTION*			TBD	TBD
VOC REMAINING			TBD	TBD
CONTROL COST:		LESS THAN \$10,000 PER TON VOC REDUCED DEPENDING ON CONSUMER PRODUCT CATEGORY		
IMPLEMENTING AGENCY:		CARB/SCAQMD		

* Reductions cannot be quantified due to the nature of the measure (e.g., multi-phase approach to reduce VOCs from consumer products).

DESCRIPTION OF SOURCE CATEGORY

According to California Air Resources Board (CARB) 2009 Almanac, consumer products will be the largest emission category for VOC by 2020. Consumer products are products used by institutional and household consumers and include such products as general purpose cleaners and degreasers, cosmetics, lawn and garden care products, detergents, adhesives, multipurpose lubricants, paint thinners and multipurpose solvents.

Background

The CARB Consumer Product Regulation exempts low vapor pressure volatile organic compounds (LVP-VOC) from counting towards the compliance obligation for consumer product VOC limits. LVP-VOCs are defined as products with a vapor pressure less than 0.1 mm Hg, a chemical compound with more than 12 carbon atoms, or having a boiling point greater than 216° C. The exemption was designed to specify the types of VOC compounds not subject to VOC limits (for example, surfactants, resins, and waxes). Certain solvents have also been introduced that qualify for the exemption. Recent testing conducted by the District on institutional cleaners found that traditionally formulated consumer products may contain significant amounts of LVP-VOC solvents. In some cases, such as certain multipurpose solvents, the products were 100 percent LVP-VOC solvents. Further testing indicated that some LVP-VOC solvents evaporate nearly as quickly as the traditional solvents they were meant to replace and have Maximum Incremental Reactivity (MIR) values well above the threshold considered to be non-reactive, currently based on ethane. The study also shows that some LVP-VOCs are non-volatile and, for those that are non-volatile, an exemption is appropriate. Reformulation of products by substituting fast-evaporating LVP-VOC solvents for other solvents considered to be VOCs may

not achieve the ozone reduction benefits anticipated by reducing the VOC content limits in the Consumer Product Regulation. In some categories, data suggest that use of LVP-VOC solvents has increased over time. Therefore, an evaluation of the continued need for use of LVP-VOC solvents in certain categories is warranted. District staff will work with CARB staff to identify categories where it may be appropriate to revise the LVP-VOC exemption. Staff will also work with CARB staff to review emission inventory data to ensure that the total organic emissions reflected in the inventory, in addition to VOC emissions, accurately capture VOC-exempt solvents and LVP-VOC emissions as well.

Regulatory History

CARB has the authority to regulate consumer products under Section 41712 of the Health and Safety Code (HSC). The District may regulate consumer products which CARB has not regulated.

PROPOSED METHOD OF CONTROL

Recent testing has shown that at ambient temperatures some LVP-VOC solvents readily evaporate. This subset of LVP-VOCs may be available to contribute to ozone formation. These findings indicate that further evaluation of consumer products formulated with LVP-VOCs is needed. Further research may be needed including identification of alternatives to LVP-VOCs and environmental chamber testing.

This measure will be developed in phases and begin with products that have greatest emission impacts, such as multi-purpose solvents, paint thinning products and institutional cleaners. Data are available for these products that indicate alternative formulations that do not rely on use of volatile or semi-volatile LVP-VOC are available.

In a subsequent phase, the control approach would revise the LVP-VOC exemption if speciated LVP-VOC survey data and research results show an opportunity to further reduce emissions from consumer products. Any proposed amendments to the Consumer Products Regulations to revise the LVP-VOC exemption would be vetted through a full public process.

EMISSIONS REDUCTION

Consumer products are expected to contribute over 89 tons per day of VOC emissions in the South Coast Basin by 2023. This inventory can be further refined by re-evaluating the TOG:VOC ratio included in the 2010 CARB inventory for Consumer Products for future ozone modeling purposes to better reflect ozone impacts from the use of consumer products. Further, as a part of the emissions inventory re-evaluation, current data are needed on sales and formulations of consumer products to determine the types and extent of LVP-VOC use and to identify categories where the LVP-VOC exemption may need revision..

RULE COMPLIANCE AND TEST METHODS

Revise the LVP-VOC exemption included in the CARB Consumer Product Regulation.

COST EFFECTIVENESS

Revisions to the LVP-VOC exemption would result in reformulation and other research and development costs for those manufacturers that have used LVP-VOC solvents to comply. However, most environmentally preferred consumer products contain little or no LVP-VOC solvents so no significant increase in cost is expected from this control measure. The estimated cost effectiveness figures are conservative estimates and likely overstate the actual costs. As an example, the City of Santa Monica reported spending 5% less on its cleaning products costs when it switched from conventional cleaners to less-toxic brands a decade ago.

IMPLEMENTING AGENCY

CARB has the authority to regulate emissions from consumer products and the District has the authority to regulate them where CARB has not done so.

CMB-01: FURTHER NO_x REDUCTIONS FROM RECLAIM – PHASE II [NO_x]

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		VARIOUS RECLAIM NO _x SOURCES		
CONTROL METHODS:		VARIOUS CONTROL TECHNOLOGIES AND METHODS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023 (2023-2007 SIP)**
NO _x INVENTORY	23.2	26.5	26.5	26.5 (26.5)
NO _x REDUCTION PHASE I*		2* - 3	2* - 3	2* - 3 (2* - 3)
NO _x REDUCTION PHASE II				1 - 2 (1 - 2)
NO_x REMAINING		24.48 – 23.48	24.48 – 23.48	23.48 – 20.48 (21.5 -23.5)
CONTROL COST:		\$ 16,000 PER TON NO _x REDUCED		
IMPLEMENTING AGENCY:		SCAQMD		

*Phase I is proposed as a contingency measure and if not triggered, the total targeted reductions targeted in Phase II will be a cumulative 3-5 tpd of NO_x with the lower end of the emission reduction range to be committed in the SIP.

** Emission reductions provided are based on the 2012 AQMP emissions inventory. Values provided in parenthesis are based on the 2007 SIP emissions inventory projects for 2023. Emission reductions reflect RTC values and no adjustment between 2007 AQMP and 2012 AQMP is necessary.

DESCRIPTION OF SOURCE CATEGORY

There were approximately 284 facilities in the Regional Clean Air Incentives Market (RECLAIM) program, as of July 1, 2010. The RECLAIM program includes facilities with NO_x or SO_x emissions greater than or equal to four tons per year in 1990 or any subsequent year. A wide range of equipment such as fluid catalytic cracking units, boilers, heaters, furnaces, ovens, kilns, coke calciner, internal combustion engines, and turbines are major sources of NO_x or SO_x emissions at the RECLAIM facilities. This control measure identifies a series of control approaches that can be implemented to further reduce NO_x emissions at the RECLAIM facilities.

Background

The RECLAIM program was first adopted in 1993 to further reduce emissions from the largest NO_x and SO_x emitting stationary sources by providing an alternative regulatory mechanism to the command and control regulatory structure. Under this program, facilities are issued NO_x and SO_x allocations, also known as RECLAIM Trading Credits (RTCs) or facility emission caps, which are declined annually. To meet the declining annual facility

caps, RECLAIM facilities have the option of installing pollution control equipment, changing operations, or purchasing RTCs in the RECLAIM market.

The RECLAIM program is subject to several legal mandates. The Health and Safety code requires the District to monitor the advancement in Best Available Control Retrofit Technology (BARCT), and if BARCT advances, the District is required to periodically re-assess the overall facility caps, and reduce the RTC holdings, as if the equipment located at the facilities would be subject to applicable equivalent command-and-control BARCT levels. The emission reductions resulting from the programmatic RTC reductions will help the basin attain the National Ambient Air Quality Standards (NAAQS) for ozone and PM_{2.5} as expeditiously as practicable. The BARCT evaluation must include an evaluation of the maximum degree of reduction achievable with advanced control technologies taking into account the environmental, energy, and economic impacts for each class or category of source.

A review of the emissions profile of the RECLAIM universe shows that the NO_x emissions are not evenly distributed among the RECLAIM facilities: the top 10% of the universe (24 facilities) comprised mainly of refineries, power plants, cement, glass, and steel manufacturing, emitted about 80% of the NO_x emissions.

Regulatory History

On October 15, 1993, the AQMD's Governing Board adopted Regulation XX – RECLAIM. The RECLAIM program at its inception included 392 NO_x facilities. RECLAIM Regulation XX includes 11 rules that specify the applicability, definitions, allocations, trading and operational requirements, as well as monitoring, reporting, and recordkeeping requirements. The NO_x RECLAIM regulation has been revised several times, and one significant amendment (2005) reflected a BARCT re-assessment. The January 2005 amendment resulted in a NO_x RTC reduction of 7.7 tons per day (tpd), approximately 22.5% reduction of the RTC holdings, which was implemented in 5 phases: 4 tpd by 2007 and an additional 0.925 tpd in each of the following 4 years.

PROPOSED METHOD OF CONTROL

Phase II of reductions will focus on periodic BARCT evaluation as required under the state law. A review of recently adopted control measures and air regulations in other air pollution control districts, as well as command-and-control rules adopted for non-RECLAIM facilities in the District, show that advancements in control technologies are available and can be applied to the top emitting sources. Such control technologies include but are not limited to selective catalytic reduction, low NO_x burners, NO_x reducing catalysts, oxy-fuel furnaces, and non-selective catalytic reduction. Several BARCT levels assessed at the inception of the program in 1993 for top emitting sources such as cement kilns, glass furnaces, and gas turbines were not subject to reduction in the 2005 RECLAIM rule amendment. These sources will be examined for further reductions in this control measure and potential rule making.

During the rulemaking process, staff may also incorporate the concepts of facility modernization, as well as include other feasible control measures such as increased energy efficiency and zero and near-zero emission technologies.

EMISSIONS REDUCTION

Staff's initial analysis shows that approximately 1-2 tpd additional NO_x RTC reductions are feasible for the second phase from the RECLAIM universe (from the overall 3-5 tpd NO_x RTC reductions discussed in the first phase). During the rule development phase, staff may refine the emission reductions to include growth and other unforeseen issues at this stage. Phase II is expected to be adopted by 2015 for implementation beginning in 2020. It should be noted that since there are substantial NO_x reductions needed by 2023, if additional reductions are feasible and cost effective, they will be evaluated during rulemaking.

According to the RECLAIM Annual Audit Reports, NO_x emissions were reduced from 2008 to 2010, and the vast majority of the RECLAIM facilities complied with their RTC allocations. The audited annual NO_x emissions for the entire RECLAIM universe were reported as 22.9, 20, and 19.5 tpd for compliance year 2008, 2009, and 2010, respectively. The NO_x RTCs allocated for the universe were reported as 29.4, 28.4, and 27.5 tpd for compliance year 2008, 2009, and 2010, respectively. Data in the audit reports reflected an excess of 6.5, 8.4, and 8.0 tpd of RTCs holdings for compliance year 2008, 2009, and 2010, respectively, or approximately a 22–30% excess in RTC holdings in the most recent three years. Being cognizant that the 2008 emission profile may reflect a period of the economic downturn, staff's estimated target of a 3-5 tpd RTC allocation reduction (approximately 38 - 63 percent of the unused RTC holdings) for both phases combined appears to be achievable.

RULE COMPLIANCE AND TEST METHODS

Compliance with the provisions of this control measure would be based on monitoring, recordkeeping, and reporting requirements that have been established in either the RECLAIM program or existing source specific rules and regulations. In addition, compliance would be verified through inspections and other recordkeeping and reporting requirements.

COST EFFECTIVENESS

It is expected that the cost effectiveness for this control measure would be in the neighborhood of \$16,000 per ton NO_x reduced. It is based on the cost effectiveness developed for non-RECLAIM facilities or other command-and-control rules in other air pollution control districts. It should be noted that since RECLAIM facilities have the ability to trade RTCs, it tends to lower the actual cost of compliance. Staff will refine the cost effectiveness during the rule development phase.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from RECLAIM facilities.

CMB-02: NOX REDUCTIONS FROM BIOGAS FLARES [NOX]

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		LANDFILLS AND DIGESTERS		
CONTROL METHODS:		NOX REDUCTIONS FROM BIOGAS FLARES		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE*	2008	2014	2019	2023
NOX INVENTORY	PENDING	PENDING	PENDING	PENDING
NOX REDUCTION			PENDING	PENDING
NOX REMAINING			PENDING	PENDING
CONTROL COST:		\$20,000 PER TON NO _x REDUCED		
IMPLEMENTING AGENCY:		SCAQMD		

* Pending because emission reductions will be provided prior to the Final Draft.

DESCRIPTION OF SOURCE CATEGORY

Background

Only hydrocarbon and toxic air contaminant emissions from landfills and waste treatment plants are regulated by AQMD rules 1150.1, 1150.2 and 1179. There are no source specific rules regulating NO_x emissions from biogas flares. Flare NO_x emissions are regulated through new source review and BACT. A survey of permits for landfill and waste treatment plant flares indicates NO_x emissions range from 0.12 to 0.025 pound per million BTU of biogas (BACT since 2006) depending on the age of the flare. This control measure proposes that, consistent with the all feasible control measures, all biogas and non-refinery flares meet current BACT and/or implement flaring minimizations strategies.

Regulatory History

There are no source specific rules regulating NO_x emissions from biogas flares.

PROPOSED METHOD OF CONTROL

This control measure proposes that, consistent with the all feasible measures control measure, all biogas and non-refinery flares meet current BACT. Most stringent current BACT (since 2006) for biogas flares is 0.025 pound of NO_x per million BTU of biogas. As an alternative control option, staff will also explore opportunities to minimize flaring at landfills and waste water treatment and other non-refinery facilities.

EMISSIONS REDUCTION

Based on facility reported emissions (2010), the annual average emissions for biogas flares are about 0.1 tons per day of NO_x. The average emission factor for biogas flares at facilities in the AQMD is 0.056 pounds per million BTU (unweighted average). However, the most stringent current BACT for biogas flares would generate NO_x emissions is 0.025 pound per million BTU of biogas. Emissions vary by season and are affected by other operations at landfills and treatment plants. Staff estimates an average emission reduction of about 50% is achievable if all flares meet the most stringent current BACT limit of 0.025 pound NO_x per million BTU of biogas.

RULE COMPLIANCE AND TEST METHODS

SCAQMD Method 100.1

COST EFFECTIVENESS

Based on cost information used for the 2006 AQMD BACT determination for biogas flares, the average cost effectiveness for meeting an emission limit of 0.025 pound per million BTU of biogas is less than \$20,000 per ton of NO_x reduced.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from these stationary sources.

CMB-03: REDUCTIONS FROM COMMERCIAL SPACE HEATING [NOX]

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		COMMERCIAL SPACE HEATERS		
CONTROL METHODS:		NOX EMISSION REDUCTIONS FROM COMMERCIAL SPACE HEATING		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023 (2023-2007 SIP)**
NOX INVENTORY	2.2	2.2	2.2	2.2 (0.7)
NOX REDUCTION		0	0.06*	0.18* (0.1)
NOX REMAINING		2.2	2.2	2.02 (0.6)
CONTROL COST:		\$20,000 PER TON NO _x REDUCED (0.6 TPD)		
IMPLEMENTING AGENCY:		SCAQMD		

* Partial Implementation (starting in 2018 with full implementation over 20 years)

** Emission reductions provided are based on the 2012 AQMP emissions inventory. Values provide in parenthesis are based on the 2007 SIP inventory projections for 2023.

DESCRIPTION OF SOURCE CATEGORY

Background

Currently the AQMD regulates boilers and small residential and commercial central furnaces used for space heating. Boilers, depending on size, are subject to Rule 1146, 1146.1 or 1146.2. Residential and small commercial fan-type central furnaces are regulated by AQMD Rule 1111. Large commercial furnaces are not currently regulated by the AQMD unless they have a heat input rating of more than 2 million BTU per hour. Units with a rating of more than 2 million BTU per hour require an AQMD permit and are subject to a NO_x BACT limit of 30 ppm (at a reference level of 3% oxygen). This control measure seeks emission reductions from unregulated commercial fan-type central furnaces used for space heating. This control measure will apply to manufacturers, distributors, sellers, installers and purchasers of commercial fan-type central furnaces used for space heating.

Regulatory History

Large commercial furnaces are not currently regulated by the AQMD unless they have a heat input rating of more than 2 million BTU per hour. Units with a rating of more than 2 million BTU per hour require an AQMD permit and are subject to new source review and a NO_x BACT limit of 30 ppm (at a reference level of 3% oxygen).

PROPOSED METHOD OF CONTROL

This control measure seeks NO_x emission reductions of about 0.12 tpd by 2023 and ultimately at least 0.6 tons/day from unregulated commercial fan-type central furnaces used for space heating. This control measure will apply to manufacturers, distributors, sellers, installers and purchasers of commercial fan-type central furnaces used for space heating.

The technology to reduce emissions from commercial space heating equipment is transferrable from residential space heating furnaces and other heating and drying equipment. Currently commercial space heaters are unregulated and have NO_x emissions in the range of 90 to 110 ppm. The AQMD has required residential space heaters to meet a limit of 40 ng/J of heat output (55 ppm) since 1984 and the future limit, starting in 2014, for residential space heaters is 14 ng/J (20 ppm). Low NO_x burners are also available for a variety of commercial and industrial heating and drying applications and achieve NO_x emission levels of 10 to 30 ppm. Assuming a future NO_x emission limit of between 20 ppm to 30 ppm, emissions from a commercial heating unit can be reduced by 60 to 80%. This measure will be implemented in two phases, beginning with a technical assessment to be completed by 2014 and Phase II rule development by 2016.

EMISSIONS REDUCTION

The commercial space heating inventory must be refined in order to identify the amount of natural gas used by fan-type space heaters versus hydronic (boiler-based) space heating. However, based on national estimates of floor space for different types of buildings and uses, staff estimates that 45 to 60% of all commercial, light manufacturing, warehouse, office, school and government building floorspace is heated by commercial forced air units. Assuming an emission reduction of between 60 to 80% and a 2008 baseline commercial heating inventory of 2.2 tons of NO_x per day (uncontrolled), the measure would reduce NO_x emissions by between 0.6 tons per day (2.2 tons/day X 45% of floor space X 60% reduction) and 1 ton per day (2.2 tons/day X 0.6 X 0.80). Growth and energy efficiency programs will affect the anticipated reduction from this control measure. Energy efficiency programs will reduce the benefit of this control measure, but together they will result in greater reductions from this source category.

RULE COMPLIANCE AND TEST METHODS

SCAQMD Method 100.1

COST EFFECTIVENESS

Based on the cost effectiveness of rules for other heating equipment (Rules 1111, 1121, 1146.2 and 1147), staff estimates the cost effectiveness at \$20,000 per ton.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from these stationary sources.

FUG-01: VOC REDUCTIONS FROM VACUUM TRUCKS [VOC]

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		VOC EMISSIONS FROM VACUUM TRUCKS		
CONTROL METHODS:		VOC CONTROL DEVICES		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE	2008	2014	2019	2023
VOC INVENTORY	1.50	1.50	1.50	1.50
VOC REDUCTION			1.05	1.05
VOC REMAINING			0.45	0.45
CONTROL COST:		\$3,000 PER TON VOC REDUCED		
IMPLEMENTING AGENCY:		SCAQMD		

DESCRIPTION OF SOURCE CATEGORY

This control measure addresses the attainment of emission reductions from vacuum trucks through the use of traditional control devices and technologies, including carbon adsorption systems, positive displacement pumps, internal combustion engines, thermal oxidizers, refrigerated condensers and liquid scrubbers.

Background

Vacuum truck services are used by a variety of industries, including petroleum refineries, marine terminals, industrial wharfs, gasoline dispensing facilities, gasoline bulk terminals, gasoline bulk plants, gasoline cargo tanks, gas well and oil well fields and pipelines. In the petroleum industry they are used to remove materials from storage tanks, vessels, sumps, boxes and pipelines. They are also used to transport materials from one location to another. The applicability of this control measure will be further studied during rule development taking into consideration the control availability and costs.

Regulatory History

Currently Vacuum Truck emissions are only controlled by Rule 1149, Storage Tank and Pipeline Cleaning and Degassing, when used as part of tank or pipeline degassing control devices. In refineries, the same vacuum trucks are used to remove hydrocarbon liquids from various types of equipment and are currently uncontrolled in these areas.

PROPOSED METHOD OF CONTROL

This measure will primarily focus on high-emitting vacuum truck operations, such as those found in petro-chemical industries, and other operations that include the transfer of volatile liquids, such as gasoline. There are a variety of technologies that are available to limit organic emissions from vacuum truck operations. Most of them can achieve capture and control efficiencies of 95%. Technologies include carbon adsorption systems, internal combustion engines, thermal oxidizers, refrigerated condensers, liquid scrubbers and positive displacement (PD) pumps. Sometimes control technologies can be combined. For example, an internal combustion engine can be combined with a chiller, or carbon adsorption can be combined with a scrubber. While some controls can be integrated into vacuum trucks, most vacuum trucks are not commonly equipped with on-board control equipment. However, vacuum truck operations do use outboard carbon adsorption systems, thermal oxidation, or internal combustion engine technologies. Such control technologies are typically connected as a “skid-mount” or “portable trailer unit.” Control equipment has generally been used for safety reasons, to control odors, or to comply with requirements in the Code of Federal Regulations.

EMISSIONS REDUCTION

Organic emissions from affected vacuum truck operations are estimated at 1.50 tpd. These emission estimates include throughput that is already controlled or minimized through use of external abatement equipment, positive displacement pumps, or gravity feed. Based on studies done in the Bay Area at similar facilities, staff estimates that 50% of vacuum truck operations can be controlled with external control equipment such as carbon adsorption or thermal oxidization. These devices have an efficiency of at least 95%. The other half of affected vacuum truck operations can be minimized by the use of positive displacement pumps or gravity feed. For these operations, staff estimates control efficiency of 75%. VOC emission reductions are estimated to be approximately 1.05 tpd, which represents an 85% reduction in emissions from regulated materials and staff estimates a 70% reduction potential of overall organic emissions from vacuum truck operations along with a high concurrent reductions in toxic air contaminants such as benzene, toluene, xylene, hexane, and possibly greenhouse gas emissions.

RULE COMPLIANCE AND TEST METHODS

Compliance would be based on field inspection and possible recordkeeping requirements that will be established in a rule or regulation requiring control technology installation and usage.

COST EFFECTIVENESS

The proposed controls would be structured to focus on cost effectiveness. Highly volatile liquids, such as gasoline, emit high rates of organic emissions when moved into vacuum trucks. However, source testing has found that many materials moved by vacuum trucks in petroleum refineries, such as wastewater, emit at a very low rate and are thus not cost effective to control. Therefore, only those materials that source tests have shown to have high emissions and that are cost-effective to control would be likely included in the scope of this effort.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from non-vehicular sources. The proposed control measure targets equipment that is not part of the propulsion engine.

**FUG-02: EMISSION REDUCTIONS FROM LPG TRANSFER AND
DISPENSING
[VOC]**

CONTROL MEASURE SUMMARY

SOURCE CATEGORY:	LPG TRANSFER AND DISPENSING
CONTROL METHODS:	PHASE I: RETROFITTING STATIONARY STORAGE TANKS AND CYLINDERS WITH LOW EMISSION FIXED LIQUID LEVEL GAUGES AND USE OF LPG LOW EMISSION CONNECTORS FOR TRANSFER AND DISPENSING (<i>Already adopted</i>) PHASE II: EXPAND RULE APPLICABILITY TO INCLUDE LPG TRANSFER AND DISPENSING AT OTHER FACILITIES, INCLUDING CURRENTLY EXEMPTED FACILITIES
EMISSIONS (TONS/DAY):	

ANNUAL AVERAGE	2008	2014	2019	2023*
VOC INVENTORY	9.5	6.8	3.9	4.1
VOC REDUCTION			1 - 2	1 - 2
VOC REMAINING			1.9 - 2.9	2.1 - 3.1

CONTROL COST: \$4,000 - 10,000/TON VOC REDUCED

IMPLEMENTING AGENCY: SCAQMD

* New emissions source category. No corresponding emissions in 2007 AQMP.

DESCRIPTION OF SOURCE CATEGORY

The purpose of this control measure is to reduce VOC emissions associated with the transfer and dispensing of Liquefied Petroleum Gas (LPG).

Background

In 1992, the California Air Resources Board (CARB) made the first attempt to quantify LPG transfer and dispensing emissions by conducting a study to determine the usage patterns of LPG and to estimate emissions resulting from these operations for the entire state of California. The study concluded that LPG fugitive emissions from transfer and dispensing operations result from three main areas: volatilization of entrapped product during disconnection of LPG supply and transfer lines, leaks in the equipment used for transfer and dispensing, and venting through

fixed liquid level gauges (FLLGs) used as a safety device to ensure that pressurized receiving containers, including cylinders and tanks are not overfilled.

Regulatory History

In August 2010 the District initiated rule development and adopted Rule 1177 on June 1, 2012, which required the use of low emission FLLGs and LPG low emission connectors. Upon full implementation in July 2017, Rule 1177 will achieve 6.1 tpd VOC reductions from the estimated 8.6 tpd baseline inventory for the regulated facilities.

Rule 1177 evaluated fugitive VOC emissions from the venting of FLLGs during filling and from the disconnection of LPG supply and transfer lines to determine baseline VOC emissions and the associated reductions. However, although leaks in the equipment used for transfer and dispensing were not evaluated or quantified due to the lack of data, Rule 1177 will implement a Leak Detection and Repair (LDAR) program for transfer and dispensing facilities that offer LPG for sale to end users.

Currently, Rule 1177 includes an exemption for facilities that are subject to the requirements of Rule 1173 – Control of Volatile Organic Compound Leaks and Releases from Components at Petroleum Facilities and Chemical Plants. These facilities include refineries, marine terminals, natural gas processing plants and pipeline transfer stations, as well as facilities that conduct fill-by-weight techniques.

PROPOSED METHOD OF CONTROL

The development and adoption of Rule 1177 constitutes Phase I of this control measure. Under Phase II, the proposed control measure will expand the applicability of Rule 1177 to include VOC emissions associated with LPG transfer and dispensing activities at previously exempted facilities and evaluate the potential for further reductions in VOC emissions.

EMISSIONS REDUCTION

The emission reductions from Phase II of the control measure are anticipated to be 1 – 2 tpd in addition to the 6.1 tpd achieved under Phase I adopted June 2012.

RULE COMPLIANCE

Compliance with the provisions of this control measure would be based on monitoring, vapor collection, and inspection requirements. In addition, compliance will be verified through recordkeeping and reporting that will be used to track requirements.

COST EFFECTIVENESS

For Phase 1 of this control measure, the cost-effectiveness is estimated to be approximately \$1,700 per ton of VOC emissions reduction. Staff will continue to evaluate technology and

costs associated with the broadened applicability and estimate a cost-effectiveness of between \$4,000 and \$10,000 per ton of VOC emissions.

IMPLEMENTING AGENCY

The District has authority to adopt and enforce rules and regulations applicable to non-vehicular sources. The control measure will not affect propulsion engines (Health and Safety Code, Section 40001).

IMPLEMENTING AGENCY:		SCAQMD		

* Emission reductions provided are based on the 2012 AQMP emissions inventory. Values provide in parenthesis are based on the 2007 SIP inventory projections for 2023.

DESCRIPTION OF SOURCE CATEGORY

This control measure targets a variety of fugitive emissions sources including, but not limited to, oil and gas production facilities, petroleum and chemical products processing, storage and transfer facilities, marine terminals, and other sources. Most of these facilities are required under District and federal rules to maintain Inspection/Maintenance or leak detection and repair (LDAR) programs that involve individual screening of all of their piping components.

The scope of this control measure is to enhance the effectiveness of existing Inspection/Maintenance and LDAR programs that identify and repair leaks from equipment components by upgrading Inspection/maintenance programs to LDAR and enhancing current LDAR Programs, where feasible. This control measure will apply LDAR programs to areas currently not covered by existing rules such as harbor vessels and oil drilling operations. For this purpose, the proposed control measure relies on recently developed technology, called optical gas imaging, to detect leaks. There are two types of optical gas imaging instruments: active and passive. The active type uses a laser beam that is reflected by the background and the attenuation of the beam traversing through a hydrocarbon cloud provides the optical image. The passive type uses the ambient illumination to detect the difference in heat radiance of the hydrocarbon cloud. For either type, the instrument displays an image of the hydrocarbon plume.

Background

Fugitive VOC leaks have been the subject of control measures in previous AQMPs since they are ozone precursors and contribute to formation of smog. Several District rules that affect petroleum and chemical-related industries, such as oil refineries, oil and gas production fields, natural gas processing plants, pipeline transfer stations and chemical plants have some kind of

requirement involving the periodic inspection of piping components and the detection and repair of leaks.

Fugitive leaks are detected with an organic vapor analyzer (OVA) that measures the leak rate for each component, using U.S. EPA Reference Method 21. In the early 1970s, U.S. EPA initiated the Petroleum Refinery Assessment Study, which developed average emission factors for each type of piping component (valve, flange, pump, etc) and concluded that mass emission rates are dependent on the phase of the process stream (gas/vapor, light liquid and heavy liquid) and the relative volatility of the liquid stream. Mass emissions from fugitive leaks can be calculated based on correlation equations developed by the U.S. EPA based on data from the 1994 Refinery Equipment Leak Report, which is specific for each type of component, such as valve, flange, pump, compressor, etc. The current LDAR program has been successful in significantly reducing fugitive VOC emissions from a variety of sources. However, the latest technology provides opportunities for further improvements in the efficiency of the conventional LDAR program and for further reductions.

Regulatory History

Fugitive emissions are currently regulated under various District rules that range from a simple inspection/maintenance program, to self-inspection programs or an LDAR program. The following rules address fugitive emissions in this manner: Rules 462 – Organic Liquid Loading, 463 – Storage of Organic Liquids, 1142 – Marine Vessel Tank Operations, 1148.1 Oil Well Enhanced Drilling, 1173 – Control of Volatile Organic Compound Leaks and Releases from Components at Petroleum and Chemical Plants, 1176 – Sumps and Wastewater Separators, and 1178 - Further Reductions of VOC Emissions from Storage Tanks at Petroleum Facilities.

PROPOSED METHOD OF CONTROL

There are numerous EPA air pollution standards as well as AQMD Rules that require specific work practices for equipment leak detection and repair (LDAR). The current work practice requires the use of a monitor which meets required performance specifications. This work practice is based on 25-year-old technology. While such work practices have been extremely successful in reducing fugitive emissions, recent developments in optical gas imaging provide opportunities for further improvements.

This control measure will pursue two goals: First, as described below, to upgrade inspection/maintenance rules to at least a self-inspection program, or to an optical gas imaging-assisted LDAR program where feasible. Second, to explore the use of new technologies to detect and verify VOC fugitive emissions in order to supplement existing programs in achieving additional emission reductions.

Rule 462 – Organic Liquid Loading, Rule 1142 - Marine Vessel Tank Operations and Rule - 1148.1 Oil Well Enhanced Drilling are rules that require owner/operators to inspect and to repair and maintain equipment in good operating order when the equipment is operating. Under this control measure, the work practices for these rules would be upgraded to a self-inspection program that requires repairs and maintenance to be documented with records and, where

appropriate, reported. Some of these same programs could be enhanced by adding some of if not all of the requirements of an LDAR program.

Rule 463 - Storage of Organic Liquids and 1178 - Further Reductions of VOC Emissions from Storage Tanks at Petroleum Facilities are two rules that utilize a self-inspection program. Rules 1173 - Control of Volatile Organic Compound Leaks and Releases from Components at Petroleum and Chemical Plants and Rule 1176 - Sumps and Wastewater Separators incorporate an LDAR program. Under this control measure, these rules would be candidates for further improvements in current work practices through the use of new detection technology.

For new detection technology this control measure will be implemented in two phases: Phase I will be a pilot LDAR program to demonstrate feasibility with the new technology and to establish implementation protocols. The completion of phase I will result in the identification of facilities/industries currently subject to LDAR programs and identification of those where the new technology is not yet ready to be utilized. Based on the results of Phase I, fugitive VOC rules will be amended as appropriate under the subsequent phase (Phase II) to enhance their applicability and effectiveness, and to further achieve emissions reductions.

EMISSIONS REDUCTION

The emission reductions from this control measure have not been determined. However, implementing an LDAR program to source categories that are currently not subject to such programs and/or augmenting current and new LDAR programs with the optical gas imaging capabilities would further reduce fugitive emissions by improving operators' ability to detect leaking components and accelerate repairs. Emission reductions are estimated at 1 – 2 tons per day.

RULE COMPLIANCE

Rule compliance would be similar to compliance requirements under existing Rules 462, 463, 1142, 1148.1 1173, 1176, and 1178. Recordkeeping and monitoring requirements would be similar to Rule 109.

TEST METHODS

Test methods include the following:

U.S. EPA Reference Method 21 - Determination of Volatile Organic Compounds Leaks.

Federal Register Vol. 71, No. 66 April 6, 2006 - Alternative Work Practice to Detect Leaks from Equipment.

COST EFFECTIVENESS

Emission reductions associated with this control measure has been determined to be approximately \$11,000 per ton VOC reduced.

IMPLEMENTING AGENCY

The District has authority to regulate fugitive VOC emissions sources from non-vehicular sources.

CONTROL COST:		NOT DETERMINED		
IMPLEMENTING AGENCY:		SCAQMD		

* Preliminary estimates only – not in current inventory, therefore reductions are not included in the SIP commitment.

DESCRIPTION OF SOURCE CATEGORY

Chipping and grinding is a process to mechanically reduce the size of greenwaste and woodwaste materials. Chipped or ground greenwaste can be utilized in related operations as feedstock for composting, bulking agent for co-composting, land-application for erosion control or soil reclamation, or alternative daily cover at landfills.

Background

California Integrated Waste Management Act of 1989 (AB 939) established a new direction for waste management in the state of California and set up a new mandate for local jurisdiction to meet diversion goals to conserve resources and extend landfill capacity. AB 939 mandated local jurisdictions to meet solid waste diversion goal of 25% by 1995 and 50% by 2000. California's statewide estimated diversion rate has been steadily increased and the rate for 2006 is 54%, 2% points higher than the 2005 estimate. Compostable organic materials comprise of approximately 25% of California's waste stream. Compostable material handling operations are currently regulated by CalRecycle in accordance with the California Code of Regulations, Title 14, Division 7, Chapter 3.1 that was promulgated in 2003. In 2007, the former California Integrated Waste Management Board (currently CalRecycle) adopted Strategic Directive 6.1, which in addition to the diversion goals outlined in AB 939, seeks an additional 50% diversion of organics from landfills, thereby increasing diversion from 50 to 75%, by 2020 in support of the California Global Warming Solutions Act of 2006. Along with the adoption of SB 1016 in 2008, the 50% diversion rate is now measured in terms of per-capita disposal expressed as pounds of solid waste disposed per person per day, to help determine each jurisdiction's progress toward achieving AB 939 diversion goals. Cities and local jurisdictions are also

seeking to improve on diversion efforts through alternative uses for foodwaste, either from unused food at restaurants or expired grocery store food products. Efforts also include limited residential foodwaste pilot programs. There has been some success in California relative to foodwaste composting and future statewide requirements are possible.

District rules currently establish Best Management Practices (BMPs) for greenwaste composting and related operations under Rule 1133.1 – Chipping and Grinding Activities, and Rule 1133.3 – Greenwaste Composting Operations. Rule 1133.1 established maximum stockpile holding times at chipping and grinding facilities consistent with the greenwaste material processing requirements in the Title 14, Division 7, Chapter 3.1, Section 17852 (a)(10)(A)(2) of the California Code of Regulations (CCR). Rule 1133.3 established BMPs and VOC emissions reduction requirements for greenwaste composting operations that process greenwaste only or a greenwaste mixture with manure or foodwaste. During rule development, stakeholders suggested the need to develop a more holistic approach, identifying and accounting for emissions from all greenwaste streams, and reducing potential emissions from greenwaste material handling operations at chipping and grinding facilities and other related facilities, not just those associated with composting operations.

Greenwaste material generated from commercial and non-commercial properties are typically transported to material recovery facilities (MRFs), transfer stations, or processing (i.e., chipping and grinding) facilities. Processed greenwaste is further utilized as feedstock for composting, used as fuel, used as an alternative daily cover at landfills, or directly applied to land for erosion control or soil reclamation. However, it is also possible that processed or unprocessed greenwaste is stockpiled for long periods of time without appropriate handling. It is possible that some processed greenwaste may be directly applied to land without a specific purpose, or even illegally dumped. In either case, unwanted VOC emissions may occur from the greenwaste piles. There is currently a lack of information on the greenwaste streams that are generated, processed, and utilized or disposed of in the District.

Regulatory History

Currently, there are approximately 70 chipping and grinding facilities in the District's jurisdiction that are covered by Rule 1133.1. These chipping and grinding facilities are required to remove stockpile from the site within 48 hours of receipt to conform to the state green material holding time requirements. San Joaquin Valley APCD developed daily VOC emission factors for greenwaste stockpile during their organic waste composting rule development process.

There is a lack of data on VOC emissions from chipping and/or grinding itself, not associated with composting operations, as well as from chipped or ground greenwaste. The existing database of chip and grind operations does not necessarily include landscape and tree trimming operations that use chippers to reduce trimmings for transport. Some operations hold materials for 4 to 7 days prior to actual disposal and it is unknown what the end use of the material is. Such operations are not necessarily in the CalRecycle database or regulated by the local enforcement agency. Key to this measure is to determine where all green material comes from and what is its end use, if not for composting, and at what point is the material most emissive, whereby control strategies can be focused. End uses include dumping and spreading material on open land, landfill disposal for daily cover, drying chips for ground cover (such as

freeway interchanges), and taking the material through the pathogen reductions process and selling as a soil amendment.

PROPOSED METHOD OF CONTROL

The greenwaste streams in the District would need to be re-evaluated in order to better understand the greenwaste material handling operations including generation processing, and final destination. This control measure would seek to establish additional BMPs for handling processed or unprocessed greenwaste material by processors, haulers, and operators who handle or stockpile material or directly apply the material to land.

According to a study of biogenic VOC emissions from leaf mulch, VOC emissions peak immediately after leaves were mulched. The emission rates declined with time after chipping and ceased after approximately 30 hours. Another study found that wounded plants have the potential to produce and emit VOCs as a wound defense mechanism. In the latter study, emissions of wound-induced VOCs occurred immediately following excising the leaf, were dependent on the degree of wounding, and were oxygen-dependent. Drying of a cut leaf also resulted in the formation of wound-induced VOCs. Such VOC emissions from chipped greenwaste are likely to be associated with the biological mechanisms of the plant's response to mechanical trauma, rather than with microbial consumption of nutrients. The biological mechanisms driving these emissions are only partially understood.

Based on these initial findings, the following control methods would be proposed.

- Cover chipped or ground greenwaste material as early as operationally possible after chipping and grinding. An impermeable tarp may be considered as a cover material. Finished compost or compost overs would be a good cover material because of a VOC adsorption effect; however, finished compost or compost overs would not be readily available at chipping and grinding facilities, but also may deteriorate the qualitative value of chipped or ground greenwaste material for further use (compost overs are defined as the oversized woody materials that do not decompose in a typical composting cycle and are screened out of finished product at the end of composting).
- Chipped or ground greenwaste material would remain covered until it is removed from the site within 48 hours, as required in the current stockpile holding time requirement pursuant to Rule 1133.1. The cover duration may be adjusted to 12 hours or 24 hours after chipping or grinding since the VOC emissions are short-lived and the emission rates decrease exponentially with time.
- Seasonal covering of the chipped or ground greenwaste material may also be considered for the summer months when ozone and secondary particulate formation potential is greatest.
- In addition, greenwaste material streams need to be understood from generation to destination. Actual throughput of the processed and produced feedstock would be better understood by strengthening the requirements of reporting in Rule 1133 Registration/Annual Update and the requirements of Rule 1133.1 Recordkeeping. Updated feedstock inventory would be used to refine emissions and reduction potentials, as well as to develop cost-effective BMPs or controls.

There are some uncertainties for this proposed control measure. According to the above studies, VOC emissions occur immediately after branches and leaves are being cut. By the time cut greenwaste material arrives at a processing facility, VOCs from the first cutting may already have been released to the air. Although the study reported that the subsequent cutting of the cut leaf still emitted VOCs, it is uncertain how much VOCs would continue to be emitted from chipping and grinding of greenwaste upon receipt at the processing facility.

This proposed control measure would be implemented in two phases:

- Phase 1 – The existing database would be reviewed to refine the greenwaste material inventory, including the Rule 1133 Registration database and any study results on greenwaste processing infrastructure conducted by public or private entities, as available. Recent regulatory development activities by CalRecycle and other air districts, including San Joaquin Valley APCD, as applicable, would be reviewed to seek potential emission mitigation measures where feasible. Recent studies on emission factors and BMPs would also be reviewed to assess reduction potential. Emission source tests may be warranted to determine VOC emissions from processed greenwaste material. Staff will work with counties and cities relative to green material handling practices in light of the aforementioned state diversion requirements and goals in order to determine green material end use and minimize any potential adverse impacts associated with implementing this measure. A survey of greenwaste processors, haulers and operators may be implemented to better comprehend the greenwaste streams and utilization.
- Phase 2 – A rule would potentially be developed to incorporate technically feasible and cost-effective BMPs or controls. The District will convene its working group involving all stakeholders to develop cost-effective and workable solutions for this source category.

EMISSIONS REDUCTION

In review of research on emissions potential from greenwaste operations commissioned by San Joaquin Valley APCD, District staff derived an emission factor of 0.196 pounds of VOC per wet ton per day for greenwaste feedstock storage and processing. For 17,000 tons of maximum permitted greenwaste throughput per day that were preliminarily estimated from 55 chipping and grinding facilities in the CalRecycle's SWISS database (accessed in 2010), about 1.67 tons of VOCs per day are estimated to be emitted from greenwaste stockpile using the District staff's daily VOCs emission factor. Note that this emission factor was initially derived from greenwaste feedstock at varying ages before it was formed into a windrow at composting facilities. Actual VOC emission factors from chipped or ground greenwaste at a processing facility may be different. New source testing is possibly warranted to derive better emission factors. An updated and comprehensive emissions inventory and facility identification is also needed to better quantify potential emissions reductions.

According to Fedele et al.'s study, VOC concentrations decreased from about 37 ppmC at 1 hour after chipping leaves to 5 ppmC at 12 hours and to about 2 ppmC at 24–30 hours. The emissions reduction potential can be calculated at about 60-80% control with proposed covering of chipped or ground greenwaste.

RULE COMPLIANCE AND TEST METHODS

A District regulation or other enforceable instrument will be considered to ensure emission reductions. The most effective regulatory tool will be selected based on the BMP options. Implementation of this control measure will not conflict with efforts under AB939. District staff will work with CalRecycle to develop appropriate test methods, based on BMPs.

COST EFFECTIVENESS

Cost-effectiveness for BMPs or controls will be determined during rule development process based on findings from Phase I.

IMPLEMENTING AGENCY

The District has the authority to regulate emissions from non-vehicular sources.

**MCS-03: IMPROVED START-UP, SHUTDOWN AND
TURNAROUND PROCEDURES
[ALL POLLUTANTS]**

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		ALL SOURCE CATEGORIES		
CONTROL METHODS:		OPERATIONAL PROCEDURES		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE*	2008	2014	2019	2023
<i>POLLUTANT INVENTORY</i>	TBD	TBD	TBD	TBD
<i>POLLUTANT REDUCTION</i>		TBD	TBD	TBD
<i>POLLUTANT REMAINING</i>		TBD	TBD	TBD
CONTROL COST:		NOT DETERMINED		
IMPLEMENTING AGENCY:		SCAQMD		

* TBD are reductions to be determined once the inventory and control approach are identified.

DESCRIPTION OF SOURCE CATEGORY

This control measure is carried over from the 2007 AQMP/SIP.

Background

Equipment start-up, shutdown and turnaround are typically associated with significantly higher emission rates compared to the emission rates observed from the same equipment operating under steady state or normal operating conditions. The higher emission rates observed during start-up, shutdown and turnaround are in part due to the higher loads equipment is subjected to during these transient operating conditions compared to the normal operating conditions as well as the lead times necessary for the conditioning of certain control technologies. The emission rates observed during start-up, shutdown and turnaround, in addition to the equipment design, are influenced by the speed with which particular equipment is fired to reach normal operating conditions or is taken out of service. Start-up, shutdown or turnaround often adversely impact the emission rates from pieces of equipment that are interconnected, either upstream or downstream, to the equipment undergoing start-up/shutdown. This is a phenomenon commonly observed in refinery operations and chemical plants that rely on interconnected equipment and processes. Refinery operations predominantly rely on flares to minimize the emissions impact resulting from start-up, shutdown and turnarounds. However, there are adverse environmental impacts associated with the use of flares as well.

Regulatory History

On November 4, 2005 the District's Governing Board adopted an amendment to Rule 1118 - Control of Emissions from Refinery Flares. In an effort to minimize flaring and associated emissions, the amendment established declining emission targets over time that each refinery

had to meet. The amendment eliminated the flaring of vent gases except for those resulting from emergencies, shutdowns and startups, turnarounds and essential operational needs. The amendment also established operational requirements of diagnostic practices to minimize flaring.

Reducing flaring and associated emissions continued to be an area of intense interest by the community, regulators as well as industry. The Rule 1118 staff report listed several possible alternatives of minimizing flare emissions that could be incorporated further explored:

Optimization of turnaround schedules

Coordination of turnaround schedules for different units can result in minimizing emissions associated with these periodic maintenance activities.

Developing startup and shutdown procedures that do not increase emissions

For certain units, it is possible to develop procedures that avoid flaring during shutdown and startup, such as using reduced loads, recycling feeds, better decontamination procedures, etc. Sometimes more time is necessary for a startup or shutdown, or physical modifications are needed to achieve this purpose.

Several of these approaches are also applicable to other types of industries in minimizing emissions from these types of operations. For example, the installation of redundant equipment to increase reliability and the promotion of operator training for environmental awareness could help a particular facility in minimizing the number of start-ups and shutdowns within a given operational cycle.

PROPOSED METHOD OF CONTROL

This measure will be implemented in two phases, beginning with a technical assessment to be completed in the 2012/2013 timeframe. Under Phase I, effort will include establishing procedures that better quantify emission impacts from start-up, shutdown or turnarounds. Under Phase II, analyses will be conducted to identify improved operating procedures that minimize emissions from such processes and develop rule amendments that could seek implementation of best management practices and/or additional hardware

EMISSIONS REDUCTION

Implementation of the control measure is expected to result in emission reductions. The magnitude of these reductions cannot be readily quantified at this time.

RULE COMPLIANCE AND TEST METHODS

Compliance would be based on monitoring, recordkeeping, and reporting requirements that have been established in existing source specific rules and regulations. In addition, compliance would be verified through inspections and other recordkeeping and reporting requirements.

COST EFFECTIVENESS

The Phase I of the study may cost up to \$300,000 and the cost of Phase II will be assessed based on findings from Phase I.

IMPLEMENTING AGENCY

The District has authority to regulate non-vehicular sources, including to establish procedures for the purpose of minimizing or eliminating emissions during equipment start-up, shutdown and turnaround.

**INC-01: ECONOMIC INCENTIVE PROGRAMS TO ADOPT ZERO AND
NEAR-ZERO TECHNOLOGIES
[NO_x]**

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		ALL COMBUSTION CATEGORIES		
CONTROL METHODS:		ALL AVAILABLE CONTROL METHODS		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE*	2008	2014	2019	2023
NO _x INVENTORY	TBD	TBD	TBD	TBD
NO _x REDUCTION		TBD	TBD	TBD
NO _x REMAINING		TBD	TBD	TBD
CONTROL COST:		TBD		
IMPLEMENTING AGENCY:		SCAQMD		

* TBD are reductions to be determined once the inventory and control approach are identified.

DESCRIPTION OF SOURCE CATEGORY

There is a need for significant NO_x reductions. The primary objective of this measure is to develop a program that promotes and encourages adoption and installation of cleaner, more efficient stationary combustion equipment with a focus on zero and near-zero emission technologies, such as boilers, ovens, furnaces, internal combustion engines, water heaters and commercial space heating, through economic incentive programs subject to the availability of public funding. Currently, there are approximately 20,000 pieces of permitted combustion equipment within the South Coast Air Basin. Incentives may include grants for new purchases of equipment as well as loan programs in areas where long-term cost savings from increased efficiency can be achieved. Projects or programs that demonstrate emission reductions also serve to protect public health by reducing the public's exposure to air pollutants.

This control measure would provide funds to reduce emissions by encouraging energy efficiency improvements and expanding renewable energy sources, so as to potentially create and retain jobs, and promote economic growth and competitiveness.

Background

In the past, the SCAQMD has adopted a series of programs that incorporate a variety of different incentive approaches, such as emissions trading programs, mitigation fee programs, Air Quality Investment Program (AQIP), and averaging. These programs were developed to promote the commercialization of advanced pollution control technologies while encouraging economic growth and providing compliance flexibility.

The District continues to implement incentive programs to help promote efficient clean equipment purchases, efficiency projects, and conservation techniques that provide toxic and criteria pollutant emissions benefits, as well as greenhouse gas emission reductions.

Currently, there are several existing incentive programs which help promote higher efficiency and lower emitting technologies such as: Coachella Valley Emission Reduction Projects; Lawn Mower and Leaf Blower Exchanges; SOON Program; Carl Moyer Memorial Air Quality Standards Attainment Program; MSRC & Area Source Credit Programs; and Voucher Incentive Program.

Regulatory History

AQMD offers a number of funding /grant resources to encourage the immediate use of commercially available, low-emission mobile and stationary technologies. The incentive programs, which include incremental funding or subsidies, are designed to promote voluntary introduction of new technologies on an accelerated schedule. These programs may also provide manufacturers with incentives to accelerate the deployment of the cleaner combustion technologies.

As this measure is not a regulatory item that will be implemented via rulemaking, there is no relevant regulatory history in this area. However, as mentioned above, the District has developed and implemented a wide array of incentive programs designed to achieve emission reductions on a voluntary basis.

PROPOSED METHOD OF CONTROL

This control measure is intended to result in the accelerated turnover of older high-polluting combustion equipment with newer, low-emission equipment providing real emission reductions above those that would otherwise occur through normal equipment turnover. This is a stationary source Moyer-type program in that the economic incentives provide additional funds for businesses to adopt cleaner, more efficient combustion equipment than currently required by the District and help meet 2023 and 2032 ozone standards.

The District in conjunction with other entities would fund cost effective projects that meet certain technical criteria in combination with implementing best management practices through various incentive programs and competitive grants. These funds would help accelerate turnover of older, energy inefficient and higher polluting equipment. The incentives would cover some or all of the cost difference associated with purchasing newer cleaner combustion equipment, add-on control equipment, and / or rebuilding the existing equipment. This could be of great benefit to companies that do not have the financial means to modernize their facilities to become more energy efficient and less polluting. Projects funded under this program must achieve emission reductions in excess of requirements under local, state or federal regulations.

Priority could be given to the projects that qualify for the use of available funds that provide: Maximum environmental and energy co-benefits such as criteria and toxic pollutant reductions as well as greenhouse gas emission reductions; energy security and efficiency; advanced technology; and demonstrate local job creation.

EMISSIONS REDUCTION

Estimates for criteria pollutant emission reduction from these technologies can potentially result in 65 percent or greater reduction in emission from today's regulatory requirements. Implementation and evaluation of additional incentive programs will provide a means to quantify emission reduction benefits as they are developed. Emission reductions achieved from these activities will be in excess of reductions achieved by current regulatory programs and will be used for SIP purposes.

RULE COMPLIANCE AND TEST METHODS

Combustion equipment and control of combustion equipment require a permit under existing District rules and regulations. Making a modification with the combustion equipment or control of emissions will require a permit modification or surrender of existing permit ensuring the cleaner equipment remains in the jurisdiction, along with the emission benefits. If there are any remaining combustion emissions, the permit conditions would ensure its limitation and compliance.

COST EFFECTIVENESS

The cost effectiveness of this measure cannot yet be determined, given the variety of incentive programs and projects that will be developed. The District will continually analyze costs associated with incentive programs and, where possible, quantify resulting emissions reductions. The cost effectiveness for specific incentive programs can be determined as they are developed and implemented by the District.

IMPLEMENTING AGENCY

The District in cooperation with other local governments, agencies, technology manufacturers and distributors will seek funding sources and provide incentives to encourage adoption of cleaner, more efficient combustion equipment.

**INC-02: EXPEDITED PERMITTING AND CEQA PREPARATION
FACILITATING THE MANUFACTURING OF
ZERO AND NEAR-ZERO TECHNOLOGIES
[ALL POLLUTANTS]**

CONTROL MEASURE SUMMARY				
SOURCE CATEGORY:		ALL SOURCE CATEGORIES		
CONTROL METHODS:		VOLUNTARY INCENTIVES		
EMISSIONS (TONS/DAY):				
ANNUAL AVERAGE*	2008	2014	2019	2023
<i>POLLUTANT INVENTORY</i>	N/A	N/A	N/A	N/A
<i>POLLUTANT REDUCTION</i>		N/A	N/A	N/A
<i>POLLUTANT REMAINING</i>		N/A	N/A	N/A
CONTROL COST:		None		
IMPLEMENTING AGENCY:		SCAQMD		

* N/A are reductions that cannot be quantified due to the nature of the measure (e.g., outreach, incentive programs).

DESCRIPTION OF SOURCE CATEGORY

This proposed measure is aimed at providing incentives for companies to manufacture zero and near-zero emission technologies locally, thus populating the market, potentially lowering the purchase cost, increasing demand, and creating local manufacturing jobs. With availability and usage of such technologies, air quality benefits will be achieved. This proposed measure focuses on two elements: 1) process the required air permit(s) in an expedited procedure; and 2) facilitate the preparation of the applicable CEQA document. A stakeholder process will be initiated to design the program and leverage other existing SCAQMD or local programs.

Background

In the past, the SCAQMD has adopted a series of programs developed to promote the commercialization of advanced pollution control technologies while encouraging economic growth and providing compliance flexibility by offering expedited permitting and CEQA preparation. Such programs include “Green Carpet” Priority Permitting Service, Business Clean Air Partnership, Regulatory Reform Initiative, and Environmental Justice Enhancement III-2 (“Super Clean Air Actions”). The manufacturing and deployment of zero and near-zero emission technologies will help reduce criteria pollutant emissions in the region, accelerate removal of equipment that can last for many decades, and advance economic development and job opportunities in the region.

Regulatory History

The SCAQMD has permitting authority over stationary sources that emit air pollutants and the controls designed to limit air pollution. The process of obtaining an air quality permit includes a thorough review to ensure compliance with all applicable rules and regulations, such as source specific standards, new source review, air toxic risk, and best available control technology.

Under Title 14 of the California Code of Regulations, Chapter 3, Article 1, Section 15002(e), “a government agency is required to comply with California Environmental Quality Act (CEQA) procedures when the agency proposes to carry out or approve the activity.” Further, under Section 15002(f), “CEQA applies in situations where a governmental agency can use its judgment in deciding whether and how to carry out or approve a project.” As a discretionary authority to approving a project through the required air quality permit, the SCAQMD has a legal obligation to ensure compliance with CEQA requirements before issuing an air quality permit.

PROPOSED METHOD OF CONTROL

This measure would seek to promote zero and near-zero emission technologies by offering the incentive of an expedited permitting and assistance in CEQA document preparation for manufacturing or distribution of such technologies. By agreeing to manufacture and distribute zero and near-zero emission technologies, a proponent would be rewarded with a streamlined administrative review by the SCAQMD while providing significant emission reduction benefits to the region. The expedited permitting and review program would only accelerate the processing of applications, which would still need to comply with all applicable rules, regulations, and guidelines.

To implement this measure, a stakeholder working group will be established to discuss and propose program designs that will provide meaningful incentives to manufacturers of zero and near zero technologies to be sited locally.

Examples of zero and near-zero emission technologies will be further developed during program development. They include, but are not limited to, the manufacturing of fuel cells, electric batteries for any stationary or mobile applications, and other zero- and near-zero technologies.

Under this measure, the SCAQMD will also evaluate potential permit system modifications that would incentivize use of zero and near zero emission technologies, and would adopt such measures that are determined to be feasible.

EMISSIONS REDUCTION

Due to the voluntary nature of this control measure, potential emission reductions associated with the implementation of this control measure cannot be quantified. The benefit of this measure is to facilitate the deployment of zero and near zero technologies that are needed to achieve the air quality standards and to create local manufacturing jobs.

RULE COMPLIANCE AND TEST METHODS

Not applicable.

COST EFFECTIVENESS

Savings, since this is a voluntary incentive program.

IMPLEMENTING AGENCY

The District has the authority to provide incentives to encourage the manufacturing of zero and near-zero technologies, and to prioritize permit applications and review processes as needed.

SECTION 1

INTRODUCTION

INTRODUCTION

The 2007 State Implementation Plan (SIP) for the 8-hour national ambient air quality standard (NAAQS) contains commitments for emission reductions from mobile sources that rely on advancement of technologies, as authorized under Section 182(e)(5) of the federal Clean Air Act. These measures, which have come to be known as the “black box,” account for a substantial portion of the NO_x emission reductions needed to attain the federal ozone standards – over 200 tons/day. The deadlines to reduce ozone concentrations in the region are 2023 (to attain the 80 ppb NAAQS) and 2032 (to attain 75 ppb NAAQS)¹. Attaining these standards will require reductions in emissions of nitrogen oxides (NO_x) well beyond reductions resulting from current rules, programs and commercially-available technologies.

Mobile sources emit over 80 percent of regional NO_x and therefore must be the largest part of the solution. On-road truck categories are projected to comprise the single largest contributor to regional NO_x in 2023. Other equipment involved in goods movement, such as marine vessels, locomotives and aircraft, are also substantial NO_x sources.

FIGURE IV-B-1

Top NO_x Emissions Categories in 2023 in the South Coast Air Basin, Annual Average (tpd)

¹ The attainment deadline for the 75 ppb standard (adopted in 2008) has been established by U.S. EPA for extreme nonattainment areas by December 31, 2032.

Preliminary District staff projections indicate that **the region must reduce regional NOx emissions by about 65 percent by 2023, and 75 percent by 2032, to attain the national ozone standards as required by federal law.**

FIGURE IV-B-2

Needed NOx Emission Reductions to Achieve Federal 8-Hour Ozone Ambient Air Quality Standards

Since NO_x emissions from most significant sources are already controlled by over 90%, **attainment of the ozone standards will require broad deployment of zero and near zero² emission technologies in the 2023 to 2032 timeframe.** On-land transportation sources such as trucks, locomotives and cargo handling equipment have technological potential to achieve zero- and near-zero emission levels. Current and potential technologies include hybrid-electric, hybrid with all electric range, battery-electric, and hydrogen fuel cell on-road vehicle technologies. New types of hybrids could also serve long-term needs while providing additional fuel diversity. These could include, for example, natural gas-electric hybrid technologies for on-road and other applications, particularly if coupled with improved aftertreatment technologies. Equipment powered solely by alternative fuels such as natural gas may also play a long-term role in some applications, if those applications are found to pose technological barriers to achieving zero or near-zero emissions. Even in such applications, however, substantial additional emission reductions will be needed through development of new, advanced aftertreatment technologies. In addition, alternative fuels will likely play a transitional near-term role. Alternative fuels such as natural gas have historically helped the region make progress toward attaining air quality standards, and -- while not achieving zero or near-zero NO_x emission levels -- they are generally cleaner than conventional fuels. Given the region's need to attain air quality standards in a few short years, alternative fueled engines will continue to play a role. Finally, we emphasize that air quality regulatory agencies have traditionally set policies and requirements that are performance based and technology and fuel neutral -- a policy that the District intends to continue. In short, all technologies and fuels should be able to compete on equal footing to meet environmental needs.

While there has been much progress in developing and deploying transportation technologies with zero- and near-zero emissions (particularly for light duty vehicles and passenger transit), additional technology development, demonstration and commercialization will be required prior to broad deployment in freight and other applications. This Appendix describes a path to evaluate, develop, demonstrate, fund and deploy such technologies for land-based transportation sources. It also proposes

² The term "near zero emissions" refers to emissions approaching zero and will be delineated for individual source categories through the process of developing the Air Quality Management Plan/State Implementation Plan. Based on current analyses, on-land transportation sources will need to achieve zero emissions where possible, and otherwise will need to be substantially below adopted emission standards — including standards with future effective dates. Near zero emissions technologies can help meet this need, particularly if they support a path toward zero emissions (e.g. electric/fossil fuel hybrids with all- electric range).

near-term measures to accelerate fleet turnover to the lowest emission units, and require deployment of zero-emission technologies where most feasible.

The District staff believes that a combination of regulatory actions and public funding is the most effective means of achieving emission these reductions. Voluntary incentive programs such as the Carl Moyer Program can help to accelerate turnover to the cleanest commercially available equipment. A majority of the on-road and off-road measures proposed are based on existing funding programs implemented by the District or the California Air Resources Board. However, several of the existing funding programs will sunset in the 2014 – 2015 timeframe. Continued funding beyond 2015 will be needed to reduce the emissions associated with the black box. Developing, demonstrating and deploying new technologies will require public/private partnerships and, in some cases, regulatory actions.

The measures described in this appendix are relatively small down payments on the total emission reductions needed to attain the current National Ambient Air Quality Standards (NAAQS) for ozone. The measures in this section are feasible steps that must be commenced in the near term to establish a path toward broader transition to the technologies that will be needed to attain federal air quality standards. Between now and 2015, the district will flesh out in greater detail the additional measures needed to attain the ozone NAAQS. The federal Clean Air Act requires the state to submit an ozone attainment plan for the 75 ppb ozone NAAQS by 2015. In addition, with the 2023 attainment deadline for the 80 ppb ozone NAAQS approaching, the district needs to specify plan measures to timely attain that standard, something which the district intends to also adopt as part of the 2015 plan update. Given the magnitude of needed emission reductions, and the time remaining until attainment deadlines, **it is important that progress and momentum to identify, develop and deploy needed technologies be sustained and accelerated.**

The District staff recognizes these are very difficult policy choices the Basin is facing. Transitioning over the next 10 to 20 years to cleaner transportation technologies will involve major costs and effects on the economy. However, adopting sufficient plan measures to attain the ozone air quality standard by 2024 is required by federal law, and failing to do so is, therefore, not an acceptable public policy. Such failure would also risk adverse health consequences highlighted in recent health studies, not to mention the potential adverse economic impacts on the region due to potential federal sanctions. The following sections further describe the measures to help reduce the emissions associated with the black box.

SECTION 2

PROPOSED 8-HOUR OZONE MEASURES

INTRODUCTION

District staff analyzed the need to accelerate the penetration of cleaner engine technologies in various mobile source sectors. This Section describes the District staff’s proposals for additional mobile source emission reductions towards achieving the 8-hour ozone ambient air quality standard by 2023 to be included in the 2012 Draft Final AQMP. The early action measures presented in this appendix are based upon a variety of control technologies that are commercially available and/or technologically feasible to implement in the next several years. The focus of these measures includes accelerated retrofits or replacement of existing vehicles or equipment, acceleration of vehicle turnover through voluntary vehicle retirement programs, and greater use of cleaner fuels in the near-term. In the longer-term, in order to attain the federal ozone ambient air quality standard, there is a need to increase the penetration and deployment of near-zero and zero-emission vehicles such as plug-in hybrids, battery-electric, and fuel cells, further the use of cleaner fuels (either alternative fuels or new formulations of gasoline and diesel fuels), and obtain additional emission reductions from aircraft engines.

PROPOSED MEASURES

Ten early action measures are proposed by the District staff for mobile sources and seven additional early action measures are proposed to accelerate near-zero and zero-emission technologies for goods movement related sources. The early action mobile source measures call for greater emission reductions through significant increase in the turnover of older vehicles to the cleanest vehicles currently available with an emphasis on zero-emission vehicles. In addition, actions are identified for earlier deployment of near-zero and zero-emission technologies in the goods movement sector. A summary of the 17 measures is provided in Table 1.

On-Road Mobile Source Measures

The District staff is proposing five on-road mobile source control measures. The focus of the first two measures is on-road light- and medium-duty vehicles operating in the South Coast Air Basin. By 2023, it is estimated that about 12 million vehicles will be operating in the Basin. The first measure would implement programs to accelerate the penetration and deployment of partial zero-emission and zero-emission vehicles in the light- and medium-duty vehicles categories. The second control measure would seek to accelerate retirement of older gasoline and diesel powered vehicles up to 8,500 gross

vehicle weight (GVW). These vehicles include passenger cars, sports utility vehicles, vans, and light-duty pick-up trucks.

The remaining three measures focus on heavy-duty vehicles. The first of these measures seeks additional emission reductions from the early deployment of partial zero-emission and zero-emission light- and medium-heavy-duty vehicles with gross vehicle weights between 8,501 pounds to 26,000 pounds. The fourth control measure for heavy-duty vehicles seeks additional emissions reductions from older, pre-2010 heavy-duty vehicles beyond the emission reductions targeted in CARB's Truck and Bus Regulation. Additional emission reductions could be achieved if an additional percentage of the oldest, pre-2010 heavy duty vehicles not subject to the Truck and Bus Regulation are targeted. The fifth on-road measure seeks emission reductions at near-dock railyards through the deployment of zero-emission heavy-duty vehicles.

Off-Road Mobile Source Measures

The District staff is proposing five control measures that seek further emission reductions from off-road mobile sources and industrial equipment. Transportation sources such as aircraft, locomotives, and marine vessels are associated with anticipated economic growth not only in the Basin, but also nationwide. These sources are principally regulated by federal and state agencies. Certain local actions can result in emission reductions beyond the emissions standard setting authority of the state and U.S. EPA. The first measure calls for the continuation of the Surplus Off-Road Opt-In for NO_x (SOON) provision of the statewide In-Use Off-Road Diesel-Fueled Fleets Regulation beyond 2014. The SOON provision implemented to-date has realized additional NO_x reductions beyond the statewide regulation. The second and third measures call for additional emission reductions from freight and passenger locomotives. The fourth measure seeks additional emission reductions from ocean-going vessels while at berth. The fifth early action measure recognizes the efforts that the Ports of Los Angeles and Long Beach are implementing to incentivize cleaner Tier 2 and Tier 3 ocean-going vessels to call at the ports.

Actions to Deploy Advanced Control Technologies

The District staff is proposing seven additional measures to deploy the cleanest control technologies as early as possible and the development and deployment of near-zero and zero-emission technologies. Many of these actions have already begun. However, additional research and development will be needed that will lead to commercial deployment of control technologies that achieve emission levels below current adopted

emission standards. Other near-zero and zero-emission technologies that are commercially available will require infrastructure development to facilitate their deployment.

The term “near-zero” technology is not defined in these actions. The term’s specific meaning could depend on the source category and feasible technologies. The actions needed to deploy zero-emission technologies, “near-zero” emission technologies, and the next generation of cleaner combustion engines will be discussed in the development of the proposed control measures in future AQMPs. To initiate the development of cleaner engines (either through in-cylinder or aftertreatment controls or in combination with hybrid systems that lead to further criteria pollutant emission reductions), District staff is proposing that optional NO_x standards be adopted. Having such optional standards will facilitate the early development of cleaner technologies and to deploy these technologies as soon as possible. Several of the technologies to achieve emission levels lower than current standards, or zero-emission levels, are currently available and are potentially transferrable to various vehicle vocations and in-use applications. However, further research and demonstration of many of these technologies is needed to evaluate their performance prior to commercialization.

The District staff, U.S. Department of Energy, U.S. Environmental Protection Agency, Federal Aviation Administration, California Air Resources Board, California Energy Commission, engine manufacturers, advanced engine control developers, and electric hybrid system developers have been discussing potential technologies to further reduce engine exhaust emissions or eliminate exhaust emissions entirely. Public forums such as technology symposiums will be used to solicit public input on technology development as part of the proposed actions.

FORMAT OF IMPLEMENTATION MEASURES

Included in each control measure description is a title, summary table, description of source category (including background and regulatory history), proposed method of control, estimated emission reductions, discussion of rule compliance, identification of test methods, estimated cost effectiveness, and references. The type of information that can be found under each of these subheadings is described below.

Implementation Measure Number

Each measure is identified by a measure number such as “CM #ONRD-04” located at the upper right hand corner of every page. “CM #” is the abbreviation for the “control measure number” and is immediately followed by the year of the AQMP revision.

The next three- to five-letter designation represents the abbreviation for a source category or specific programs. For example, “ONRD” is an abbreviation for “On-Road Mobile Sources.” The following provides a description of the abbreviations for each of the measures.

- ONRD On-Road Mobile Sources for the South Coast Air Basin
- OFFRD Off-Road Mobile Sources for the South Coast Air Basin
- ADV Actions to Deploy Advanced Control Technologies

Summary Table

Each measure contains a table that summarizes the measure and is designed to identify the key components of the measure. The table contains a brief explanation of the source category, control method, emission reductions, control costs, and implementing agency.

Description of Source Category

This section provides an overall description of the source category and the intent of the early action measure. The source category is presented in two sections, background and regulatory history. The background has basic information about the control measure such as the number of sources in the Basin, description of emission sources, and targeted pollutants.

The regulatory history contains information regarding existing regulatory control of the source category such as applicable state or federal rules or regulations and whether the source category was identified in the 2007 or prior AQMPs.

Proposed Method of Control

The purpose of this section is to describe the actions over the next several years and beyond. Relative to the “ADV” measures, this section reflects actions to be taken to further develop zero- and near-zero emission technologies or advanced control technologies that will lead to further emissions reductions.

Emissions Reduction

The emission reductions are estimated based on the baseline inventories prepared for the 2012 AQMP and are provided in the Control Measure Summary Table. The emissions data are based on the annual average inventory for all five criteria pollutants. The planning inventory adjusts the emissions by taking into consideration a source category’s

seasonal variations. The emissions affecting ozone concentration (i.e., VOC and NO_x) are presented under the Summer Planning Inventory. The emissions section of the summary table includes the 2008 and 2023 inventories. The 2023 emission projections reflect implementation of adopted rules. Based on the expected reductions associated with implementing the measure, emission data are calculated for 2023 assuming the implementation of the early actions in the absence of other competing measures.

The emission reductions listed in the summary table represent the current best estimates, which are subject to change as the actions are implemented. For three of the measures, ONRD-05, OFFRD-01, and OFFRD-02, emissions reductions are also reported based on the projected 2023 emissions inventory provided in the 2007 SIP since the reductions are associated with the Section 182(e)(5) emission reduction commitments in the 2007 SIP.

Rule Compliance

This section was designed to satisfy requirements in the 1990 Clean Air Act in which EPA has indicated that it is necessary to have a discussion of rule compliance with each control measure. This section discusses the recordkeeping and monitoring requirements envisioned for the control measure. In general, the District would continue to verify rule compliance through site inspections and submittal of compliance plans.

Test Methods

In addition to requiring recordkeeping and monitoring requirements, U.S. EPA has stated that “An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance.” This section of the measure write-up identifies appropriate approved District, ARB, and EPA source test methods, where currently available.

Cost Effectiveness

The Discounted Cash Flow (DCF) method is used to calculate the cost-effectiveness of each measure. As measures undergo the rule making process, more detailed control costs will be developed.

The cost effectiveness values contained herein may overestimate actual levels because of a number of factors. As additional information on costs and more accurate numbers of affected entities becomes available, the cost effectiveness will be revised and analyzed in the socioeconomic assessment report of the 2012 AQMP.

Implementing Agency

This section identifies the agency(ies) responsible for implementing the measure or may have an ability to implement the measure. Also included in this section is a description of any jurisdictional issues that may affect the measure's implementation. Relative to the "ADV" measures, entities identified in this section are envisioned to work collaboratively to advance the development and commercialization of zero- and near-zero emission technologies or advanced engine control technologies that will lead to further emissions reductions. For measures that involve voluntary incentives programs, agency(ies) identified have historically implemented such programs or may be recipients of funds to implement such programs. It is envisioned that the same agencies will implement the measure if funds are available to the implementing agency.

CONTROL COST:	TBD. MINIMUM INCENTIVES FUNDING - \$5,000,000/YEAR	
IMPLEMENTING AGENCY:	CARB, SCAQMD	

* Emission reductions will be determined after projects are identified and implemented.

DESCRIPTION OF SOURCE CATEGORY

The purpose of this early action measure is to seek emission reductions from existing passenger cars, sports utility vehicles, and other light- and medium-duty vehicles through the increased use

of partial zero-emission and zero-emission vehicles that would provide substantial improvements in emissions performance beyond current conventional gasoline and diesel vehicle technologies. This measure would continue the use of voluntary incentive programs that would facilitate the commercial deployment of plug-in hybrid-electric, battery electric, and fuel cell vehicles.

Background

Emissions from passenger vehicles continue to represent a significant portion of the emissions inventory in the South Coast Air Basin, adversely affecting regional air quality. The intent of this measure is to specifically mitigate impacts associated with passenger car emissions through early deployment of partial-zero- and zero-emission vehicles that are currently available commercially or expected to be offered commercially in the next two to three years.

Regulatory History

To address California's acute air quality problems, the federal Clean Air Act provides California the authority to adopt and enforce rules to control mobile source emissions within California. The California Air Resources Board (CARB) is the responsible agency to adopt emissions standards that are as stringent or more stringent than federal requirements.

Significant strides have been made in reducing emissions from motor vehicles through CARB's mobile source regulations that apply predominately to new vehicles. As a result, a "new" vehicle today is approximately 99% less polluting compared to a vehicle manufactured a couple of decades ago. However, on-road and off-road mobile sources account for about 70 percent of ozone precursor emissions in the State. Because of the large emissions contribution, requiring the use of advanced technology such as plug-in hybrid electric vehicle technology capable of zero-emission transportation is essential if clean air standards are to be realized, especially for in-use vehicles. In January 2012, the CARB adopted amendments to the Low Emission Vehicle (LEV) program and the Zero-Emission Vehicle (ZEV) regulation.

In addition, CARB implements a "Clean Vehicle Rebate Project" (CVRP) that provides individual vehicle incentives of up to \$2,500 for full zero-emission vehicles, \$1,500 for plug-in hybrid vehicles, \$900 for neighborhood electric vehicles, and \$900 for zero-emission motorcycles. For the 2011/2012 fiscal year, a total of \$15 million was allocated statewide.

PROPOSED METHOD OF CONTROL

This measure proposes to continue the CVRP through 2023 with a minimum number of 1,000 vehicles per year to be incentivized through the CVRP. The proposed incentives would be up to \$5,000 per vehicle. As part of this action, additional funding opportunities will be sought.

EMISSIONS REDUCTION

Emission reductions are not estimated at this time and will depend on the actual number of vehicles participating in the program.

RULE COMPLIANCE AND TEST METHODS

Not applicable.

COST EFFECTIVENESS

This proposed control measure will affect light- and medium-duty vehicles with gross vehicle weight ratings up to 8,500 lbs. The estimated funding level is \$5 million per year to incentivize a minimum of 1,000 vehicles per year.

The cost effectiveness of this control measure has not been estimated at this time. The cost effectiveness will be affected by any changes to the per vehicle incentive levels or if total funding levels are not realized.

IMPLEMENTING AGENCY

CARB is currently implementing the AB118 CVRP. This early action measure would continue the implementation of the CVRP.

IMPLEMENTING AGENCY:	CARB, BUREAU OF AUTOMOTIVE REPAIR, SCAQMD	

* Emission reductions will be determined after projects are identified and implemented.

DESCRIPTION OF SOURCE CATEGORY

The purpose of this control measure is to implement a strategy to accelerate retirement of older gasoline- and diesel-powered vehicles up to 8,500 lbs. gross vehicle weight (GVW). These vehicles include passenger cars, sports utility vehicles, vans, and light-duty pick-up trucks.

Background

Light-duty vehicles are major contributors of air pollutants in the South Coast Air Basin. While vehicle miles traveled increased more than 50 percent over the last 20 years, vehicle emissions have dropped by a factor of almost three due to increasingly stringent vehicle emission standards. Yet, the light- and medium-duty vehicle fleet continues to contribute more than a third of the Basin's total emissions of ozone and particulate matter forming pollutants in part due to high emitting vehicles.

Motor vehicle emissions progressively increase as vehicles age and accumulate mileage. The causes of these emissions increases are numerous, but can be broadly categorized in terms of normal deterioration of properly functioning on-board emission control system components, emission control system malfunctions due to design flaws and/or lack of proper maintenance, and tampering. In recognition that emission reductions could occur through regular emission testing of vehicles and repair of those vehicles with high in-use emissions, Smog Check programs have been established in an attempt to ensure that vehicles stay clean as they age, but room for improvements in such programs exist. In addition, through the Bureau of Automotive Repairs (BAR) High Emitter profile, certain model year vehicles are considered inherently high emitters despite passing Smog Check.

Regulatory History

On September 23, 2004, the Governor signed AB 923 (Firebaugh) which resulted in a significant increase in incentive funding for programs that achieve emission reductions from vehicular sources and off-road engines. The legislation identified and emphasized that in-use higher emitting vehicles are sources that need additional scrutiny and control in part because of their large contribution to the fleet's total emissions. To address this, the District is implementing, under the AB923 program, pilot programs to identify and retire high emitting on-road vehicles. In addition, based on cost effectiveness guidelines, model year 1992 and older vehicles would be considered for early retirement.

CARB adopted the Enhanced Fleet Modernization Program (EFMP) Regulation in June 2009. The regulation implements the voluntary vehicle scrap and replacement voucher provisions of AB 118 (Nunez). The legislation includes \$30 million annually statewide for an Enhanced Fleet Modernization Program (EFMP). The EFMP augments the State's existing voluntary accelerated vehicle retirement program, referred to as the Consumer Assistance Program (CAP). The focus of the EFMP is to augment existing retirement programs and provide funding through vehicle replacement vouchers to retire the highest polluting vehicles in the areas with the greatest air quality problems.

PROPOSED METHODS OF CONTROL

Currently, California vehicles less than 10,000 lbs. GVW are required to undergo Smog Check testing every two years or upon change of a vehicle's ownership. Recent studies have indicated that repairs performed in conjunction with the Smog Check Test Program do not last the entire biennial cycle and result in high emitting vehicles being driven on California roadways. The current Consumer Assistance Program (CAP) operated by BAR encourages vehicle retirement for on-cycle (those vehicles within three months of their smog check test due dates) vehicles that cannot pass the Smog Check Test. Vehicles identified as high emitters that are off-cycle to the smog check test are not eligible under the CAP program implemented by BAR and the State of California. This measure would give first priority to pre-1992 model year vehicles identified as high emitters and are off-cycle to California's Smog Check Program.

The early action is to retire at a minimum, 2,000 light- and medium-duty vehicles per year to 2023. The proposed incentives would be up to \$2,500 which could include a replacement voucher under the AB 118 EFMP program.

EMISSIONS REDUCTIONS

Emission reductions are not estimated at this time and will depend on the actual number of vehicles participating in the program.

COST EFFECTIVENESS

The Carl Moyer \$17,080 per ton threshold is used to calculate the cost-effectiveness of the vehicle retirement program. Because this program is solely reliant on a volunteer participation rate by the consumers, the exact cost effectiveness of the program is difficult to assess prior to the program implementation.

IMPLEMENTING AGENCY

The implementing agencies would be the South Coast Air Quality Management District under AB 923 and guidelines set forth by CARB for the Light-Duty Vehicle Program. In addition, the EFMP would be implemented by CARB and BAR with the District's administration of the replacement voucher provisions of the EFMP regulation.

DESCRIPTION OF SOURCE CATEGORY

Background

Emissions from heavy-duty diesel mobile sources continue to represent a significant and increasing portion of the emissions inventory in the South Coast Air Basin, adversely affecting regional air quality. The two primary pollutants resulting from diesel fuel combustion are particulate matter (PM) and oxides of nitrogen (NOx). PM typically constitutes the visible emissions from diesel engine exhaust, and it contains over 40 known cancer-causing substances. In 1998, California identified diesel PM as a toxic air contaminant based on its potential to cause cancer. In March 2005, the District released a report titled, “The Multiple Air Toxic

Exposure Study in the South Coast Air Basin.” This report concluded that about 85 percent of the carcinogenic risk associated with breathing ambient air can be attributed to diesel particulate emissions. Diesel engines also emit significant quantities of NO_x, which is a precursor to ozone and secondary particulate matter formation. Additional control on diesel engine emissions is essential for attainment of ozone and PM ambient air quality standards, as well as mitigating its toxic air quality impact.

The intent of this measure is to seek greater emission reduction benefits through the early deployment of partial zero-emission and zero-emission light-heavy- and medium-heavy-duty vehicles with gross vehicle weight ratings (GVWR) from 8,501 lbs to 26,000 lbs.

Regulatory History

The regulation of emissions from heavy-duty diesel mobile emission sources is the responsibility of CARB and U.S. EPA. Specifically, heavy-duty vehicle engines are subject to specific emission standards pursuant to state and/or federal requirements. Emission standards for new diesel engines powering heavy-duty vehicles were first established for the 1973 model-year and have gradually increased in stringency over time. The current most stringent set of heavy-duty engine emission standards has been established by CARB and U.S. EPA for 2010 and subsequent model-years, which includes a 0.2 g/bhp-hr NO_x emission standard.

In December 2008, CARB adopted the Truck and Bus Regulation which applies to a significant number of heavy-duty vehicles with gross vehicle weight ratings of 14,001 lbs and greater. Heavier trucks (26,001 lbs and greater) must meet regulatory requirements beginning January 1, 2012. Lighter trucks (14,001 lbs to 26,000 lbs) must meet regulatory requirements beginning January 1, 2015.

Currently, heavy-duty diesel engine manufacturers are introducing electric-hybrid systems in medium-heavy-duty on-road vehicle applications. Such systems in conjunction with a 2010-compliant conventionally-fueled or alternative-fueled engine can potentially result in additional NO_x emissions benefits. Many of the hybrid systems introduced to-date are for lighter vehicles with gross vehicle weight ratings from 8,501 to 26,000 lbs.

PROPOSED METHOD OF CONTROL

This measure seeks additional emission reductions through the early introduction of electric hybrid vehicles. The proposed actions would continue the state hybrid truck and bus voucher incentive project (HVIP) which accelerates the deployment of hybrid and zero-emission medium-heavy-duty vehicles in the South Coast Air Basin.

Incentives of up to \$25,000 per vehicle are proposed with a minimum target of 1,000 hybrid and zero-emission vehicles funded each year to 2023. The proposed funding would place the highest priority towards zero-emission vehicles and hybrid vehicles with a portion of their operation in an “all electric range” mode.

EMISSIONS REDUCTION

Emission reductions are not estimated at this time and will depend on the actual number of vehicles participating in the program.

RULE COMPLIANCE AND TEST METHODS

Not Applicable.

COST EFFECTIVENESS

This proposed control measure will affect heavy-duty engine manufacturers, heavy-duty diesel truck owners, and heavy-duty diesel fleet operators. Costs of replacement engines vary depending on the specific model and vehicle application, and an evaluation would need to be conducted to determine the specific types of trucks and engine models that would be primarily affected by this measure, as well as prioritizing vehicle applications on a cost-effectiveness basis for engine or vehicle replacement. The proposed incentives of \$25,000 per vehicle will help offset the capital cost of the vehicles.

IMPLEMENTING AGENCY

CARB, SCAQMD or U.S. EPA could jointly or separately implement incentive programs that would help offset the costs associated with new hybrid or zero-emission truck purchase, engine repower, and/or retrofit kit installation.

DESCRIPTION OF SOURCE CATEGORY

Background

Emissions from heavy-duty diesel mobile sources continue to represent a significant portion of the emissions inventory in the South Coast Air Basin, adversely affecting regional air quality. The two primary pollutants resulting from diesel fuel combustion are particulate matter (PM) and oxides of nitrogen (NOx). PM typically constitutes the visible emissions from diesel engine exhaust, and it contains over 40 known cancer-causing substances. In 1998, California identified diesel PM as a toxic air contaminant based on its potential to cause cancer. In March 2005, the District released a report titled, “The Multiple Air Toxic Exposure Study in the South

Coast Air Basin.” This report concluded that about 85 percent of the carcinogenic risk associated with breathing ambient air can be attributed to diesel particulate emissions. Diesel engines also emit significant quantities of NO_x, which is a precursor to ozone and secondary particulate matter formation. Additional control of diesel engine emissions is essential for attainment of ozone and PM ambient air quality standards, as well as mitigating its toxic air quality impact.

Over the past decade, warehouse and distribution centers have been steadily increasing in size and number throughout the region. The greatest growth in warehouses/distribution centers has been in the Riverside and San Bernardino areas. Based on the Southern California Association of Governments, by 2035 over 1 billion square feet of warehousing will be needed in the Southern California area to support goods movement activities (SCAG, 2010).

Distribution centers and/or warehouses are facilities that serve as a distribution point for the transfer of goods. Such facilities include cold storage warehouses, goods transfer facilities, and transloading facilities, where imported goods are sorted, tagged, repackaged and prepared for retail distributions. These operations involve trucks, trailers, shipping containers, and other equipment with diesel engines. A warehouse/distribution center can be comprised of multiple centers or warehouse/distribution centers within an area. The size can range from 100,000 square feet to well over a million square feet. Depending on the size and type, a warehouse/distribution center may have hundreds of diesel trucks a day that deliver, load, and/or unload goods, generally operating seven days a week. To the extent that these trucks are transporting perishable goods, they are equipped with diesel-powered transport refrigeration units (TRUs) or TRU generator sets. The activities associated with delivering, storing, and loading freight produces NO_x and PM emissions, including diesel particulate matter (DPM).

The intent of this control measure is to seek additional emission reductions from existing heavy-duty vehicles with gross vehicle weight ratings (GVWR) greater than 26,000 lbs through an accelerated vehicle replacement program with new 2010 and later model year engines. In addition, for heavy-duty vehicles not replaced with new models, existing vehicle engines would be repowered with commercially available engines meeting 2010 emission standards or modified with retrofit kits to achieve lowest possible emission levels. Given the exceedences of the federal 24-hour fine particulate (PM_{2.5}) ambient air quality standard in the Mira Loma area, the proposed measure will place priority to replace older heavy-duty vehicles serving warehouse and distribution centers located within a 10 mile radius of the District’s Mira Loma air monitoring station.

Regulatory History

The regulation of emissions from heavy-duty diesel mobile emission sources is the responsibility of CARB and U.S. EPA. Specifically, heavy-duty vehicle engines are subject to specific emission standards pursuant to state and/or federal requirements. Emission standards for new diesel engines powering heavy-duty vehicles were first established for the 1973 model-year and have gradually increased in stringency over time. The current most stringent set of heavy-duty engine emission standards has been established by CARB and U.S. EPA for 2010 and subsequent model-years, which includes a 0.2 g/bhp-hr NO_x emission standard.

In December 2008, CARB adopted the Truck and Bus Regulation which applies to a significant number of heavy-duty vehicles with gross vehicle weight ratings of 14,001 lbs and greater. Heavier trucks (26,001 lbs and greater) must meet regulatory requirements beginning January 1, 2012. Lighter heavy-duty trucks (14,001 lbs to 26,000 lbs) must meet regulatory requirements beginning January 1, 2015.

The Carl Moyer Memorial Air Quality Standards Attainment Program is in its 13th year. The Carl Moyer Program was placed into state law and is the enabling mechanism to fund the cleanup of older diesel vehicles and equipment. At its initial inception, the Carl Moyer Program was funded annually through a state budget line item that must be approved by the state legislature. In 2004, the state legislature approved Senate Bill (SB) 1107, which allowed for the funding of the Carl Moyer Program. In addition, the state legislature passed Assembly Bill (AB) 923, which provides funding until 2015 and allowed California local air districts to opt into a local Moyer Program.

The SB1107 funds are generated from new vehicle sales. In lieu of having Smog Check inspections in the first four years, new vehicles are now subject to their first Smog Check inspection after six years. A fee of \$48 is assessed at the time of vehicle purchase, which is typically less expensive than the Smog Check inspection and certificate. Half of the \$48 is directed to CARB, who distributes the funds among local air districts for implementation of the Carl Moyer Program.

The AB923 program has two components. One is a tire disposal fee which generates about \$10 million a year and is distributed by CARB among the local air districts. The other is a \$2 Department of Motor Vehicle registration fee that each local air district's Board has the authority to approve independently and generate funds from vehicles registered within their respective district boundaries. Fees generated are used for both the Carl Moyer and the School Bus Programs.

In 2006, California voters approved a bond measure called Proposition 1B. The bond measure would generate \$19 billion of which \$2 billion would go towards improving California's freight transportation infrastructure, \$1 billion towards the cleaning up older diesel vehicles, and \$200 million to school bus retrofits. The funding is predicated on bond sales. To-date, close to 2,000 older diesel trucks have been replaced with either newer diesel trucks or alternative fuel trucks.

PROPOSED METHOD OF CONTROL

This measure seeks additional emission reductions from older, pre-2010 heavy-duty vehicles beyond the emission reductions targeted in CARB's Truck and Bus Regulation. In addition, the proposed action is to direct a portion of available public funding to assist in replacing older diesel trucks serving warehouse and distribution centers to a truck with an engine meeting on-road heavy-duty exhaust emission standards and replacing older cargo handling equipment with equipment meeting Tier 4 off-road exhaust emission standards by 2015. The incentive programs will place the highest priority on on-road vehicles that provide at least 75% of their service to warehouse and distribution centers in the Mira Loma region and have gross vehicle weight ratings of 26,001 lbs or greater.

A significant number of heavy-duty trucks have been replaced through Proposition 1B Goods Movement Emission Reduction Program funding, the Carl Moyer Program, and other local incentives programs. This measure would continue these programs through 2023. In addition, this measure would seek a provision from the State for the District to implement a SOON-like (Surplus Off-Road Option for NOx) provision for the largest on-road truck fleets operating in the South Coast Air Basin.

While the Truck and Bus Regulation will ultimately require a majority of the heavy-duty trucks to meet 2010 heavy-duty exhaust emission standards by 2023, funding programs, which partially offset the costs, are typically made available to fleets with 10 or less trucks. However, many of these smaller fleets are not able to provide the remaining capital necessary to purchase a 2010-compliant truck and thus, cannot take advantage of funding opportunities. As such, the District staff believes a SOON-like program for the largest on-road truck fleets can lead to greater emission reductions earlier and complement traditional funding programs.

Examples of SOON-like programs include the San Pedro Bay Ports Clean Truck Program where the Ports adopted programs to incentivize the use of 2007 or cleaner trucks entering the Ports. Revenues from the Clean Truck Program are used to help fund cleaner trucks. A SOON-like program implemented regionwide would require the largest on-road truck fleets to access incentives funding to replace older model trucks earlier than required or to replace older model trucks which would otherwise be exempt from the regulation.

EMISSIONS REDUCTION

Emission reductions are not estimated at this time and will depend on the actual number of vehicles participating in the program.

RULE COMPLIANCE AND TEST METHODS

CARB, subject to existing and future waiver decisions by U.S. EPA, has the authority to establish emission standards and certification requirements, and verify compliance with these requirements, for on-road vehicles and engines sold in California. In addition, CARB has the authority to establish requirements for the verification of retrofit kits that would be used to modify heavy-duty diesel engines. Compliance with requirements of an incentive program(s) used to offset the costs of new heavy-duty vehicles, engines, or retrofit kits could be jointly or separately administered by SCAQMD or CARB.

COST EFFECTIVENESS

The cost effectiveness of the proposed action is not estimated. Recent funding for goods movement related vehicles under the Proposition 1B Air Quality Improvement Funds provided at least \$35,000 per truck replaced.

IMPLEMENTING AGENCY

CARB, SCAQMD or U.S. EPA could jointly or separately implement incentive programs that would help offset the costs associated with new truck purchase, engine repower, and/or retrofit kit installation. In particular, there is a need to incentivize emission reductions from interstate trucks registered outside of California, but operating substantially within California.

DESCRIPTION OF SOURCE CATEGORY

Background

Intermodal container movement is the movement of containers directly between the marine ports and a railyard. There are three types of railyards used for intermodal: on-dock railyards, near-dock railyards, and off-dock railyards. On-dock railyards are located on marine terminals, near-dock railyards are less than five miles from marine terminals, and off-dock railyards are more than five miles from marine terminals. Heavy-duty diesel trucks are currently used to transport containers from marine terminals to near- and off-dock railyards. These trucks are a significant source of NOx and PM emissions.

The Intermodal Container Transfer Facility (ICTF) operated by Union Pacific (UP) is presently the only near-dock railyard. ICTF serves both the Ports of Los Angeles and Long Beach. In January 2009, the Ports of Los Angeles and Long Beach released a California Environmental Quality Act (CEQA) Notice of Preparation to double the throughput at ICTF. In addition, Burlington Northern Santa Fe (BNSF) Railway is proposing to build the Southern California International Gateway (SCIG) facility that will be a near-dock railyard directly south of the ICTF. ICTF and the proposed SCIG facility are located less than five miles from the Ports of Los Angeles and Long Beach.

Regulatory History

In December 2007, the California Air Resources Board (ARB) adopted a regulation to reduce emissions from drayage trucks operating at California's ports and intermodal railyards. This regulation was amended in 2010. The drayage truck regulation applies to diesel-fueled drayage trucks having a gross vehicle weight rating greater than 26,000 pounds operating at specified California ports, intermodal railyards, or both. The regulation sets two compliance deadlines that affect all drayage trucks operating specifically at California's ports and intermodal railyards:

- Phase 1: By December 31, 2009, all pre-1994 model year (MY) engines are to be retired or replaced with 1994 and newer MY engines. Furthermore, all drayage trucks with 1994 – 2003 MY engines are required to achieve an 85 percent PM emission reduction through the use of an approved Level 3 verified diesel emission control strategy (VDECS).
- Phase 2: By December 31, 2013, all trucks would be required to further reduce emissions to meet the 2007 MY California or federal heavy-duty diesel-fueled on-road emission standards.

CARB's On-Road Heavy-Duty Diesel Truck and Bus Rule incorporates the Drayage Truck Regulation and will further require that trucks operating at the Ports meet 2010 federal on-road standards by 2021.

In 2006, the Ports of Los Angeles and Long Beach adopted the San Pedro Bay Ports Clean Air Action Plan (CAAP), a planning and policy document that sets goals and implementation strategies to reduce air emissions and health risks associated with Port operations. One measure contained in the CAAP reduces emissions from on-road heavy-duty trucks used to dray goods to and from the Ports. CAAP Control Measure HDV-1: Performance Standards for On-Road Heavy Duty Vehicles (Clean Truck Program) requires all on-road trucks entering the Ports comply with the following:

- October 1, 2008: All pre-1989 trucks are banned from entering the Port.
- January 1, 2010: 1989-1993 trucks will be banned, in addition to 1994-2003 trucks that have not been retrofitted to achieve 85 percent DPM reduction and 25 percent NOx reduction through use of a CARB approved Level 3 VDECS.

- January 1, 2012: All trucks that do not meet the 2007 federal on-road standards will be banned from the Ports starting in 2012; CARB's Drayage Truck Regulation aligns with the Clean Truck Program.

When fully implemented, this CAAP measure and the statewide Drayage Truck Regulation will reduce emissions from drayage trucks accessing current and future near-dock railyards, such as the ICTF and SCIG railyards. However, due to the large number of trucks trips to the ICTF and potential future near-dock railyards, additional emission reductions are needed from trucks.

PROPOSED METHOD OF CONTROL

This control measure calls for CARB to adopt a regulation or through other enforceable mechanisms, which further reduces emissions from near-dock railyard drayage trucks. The regulation would require by 2020, all containers transported between the marine ports and the near-dock railyards to use zero-emission technologies that do not create tailpipe emissions from the vehicle or systems that transport containers by regulating truck emissions and potentially allowing alternative technologies. Zero-emission technologies are well suited for transporting containers to near-dock railyards because of their short distance to and from marine terminals. In-lieu of a regulation or to complement a regulation, other enforceable mechanisms may achieve the objectives of the control measures. The Ports of Los Angeles and Long Beach have successfully implemented the Clean Truck Program as mentioned above. A second phase of such a program could be implemented to bring zero-emission trucks or hybrid trucks with sufficient all electric range to serve the near-dock railyards. In addition, incentives funding programs will encourage the deployment of such zero-emission trucks.

Any of several types of zero-emission container movement systems could be used to implement this measure. Zero-emission container movement systems include, but are not limited to, on-road technologies such as battery-electric trucks, fuel cell trucks, hybrid-electric trucks with all-electric range (AER) and zero-emission hybrid or battery-electric trucks with "wayside" power (such as electricity from overhead wires). The measure could also be implemented with the deployment of zero-emission fixed guideway systems such as electric, maglev or linear synchronous motor propulsion or any other technologies that result in zero-emission track miles.

Such systems are not currently in use for full-scale port to railyard operations and, depending on the technology, may require different levels of additional development and optimization. However, a variety of these technologies are being demonstrated, and there is substantial evidence that they can be made commercially available prior to 2020, particularly if regulations create a positive signal to technology developers by requiring the use of zero-emission technologies.

In addition, many of these zero-emission technologies are expected to be operationally feasible to serve the ports. For example, electric trucks with adequate zero-emission range, power and reliability – such as are being developed and demonstrated at the Ports could fit into current operating procedures as a replacement for fossil fuel-powered trucks. Drayage service to and from near-dock railyards is particularly conducive to implementation of zero-emission trucking technologies because of the relatively short distance involved (less than five miles) and because

near-dock railyards could be served by a relatively limited number of trucks compared to the total number serving the ports and region.

Zero-emission trucks can be powered by grid electricity stored in a battery, by electricity produced onboard the vehicle through a fuel cell, or by “wayside” electricity from outside sources such as overhead catenary wires, as is currently used for transit buses and heavy mining trucks. All technologies eliminate fuel combustion and utilize electric drive as the means to achieve zero-emission and higher system efficiency compared to conventional fossil fuel combustion technology. Hybrid-electric trucks with all electric range can provide zero emission in certain corridors and flexibility to travel extended distances (e.g. outside the region) powered by alternative fuels, conventional fuels, or fuel cells.

EMISSIONS REDUCTION

The proposed control measure would require zero-emission technologies to replace up to 1,000 heavy-duty trucks that serve the San Pedro Bay Ports and the near-dock railyards. Implementation of this control measure is expected to result in 0.75 and 0.025 tons/day of NOx and PM emission reductions.

RULE COMPLIANCE AND TEST METHODS

Compliance would be based on monitoring, recordkeeping, and reporting requirements that have been established in existing regulations. In addition, compliance would be verified through inspections and other recordkeeping and reporting requirements.

COST EFFECTIVENESS

Not determined.

IMPLEMENTING AGENCY

CARB would adopt a new regulation or amend the existing Drayage Truck Regulation to require zero-emission on-road technologies or fixed guideway systems, if feasible. This control measure should be adopted by CARB no later than 2015, with full implementation by 2020.

* Emission reductions provided are based on the 2012 AQMP emissions inventory. The emissions inventory in the 2007 SIP was updated as part of the Final Approval of the 2007 SIP for the 1997 8-Hour Ozone Standards (77 FR 12674) and is the same inventory used for the 2012 AQMP.

DESCRIPTION OF SOURCE CATEGORY

The purpose of this measure is to promote faster turnover of older in-use construction and industrial diesel engines.

Background

In 2023, off-road equipment is the second largest source category of NO_x emissions and accounts for 14 percent of the total NO_x emissions in the South Coast Air Basin. Heavy-duty construction, industrial, airport ground support (GSE), and drilling equipment are eligible for participation in the District's Surplus Off-road Opt-in for NO_x (SOON) program and represent almost 40 percent of the off-road equipment category NO_x emissions. In 2007, CARB adopted the In-Use Off-Road Diesel-Fueled Fleets Regulation that reduces primarily PM and secondarily NO_x emissions through retrofit controls, engine repowers, equipment replacement and fleet reduction. NO_x emissions reduction of about 17 percent is expected to be achieved with full implementation of the regulation by 2023.

Regulatory History

The Federal Clean Air Act prohibits states from regulating emissions from new engines used in construction and farming equipment less than 175 horsepower. Diesel engines greater than 175 horsepower are regulated by CARB. In September 1996, CARB, U.S. EPA, and the diesel engine manufacturers signed a statement of principles, which called for a cooperative effort to reduce NO_x, VOC, and PM emissions by more than 60 percent. In August 1998, U.S. EPA adopted new emission standards pertaining to off-road diesel engines. Subsequently, in January 2000 and in December 2004, CARB adopted amendments to existing California emission standards to harmonize with the federal requirement. These amendments included a tiered approach starting from 1996 for Tier 1 and concluding in 2015 with all engines required to meet Tier 4 standards.

In order to accelerate the introduction of new low emission equipment, CARB adopted the In-Use Off-Road Diesel-Fueled Fleets Regulation (Off-Road rule) in 2007. The rule applies to diesel fueled construction, mining, industrial, airport ground support equipment, and mobile oil drilling equipment and established annual fleet average emission targets. Fleets that do not meet the fleet average in any year are required to “turnover,” (i.e., retire, replace, retrofit, or repower) a specified percentage of their horsepower. The Off-Road rule was amended in 2011 which relaxed the target emission reductions and set the initial date for vehicle compliance to 2014.

As part of the statewide regulation, CARB adopted the SOON provision that allows air districts to opt-in to additional NO_x emissions reductions from the largest off-road fleets subject to the regulation. The District has been implementing the SOON provision since 2008. The District Governing Board set aside up to \$30 million per year to implement the SOON provision.

PROPOSED METHOD OF CONTROL

New off-road diesel engines are now required to meet Tier 4 emission standards. Tier 4 includes optional phase-in provisions (Interim Tier 4 standards) with relaxed standards from 2008 to 2014, depending on horsepower category. By 2015, all new off-road diesel engines between 75 hp and 750 hp, which represent most off-road construction equipment, will be required to meet exhaust emissions standards of 0.3 g/bhp-hr NO_x and 0.015 g/bhp-hr PM. To comply with these standards, advanced fuel injection, air induction, and after-treatment technologies are required. The emission reductions from Tier 4 engines compared to Tier 0 engines is at least 95 percent for NO_x and PM.

The long life of off-road equipment means that older, high emitting engines will remain in the off-road equipment population beyond 2020. District staff believes that using incentive programs, such as the Carl Moyer Program and the SOON Provision of the Off-Road rule, significant emission reductions could be realized by accelerating fleet turnover through equipment replacement and engine repowers.

During the last four years, the SOON program has funded close to 500 engine repowers at an average cost effectiveness of approximately \$11,000/ton NO_x reduction. The District Governing Board has allocated up to \$30,000,000 per year for the program. This measure proposes to extend the current SOON Program beyond 2014 to 2023.

EMISSIONS REDUCTION

While the NO_x emissions from the off-road category are projected to be around 44 tpd in 2023, emissions from vehicles eligible to participate in the SOON program are 15.91 tpd. Reductions from this proposed measure are estimated to be 7.47 tpd for NO_x.

COST EFFECTIVENESS

The SOON program has funded approximately 500 engine repowers during the last four years at an average cost effectiveness of approximately \$11,000/ton NO_x reduced. While the cost of Tier 4i and Tier 4 engine repowers are expected to be higher, the cost effectiveness is expected to remain the same because of the lower NO_x emission standards of the Tier 4 engines. This measure proposes to extend the SOON program with proposed funding of up to \$30,000,000 per year and is expected to repower at least 1,200 Tier 0 engines to Tier 4 by 2023 resulting in 7.47 tpd of NO_x reductions.

IMPLEMENTING AGENCY AND ISSUES

The District would implement the SOON provision of the In-Use Off-Road Diesel-Fueled Fleets Regulation.

* Emission reductions provided are based on the 2012 AQMP emissions inventory. Values provided in parentheses are based on the 2007 SIP emissions inventory projections for 2023. The reductions will not be resubmitted as part of the 2012 AQMP SIP since the commitment is already contained in the approved 2007 SIP for the 8-hour ozone ambient air quality standard.

DESCRIPTION OF SOURCE CATEGORY

Background

Diesel-electric locomotives have a large diesel engine (main traction engine) for generating electric power which in turn drives electric motors in each axle. Locomotives can be grouped into three major categories: switch or yard locomotives, medium horsepower (MHP) locomotives, and interstate line haul locomotives. Switch or yard locomotives range in sizes from 1,006 to 2,300 horsepower (hp), and are generally used within railyards to assemble

railcars to form a train. They are also, in limited cases, used in short local haul services. MHP locomotives range from 2,300 to 3,800 hp, and are used in passenger and various local and intrastate freight line haul locomotive operations. The small-size MHP locomotives ranging in sizes from 2,301 to 2,999 hp are used in local service and as large switch locomotives. The mid-size MHP locomotives (3,000 to 3,300 hp) perform local and regional short line-haul services, or provide additional power to assist trains over steep grades. The large-size MHP locomotives (3,301 to 3,800 hp) are generally used for intrastate or regional line haul locomotive operations. Interstate line haul locomotives are high power locomotives with over 4,000 hp, and are used to move freight over long distances and many states.

CARB estimates that about 139 switchers, 150 MHP, and 200 interstate line haul locomotives operate within the South Coast Air Basin at any given time. Locomotives contributed approximately 22.1 tons per day of NO_x and 0.62 ton per day of PM_{2.5} emissions to the South Coast Air Basin emissions inventory in 2008. The U.S. EPA locomotive regulations, CARB diesel fuel regulation, and the 1998 Memorandum of Understanding (MOU) between CARB, Union Pacific Railroad Company (UP), and Burlington Northern Santa Fe Railway Company (BNSF) have collectively produced reductions in locomotives emissions from 2000 to 2010. CARB projected freight locomotives to contribute 17.8 tons per day in 2023 to the South Coast Air Basin's annual average NO_x emissions inventory.

Regulatory History

In December 1997, the U.S. EPA published emission standards for diesel locomotives. These standards included Tier 0 standards for 1973-2001 uncontrolled locomotives upon rebuilding of their diesel engines; more stringent Tier 1 standards for new 2002-2004 locomotives; and modestly stringent Tier 2 standards for 2005 and newer locomotives. In 2008, the U.S. EPA adopted a three-part regulation to further reduce emissions from existing locomotive engines, reduce idling emissions, and introduce new generations of clean locomotives. First, locomotives originally manufactured after 1972 and powered by Tier 0, Tier 1, and Tier 2 engines are required to meet new emissions standards when the locomotives are remanufactured. Second, newly-built line-haul and switch locomotives are subject to a different set of stringent near-term (Tier 3) and longer-term (Tier 4) emissions standards. Tier 3 standards are already effective, and Tier 4 standards will be effective beginning in 2015. Lastly, newly-built and remanufactured locomotives are also required to be equipped with an Automatic Engine Stop/Start System capable of shutting-down a locomotive after idling for no more than 30 minutes continuously. This three-part regulatory approach is expected to achieve up to 22 percent NO_x and 63 percent PM reductions from remanufactured locomotives, compared to their corresponding current standards. Additionally, locomotives powered by Tier 3 or Tier 4 engines will achieve up to 83 percent NO_x and 87 percent PM reductions, compared to engines meeting the current Tier 2 standards

Besides the federal emission requirements for locomotives, CARB has signed two memorandum of understandings (MOU) with the two Class 1 freight railroads operating in California, Burlington Northern Santa Fe Railway (BNSF) and Union Pacific Railroad (UP). The first agreement, the South Coast MOU, was signed in 1998. Among other features, it commits the two Class 1 railroads to meeting Tier 2 NO_x standards, on average, starting in 2010 with their locomotives operating in the South Coast Air Basin. The second CARB agreement, the Rail

Yard Agreement, was signed in 2005. It calls upon the two Class 1 railroads to reduce diesel emissions in and around railyards in California including a statewide locomotive idling limitation program, increase use of low-sulfur diesel for locomotives fueled in California, and a visible emissions detection and repair program.

In 2010, the Ports of Los Angeles and Long Beach updated the San Pedro Bay Ports Clean Air Action Plan that includes a measure calling nearly all locomotives entering the Ports and nearby intermodal yards to meet an emissions goal of Tier 4 by 2020.

PROPOSED METHOD OF CONTROL

The proposed measure carries forward the freight locomotive control measures from the 2007 SIP. The measure calls for replacing existing locomotive engines with Tier 4 engines beginning 2015 such that by 2023, there will be at least 95% Tier 4 locomotives operating in the South Coast Air Basin. CARB would seek further emission reductions from freight locomotives through enforceable mechanisms within its authority. In addition, the Ports as landlords of the property which the near-dock railyards operate have the ability to negotiate (either through lease agreements or environmental mitigation measures) the use of Tier 4 locomotives to achieve the emission reductions provided in this measure. As part of the proposed efforts, the District and CARB will work with U.S. EPA to develop additional enforceable mechanisms to ensure that the proposed control measure is fully implemented by 2023.

EMISSIONS REDUCTION

It is estimated that by 2023, this measure would reduce NO_x by 70 percent and direct PM_{2.5} by about 75 percent. Full implementation of the proposed control measure would result in a 12.7 tons/day reduction in NO_x and 0.32 tons/day reduction in PM_{2.5} emissions by 2023.

COST EFFECTIVENESS

The cost-effectiveness will be determined after further discussion with CARB and railroads.

IMPLEMENTING AGENCY

U.S. EPA has the legal authority to adopt emission standards for locomotives. CARB has developed voluntary agreements with the Class I railroads for further emissions reductions. In addition, the Ports of Los Angeles and Long Beach have the ability as landlords to negotiate certain conditions on leases and other contractual arrangements, potentially including port-wide conditions.

CONTROL COST:	THE COST-EFFECTIVENESS OF THIS MEASURE WILL VARY DEPENDING ON THE TYPE OF CONTROL EQUIPMENT. THE AVERAGE COST-EFFECTIVENESS IS ESTIMATED TO BE AROUND \$5,000/TON.	
IMPLEMENTING AGENCY:	SOUTHERN CALIFORNIA REGIONAL RAIL AUTHORITY (METROLINK)	

DESCRIPTION OF SOURCE CATEGORY

The purpose of this control measure is to promote earlier and cleaner replacement or upgrade of existing passenger locomotives to meet Tier 4 locomotive emission standards.

Background

Diesel-electric locomotives have a large diesel engine (main traction engine) for generating electric power which in turn drives electric motors in each axle. Passenger locomotives have engines with about 3,800 horsepower and four drive axles. U.S. EPA emission standards affect 1973-2001 locomotives upon engine rebuild and new 2002 and later locomotives. Locomotives remain in commercial service from 25 to 40 years.

Two passenger railroads, Metrolink and Amtrak, operate passenger train service in the South Coast Air Basin. Metrolink operates seven service lines, 55 stations, and moves approximately 40,000 passengers daily over a 512 track-mile network located almost exclusively within the South Coast Air Basin. Amtrak operates three interstate routes and one intrastate route that travel through the Basin. Metrolink locomotives contribute approximately 77 percent of the emissions of NO_x and PM_{2.5}, with Amtrak locomotives responsible for the remainder. Metrolink's fleet consists of approximately 60 percent older Tier 0 locomotives with the remainder being locomotives that meet the Tier 2 emissions standards. Metrolink plans to upgrade their fleet so that all locomotives will meet the cleanest (Tier 4) emission standards from 2014 through 2016 which will result in a fleet with at least 85 percent lower emissions. Amtrak's fleet that travels in the South Coast Air Basin is almost exclusively locomotives meeting the Tier 0 emission standards and plans are being made to upgrade them to Tier 0+ emission standards.

Regulatory History

U.S. EPA promulgated regulations for the control of emission from locomotives in 1998 and 2008. The regulations require locomotives to meet increasingly more stringent emission levels (Tier 0 thru Tier 4) when they are manufactured and in some cases additional emissions improvements when they are remanufactured at the end of their useful life. For newly manufactured passenger locomotives the cleanest emission standard (Tier 4) is required beginning in 2015 and will result in emissions that are over 90 percent cleaner than those from unregulated locomotive engines. For passenger locomotives manufactured before 2012 (i.e., meeting Tier 0, 1 or 2 emission standards), modest emissions improvements (referred to as "plus" standards) are required at the date of remanufacture which usually occurs seven to 10 years after the new locomotive is put into service.

Locomotives by design remain in operation for a long time (typically over 30 years). As such, emission reductions from natural turnover of the passenger locomotive fleet will take many years to be realized. Additionally, as most of the passenger locomotives operating in the Basin meet the Tier 0 or Tier 2 standards, they are only required to meet the more modest Tier 0 plus and Tier 2 plus standards on remanufacture unless they are replaced with new locomotives.

PROPOSED METHOD OF CONTROL

Metrolink's Board (Southern California Regional Rail Authority) has adopted a locomotive replacement plan which includes the procurement of Tier 4 locomotive engines to replace its 30 Tier 0 locomotives over a three-year period. In addition, the replacement plans calls for repowering the existing Tier 2 locomotives to Tier 4 emissions levels. These actions will result in 100% Tier 4 passenger locomotives by 2023.

In addition, the District will encourage Amtrak to replace or repower their Tier 0 locomotives to meet Tier 4 locomotive emission standards starting in 2015 rather than remanufacturing these engines.

EMISSIONS REDUCTION

Emission reductions are estimated to be 2.96 tons/day for NO_x and 0.06 tons/day PM_{2.5} in 2023.

COST EFFECTIVENESS

Metrolink staff estimates that upgrading their oldest locomotives will cost approximately \$3.4 million per locomotive, and for their newer locomotives, approximately \$2.4 million each. Total cost to upgrade the fleet will be approximately \$150 million. Assuming a 20 year locomotive life, the cost effectiveness of the upgrades will be in the range of \$5,000 per ton of emissions reduced.

IMPLEMENTING AGENCY

The Southern California Regional Rail Authority will be considering the procurement of Tier 4 locomotive engines.

DESCRIPTION OF SOURCE CATEGORY

The purpose of this control measure is to incentivize additional controls on auxiliary engines and boilers on ocean-going marine vessels while at berth.

Background

Ocean-going vessels (OGV) visit the Ports of Los Angeles and Long Beach over 4,500 times per year and can remain at berth for up to 48 hours or more loading and unloading cargo. While at berth (also called hotelling), ships use auxiliary engines to provide electricity and boilers to provide steam while the ship is in operation. Ships require electrical power while at berth for operation of lights, ventilation, and loading and unloading operations and steam is used for heating. Beginning August 2012 until January 1, 2014, auxiliary engines and boilers use diesel oil that can contain sulfur levels as high as 10,000 ppm (as compared to diesel used by other mobile vehicles at 15 ppm). These engines and boilers produce significant amounts of NO_x, SO_x, PM, and toxic air contaminant (TAC) emissions. A typical medium size cargo ship burns seven tons of diesel fuel a day while at the port, and generates as much as one ton of NO_x, 0.5 tons of SO_x and 60 pounds of PM10 daily. Overall, auxiliary engines produce upwards of 12.3 tpd of NO_x, 6.0 tpd of Sox, and 0.88 tons per day of PM10 in the South Coast Air Basin each year with boilers contributing the remainder of the at-berth NO_x, SO_x, and PM10 emissions of 1.3, 10.6, 0.52 tpd respectively.

This early action measure focuses on having ocean-going vessels not subject to the statewide shorepower regulation to cold iron, which is a technology that is used to provide on-board power from the shore, while berthed at the Ports of Los Angeles and Long Beach. Other technologies that are currently being evaluated include a bonnet system to funnel ship exhaust emissions into filter and NO_x reduction systems, and are considered under this measure.

Regulatory History

The regulation of emissions from ocean-going vessels is primarily accomplished through CARB and U.S. EPA regulations. Cargo container, cruise lines, and refrigerated cargo (reefers) vessels are subject to CARB's shorepower regulation which requires fleets that have vessels that frequently visit California ports (for cargo container and reefers - 25 visits per year or more, and for cruise liners - five visits or more per year) to reduce emissions from their fleets by 50 percent beginning in 2014 and by 80 percent in 2020. Strategies to control emissions include shorepowering of vessels (utilizing grid based electrical power in lieu of auxiliary engines) and exhaust after-treatment by ducting exhaust gases from auxiliary engines and boilers to treatment systems.

PROPOSED METHOD OF CONTROL

Electrical power for hotelling operations can be provided to a ship via electrical cables using shorepower. Shorepower can be locally generated at the port or obtained from the grid. Shorepower can be locally generated using clean technologies such as fuel cells, gas turbines, microturbines, and combined cycle units. These stationary power generating systems can use alternative fuels such as natural gas, reducing emissions to very low levels. The in-Basin grid power generation NO_x emission factor is significantly lower than that of diesel-fueled engines

especially because most stationary power generating units have installed selective catalytic reduction (SCR) control technologies. The use of shorepower for hotelling operations is termed “cold ironing.”

Due to technical and operational (i.e., frequency of calls) reasons, however, cold ironing may not be a viable option for all types of ships. Also, ships require steam for hotelling operations. If all the electrical power for hotelling is supplied by cold ironing, steam must be provided from the ship’s boilers or the shore to the ships. Based on energy consumption, steam can account for as much as 30 percent of all energy used during hotelling.

This measure would seek at a minimum, an additional 25 percent of the calls not subject to the statewide shorepower regulation to deploy shorepower technologies or alternative forms of emission reductions as early as possible.

EMISSIONS REDUCTION

Emission reductions are not estimated at this time and will depend on the number of vessels participating and the type of technology utilized.

COST EFFECTIVENESS

CARB staff estimated the cost effectiveness of the regulation to range from \$11,000 to \$47,000 per ton of NO_x controlled as part of the adoption of the statewide Shorepower Regulation. TIAX under contract to the District evaluated the bonnet system that funnels the emissions to a shore-side treatment system. The cost effectiveness of this system range from \$15,000 to \$45,000 per ton of NO_x controlled. The expected cost effectiveness of this control measure should fall within the ranges of these two studies.

IMPLEMENTING AGENCY

San Pedro Bay Ports, CARB, SCAQMD.

* Emission reductions will be determined after the vessel participation rates are reported.

DESCRIPTION OF SOURCE CATEGORY

The purpose of this measure is to incentivize the newest Tier 2 and Tier 3 vessels to call at the Ports of Los Angeles and Long Beach.

Background

Ocean-going vessels (OGV), because of their large relatively uncontrolled diesel engines, contribute a significant portion of NO_x, PM, greenhouse gas and toxic emissions particularly in coastal regions and in and around shipping ports. OGV engines can range in size from 1,000 to over 100,000 horsepower and can burn significant amounts of fuel a day. Beginning in 2016,

vessels built to operate in North American waters will be required to meet emission standards requiring exhaust emission controls that will be significantly cleaner than today's engines. However, because of OGV long lifetimes (on the order of 20 or more years), it will be many years before sufficient numbers of the cleanest vessels will call at marine ports in the region to significantly reduce emissions. Moreover, post-2015 vessels may not be routed to North American ports. It is essential that the cleanest vessels be incentivized to call at marine ports as expeditiously as possible to ensure progress toward meeting ambient air quality standards.

Regulatory History

The regulation of emissions from mobile port-related emission sources is traditionally the responsibility of CARB and U.S. EPA. Specifically, ships are each subject to specific emission standards pursuant to state, federal, and/or international requirements. The standards, primarily affecting new units, vary in stringency and compliance dates.

OGV main and auxiliary engines are subject to the International Maritime Organizations international emission standards as contained in Annex VI to the International Convention on the Prevention of Pollution from Ships (MARPOL Annex VI). U.S. flagged ships must meet similar U.S. EPA requirements, but most vessels must meet the IMO standards as they are not U.S. flagged ships. In October 2008, the IMO adopted new standards for engines and require vessels to meet increasingly more stringent NO_x emission standards. The standards are designated by Tiers ranging from Tier 0 being uncontrolled or no emission controls to the most stringent Tier 3 standard. Tier 2 NO_x emission standards are around 20% cleaner than Tier 0 standards and can be achieved through engine design changes. The Tier 3 NO_x standard is significantly more stringent (better than 80 percent cleaner) and most likely can only be met using engine aftertreatment systems. Engines on vessels must meet the Tier 3 NO_x standard if they are built after 2015 and must travel through designated Emission Control Areas (ECA). ECAs can be created by member states if approved by the IMO. On March 26, 2010, the IMO designated waters within 200 nautical miles of the United States and Canadian coasts as the North American ECA.

In addition to NO_x emission requirements, IMO and CARB require vessels to use lower sulfur distillate fuels when the vessels travel within 200 nautical miles (as defined in the ECA) or 24 nautical miles of the California coastline (as defined in the CARB regulation). By 2015, all vessels will be required to use distillate fuels with sulfur contents less than 1,000 ppmw when they travel within the North American ECA.

PROPOSED METHOD OF CONTROL

As part of the San Pedro Bay Ports Clean Air Action Plan 2010 update, the Ports adopted incentive programs to maximize the early introduction and preferential deployment of vessels to the San Pedro Bay Ports with cleaner/newer engines meeting the new Tier 2 and Tier 3 IMO NO_x standards. The Port of Long Beach is proposing to offer up to \$2,500 for each Tier 2 vessel call and up to \$6,000 for each Tier 3 vessel call. The Port of Los Angeles is proposing a scoring standard based on the "Environmental Ship Index" or ESI to establish the level of incentive funding. The Ports indicated that the program will be monitored annually regarding participation and if adjustments will be necessary to maximize Tier 2 and Tier 3 vessel calls.

This measure seeks to enhance the Ports' programs as necessary to maximize the number of Tier 3 vessels calling at the Ports. In addition, other mechanisms that could complement the Port program will be explored. Examples include discussions on the state and federal level on mechanisms to incentivize Tier 2 and Tier 3 vessel calls through the North American ECA and programs to retrofit or repower existing vessels to meet Tier 3 standards.

EMISSIONS REDUCTION

Based on the assumed penetration of new Tier 2 and Tier 3 vessels in the U.S. EPA rulemaking, this measure could achieve, at a minimum, NO_x, PM₁₀, and PM_{2.5} reductions of 2.8 tpd, 0.1 tpd, and 0.09 tpd, respectively by 2023. Emission reductions could be higher if the participation rate of the Ports programs and other potential programs are greater than anticipated.

COST EFFECTIVENESS

Not Determined.

IMPLEMENTING AGENCY

San Pedro Bay Ports relative to existing incentives programs. San Pedro Bay Ports, CARB, U.S. EPA, and the District relative to seeking additional mechanisms to incentivize Tier 3 vessel calls at the state and federal levels.

GROUP 3

ACTIONS TO DEPLOY ADVANCED CONTROL TECHNOLOGIES

**ADV-01: ACTIONS FOR THE DEPLOYMENT OF ZERO
AND NEAR-ZERO EMISSION ON-ROAD HEAVY-DUTY VEHICLES
[NOX, PM]**

CONTROL MEASURE SUMMARY

SOURCE CATEGORY:	ON-ROAD HEAVY-DUTY VEHICLES (26,001 LBS AND GREATER)
CONTROL METHODS:	ADVANCED NEAR-ZERO AND ZERO-EMISSION TECHNOLOGIES
EMISSIONS (TONS/DAY):	NOT ESTIMATED
CONTROL COST:	THE CONTROL COSTS VARY WITH THE TYPE OF CONTROL TECHNOLOGY IMPLEMENTED
IMPLEMENTING AGENCY:	SCAQMD, SCAG, LOS ANGELES COUNTY TRANSPORTATION AUTHORITY, SAN PEDRO BAY PORTS, CARB, CALTRANS, U.S. EPA

DESCRIPTION OF SOURCE CATEGORY

The technology and infrastructure phases, combined with the agency implementation actions, focus on defining, developing, demonstrating and deploying transportation systems and technologies that will address mid- to long-term regional needs. These actions seek to develop coordinated solutions for mobility, economy, energy and the environment, so that single investments can provide multiple benefits. A key strategy is to deploy zero- and near-zero freight transport equipment powered by clean energy. This strategy has the potential to simultaneously address regional and local air quality problems, foster public support for needed freight infrastructure capacity enhancements, provide greater energy security and cost certainty, address climate change, and foster local jobs in logistics and clean technology.

Background

This measure describes the actions needed to commercialize advanced zero-emission and cleaner combustion emission technologies that could be deployed in the 2015 to 2035 timeframe. Such technologies include advanced engine controls to achieve at least 95 percent reduction in NO_x exhaust emissions beyond the current 2010 heavy-duty exhaust emissions standards or a combination of advanced engine controls deployed with electric hybrid systems and zero-emission technologies such as electric, battery-electric, and fuel cells. In addition, greater use of any alternative fuels and renewable fuels with relatively low NO_x emissions compared to conventional fuels, in conjunction with zero-emission technologies, are important over the next 10 to 20 years for any vehicle vocations where zero-emission technologies could not be applied in that timeframe.

Regulatory History

The establishment of emission standards for on-road heavy-duty diesel emission sources is the responsibility of CARB and U.S. EPA. Specifically, heavy-duty vehicle engines are subject to

specific emission standards pursuant to state and/or federal requirements. Emission standards for new diesel engines powering heavy-duty vehicles were first established for the 1973 model-year and have gradually increased in stringency over time. The current most stringent set of heavy-duty engine emission standards has been established by CARB and U.S. EPA for 2010 and subsequent model-years, which includes a 0.2 g/bhp-hr NO_x emission standard.

In December 2008, CARB adopted the Truck and Bus Regulation which applies to a significant number of heavy-duty vehicles with gross vehicle weight ratings of 14,001 lbs and greater. Heavier trucks (26,001 lbs and greater) must meet regulatory requirements beginning January 1, 2012. Lighter trucks (14,001 lbs to 26,000 lbs) must meet regulatory requirements beginning January 1, 2015.

In the South Coast Air Basin, the two national ozone standards established by U.S. EPA will require reductions in emissions of nitrogen oxides (NO_x) well beyond reductions resulting from current rules, programs and commercially available technologies. Because most significant emission sources are already controlled by over 90 percent, attainment of the ozone standards will require broad deployment of zero and near-zero emission technologies in the 2015 to 2035 timeframe.

PROPOSED METHOD OF CONTROL

Two separate sets of actions are proposed under this measure. The first is the establishment of an optional NO_x exhaust emissions standard that is at least 95 percent lower than the current 2010 on-road exhaust emissions standard (i.e., at or below 0.01 g/bhp-hr). The second set of actions is to develop zero-emission technologies for heavy-duty vehicles that can be deployed in the 2015 to 2035 timeframe.

Actions to Deploy Technologies to Achieve 95 Percent or Greater Reductions in NO_x

This proposed action seeks CARB to establish an optional NO_x exhaust emissions standard which represents a 95 percent reduction of the 2010 standard or 0.01 g/bhp-hr. The optional NO_x standard serves as a benchmark for heavy-duty engine manufacturers to develop the next generation of cleaner combustion engines. Such engines in combination with the ability to achieve a specific level of zero-emission miles are likely to be developed in the near-term to achieve the proposed optional NO_x exhaust emission standard. In addition, having optional NO_x emission standards provides certainty in funding incentives, by establishing a standard for engines to meet in order to receive incentives.

Actions to Deploy Zero-Emission Technologies for On-Road Heavy-Duty Vehicles

There has been much progress in developing on-road technologies with zero- and near-zero emissions, particularly for light-duty vehicles and passenger transit. In general, however, additional technology development, demonstration and commercialization will be required prior to broad deployment of zero-emission technologies for freight movement. The actions and schedules specified below describe a path to evaluate, develop, demonstrate, fund and deploy such technologies for on-road heavy-duty vehicles.

Infrastructure Planning Actions. Part of the actions and schedules specified below involve evaluations and determinations regarding infrastructure needed to support deployment of zero- and near-zero emission technologies. The key question is whether on-road trucks will be able to operate fully under their own power with zero-emission technologies, or whether that equipment will require some form of “wayside” electric or magnetic power built into the roadway infrastructure to boost the pulling capacity or range of the equipment.

This may include battery charging or fueling infrastructure, as well as transportation infrastructure such as dedicated truck lanes. Such lanes can provide opportunities to incentivize zero-emission vehicles (e.g. through discounts of any applicable tolls) as well as to provide wayside electric power to trucks, much as power is now provided to electric transit buses in San Francisco and other cities. Alternatively, if battery, fuel cell or other zero/near zero emission technologies progress sufficiently, the need for wayside power for rail or trucks may be diminished or eliminated.

There are multiple technologies under consideration, and each must be analyzed to assess utility and practicality, costs, benefits, and reliability. Some technologies are more developed than others; some may have a quicker ramp-up to commercialization than others. A path forward to development and deployment of a long-term freight system is set out below, including a schedule with milestones and key decision points.

Phase 1: Project Scoping and Existing Work

Continue to build on current regional research and technology testing efforts.

Southern California has long been a goods movement hub, and a significant amount of work has already been done to assess current and future goods movement volumes, to explore the range of technologies under consideration, to evaluate user needs and potential markets, to analyze current and projected transportation corridors and select the highest priority corridors, and to begin to develop and test some vehicle prototypes. That work has already been initiated, and constitutes Phase 1 of the effort to develop and implement a long-term freight system.

A high level summary of the work completed or underway in Southern California is provided below, along with the challenges that remain for successful commercialization and widespread deployment of zero- or near-zero emission truck technologies.

Existing Work

Over the last five years, studies have assessed the transportation corridors that currently carry high volumes of freight truck traffic and are likely to be heavily impacted in the future.³ The I-710 corridor was selected as high priority for introduction of zero-emission technology.⁴ The 2012 Regional Transportation Plan also designates a route along the 60 freeway as an east-west freight corridor.

³ Los Angeles County Metropolitan Transportation Authority, et al, *Multi-County Goods Movement Action Plan*. Prepared by Wilbur Smith Associates, April 30, 2008.

⁴ Los Angeles County Metropolitan Transportation Authority, *Alternative Goods Movement Technology Analysis-Initial Feasibility Study Report. Final Report. I-710 Corridor Project EIR/EIS*. Prepared by URS. January 6, 2009.

The truck technologies being assessed for a zero-emission freight transport system can be grouped into two categories: zero-emission trucks alone and zero-emission trucks combined with wayside power systems. Zero-emission trucks using their own motive power would have significantly smaller infrastructure needs but would be limited in their applicability by the technology. Integrating infrastructure, such as wayside power, with the truck technology would provide a system to power trucks while on the road and thereby significantly increase the utility and range of the trucks while operating in zero-emission mode.

Zero-emission truck technology includes full battery-electric trucks, fuel cell trucks, and dual-mode (hybrid) electric trucks with all-electric range. Battery-electric trucks are established in smaller trucks and in a variety of different vocations. Fuel cell trucks – either with a small battery pack or with the fuel cell as a range extender with a larger battery pack – have been demonstrated in other categories and are seeing significant progress in both light- and heavy-duty vehicle applications.

Dual-mode trucks would have sufficient battery power to operate in electric-only mode, but would also have a source of motive power (internal combustion engine running on diesel, natural gas, hydrogen, or other fuel) that provides flexibility for longer routes. The terminology of dual-mode is being used here to signify a truck with a distinct all-electric range as opposed to most current hybrids which use a battery and electric motor to augment an internal combustion engine.

Wayside power technologies include overhead catenary, in-road power such as third rail or linear synchronous motor (LSM), and fast charging. All three technologies must be integrated closely with the zero-emission trucks, and all have the potential to significantly increase the functionality and range of trucks utilizing batteries, including dual mode-hybrids. (It is unlikely that fuel cell trucks would need wayside power, due to their range and relatively quick refueling capability). In overhead catenary systems, power is delivered from the electrical grid through the overhead wire to a pantograph on the vehicle itself. Catenary systems are well-established and efficient in light-rail applications, trolley cars and buses, and even mining trucks.

For in-road power, the roadway itself provides power to the vehicles, which must be equipped with pick-up devices. In one technology, cables/wires embedded in the roadway carry electric power; in another technology, LSMs provide power by interacting with a permanent magnet on the vehicle. In-road power systems have advantages but the technology is currently less developed than catenary. Fast-charging is a high-power charging system used to quickly recharge the batteries in an electric vehicle at destination points, e.g., railyards or distribution centers. While technically not “wayside” power, fast charging is similarly grouped with other approaches that require infrastructure to be designed and built into the freight facilities and corridors.

Zero-emission truck prototype testing is underway with funding from the Port of Los Angeles, the Port of Long Beach, and the District. A demonstration of the Balqon lead-acid battery electric truck was initiated in 2007. The battery was upgraded to a lithium-ion battery, and testing of the upgraded system is underway. Additional testing is ongoing with units made specifically for drayage by Vision Motor Corporation, using a combination of lithium-ion batteries and fuel cells.

Phase 2: Evaluation, development, and prototype testing

Overview. The actions described below are directed at developing and demonstrating truck technologies for regional service, developing and demonstrating truck technologies for interstate transport, and evaluating the logistics impacts of a zero or near zero emission freight system.

Near-Term Major Infrastructure Project Approvals. In the near term, while the technology development and demonstration actions described below are being undertaken, it is anticipated that several major regional infrastructure projects will be considered for approval. These include the I-710 freight corridor project, the BNSF Southern California International Gateway railyard project, and the Union Pacific Intermodal Container Transfer Facility modernization and expansion project. These proposed projects will, if approved, comprise key portions of regional freight infrastructure for many decades to come. (Other major projects may also be considered for approval in this timeframe). The action to approve such projects will be a key opportunity to establish appropriate operating and environmental requirements for the infrastructure. In some cases, the project approval action may be the only opportunity to establish requirements. *It is therefore important that such project approvals be fashioned to assure that the projects participate in the technology development and demonstration activities for trucks described below, and that the project approvals ensure implementation of resulting technologies when determined to be feasible.*

Port to Near-Dock Railyard Transport. The case of container transport between the ports and the near-dock railyards is unique. Such transport presents fewer technical and other issues compared to regional transport due to the relatively short distances involved — about five miles. In addition, as described in the Roadmap for Moving Forward with Zero Emission Technologies at the Ports of Long Beach and Los Angeles,⁵ the ports have already done considerable work to evaluate and develop truck technologies for this service, and battery and fuel cell hybrid vehicles are now being actively demonstrated. It is also possible that zero-emission trucks for this relatively short corridor can be successfully deployed without wayside power (although, as noted below, this corridor would be a good location to initially demonstrate wayside power technology that ultimately could be deployed for longer range regional transport). Finally, the total number of trucks needed for this service is limited compared to the thousands of vehicles needed for regional service. The number required between the ports and near-dock railyards is likely approximately 500 per railyard.

The truck technologies being developed and demonstrated for container transport between the ports and near-dock railyards can form the basis of technologies used in the region as a whole. For example, development of trucks capable of operating on electric power, even for relatively short distances, can potentially be coupled with wayside power to extend zero-emission range farther through the region. Fuel cell hybrid truck technologies hold the promise of extended range without wayside power. The current effort to develop and demonstrate zero emission truck technologies for the port to near-dock railyard application thus should be viewed as an important initial part of the effort to develop regional zero-emission transport.

⁵

<http://www.cleanairactionplan.org/civica/filebank/blobdload.asp?BlobID=2527>

For these reasons, it is appropriate that the schedules for technology development and demonstration activities, and technology deployment, reflect the potential for earlier technology implementation between the ports and near-dock railyards than for the region as a whole. The schedules specified below for regional zero-emission truck technology deployment extend from 2015 to beyond 2021, depending on need for wayside power. *By contrast, the technology development, demonstration and deployment schedules for container transport between the ports and near-dock railyards target full deployment of zero-emission technologies as soon as practicable but no later than 2020.*

Phase 3: Initial deployment and operational demonstration

Truck Fleet Evaluation Testing. Develop, deploy and assess, with local fleet users, multiple vehicles with on-going data collection, analysis and sharing for rapid iterative design improvement.

Further Demonstrate Wayside Power. Demonstrate the ability to introduce and power multiple trucks on a test corridor.

Select Truck Corridor Technologies and Needed Infrastructure for Phase 4 Deployment. Assess whether viable truck technologies will require wayside power or other infrastructure. Incorporate needed infrastructure into constrained portion of RTP for corridors determined to be high priority based on potential truck volumes.

Phase 4: Full scale demonstrations, commercial deployment and infrastructure construction (if wayside power is needed)

Phases 1-3 are designed to bring truck technologies and needed infrastructure to the beginning of commercial deployment. This timing corresponds well with needed decisions for what technologies and infrastructure to include in the 2016 RTP, the next major SIP, and the I-710 corridor. The results of the first three phases will be used to determine the concrete commercialization steps needed in Phase 4, especially the regulatory and market mechanisms needed to launch and expand commercialization. In addition, it is necessary to continue expanding plans for any needed wayside power infrastructure to additional high priority corridors (e.g., priority East-West corridor route identified by SCAG). The timing for this step is highly dependent on the need for wayside power if needed, and the construction of such infrastructure.

Actions

- By 2013 – Demonstration: Develop and build trucks and wayside power infrastructure sufficient for demonstration within the transport corridor consisting of the Terminal Island Freeway and connecting routes to the Ports (or alternative routes serving the same locations); commence demonstration upon completion of trucks and infrastructure.
- By 2015 – Initial Operational Deployment: Build wayside power infrastructure sufficient for operation on the Terminal Island Freeway and connecting routes to the Ports (or alternative routes serving the same locations), and build maximum number of trucks for initial operational deployment allowed by available funding (with all feasible leveraging of

private resources), unless a zero-emission technology not utilizing wayside power is determined to be superior and can be implemented in a similar or earlier time frame. In the latter case, remaining funds allocated to this project will be applied to demonstration and deployment of zero-emission trucks not utilizing wayside power.

Major Agency Implementation Actions

YEAR(S)	AGENCY	AGENCY ACTION
2012	SCAG	<ul style="list-style-type: none"> • Incorporate “footprint” and planning for incorporation of wayside power into regional truck lanes in 2012 constrained RTP • Incorporate funding to support truck and wayside power evaluation and demonstration efforts described in this chapter into constrained portion of RTP • Implement plan of advocacy to secure action by federal or other governments where required to implement any related elements of the SIP or RTP; include evaluation of impacts of zero-emission technologies on national priorities, e.g. energy security, energy cost certainty, interstate transportation, climate protection.
2012-2014	District, CARB, and SCAG	<ul style="list-style-type: none"> • Evaluate and demonstrate potential truck technology implementation and funding mechanisms, including: <ul style="list-style-type: none"> ▪ Regulatory requirements; incentives (local, state, federal, interstate cooperative); differential tolls; public-private partnerships • Evaluate potential funding mechanisms for truck infrastructure (e.g. wayside power), including: <ul style="list-style-type: none"> ▪ federal, state, local government funding; tolling; public-private partnerships; electric utility funding of corridor construction

Major Agency Implementation Actions

YEAR(S)	AGENCY	AGENCY ACTION
2015	District, CARB, and SCAG	<ul style="list-style-type: none"> • Resolve need for wayside power infrastructure for trucks on I-710 and other corridors beyond near-dock railyards, including East-West corridor (based on expected range and functionality of technologies in zero-emission mode without wayside power in 2020-2030 timeframe) • If wayside power is needed, incorporate such technology description into RTP constrained plan and next major SIP • Develop recommendations regarding type of funding and implementation mechanisms for trucks and any needed infrastructure • Incorporate recommendations regarding type of funding and implementation mechanisms into RTP constrained plan and next major SIP, including: <ul style="list-style-type: none"> ▪ Strategy description and timeframe for any rules ▪ Strategy description, potential funding sources and timeframe for any incentives
2015-2016	District, CARB, SCAG	<p>Determine need for wayside power infrastructure for trucks on major freight movement corridors.</p> <p>Incorporate decisions regarding type of funding and implementation mechanisms into RTP constrained plan and SIP, including:</p> <ul style="list-style-type: none"> • Strategy description and timeframe for potential regulatory actions • Strategy description, potential funding sources and timeframe for needed incentives • Begin deployment of zero- and near-zero emission trucks for regional service.
2017+	District, CARB, SCAG	<ul style="list-style-type: none"> • Begin full deployment of appropriate zero- and near-zero emission trucks for substantially all regional transport. • 2020 – Target for full deployment of zero-emission trucks transporting containers between the ports and near-dock railyard facilities.

IMPLEMENTING AGENCY

SCAQMD, SCAG, Los Angeles County Transportation Authority, San Pedro Bay Ports, SCAG, CARB, Caltrans, and U.S. EPA. In July 2011, the Los Angeles County Metropolitan Transportation Authority formed the Countywide Zero-Emission Trucks Collaborative, which includes the Ports of Los Angeles and Long Beach, Caltrans, SCAG, and the District, to address issues including, but not limited to, developing a common definition of “zero-emission trucks”, establishing performance standards, coordinating infrastructure policies/standards, and seeking funding for demonstration projects.

Potential Partners For Development, Testing, Funding, and Deployment of Landside Freight Transport Technology

Achieving zero- or near-zero emissions freight transport is an ambitious goal. But given the current volume of freight movement in Southern California, and the projected increases over the next two decades, accomplishing this goal is critical to economic and public health in the region. Success will require private companies and public agencies working together with a shared vision and a commitment to address the practical issues to ensure efficient operations.

Following is a partial list of entities that will be contacted to seek a contribution of expertise, in-kind services, equipment, space, and/or funding to support the effort.

SCAG (2012) Regional Transportation Plan, Adopted

**ADV-02: ACTIONS FOR THE DEPLOYMENT OF
ZERO-EMISSION AND NEAR-ZERO LOCOMOTIVES
[NOX, PM]**

CONTROL MEASURE SUMMARY

SOURCE CATEGORY:	LOCOMOTIVES (ALL CLASSES)
CONTROL METHODS:	ADVANCED NEAR-ZERO AND ZERO-EMISSION TECHNOLOGIES BEYOND LOCOMOTIVE TIER 4 EMISSION STANDARDS
EMISSIONS (TONS/DAY):	TBD
CONTROL COST:	THE CONTROL COSTS VARY WITH THE TYPE OF CONTROL TECHNOLOGY IMPLEMENTED
IMPLEMENTING AGENCY:	SCAQMD, SAN PEDRO BAY PORTS, CARB, U.S. EPA

DESCRIPTION OF SOURCE CATEGORY

Background

This measure describes the actions needed to commercialize advanced zero-emission and near-zero emission technologies that could be deployed in the 2020 to 2030 timeframe. Such technologies include advanced engine controls or a combination of advanced engine controls with hybrid systems or external power source to power the electric motor to achieve greater reduction in NO_x exhaust emissions beyond the Tier 4 locomotive engine emissions standards and zero-emission technologies such as electric, battery-electric, and fuel cells. In addition, greater use of any alternative fuels and renewable fuels with relatively low NO_x emissions compared to conventional fuels, in conjunction with zero-emission technologies, are important over the next 10 to 20 years for any locomotive applications where zero-emission technologies could not be applied in that timeframe.

Regulatory History

U.S. EPA promulgated regulations for the control of emissions from locomotives in 1998 and 2008. The regulations require locomotive engines to meet increasingly stringent emission levels (Tier 0 through Tier 4) when they are manufactured and in some cases, additional emissions improvements when they are remanufactured at the end of their useful life. For newly manufactured locomotives the cleanest emission standard (Tier 4) is required in 2015 and will result in emissions that are over 90 percent cleaner than those from unregulated locomotive engines.

Beside the federal emission requirements for locomotives, CARB has signed two agreements with the two Class 1 railroads operating in California, Burlington Northern Santa Fe Railway (BNSF) and Union Pacific Railroad (UP). The first agreement, the South Coast Memorandum of Understanding (MOU), was signed in 1998. Among other features, it commits these railroads to meeting Tier 2 NO_x standards, on average, starting in 2010 with their locomotives operating

in the South Coast Air Basin. The second agreement, the Rail Yard Agreement signed in 2005, calls upon the Class I railroads to reduce diesel emissions in and around railyards in California including a statewide locomotive idling limitation program, increase use of low-sulfur diesel for locomotives fueled in California, and a visible-emissions detection and repair program.

In 2010, the Ports of Los Angeles and Long Beach updated the San Pedro Bay Ports Clean Air Action Plan that includes a measure calling for locomotives entering the Ports and nearby intermodal yards to meet a goal of using Tier 4 locomotives by 2020.

PROPOSED METHOD OF CONTROL

Actions for the deployment of near zero or zero emission locomotives would include four phases as outlined below:

Phase 1: Project Scoping and Existing Work

Southern California has long been a goods movement hub with locomotives playing a central role. Significant effort has gone into analyzing the options for a zero-emission rail system in the Basin. These include recent efforts by the Ports of Long Beach and Los Angeles in their *Roadmap* study⁶ and by SCAG in the freight rail electrification report⁷. Each of these efforts highlights the technical opportunities and the need to pursue a zero-emission freight transport system for the future. However, they also highlight the difficult challenges associated with this sector, especially with regard to operational needs, integration of the technologies into the national rail system, federal safety requirements, and cost.

At this time, several broad technology categories have gained the most focus and could be applied toward freight and passenger locomotives to achieve zero emissions track miles: overhead catenary (with electric or dual-mode locomotives), linear synchronous motor (LSM) technology, and battery-hybrid systems (either integrated into a new locomotive or as a tender car). Another technology with potential for zero emissions is fuel cells.

In addition, the use of alternative fuels such as liquefied natural gas (LNG) have a potential role in reducing emissions further prior to commercialization of battery-hybrid systems and as a primary fuel in conjunction with battery-hybrid technologies.

Of these technologies, catenary systems are the most extensively used today, although more commonly in passenger train and light-rail applications. LSM systems are less developed, but have potential in terms of being able to use existing rail beds and conventional rail cars, with modifications. Dual mode (i.e., combined diesel-electric and electric capable) locomotives with wayside power have the potential for zero-emission range capability within catenary system areas, and have the ability to minimize operational changes, but have not been developed or demonstrated in a freight application due to insufficient market case or regulatory impetus.

⁶ Port of Long Beach and Port of Los Angeles, Roadmap for Moving forward with Zero Emission Technologies at the Ports of Long Beach and Los Angeles, Technical Report, August 2011.

⁷ Southern California Association of Governments. *Task 8.2 Analysis of Freight Rail Electrification in the SCAG Region*, Technical Memorandum. Draft Version, Prepared by Cambridge Systematics, August 26, 2011.

General Electric (GE) indicated that Tier 4 diesel-electric locomotives could be augmented with advanced battery technology to allow periodic zero-emission operation. GE indicated that the goal would be for the batteries to be able to provide full power for a line-haul locomotive for up to 30 miles with no emissions from the locomotive engine, operate in the Tier 4 diesel-electric mode for up to 70 miles while also recharging the battery bank, and then return back to the battery mode for the next 30 miles. The fuel savings would allow a one-third downsizing of the fuel storage tank to be able to provide additional space for battery storage within a conventional length locomotive. This approach would allow the battery mode to be engaged up to twice while operating within the South Coast Air Basin. Under this scenario, the hybrid locomotive could provide up to a 60 percent reduction beyond Tier 4 emissions levels within the Basin.

Another option is the potential use of battery tender cars connected to locomotives to provide power within urban areas with air quality issues. Such a system could provide zero-emission operation with either new or existing locomotives, and would reduce or eliminate the need for wayside power. Tender cars could also potentially be designed to connect existing locomotives to wayside power. The operational impacts of tender car augmentations, the duty cycle and power demands of line haul locomotives, and the power, weight, and costs of battery tender cars – while operating within the South Coast Air Basin – would need to be studied further. However, the potential benefits can be significant since the battery tender car could potentially be used in any urban area and recharged as the train transits from the South Coast Air Basin to its destination. In addition, the use of tender cars addresses the concerns regarding sufficient space for the batteries if they are installed inside the locomotive and capacity and number of batteries needed will not be limited to the dimensions of the locomotive, but to the capacity and dimension of the rail car.

All of these systems and approaches (with the exception of traditional catenary-electric locomotives) will need additional study, research, design, proof of concept testing, and both small and full scale demonstration programs to advance the technology for freight and passenger applications within Southern California. All will need additional examination of means to address operational impacts and costs.

Phase 2: Evaluation, development, and prototype testing (2012 – 2014)

Actions needed to implement phase 2 include:

1. *Secure Funding.* Collaborate with public and private partners to secure funding commitments for the development of new technology locomotive prototypes and infrastructure demonstrations.
2. *Evaluate Practicability of Applying Existing Electrified Rail Technologies to Region.* Conduct an evaluation of the practicability of applying existing electrified rail technologies to the region. Electrified rail technologies are currently used in many countries to move passenger and freight. This evaluation would comprehensively assess the practicability of utilizing such existing technologies for rail service in the South Coast Air Basin.

3. *Develop Locomotive Prototypes and Wayside Power Infrastructure.* This phase involves the development and design validation, and initial proof of concept and prototype testing of several types of zero-emission locomotive technologies and supporting infrastructure. This includes improvements to currently available technologies as well as new technologies that may have cost or operational advantages. Basic performance requirements at this stage include, but not limited to, sufficient tractive power to haul double-stacked railcars, adequate braking capability and other parameters to support safe operation, and the ability to operate in zero-emission mode. This task should seek to further evaluate, develop, and test prototypes for the following technologies, at a minimum:
 - Overhead catenary electric system: Initiate development of an overhead catenary demonstration, with either an all-electric or dual-mode locomotive. The prototype locomotive must be built to provide comparable performance capabilities (e.g., tractive effort) as a U.S. diesel-electric freight locomotive. The prototype electric or dual mode electric locomotive would need to be tested with an existing electrical rail system (e.g., Amtrak passenger electric rail system for the Acela on the east coast) – assuming the electric rail system has the proper voltage and electrical connections/hardware for the prototype locomotive.
 - LSM technology: Set up a test track and demonstrate proof of concept for an LSM system in a freight locomotive application.
 - Dual-mode with battery-hybrid system: Initiate development of battery-hybrid locomotives with zero-emission range that would achieve up to 60 percent lower than Tier 4 emissions when operating within the South Coast Air Basin
 - Battery tender car: Develop a prototype designed for compatibility with existing U.S. diesel-electric or new Tier 4 locomotives. If the battery tender car is designed for use with catenary systems, similar to the electric or dual-mode locomotives, it would need to be tested within an existing electrical rail system.
 - Other technology options: CARB and the District are currently funding a study by UC Irvine to develop a design for a Solid Oxide Fuel Cell to power a locomotive. The fuel cell will need to be able to generate comparable horsepower as a current U.S. diesel-electric freight line haul locomotive, or about 4,500 gross horsepower. Union Pacific Railroad has agreed to participate in the construction of a prototype fuel cell locomotive upon successful completion.
4. *Select Locomotive Technologies for Phase 3 Demonstration.* Assess the development of the locomotive technologies and infrastructure from Phase 2 programs and select appropriate technologies to proceed with prototype development and testing programs.

Phase 3: Initial deployment and operational demonstration (2014-2016)

Actions needed to implement Phase 3 include:

1. *Conduct Advanced Technology Locomotive Demonstrations.* Evaluate zero-emission line-haul rail technologies with any needed wayside power source on test or operations track

with sufficient length, switches and grades to validate operational feasibility within the Basin. Move most promising technologies to initial demonstration in operational service, preferably within the Basin.

2. *Select Advanced Technology Locomotive Technologies for Phase 4 Deployment.* Assess the development of the locomotive technologies and infrastructure from Phase 3 testing and demonstration programs, and select technologies and infrastructure to proceed to initial deployment.

Phase 4: Full scale demonstrations, commercial deployment and infrastructure construction (if wayside power is needed) (2017-2023)

Actions to implement Phase 4 include:

At this stage, it is still expected that advanced rail technologies will require additional field demonstrations prior to full commercialization. Technology choices need to advance from small scale demonstration phase to full scale demonstration in operational service. New technology deployments must be coordinated with any needed infrastructure. The timing for this step is highly dependent on the need for wayside power (or not) and the construction of such infrastructure.

The actions needed to develop implementation mechanisms (e.g. funding and regulatory mechanisms) to deploy zero and near-zero emission rail technologies as part of a long-term freight system that meets the performance objectives described earlier are provided in the schedule below.

Major Agency Implementation Actions

YEAR(S)	AGENCY	AGENCY ACTION
2012-2013	SCAG	<ul style="list-style-type: none"> • Identify funding to support rail evaluation and demonstration efforts. • Implement plan of advocacy to secure action by federal or other governments where required to implement any related elements of the SIP or RTP; include evaluation of impacts of zero-emission technologies on national priorities, e.g. energy security, energy cost certainty, interstate transportation, climate protection Evaluate and determine practicability of applying existing electrified rail technologies to region • Evaluate potential funding and implementation mechanisms for zero- and near zero-emission locomotives, and wayside power, including: <ul style="list-style-type: none"> ▪ Private (railroads); federal, state, local government; public-private partnerships; electric utility

YEAR(S)	AGENCY	AGENCY ACTION
2012-2014	District, CARB	<ul style="list-style-type: none"> • Begin discussions on development and deployment of Tier 4 locomotives with footprint to hookup external power source • Evaluate and determine practicability of external sources of power such as battery tender cars • Initiate demonstration projects for identified technologies. • If demonstrations of battery tender cars or other zero- and near-zero emission technologies are determined feasible, begin discussions to deploy such technologies on a phase-in basis.
2015-2016	District, CARB, SCAG	<ul style="list-style-type: none"> • Identify technologies, infrastructure, and implementation mechanisms in RTP amendment and next major SIP. • If existing electrified rail technologies were determined to be practicable for the region, begin infrastructure planning, development and deployment of such technologies.
2017-2018	District, CARB, SCAG	<ul style="list-style-type: none"> • If new rail technologies are needed to achieve zero- or near-zero emission in the region, determine need for wayside power for new rail technologies (based on expected range of technologies in zero-emission mode without wayside power in 2020-2030 timeframe). • If wayside power is needed, incorporate “footprint” and planning for wayside power into rail lines into 2018 constrained RTP • Incorporate recommendations regarding type of funding and implementation mechanisms into constrained RTP and next major SIP, including: <ul style="list-style-type: none"> ▪ Strategy description and timeframe for any rules ▪ Strategy description, potential funding sources and timeframe for any incentives.
2018+		<ul style="list-style-type: none"> • If battery tender car or other external sources of electrical power are demonstrated, begin deployment such technologies. • Construct needed infrastructure for zero-emission technologies as needed.

**ADV-03: ACTIONS FOR THE DEPLOYMENT OF ZERO-EMISSION
AND NEAR-ZERO CARGO HANDLING EQUIPMENT
[NOX, PM]**

CONTROL MEASURE SUMMARY

SOURCE CATEGORY:	OFF-ROAD EQUIPMENT OPERATING USED TO MOVE FREIGHT CONTAINERS
CONTROL METHODS:	ADVANCED NEAR-ZERO AND ZERO-EMISSION TECHNOLOGIES
EMISSIONS (TONS/DAY):	TBD
CONTROL COST:	THE CONTROL COSTS VARY WITH THE TYPE OF CONTROL TECHNOLOGY IMPLEMENTED
IMPLEMENTING AGENCY:	SCAQMD, SAN PEDRO BAY PORTS, CARB, U.S. EPA

DESCRIPTION OF SOURCE CATEGORY

Background

Emissions from goods movement related mobile sources (e.g., ships, trains, trucks, and off-road equipment) continue to represent a significant and increasing portion of the emissions inventory in the South Coast Air Basin, adversely affecting not only the local port area, but also the regional air quality of the Basin. The purpose of this early action measure is to demonstrate and commercialize advanced zero-emission and near-zero emission technologies for cargo handling equipment operated at marine ports, intermodal freight facilities, and warehouse distribution centers that could be deployed in the 2020 to 2030 timeframe. Such technologies include advanced engine controls to achieve further reductions in NO_x exhaust emissions beyond the Tier 4 off-road exhaust emissions standards and zero-emission technologies such as electric, battery-electric, and fuel cells.

Regulatory History

The U.S. EPA and CARB's Tier 1, Tier 2, Tier 3, and Tier 4 emissions standards for non-road diesel engines require compliance with progressively more stringent standards for hydrocarbon, CO, NO_x, and PM. Tier 4 standards for non-road diesel powered equipment complement the latest 2007 and later on-road heavy-duty engine standards requiring 90 percent reduction in NO_x and PM when compared against the current level. To meet these standards, engine manufacturers will produce new engines with advanced emissions control technologies similar to those already expected for on-road heavy-duty diesel vehicles. These standards for new engines will be phased in starting with smaller engines in 2008 until all but the very largest diesel engines meet NO_x and PM standards in 2015.

In December 2005, CARB adopted a regulation to reduce emissions from cargo handling equipment (CHE) such as yard tractors and forklifts starting in 2007. The regulation calls for the replacement or retrofit of existing engines with engines that use Best Available Control

Technology (BACT). Beginning January 1, 2007, the regulation will require that newly purchased, leased, or rented CHE be equipped with either a 2007 or later on-road engine, a Tier 4 off-road engine or the cleanest verified diesel PM emissions control system which reduces PM by 90% and NOx by at least 70 percent for yard tractors. For non-yard tractors cargo handling equipment currently verified technologies reduce PM by 85 percent.

In November 2006, the Ports of Los Angeles and Long Beach adopted the San Pedro Bay Ports Clean Air Action Plan (CAAP). One of the control measures (CHE-1) provided in the CAAP calls for terminal operators to use cargo handling equipment with the cleanest engines by 2012 (2007 on-road heavy-duty engine emission standards or Tier 4 off-road engine standards). The CAAP accelerates the implementation of CARB's rule requirements through lease requirements or other mechanisms. The CAAP measure provides an additional 15 percent NOx and 19 percent PM reductions by 2011 beyond CARB's regulation based on the replacement of existing cargo handling equipment with equipment meeting Tier IV off-road or 2007 on-road engine standards (for port tenants with lease openings by 2011).

By 2020 under current regulations, all cargo handling equipment will meet Tier 3 off-road standards with a PM retrofit device, 2007 or 2010 on-road standards, or Tier 4 off-road standards.

PROPOSED METHOD OF CONTROL

Cargo handling equipment is generally categorized as construction equipment (excavators, front-end loaders, tractors, etc) used for bulk material handling, forklifts, container handling equipment (top picks, side picks), rubber-tired gantry cranes, and yard trucks. This equipment is predominately diesel powered. Due to the CARB regulation, the 2023 population is estimated from the CHE Emissions Inventory Model to be 85 percent Tier 4 or 2010 on-road, 9 percent Tier 4i or 2007 on-road, and 6 percent Tier 3 with PM retrofit devices. As a result, there are opportunities to further reduce emissions through accelerated turnover to zero-emission and near-zero emission technologies.

The proposed measure is to further develop zero-emission technologies for cargo handling equipment. Zero-emission technologies include battery electric (BEV) and plug-in electric hybrid (PHEV) technologies. These technologies are based on automotive systems and are now being demonstrated in cargo handling equipment. Other potential technologies include fuel cell (FC) and fuel cell-battery hybrids (FCH) for mobile equipment, as well as container movement systems using wide-span grid-power based overhead cranes and container conveyer systems to replace cranes, forklifts, and yard trucks. In addition, hybrid systems have been developed and deployed on cranes used at marine ports and intermodal railyards. The following table summarizes potential zero-emission and hybrid systems to be evaluated over the next several years.

TECHNOLOGY	APPLICATION	STATUS/ POTENTIAL EMISSION REDUCTION
Electric	Wide Span Gantry Cranes	Available but not used in local ports, demonstrations under discussion/100%
Battery-Electric	Yard Tractor; Top-Pick/Side-Pick; Forklifts	Yard tractor demonstrations underway, other CHE demonstrations planned/100%
Fuel Cell	Yard Tractor; Top-Pick/Side-Pick; Forklifts	Demonstrations under discussion /100%
Plug-In Hybrid Electric	Yard Tractor; Top-Pick/Side-Pick; Forklifts	Drayage truck demonstration underway, CHE Demonstrations under discussion /75%
Alternative Fuels	Compressed/Liquefied Natural Gas	Available for trucks and forklifts, demonstrations under discussion for CHE/ 50%
Hybrid Systems	Gantry Cranes	Available but in limited use; Demonstration under discussion/50%
Battery-Electric	Gantry Cranes	Demonstration under discussion/100%

Battery-electric and fuel-cell equipment. Zero-emission yard truck prototype testing is underway with funding from the Port of Los Angeles, the Port of Long Beach, and the District. A demonstration of the Balqon lead-acid battery electric truck was initiated in 2007. The battery was upgraded to a lithium-ion battery, and testing of the upgraded system is underway. Additional testing is ongoing with units made specifically for drayage by Vision Motor Corporation, using a combination of lithium-ion batteries and fuel cells. Transfer of these technologies from on-road truck applications to off-road yard trucks are considered to be straightforward and is currently in the planning stage at the Ports of Los Angeles. Transfer of the technology to cargo handling equipment such as top picks is in the discussion stage but has not been demonstrated.

Hybrid diesel-electric equipment. Class 6 hybrid and/or plug-in hybrid trucks offering reduced emissions are now becoming commercially available from a number of established manufacturers, e.g. Kenworth T370. These trucks could operate in drayage service and development is continuing on Class 7 and Class 8 trucks. Application of these technologies to yard trucks are also considered to be straight forward. The Ports are currently considering a demonstration of a hybrid yard truck. Applications of hybrid technologies to other cargo handling equipment including forklifts, top-picks/side-picks, and gantry cranes are in the research and development stage with demonstrations possible within two years. Ports are also evaluating alternative fueled drayage trucks and are planning to demonstrate CNG and LNG cargo handling equipment.

Grid electric. Wide span gantry cranes and automated guideways for moving and positioning cargo containers in the ports and railyards are commercially feasible but have not been used in local port applications. The Ports have reviewed some proposals for demonstrations and are in continuing discussions with applicants.

Alternative Fuels. Natural gas fueled trucks and buses are commonly available. Gasoline and propane fueled off-road equipment is available and could be adapted to compressed or liquid natural gas.

Schedule for Action

The actions described below are directed at developing and demonstrating technologies for zero-or near-zero emission cargo handling systems. Development of equipment capable of operating on electric power, even for relatively short times, should be viewed as an important initial part of the effort to develop a zero-emission cargo handling system. For these reasons, it is appropriate that the schedules for technology development and demonstration activities, and technology deployment, reflect the potential for earlier technology implementation in focused applications rather than for all equipment categories and vocations. The schedules specified below for zero-emission cargo handling equipment technology deployment extend from 2015 to beyond 2023.

Actions

San Pedro Bay Ports Technology Advancement Program (TAP) Working Group (2012-2014). The District, CARB, and U.S. EPA serve on the TAP Working Group to evaluate potential emission reduction projects. The TAP could serve as a forum to focus efforts specifically on zero-emission penetration into specific types of cargo handling equipment. The power storage, drive systems, and fast charging technologies are currently emerging technologies. Other technologies and/or combinations of technologies may emerge that could also play a role in the longer-term zero emission cargo handling system. The Working Group would coordinate with core end users to define their needs and key vehicle design parameters in the 2012 – 2014 timeframe.

Secure Funding (2012-2014). Collaborate with public and private partners to secure funding commitments for the development of vehicle prototypes and infrastructure demonstrations.

Develop and Demonstrate Equipment Prototypes (2012-2015). This phase involves the development, design validation, and initial demonstration of several types of advanced prototype vehicles. The demonstration would include technology optimization for prescribed equipment types and functions. This task should seek to further evaluate, develop, and test prototypes.

Select Technologies for Field Evaluation (2012-2017). Identify potential equipment types and drive technologies to test in small-scale demonstrations. Designate equipment test deployment, and develop a test and development plan for a limited number of equipment.

Equipment Evaluation Testing (2013-2020). Develop, deploy and assess, with operators, multiple equipment types with on-going data collection, analysis, and sharing for rapid iterative design improvement.

Deployment (2015+). Identify/develop mechanisms to deploy demonstrated technologies as early as possible. Such mechanisms may include lease agreements, environmental mitigation measures, and funding incentives.

ADV-04: ACTIONS FOR THE DEPLOYMENT OF CLEANER COMMERCIAL HARBOR CRAFT [NOX, PM]

CONTROL MEASURE SUMMARY

SOURCE CATEGORY:	CATEGORY 1 AND 2 MARINE ENGINES USED IN COMMERCIAL HARBOR CRAFT
CONTROL METHODS:	ADVANCED HYBRID SYSTEMS AND ALTERNATIVE FUEL ENGINES
EMISSIONS (TONS/DAY):	TBD
CONTROL COST:	THE CONTROL COSTS VARY WITH THE TYPE OF CONTROL TECHNOLOGY IMPLEMENTED
IMPLEMENTING AGENCY:	SCAQMD, SAN PEDRO BAY PORTS, CARB, U.S. EPA

DESCRIPTION OF SOURCE CATEGORY

Background

This measure describes the actions needed to commercialize advanced engine control technologies and hybrid systems that could be deployed in the 2020 to 2030 timeframe. Such technologies include advanced engine controls to achieve at least a 60 percent reduction in NOx exhaust emissions beyond the most stringent Category 1 and 2 marine engine exhaust emissions standards. There are approximately 750 commercial harbor craft operating within the District that are estimated to emit 17.7 tpd of NOx. Commercial harbor craft includes tug, ferry, crew and supply, excursion, commercial fishing, work, barge, dredge, and pilot vessels. Commercial harbor craft generally have multiple propulsion and auxiliary engines per vehicle with total power of between several hundred and several thousand horsepower. Essentially all are currently diesel powered. Work activity varies significantly with some vessels spending most time within the port harbor and adjacent waters while others leave the local port for adjacent ports, Catalina Island, or oil platforms. Several harbor craft operators have deployed hybrid systems on their harbor craft to improve fuel efficiency and reduce criteria and greenhouse gas emissions. NOx and PM reducing aftertreatment systems are also beginning to be demonstrated.

Regulatory History

The U.S. EPA established new engine standards for new “Category 1 and 2” diesel engines – engines rated over 50 hp used for propulsion in most commercial harbor craft. These standards are to be phased in between 2004 and 2017 and limit NOx, VOC, CO and PM emissions, but the emissions reductions achieved are modest in the next five years. The current most stringent standard for marine engines is Tier 4 (0.03 g/bhp-hr PM and 1.3 g/bhp-hr NOx) which takes effect in all engine categories by 2017. These standards do not require either diesel particulate filters or selective catalytic reduction after-treatment systems.

In 2007, CARB adopted a Regulation for Commercial Harbor Craft to accelerate deployment of low emission engines. A compliance schedule was included requiring that commercial harbor craft with Tier 0 and Tier 1 engines would have to be retired or repowered by 2023. In addition, any new vessel had to have engines built to the then current emission standard (Tier 2, Tier 3 or Tier 4).

The San Pedro Bay Ports Clean Air Action Plan (CAAP) contains a source specific control measure (HC-1) to repower all home port vessels to Tier 3 within five years of engine availability. The CAAP HC-1 measure is implemented through lease requirements or other mechanisms.

PROPOSED METHOD OF CONTROL

Available control technologies that achieve maximum control of emissions include aftertreatment systems using catalysts to control NO_x and PM emissions as well as hybrid engine technologies. The following table summarizes potential near zero-emission technologies to be evaluated over the next several years.

TECHNOLOGY	APPLICATION	STATUS/ POTENTIAL EMISSION REDUCTION
Battery-Electric	Vessels with high percentage of standby time or low load time while docked	Small excursion or pleasure craft are available but not commercial harbor craft/100%
Fuel Cell	Vessels with high percentage of medium to high power that have access to fueling infrastructure	Demonstration units in development/100%
Diesel-Electric Hybrid Systems	Vessels with variable engine loads, limited standby time while docked and need for extended range some times.	Technology demonstrated on two tugboats/50% NO _x and 70% PM compared to similar standard diesel engine
SCR/DPF Aftertreatment	Vessels with high usage and space available for installation of the systems.	Commercialized in Europe, local demonstration projects underway/80% from Tier 2

Battery-electric. Battery powered recreational boats have been available for many years. Advanced lithium battery technology can be applied to harbor craft.

Fuel cells. Fuel cell power systems are being demonstrated for on-road vehicles and have been used commercially for stationary power generation. Testing is ongoing with units made specifically for drayage by Vision Motor Corporation, using a combination of lithium-ion batteries and fuel cells. Application of these technologies to harbor craft operating appears technically feasible and would provide extended range needed for many harbor craft.

Diesel-electric hybrid. Diesel-battery hybrid technology has been demonstrated on two tugboats at the Ports of Los Angeles and Long Beach. The vessels are equipped with batteries and an electric propulsion motor. This system allows the auxiliary engines to provide electrical propulsion power as well as supply electrical power to the vessel. With advanced software the power to propel the vessel can come from on-board batteries, one or both auxiliary engines and one or both of the main engines, or any combination of on-board power sources. In addition, when the vessel is docked, grid based power can be used to charge the batteries thereby displacing a portion of the use of the diesel engines for propulsion and electrical generation. Engine use is thus minimized and optimized and can result in significant emission reductions. The two hybrid tugs are in operation in the Ports of Los Angeles and Long Beach have shown emission reductions of 50 percent for NO_x and 70 percent for diesel PM as well as fuel savings of over 25 percent.

SCR/DPF Aftertreatment. Diesel aftertreatment systems have been demonstrated on ferries in New York and California and will soon be demonstrated on tugs in the District. These systems include selective catalytic reduction (SCR) catalysts for control of NO_x and diesel oxidation catalysts (DOC) or DOC plus diesel particulate filters (DPF) for control of PM, VOC, and CO. SCR catalyst systems have been in operation in Europe for more than 10 years on over 200 vessels without any technical issues. These systems have achieved up to 80 percent control of emissions from commercial harbor craft engines. After-treatment systems are particularly appropriate for in-use vessels because of the long useful life of boats and marine engines but space constraints, urea tanks, and high heat from DPF systems are safety concerns. Currently, CARB in coordination with the District and Hug Filtersystems have begun a demonstration of an SCR/DPF aftertreatment device on a tug boat at the Ports of Los Angeles and Long Beach.

Schedule for Action

The following actions are directed at developing and demonstrating reduced emission technologies for commercial harbor craft.

San Pedro Bay Ports Technology Advancement Program (TAP) Working Group (2012-2013). The District, CARB and US EPA serve on the San Pedro Bay Ports Technology Advancement Program (TAP) advisory committee. The TAP could serve as a forum to focus efforts specifically for reduced emission technologies for commercial harbor craft.

Secure Funding (2012-2014). Collaborate with public and private partners to secure funding commitments in 2013 for the development of technology prototypes and in-vessel demonstrations.

Develop and Demonstrate Prototypes (2012-2015). This phase involves the development, design validation, and initial demonstration of reduced emission technologies on vessels. The demonstration would include technology optimization primarily for vessels identified by the Working Group as good candidates for early implementation.

Select Technologies for Field Evaluation (2012-2017). Identify potential vessels and low emission technologies to test in the small scale demonstrations in Phase 3. Designate vessel deployment and lay out a test and development plan for a limited number of vessels.

Technology Evaluation Testing (2013-2020). Develop, deploy, and assess, with vessel operators, multiple technology and vessel types with on-going data collection, analysis, and sharing for rapid iterative design improvement.

Deployment (2015+). Identify/develop mechanisms to deploy demonstrated technologies as early as possible. Such mechanisms may include lease agreements, environmental mitigation, measures, and funding incentives.

**ADV-05: ACTIONS FOR THE DEPLOYMENT
OF CLEANER OCEAN-GOING MARINE VESSELS
[NOX, PM]**

CONTROL MEASURE SUMMARY

SOURCE CATEGORY:	CATEGORY 3 MARINE ENGINES USED IN OCEAN-GOING MARINE VESSELS
CONTROL METHODS:	DEPLOY TIER 3 MARINE ENGINES IN NEW SHIP BUILDS AND TIER 3 LEVEL RETROFIT TECHNOLOGIES IN EXISTING CATEGORY 3 MARINE ENGINE VESSELS
EMISSIONS (TONS/DAY):	TBD
CONTROL COST:	THE CONTROL COSTS VARY WITH THE TYPE OF CONTROL TECHNOLOGY IMPLEMENTED
IMPLEMENTING AGENCY:	SCAQMD, SAN PEDRO BAY PORTS, CARB, U.S. EPA

DESCRIPTION OF SOURCE CATEGORY

Background

Ocean-going marine vessels, which primarily run on diesel oil, contribute a significant portion of NO_x, PM, greenhouse gas, and toxic emissions particularly in coastal regions and in and around shipping ports. These emissions contribute to on-shore air quality problems. In order for progress to continue to meet clean air goals, emission reductions from marine vessels are necessary.

Currently, the San Pedro Bay Ports Technology Advancement Program (TAP) Advisory Group, which is comprised of CARB, U.S. EPA, and SCAQMD is exploring promising retrofit technologies to be used on marine vessels. The TAP is also working on demonstration projects. The primary objectives of the marine vessel technology demonstration projects are to identify technologies that are capable of reducing NO_x, PM, and greenhouse gases, identify and demonstrate emission measurement systems capable of accurately measuring pollutant emissions in ship exhaust streams; and install the most promising technology on an in-use Category 3 ocean-going vessel for demonstration under real world conditions and establish the emission reduction potential in different modes of operation.

This measure describes the actions needed to deploy retrofit technologies on existing Category 3 marine engines to achieve Tier 3 marine engine emissions standards. The actions proposed are consistent with Measure OGV-6 provided in the San Pedro Bay Ports Clean Air Action Plan (CAAP). Marine engine manufacturers have indicated that such retrofits are feasible. The Ports of Los Angeles and Long Beach have documented various control technologies that are potentially feasible to deploy. To-date, a limited number of demonstrations have been conducted.

Regulatory History

The regulation of emissions from mobile port-related emission sources is traditionally the responsibility of CARB and U.S. EPA. Specifically, ships are each subject to specific emission standards pursuant to state, federal, and/or international requirements. The standards, primarily affecting new units, vary in stringency and compliance dates.

OGV main and auxiliary engines are subject to the International Maritime Organizations international emission standards as contained in Annex VI to the International Convention on the Prevention of Pollution from Ships (MARPOL Annex VI). U.S. flagged ships must meet similar U.S. EPA requirements. In October 2008, the IMO adopted the current standards for engines and these require vessels to meet increasingly more stringent NO_x emission standards. The standards are designated by tiers ranging from Tier 0 being uncontrolled or no emission controls to the most stringent Tier 3 standard. NO_x emission standards are modestly more stringent when going from Tier 0 to Tier 2 (approximately 20 percent cleaner) and can be achieved through engine design changes. The Tier 3 NO_x standard is significantly more stringent (better than 80 percent cleaner) and most likely can only be met using engine after-treatment systems. Engines on vessels must meet the Tier 3 NO_x standard if they are built after 2015 and travel through designated Emission Control Areas (ECA). ECAs can be created by member states if approved by the IMO. On March 26, 2010, the IMO officially designated waters within 200 nautical miles of the United States and Canadian Coasts as the North American ECA.

In addition to NO_x emission requirements, IMO and CARB require vessels to use lower sulfur distillate fuels when the vessels travel close enough to our shores. By 2015, all vessels will be required to use distillate fuels with sulfur contents less than 1,000 ppmw when they travel within the North American ECA. With the low sulfur fuel requirements, reduction of SO_x and PM emissions will be realized.

PROPOSED METHOD OF CONTROL

As part of the San Pedro Bay Ports Clean Air Action Plan 2010 update, the Ports have adopted a program to reduce diesel particulate matter (DPM) and NO_x emissions from the existing fleet of vessels through the identification of new effective technologies. Numerous emission reduction technologies are being evaluated for integration into vessel new builds and use of these technologies as a retrofit for existing vessels will be explored. These would fall into several broad categories shown in the table below. Many of these retrofit technologies are currently available and demonstrated in Europe on smaller ocean-going vessels. The two major marine engine manufacturers, MAN Diesel and Wartsila, have been developing these technologies to meet current and future International Maritime Organization (IMO) standards..

CONTROL	CONTROL DETAILS	ESTIMATE EMISSION REDUCTIONS*	
		NOx	PM
Engine Technologies	Common Rail Fuel Injection, Slide Valves, Electronic Fuel Control, Electronically Controlled Lubrication Systems, and Automated Engine Monitoring/Control Systems	Up to 20%	Up to 40%
Engine Support Technologies	Water Injection, Exhaust Gas Recirculation, High Efficiency Turbo Charging, Scavenging Air Moistening/Humid Air Motor, Two Stage Turbo Charging	Up to 60%	Up to 20%
After-Treatment Technologies	Selective Catalytic Reduction (SCR), and Exhaust Gas Scrubbers (Wet –freshwater, saltwater, hybrid, and Dry)	Up to 90%	Up to 90%
Alternative Fuels	Liquefied Natural Gas	Up to 90%	Up to 99%
Alternative Supplemental Power Systems	Wind and Solar Power, Marine Fuel Cell, Marine Hybrid Systems, Waste Heat Recovery	Data Not Available	Data Not Available

* San Pedro Bay Ports Clean Air Action Plan – Guide to OGV Emission Control Strategies

New Slide Valve Designs - Replacement of existing valves on main and auxiliary engines with new “slide” valves could provide up to 30 percent reduction in NOx (depending on the design). In addition, installing slide valves reduces particulate emissions and leads to greater fuel efficiency. MAN Diesel (one of the two leading manufacturers of marine engines) currently has such slide valves commercially available. Slide valves are in use on several marine vessels operating in Europe. Slide valves are being tested on container vessels operating in California.

Internal Engine Modifications - There are several modifications that could be made to the engine’s operation that would lead to reduced NOx emissions. Modifications include: delayed fuel injection and ignition, which reduces the in-cylinder duration of the combustion gases at high temperatures; lowering fuel injection pressure; raising the degree of premixing; advancing the closing time of the inlet valve to lower the final combustion temperature (“Miller valve timing”); reducing the temperature and pressure of the combustion air fed into the cylinders; optimizing the geometry of the combustion space and the compression ratio; and optimizing the fuel injection method. Such modifications could result in up to 30 percent reduction in NOx emissions.

Direct Water Injection (DWI) - Direct water injection is a form of diesel emulsification, where freshwater is injected into the combustion chamber. Injecting water lowers the combustion temperature leading to lower NOx emissions (on the order of 40 to 50 percent reduction).

Typical water to fuel ratio ranges between 40 to 70 percent. As of 2005, there are about 23 vessels operating in the Baltic Region, equipped with water injection, primarily on auxiliary engines. Such use could be transferred to vessels operating in and out of California ports.

Humid Air Motor (HAM) or Saturated Air Motor (SAM) - HAM is similar to the direct water injection application except that seawater is vaporized directly into the combustion chamber to lower the combustion temperature. The waste heat is recovered and used to vaporize the seawater. The salt content of the Baltic Sea water is not as high as in other parts of the ocean, which makes the HAM application more appealing since there is no need to store freshwater on board the vessel.

Selective Catalytic Reduction (SCR) - Similar application to stationary source boilers and engines. SCR technologies have been applied to ferries and roll-on/roll-off vessels in Europe. In addition, four steel carrier vessels operating between California and Korea have used SCR since the early 1990s. The two major Category 3 marine engine manufacturers have indicated that SCR technologies will most likely be Tier 3 solutions. Such technologies can achieve over 90 percent emission reduction in NOx from uncontrolled levels.

Exhaust Gas Recirculation (EGR) - EGR technologies are similar to that used on on-road engines. However, the units are much larger in size and have not been fully developed at this point. As with on-road engine applications, the expected NOx emission reduction is about 50 percent.

Sea Water Scrubbers - Sea water scrubber systems are developed primarily for the cleanup of sulfur oxides and particulates. Relative to NOx emissions reduction, the sea water scrubber has been estimated to have about a 5 percent benefit.

LNG Fueled Marine Engines - Currently there is limited use of liquid natural gas (LNG) to power propulsion engines on marine vessels. One of the major category 3 marine engine manufacturers recently announced plans to manufacture additional LNG-fueled ocean-going vessels. LNG could meet Tier 3 emissions levels and reduce greenhouse gas emissions.

All of these systems and approaches need additional study, research, design, proof of concept testing, and both small and full scale demonstration programs to advance the technology for application on ocean-going vessels traveling in the South Coast Air Basin, as well as a greater examination of operational impacts and costs.

Schedule for Actions

With the goal of ensuring only the cleanest vessels visit the San Pedro Bay Ports, the following actions are identified.

Actions

San Pedro Bay Ports OGV 5 and OGV 6 Task Force (2012-2014). The Ports along with the District, CARB, and U.S. EPA have formed the OGV 5 and OGV 6 task force to work with stakeholders (including vessel operators, engine manufacturers, regulatory agencies) to identify

and prioritize technology options as well as the most appropriate vessel types for early introduction of the technology using cost, feasibility, operational integration, and other parameters identified by the task force. Technology gaps will also be identified.

Identify and Secure Funding (2012-2014). The TAP program is the ports' vehicle to identify sources and develop partnerships that would accelerate the deployment of developing or developed technology. Through the TAP, partnerships with other public and private groups are developed to secure funding commitments for the development of prototype demonstrations. Efforts to expand these partnerships for other candidate funding sources such as other U.S. Ports, Federal Agencies (e.g., U.S. Maritime Administration), international organizations (e.g., IMO) and air districts should be considered. Interested technology developers and engine manufacturers are also candidates for in-kind contributions as well as vessel operators.

Develop and Demonstrate Prototypes (2012-2015). Through the TAP collaborative demonstration projects with stakeholders for the development, design validation, and initial demonstration of reduced emission retrofit technologies on vessels are performed. These demonstrations would include retrofit technology optimization primarily for vessel types and engines identified as good candidates for early implementation.

Select Technologies for Fleet Evaluation (2012-2017). Identify potential vessels and retrofit technologies to test in the small scale demonstrations. Through the TAP designate vessel test deployment, and lay out a test and development plan for a limited number of vessels.

Technology Evaluation Testing (2015-2020). Develop, deploy and assess with multiple vessels with on-going data collection, analysis and sharing for rapid iterative design improvement. The TAP can provide the structure to monitor and evaluate equipment performance and emission benefits during demonstration projects.

Deployment (2017+). Identify and develop mechanism to deploy demonstrated technologies as early as possible. Such mechanism may include lease agreements, environmental mitigation measures, and funding. The San Pedro Bay Ports have adopted programs to incentivize Tier 2 and Tier 3 vessel calls.

As part of this action, between 2012 to 2015, the South Coast Air Quality Management District, CARB, the San Pedro Bay Ports, and U.S. EPA will collaborate and develop potential additional mechanisms to incentivize or require Tier 3 vessel calls at the state and federal levels.

**ADV-06: ACTIONS FOR THE DEPLOYMENT OF
CLEANER OFF-ROAD EQUIPMENT
[NOX, PM]**

CONTROL MEASURE SUMMARY

SOURCE CATEGORY:	OFF-ROAD CONSTRUCTION, INDUSTRIAL ENGINES
CONTROL METHODS:	ADVANCED HYBRID SYSTEMS AND CONTROL TECHNOLOGIES TO ACHIEVE AT LEAST AN ADDITIONAL 60 PERCENT REDUCTION BEYOND TIER 4 EMISSION STANDARDS
EMISSIONS (TONS/DAY):	TBD
CONTROL COST:	THE CONTROL COSTS VARY WITH THE TYPE OF CONTROL TECHNOLOGY IMPLEMENTED
IMPLEMENTING AGENCY:	SCAQMD, CARB, U.S. EPA

DESCRIPTION OF SOURCE CATEGORY

Background

This measure describes the actions needed to commercialize advanced zero-emission and near-zero emission technologies that could be deployed in the 2020 to 2030 timeframe. Such technologies include advanced engine controls to achieve at least an additional 60 percent reduction in NO_x exhaust emissions beyond the Tier 4 off-road emissions standards.

Regulatory History

The federal Tier 4 Final standards are currently the most stringent emission standards for off-road diesel engines used in heavy construction and industrial equipment. These standards take effect in 2014 or 2015 for engines in the 75-750 hp range which includes the majority of this equipment and requires NO_x emissions not to exceed 0.3g/bhp-hr. In addition to these standards for new engines, CARB adopted the In-Use Off-Road Diesel-Fueled Fleets Regulation (Off-Road rule) in 2007 in order to accelerate the introduction of equipment using Tier 4 engines. The off-road rule applies to diesel fueled construction, mining, industrial, airport ground support equipment, and mobile oil drilling equipment and established increasingly stringent annual fleet average emission targets. Fleets that do not meet the fleet average in any year are required to “turnover,” (i.e., retire, replace, retrofit, or repower) a specified percentage of their horsepower. The rule currently requires large and medium sized fleets to meet 1.5 g/bhp-hr NO_x by 2023 and small fleets to meet 1.5 g/bhp-hr NO_x by 2028. This represents 70 percent Tier 4, 7 percent Tier 4i equipment with decreasing fractions of Tier 3, Tier 2, Tier 1 and Tier 0 equipment.

PROPOSED METHOD OF CONTROL

Equipment subject to the Off-Road rule represents 59 percent of the 2023 NO_x emissions from this source category. Diesel engines produce 70 percent of the 2023 construction and industrial NO_x emissions while large spark ignition (LSI) engines, primarily gasoline, represent about 30 percent of the NO_x emissions. Different methods of control may be best suited to different types of equipment due to size, work location, and duty cycle. The following four phase program is proposed to identify and apply the most appropriate control method for each equipment type.

Construction and industrial equipment have substantially different work locations and duty cycles and include engines from all horsepower categories and fuel types. Equipment types range from small boom lifts to heavy off-road trucks and dual engine scrapers. Construction equipment is usually operated at field locations with limited grid power and limited access. As a result, zero emission drive systems are more difficult to deploy in construction equipment than other off-road mobile categories. Industrial equipment is usually operated at fixed sites with readily available grid power and with access to alternative fuel required for fuel cells. Industrial equipment therefore is a more likely candidate for early introduction of zero emission drive systems than off-road construction equipment. The following table summarizes potential zero- and near zero-emissions systems to be evaluated over the next several years.

TECHNOLOGY	APPLICATION	STATUS/POTENTIAL EMISSION REDUCTION
Battery-Electric	Equipment with high percentage of standby time or low load time and located at site with grid power	Industrial equipment commercialized, smaller construction equipment demonstrations needed/100%
Fuel Cell	Equipment with access to fuel infrastructure – most likely equipment at fixed sites or returning to equipment yards at night.	Development of forklifts and other industrial equipment in process/100%
Plug-In Hybrid Electric	Equipment with energy recovery duty cycles or high percentage of idle/low power operation. Equipment can operate at remote sites with conventional fuel or grid power if available at job site. Hybrid technology may vary by equipment type.	On-road truck systems commercialized; industrial equipment in development, construction equipment depends on market interest/40% from Tier 4
CNG/LNG	Equipment at fixed sites or returning to equipment yards at night	Available for some forklifts; demonstrations underway for heavy construction equipment/60% from Tier 4
Hybrid Systems	Equipment with energy recovery duty cycles or high percentage of idle/low power operation. Equipment can operate at remote sites with diesel fuel. Hybrid technology may vary by equipment type.	Entering commercialization in selected applications/25% from Tier 4
Cleaner Combustion Engines	Heavy construction equipment >300 hp	Engines with NO _x emissions at least 60% cleaner from Tier 4 standards

Battery-Electric Equipment. Battery-electric equipment is already commercialized for many industrial equipment categories. However, this equipment has been developed with conventional automotive lead acid battery technology. Further demonstrations are needed in conjunction with the latest battery technologies.

Fuel Cell Equipment. This zero-emission technology is being demonstrated in light-duty passenger cars, buses and trucks. Fuel cell technologies need additional development for off-road applications.

Hybrids. Hybrid electric drives are now being introduced into construction equipment (Caterpillar D7E bulldozer and Komatsu excavator). Other manufacturers including Volvo and John Deere are developing diesel hybrid equipment. For smaller equipment, plug-in hybrid systems are being adapted from light and medium duty on-road vehicles.

In order to establish the emission benefit and to facilitate the deployment of hybrid equipment through incentive programs, a methodology to determine the emissions of hybrid drive systems compared to conventional diesel engines will be developed in cooperation with CARB, EPA, and equipment manufacturers with input through the Working Group.

Reduced Emission Diesel Engines. More significant emission reductions (60% below Tier 4 – 0.12 g/bhp-hr) will require further advancements in engine and exhaust treatment technologies for diesel engines or use of alternative fuels such as natural gas. Many of these technologies currently exist and are used for passenger car and truck engines. However, these technologies are not likely to be used in off-road engines without new technology forcing exhaust emissions standards.

Schedule for Action

The following actions are directed at developing and demonstrating technologies for zero- or near-zero emission construction and industrial equipment. Since all of these technologies are currently in some stage of development for on-road trucks and industrial equipment, it is appropriate that the schedules for technology development, demonstration activities and technology deployment, reflect the potential for earlier technology implementation in selected applications than for all equipment categories and applications. The schedules specified below for zero-emission construction equipment technology deployment where feasible extend from 2015 to beyond 2021.

Actions

Off-road Equipment Working Group (2012-2014). A technical working would be formed to focus efforts specifically on near-zero and zero-emission opportunities for penetration into each type of off-road construction and industrial equipment. Performance requirements, work location, and duty cycle will be matched to technology factors including power storage, drive system type, system size and weight, and charging technologies. The Working Group would coordinate with core end users to define their needs and key equipment design parameters in the 2012 – 2013 timeframe. The Working Group will include air quality regulatory agencies,

equipment and drive system manufacturers, equipment operators, and independent research and academic organizations.

Secure Funding (2012-2014). Collaborate with public and private partners to secure funding commitments for the development of vehicle prototypes and infrastructure demonstrations similar to the Off-Road Showcase.

Develop and Demonstrate Equipment Prototypes (2012-2015). This phase involves the development, design validation, and initial demonstration of several types of advanced prototype vehicles. The demonstration would include technology optimization for equipment types and applications recommended by the Working Group.

Select Technologies for Field Evaluation (2012-2017). Identify potential equipment types and drive technologies to test in the small scale demonstrations. Designate equipment deployment and lay out a test and development plan for a limited number of equipment.

Equipment Evaluation Testing (2013-2020). Develop, deploy and assess, with equipment operators, multiple equipment types with on-going data collection, analysis and sharing for rapid iterative design improvement.

Deployment (2015+). Identify/develop mechanisms to deploy demonstrated technologies as early as possible. Such mechanisms may include lease agreements, environmental mitigation measure, and funding incentives.

**ADV-07: ACTIONS FOR THE DEPLOYMENT
OF CLEANER AIRCRAFT ENGINES
[NOX, PM]**

CONTROL MEASURE SUMMARY

SOURCE CATEGORY:	COMMERCIAL JET AIRCRAFT ENGINES
CONTROL METHODS:	ADVANCED ENGINE TECHNOLOGIES AND CLEANER AVIATION FUELS
EMISSIONS (TONS/DAY):	TBD
CONTROL COST:	THE CONTROL COSTS VARY WITH THE TYPE OF CONTROL TECHNOLOGY IMPLEMENTED
IMPLEMENTING AGENCY:	SCAQMD, CARB, FAA, U.S. EPA

DESCRIPTION OF SOURCE CATEGORY

Background

This measure describes the actions needed to develop, demonstrate, and commercialize advanced technologies, procedures, and sustainable alternative jet fuels that could be deployed in the 2020 to 2030 timeframe. Such technologies include advanced engine controls to reduce landing and takeoff cycle NO_x emissions by at least 60 percent, without increasing other gaseous or particulate emissions beyond the International Civil Aviation Organization (ICAO) standards adopted in 2004. In addition, greater use of sustainable alternative jet fuels in conjunction with advanced technologies is critical over the next 10 to 20 years to realize substantial emissions reductions from commercial jet aircraft applications.

Regulatory History

In 1973, the U.S. EPA published emissions standards and test procedures to regulate gaseous emissions, smoke, and fuel venting from aircraft engines. In 1997, the standards were revised to be more consistent with those of the ICAO Committee of Aviation Environmental Protection (CAEP) for turbo engines used in commercial aircraft. These standards (CAEP/2) included new CO, HC, and NO_x emissions standards of 118 grams per kilonewtons (g/kN), 19.6 g/kN, and 40 g/kN, respectively. In 2005, the standards were harmonized with ICAO CAEP/4 requirements which tightened the CAEP/2 NO_x standards by 32% for newly-certified commercial aircraft engines.

On June 1, 2012, the U.S. EPA Administrator signed a final rule to further revise the standards to be consistent with the current ICAO CAEP/6 and CAEP/8 requirements to further reduce NO_x emissions. The first set of standards take effect 30 days after from the date the rule is published in the Federal Register and will require all new engines meet the ICAO CAEP/6 standards. The CAEP/6 standards represent approximately 12 percent emissions reduction from

the ICAO Tier 4 levels. The second set of standards, Tier 8, take effect in 2014 and represents approximately a 15 percent from Tier 6 levels.

PROPOSED METHOD OF CONTROL

The proposed actions seek the development and deployment of new and cleaner commercial aircraft engines beginning 2015 such that by 2023, there will be a substantial number of low-emissions commercial jet aircraft that could be routed to the South Coast Air Basin.

Schedule for Action

State and local aircraft emission regulation is preempted by the Clean Air Act which gives that responsibility to U.S. EPA in consultation with the Federal Aviation Administration (FAA). New engine aircraft standards were adopted in 2005 and revised standards are being proposed by US and CAEP. No regulations are planned for the in-use aircraft fleet so emission reductions can only be achieved through fleet turn-over. Fortunately, new aircraft offer lower fuel consumption as well as reduced emissions providing an economic incentive for airlines to accelerate replacement of their older aircraft.

In 2010, the FAA initiated the Continuous Lower Energy, Emissions and Noise (CLEEN) Program to reduce NOx emissions by 75% relative to the 2005 emission standards by 2025. Potential low emission aircraft technologies include alternative fuels, lean combustion burners, high rate turbo bypass, advanced turbo-compressor design, and engine weight reduction. This program provides a framework and goal to develop and demonstrate technologies for improved efficiency and reduced emissions on a continuous incremental basis. The major elements of the framework are described below.

Actions

Formation of the CLEEN program working group (completed). The working group consists of aircraft manufacturers, jet engine manufacturers, component suppliers, the U.S. EPA, and NASA. The working group meets bi-annually.

Secure Funding (2012-2018). The FAA is providing limited funding for test and evaluation. Participating companies are also providing internal research, prototype preparation and laboratory tests.

Develop and Demonstrate Equipment Prototypes (2012-2018). Prototype technologies are being prepared for laboratory testing.

Select Technologies for Fleet Evaluation (2015-2018). Select successful technology improvements from bench test data to test in flight operations. Identify target flight test partners and lay out a test and development plan for a limited number of vehicles.

Technology Evaluation Testing (2018-2020). Develop, deploy and assess the selected engine technologies on aircraft operated by participating airlines. Provide on-going data collection,

analysis and sharing for rapid iterative design improvement and support for FAA and international flight certification.

Prepare and Submit FAA Certification and Application (2018-2020). Each engine manufacturer is responsible for obtaining certification of successfully demonstrated technology improvements.

Deployment (2020+). Identify/develop mechanisms to deploy demonstrated technologies as early as possible.

Executive Summary

This Appendix describes the Southern California Association of Government's (SCAG) transportation strategy and transportation control measures (TCMs) to be included as part of the 2012 Air Quality Management Plan (AQMP) / PM2.5 State Implementation Plan (SIP) for the South Coast Air Basin. The transportation strategy and TCMs are based on SCAG's adopted 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and 2011 Federal Transportation Improvement Program (FTIP) as amended which were developed in consultation with federal, state and local transportation and air quality planning agencies and other stakeholders. The four County Transportation Commissions (CTCs) in the South Coast Air Basin, namely Los Angeles County Metropolitan Transportation Authority, Riverside County Transportation Commission, Orange County Transportation Authority and the San Bernardino Associated Governments, were actively involved in the development of the regional transportation measures of this Appendix.

The Regional Transportation Strategy and Transportation Control Measures portion of the 2012 AQMP/SIP consists of the following three related Sections.

Section I. Linking Regional Transportation Planning to Air Quality Planning

As required by federal and state laws, SCAG is responsible for ensuring that the regional transportation plan, program, and projects are supportive of the goals and objectives of AQMPs/SIPs. SCAG is also required to develop demographic projections and regional transportation strategy and control measures for the AQMPs/SIPs.

As the Metropolitan Planning Organization (MPO), SCAG develops the RTP/SCS every four years. The RTP/SCS is a long-range regional transportation plan that provides a vision for transportation investments throughout the SCAG region. The 2012-2035 RTP/SCS also integrates land use and transportation planning to achieve regional greenhouse gas (GHG) reduction targets set by the California Air Resources Board (ARB) pursuant to SB375.

SCAG also develops the biennial FTIP. The FTIP is a multimodal list of capital improvement projects to be implemented over a six year period. The FTIP implements the programs and projects in the RTP/SCS.

Section II. Regional Transportation Strategy and TCMs

The SCAG region faces daunting mobility, air quality, and transportation funding challenges. Under the guidance of the goals and objectives adopted by SCAG's Regional Council, the 2012-2035 RTP/SCS was developed to provide a blueprint to integrate land use and transportation strategies to help achieve a coordinated and balanced regional transportation system. The 2012-2035 RTP/SCS represents the culmination of more than two years of work involving dozens of public agencies, 191 cities, hundreds of local, county, regional and state officials, the business community, environmental groups, as well as various nonprofit organizations. The 2012-2035 RTP/SCS was formally adopted by the SCAG Regional Council on April 4, 2012.

The 2012-2035 RTP/SCS contains a host of improvements to every component of the regional multimodal transportation system including:

- Active transportation
- Transportation demand management (TDM)
- Transportation system management (TSM)
- Transit
- Passenger and high-speed rail
- Goods movement
- Aviation and airport ground access
- Highways
- Arterials
- Operations and maintenance

Included within these transportation system improvements are projects that reduce vehicle use or changing traffic flow or congestion conditions (“TCMs”). TCMs include the following three main categories of transportation improvement projects and programs:

- High occupancy vehicle (HOV) measures,
- Transit and systems management measures, and
- Information-based transportation strategies.

New to this cycle of the RTP is the inclusion of the SCS as required by SB 375. The primary goal of the SCS is to provide a vision for future growth in Southern California that will decrease per capita GHG emissions from passenger vehicles. However, the strategies contained in the 2012-2035 RTP/SCS will produce benefits for the region far beyond simply reducing GHG emissions. The SCS strives to integrate the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas on existing main streets, in downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. In addition, SCAG is a strategic partner in a regional effort to accelerate fleet conversion to near-zero and zero-emission transportation technologies. A significant expansion of alternative-fuel infrastructure is needed throughout the region to accommodate the anticipated increase in alternative fueled vehicles.

Section III. Reasonably Available Control Measure Analysis

As required by the Federal Clean Air Act (CAA), a reasonably available control measure (RACM) analysis must be included as part of the overall control strategy in the AQMP/SIP to ensure that all potential control measures are evaluated for implementation and that justification is provided for those measures that are not implemented. Appendix IV-C contains the TCM RACM component for the South Coast PM_{2.5} control strategy. In accordance with EPA procedures, this analysis considers TCMs in the 2012-2035 RTP/SCS, measures identified by the CAA, and relevant measures adopted in other non-attainment areas of the country.

Based on this comprehensive review, it is determined that the TCMs being implemented in the South Coast Air Basin are inclusive of all TCM RACM. None of the candidate measures reviewed and determined to be infeasible meets the criteria for RACM implementation.

Section I. Linking Regional Transportation Planning to Air Quality Planning

Federal and State Requirements

The air quality conformity requirements of the Federal CAA establish a need to integrate air quality planning and regional transportation planning. This integration presents the challenge of balancing the real need for improved mobility with the equally important goal of cleaner air. As the federally-designated MPO for the six-county Southern California region, SCAG is required by law to ensure that transportation activities “conform” to, and are supportive of, the goals of regional and state air quality plans to attain the National Ambient Air Quality Standards (NAAQS). In addition, SCAG is a co-producer, with the South Coast Air Quality Management District (AQMD), of the AQMP for the South Coast Air Basin. SCAG has the responsibility for the demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies, as well as analyzing and providing emissions data related to its planning responsibilities (California Health and Safety Code §40460).

Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Federal Transportation Improvement Program (FTIP)

The SCAG Region is the largest metropolitan planning area in the United States, encompassing 38,000 square miles. The region is divided into 14 subregions and is one of the largest concentrations of population, employment, income, business, industry and finance in the world. The six-county SCAG Region is home to more than 18 million people, nearly half of the population of the state of California.

Federal and state regulations require SCAG, as the Regional Transportation Planning Agency and MPO, to develop an RTP every four years in order for our region's transportation projects to qualify for federal and state funding. The RTP is updated to reflect changes in trends, progress made on projects, and to adjust the growth forecast for population changes. The long-range transportation plan provides a vision for transportation investments throughout the region. Using growth forecasts and economic trends that project out over a 20-year period, the RTP considers the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address our mobility needs.

The SCS is a newly required element of the RTP. The SCS integrates land use and transportation strategies that will achieve ARB greenhouse gas emissions reduction targets. According to SB 375, “The Sustainable Communities Strategy shall:

1. identify the general location of uses, residential densities, and building intensities within the region;
2. identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth;
3. identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region;

4. identify a transportation network to service the transportation needs of the region;
5. gather and consider the best practically available scientific information regarding resource areas and farmland in the region;
6. consider the state housing goals specified in Sections 65580 and 65581;
7. set forth a forecasted development pattern for the region, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board;
8. allow the regional transportation plan to comply with the federal Clean Air Act."

The RTP/SCS was developed through a collaborative process, guided by the SCAG Regional Council and its Policy Committees and Sub-committees, the Plans & Programs Technical Advisory Committee, numerous task forces, CTCs, subregions, local governments, state and federal agencies, environmental and business communities, tribal governments, non-profit groups, as well as the general public. The RTP/SCS constitutes the Regional Transportation Strategy and Control Measures for the AQMP.

SCAG is also responsible for developing a biennial short-term (six year planning horizon) FTIP. SCAG develops the FTIP in partnership with the CTCs of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura, and Caltrans Districts 7, 8, 11, and 12. The FTIP is a multimodal list of capital improvement projects to be implemented over a six-year period. The FTIP identifies specific funding sources and fund amounts for each project. It is prioritized to implement the region's overall strategy for providing mobility and improving both the efficiency and safety of the transportation system, while supporting efforts to attain federal and state air quality standards for the region by reducing transportation related air pollution. The FTIP must include all federally funded transportation projects in the region, as well as all regionally significant transportation projects for which approval from federal funding agencies is required, regardless of funding source. The FTIP is developed to incrementally implement the programs and projects in the RTP. TCMs that are committed to in the applicable SIP are derived from the first two years of the prevailing FTIP.

Section II. Regional Transportation Strategy and TCMs

Introduction

The 2012-2035 RTP/SCS is a long-range regional transportation plan that provides a blueprint to integrate land use and transportation strategies to help achieve a coordinated and balanced regional transportation system. Transportation projects in the SCAG region must be included in the RTP/SCS in order to receive federal funding. The 2012-2035 RTP/SCS is comprised of the following elements: (1) a policy element that presents an overview of the challenges facing the region; the RTP/SCS goals, policies and performance outcomes; (2) the SCS, which includes land use policies and forecasted future growth and land use for the region; (3) an action element that describes the transportation investments and programs necessary to implement the Plan and performance measures to determine how the Plan performs; and (4) the financial element that summarizes the cost of Plan implementation constrained by a realistic projection of available revenues and provides recommendations for the allocation of funds.

The 2012-2035 RTP/SCS represents the culmination of more than two years of work involving dozens of public agencies, 191 cities, hundreds of local, county, regional and state officials, the business community, environmental groups, as well as various nonprofit organizations, and was founded on a broad-based public outreach effort. The implementation of one of the most comprehensive and coordinated public participation plans ever undertaken by SCAG is documented in the 2012-2035 RTP/SCS, Public Participation and Consultation Appendix¹.

The 2012-2035 RTP/SCS was formally adopted by the SCAG Regional Council on April 4, 2012 and submitted for approval to the federal agencies. The 2012-2035 RTP/SCS constitutes the transportation control strategy portion of the 2012 AQMP. A full, illustrative list of the 2012-2035 RTP/SCS projects can be found in the Project List Appendix of the 2012-2035 RTP/SCS. (See <http://rtpscs.scag.ca.gov/Pages/2012-2035-RTP-SCS.aspx>)

Key Planning Challenges

The challenges facing the region's future are daunting:

Mobility Challenges: The region's roadways are the most congested in the nation, resulting in over three million hours wasted each year sitting in traffic. Traffic relief is critical, even more so in the region's current economic situation. By failing to adequately address congestion in the Region, we have foregone jobs - every 10 percent decrease in congestion can bring an employment increase of about 132,000 jobs.

Air Quality Challenges: While Southern California is a leader in reducing emissions and ambient levels of air pollutants are improving, the SCAG region continues to have the worst air quality in the nation, and air pollution causes thousands of premature deaths every year, as well as other serious adverse health effects. The South Coast Air Basin has the worst air quality of the four air basins contained in the SCAG region.

¹ http://rtpscs.scag.ca.gov/Documents/2012/final/SR/2012fRTP_PublicParticipation.pdf

Funding Need: Of all the challenges facing the transportation system today, there is perhaps none more critical than funding. With the projected growth in population, employment, and demand for travel, the costs of our multimodal transportation needs surpass projected revenues available from our historic transportation funding source - the gas tax. State and federal gas taxes have not changed in nearly 20 years. Yet, highway construction costs have grown by over 80 percent. The region must consider ways to stabilize existing revenue sources and supplement them with reasonably available new sources.

Regional Goals and Policies: To Realize a Sustainable Future

To guide development of the projects, programs, and strategies, SCAG's Regional Council adopted goals and objectives that help carry out the 2012-2035 RTP/SCS vision which encompasses three principles: mobility, economy, and sustainability. The regional goals reflect the wide-ranging challenges facing transportation planners and decision-makers in achieving the RTP/SCS vision. The goals demonstrate the need to balance many priorities in the most cost-effective manner. SCAG's Regional Council adopted the following goals as part of the 2012-2035 RTP/SCS.

- Align the plan investments and policies with improving regional economic development and competitiveness
- Maximize mobility and accessibility for all people and goods in the region
- Ensure travel safety and reliability for all people and goods in the region
- Preserve and ensure a sustainable regional transportation system
- Maximize the productivity of our transportation system
- Protect the environment and health of our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking)
- Actively encourage and create incentives for energy efficiency, where possible
- Encourage land use and growth patterns that facilitate transit and non-motorized transportation
- Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies

The six 2012-2035 RTP/SCS guiding policies below help focus future investments on the best-performing projects and strategies that seek to preserve, maintain, and optimize the performance of the existing system.

- 1) Transportation investments shall be based on SCAG's adopted regional Performance Indicators
- 2) Ensuring safety, adequate maintenance, and efficiency of operations on the existing multimodal transportation system should be the highest RTP/SCS priorities for any incremental funding in the region
- 3) RTP/SCS land use and growth strategies in the RTP/SCS will respect local input and advance smart growth initiatives
- 4) Transportation demand management (TDM) and non-motorized transportation will be focus areas, subject to Policy 1

- 5) HOV gap closures that significantly increase transit and rideshare usage will be supported and encouraged, subject to Policy 1
- 6) Monitoring progress on all aspects of the Plan, including the timely implementation of projects, programs, and strategies, will be an important and integral component of the Plan

Transportation Investments

The RTP/SCS contains a host of improvements to the regional multimodal transportation system. These improvements include closures of critical gaps in the network that hinder access to certain parts of the region, as well as the strategic expansion of our transportation system where there is room to grow in order to provide the region with the mobility it needs.

Active Transportation Component: \$6.7 billion will be invested in various active transportation strategies to increase bikeways in the SCAG region from 4,315 miles to 10,122 miles, bring significant amount of sidewalks into compliance with the Americans with Disabilities Act (ADA), safety improvements, and various other strategies.

Transportation Demand Management (TDM) Component: \$4.5 billion will be invested in various TDM strategies to incentivize drivers to reduce solo driving: (1) Increase carpooling and vanpooling; (2) Increase the use of transit, bicycling, and walking; (3) Redistribute vehicle trips from peak periods to non-peak periods by shifting work times/days/locations; (4) Encourage greater use of telecommuting; and (5) Other “first mile/last mile” strategies to allow travelers to easily connect to and from transit service at their origin and destination. These strategies include the development of mobility hubs around major transit stations, the integration of bicycling and transit through folding-bikes-on-buses programs, triple bike racks on buses, and dedicated racks on light and heavy rail vehicles.

Transportation System Management (TSM) Component: \$7.6 billion will be invested in various TSM strategies to enhanced incident management, advanced ramp metering, traffic signal synchronization, advanced traveler information, improved data collection, universal transit fare cards (Smart Cards), and Transit Automatic Vehicle Location (AVL) to increase traffic flow and reduce congestion.

Transit Component: A total of \$55.0 billion will be invested in (1) bus rapid transit (BRT) - new BRT routes, extensions, and/or service enhancements in Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties; (2) light rail transit - new light rail and commuter rail routes/extensions in Los Angeles and San Bernardino Counties; (3) heavy rail transit – heavy rail extension in Los Angeles County; and (4) bus - new and expanded bus service in Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties.

Passenger and High-Speed Rail Component: A total of \$51.8 billion will be invested in (1) commuter rail - Metrolink extensions in Riverside County and Metrolink system-wide improvements to provide higher speeds; and (2) high speed rail - improvements to the Los Angeles to San Diego (LOSSAN) Rail Corridor with an ultimate goal of providing San Diego-Los Angeles express service in under two hours, and Phase I of the California High-Speed Train (HST) project that would provide high-speed service from the Kern County line to Anaheim via

L.A. Union Station with stops in Palmdale, San Fernando Valley, L.A. Union Station, Norwalk and Anaheim.

Goods Movement (includes Grade Separations) Component: \$48.4 billion will be invested in various goods movement strategies including Port access improvements, freight rail enhancements, grade separations, truck mobility improvements including an East-West Freight Corridor, intermodal facilities, and support of emission-reduction strategies such as the deployment of commercially available lower-emission trucks and locomotives in the near term while taking critical steps (including technology demonstration projects) toward the phased implementation of a zero- and near-zero emission freight system.

Aviation and Airport Ground Access Component: As included in their respective modal investments, substantial investment will be made in various airport ground access improvements including rail extensions and improvements to provide easier access to airports, and new express bus service from remote terminals to airports.

Highways Component: \$64.2 billion will be invested in (1) toll facilities - closure of critical gaps in the highway network to provide access to all parts of the region (\$27.3 billion); (2) High-Occupancy Vehicle (HOV)/High-Occupancy Toll (HOT) - closure of gaps in the HOV lane network and the addition of freeway-to-freeway direct HOV connectors to complete Southern California's HOV network and a connected network of Express/HOT lanes (\$20.9 billion); and (3) mixed flow – interchange improvements to and closures of critical gaps in the highway network to provide access to all parts of the region (\$16.0 billion).

Arterials Component: \$22.1 billion will be invested in various arterial improvements including spot widening, signal prioritization, driveway consolidations and relocations, grade separations at high-volume intersections, new bicycle lanes, and other design features such as lighting, landscaping, and modified roadway, parking, and sidewalk widths.

Operations and Maintenance Component: \$216.9 billion will be invested in the operations and maintenance of transit (\$139.3 billion), highways (\$56.7 billion), and arterials (\$20.9 billion) to preserve our multimodal system in a good state of repair.

Financial Plan

The 2012–2035 RTP/SCS financial plan identifies how much money is available to support the region's transportation investments. The plan includes a core revenue forecast of existing local, state, and federal sources along with funding sources that are reasonably available over the time horizon of the RTP/SCS. These new sources include adjustments to state and federal gas tax rates based on historical trends and recommendations from two national commissions (National Surface Transportation Policy and Revenue Study Commission and National Surface Transportation Infrastructure Financing Commission) created by Congress, further leveraging of existing local sales tax measures, value capture strategies, potential national freight program/freight fees, as well as passenger and commercial vehicle tolls for specific facilities. Reasonably available revenues also include innovative financing strategies, such as private equity participation. In accordance with federal guidelines, the plan includes strategies for ensuring the availability of these sources.

Sustainable Communities Strategy

Under SB 375, the primary goal of the SCS is to provide a vision for future growth in Southern California that will decrease per capita greenhouse gas emissions from automobiles and light trucks. This leads to strategies that can help reduce per capita vehicle miles traveled over the next 25 years. The strategies contained in the 2012–2035 RTP/SCS will produce benefits for the region far beyond simply reducing GHG emissions. Because it is the latest refinement of an evolving regional blueprint that SCAG began in 2000, the 2012–2035 RTP/SCS will help the region contend with many ongoing issues across a wide range of concerns, including better placemaking, lower cost to taxpayers and families, benefits to public health and environment, greater responsiveness to changing demographics and housing markets, and improved access and mobility.

The 2012–2035 RTP/SCS was built primarily from local General Plans and input from local governments using the Local Sustainability Planning Tool, from the subregional COGs and from the County Transportation Commissions. A review of local plans and subregional strategies points to the common ground that is inherent in SCAG’s 2008 Advisory Land Use Policies. The advisory land use policies are a foundation for the overall regional land use development pattern:

- Identify regional strategic areas for infill and investment – Identify strategic opportunity areas for infill development of aging and underutilized areas and increased investment in order to accommodate future growth.
- Structure the plan on a three-tiered system of centers development – Identify strategic centers based on a three-tiered system of existing, planned, and potential, relative to transportation infrastructure.
- Develop “complete communities” – Create mixed-use districts, or “complete communities,” in strategic growth areas through a concentration of activities with housing, employment, and a mix of retail and services, located in close proximity to each other.
- Develop nodes on a corridor – Intensify nodes along corridors with people-scaled, mixed-use developments.
- Plan for additional housing and jobs near transit – Support and improve transit use and ridership by creating pedestrian-friendly environments and more compact development patterns in close proximity to transit.
- Plan for a changing demand in types of housing – Address shifts in the labor force that will likely induce a demand shift in the housing market for additional development types such as multifamily and infill housing in central locations, which will appeal to the needs and lifestyles of these large populations.
- Continue to protect stable, existing single-family areas – Continue to protect stable, existing single-family neighborhoods as future growth and a more diverse housing stock are in infill locations near transit stations.
- Ensure adequate access to open space and preservation of habitat – Ensure access to open space and habitat preservation despite competing quality-of-life demands driven by growth, housing and employment needs, and traditional development patterns.

- Incorporate local input and feedback on future growth – Continue public outreach efforts and incorporate local input through public workshops, scenario planning, and stakeholder outreach.

These policies have evolved over time and serve as the basis for SCAG’s Compass Blueprint, a regional voluntary program that offers innovative planning tools, creative strategies, and collaborative partnerships to all local governments within the region. Since its inception, Compass Blueprint has supported local demonstration projects that seek to improve mobility for all residents, foster livability in all communities, enable prosperity for all people, and promote sustainability for future generations.

The SCS strives to integrate the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375, as evidenced by several Compass Blueprint demonstration projects and various county transportation improvements. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas in existing main streets, downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. This overall land use development pattern supports and complements the proposed transportation network that emphasizes system preservation, active transportation, and transportation demand management measures. The RTP/SCS fully integrates the two subregional SCSs prepared by the Gateway Cities and Orange County Council of Governments.

In addition to Compass Blueprint, cities and counties within the SCAG region continue to implement their own local land use and transportation projects that support the goals of the 2012–2035 RTP/SCS.

To achieve the goals of the 2012–2035 RTP/SCS, public agencies at all levels of government may implement a wide range of strategies that focus on four key areas:

- A Land Use growth pattern that accommodates the region’s future employment and housing needs and protects sensitive habitat and natural resource areas;
- A Transportation Network that consists of public transit, highways, local streets, bikeways, and walkways;
- Transportation Demand Management (TDM) measures that reduce peak-period demand on the transportation network; and
- Transportation System Management (TSM) measures that maximize the efficiency of the transportation network.

In addition, SCAG is a strategic partner in a regional effort to accelerate fleet conversion to zero- and near-zero emission transportation technologies. SCAG’s policy with regard to alternative fuels is technology neutral and does not favor any one technology over any other. To accommodate the anticipated increase in alternative fueled vehicles, a significant expansion of infrastructure is needed throughout the region, among other preparedness steps.

SB 375 provides incentives in the form of CEQA streamlining to encourage community design that supports reduction in per capita GHG emissions. Generally, two types of projects are eligible for streamlined CEQA review once a compliant RTP/SCS has been adopted: (1) residential/mixed-use projects (consistent with the SCS) or (2) a Transit Priority Project (TPP).

Regional Transportation Emissions

Based on the data generated from SCAG’s Regional Travel Demand Model (e.g., traffic volumes, vehicle speeds, transit ridership, etc.), an estimate of emissions associated with on-road mobile sources can be generated using CARB’s emission factor model (EMFAC). Through this process, future emissions from on-road mobile sources can be compared for the regional transportation system assuming implementation of the RTP/SCS versus a baseline case without RTP/SCS implementation. It is generally understood that potential future improvements in air quality deriving from the RTP/SCS will likely be much smaller, since motor vehicle emissions have and will continue to be substantially reduced through technology (i.e., emission standards for new engines and in-use standards for existing fleets). Table 1 below compares VOC (ROG), NOx, and PM2.5 emissions between implementation of the 2012-2035 RTP/SCS and the baseline without the regional transportation strategy for 2014 and 2035.

Table 1 Regional Transportation Emissions (annual average) (tons per day) *

	VOC (ROG)		NOx		PM _{2.5} **	
	2014	2035	2014	2035	2014	2035
2012 RTP/SCS	137.5	70.9	285.9	119.6	15.2	14.2
2012 RTP Baseline	137.6	72.8	285.5	124.8	15.2	15.6
RTP/SCS Reduction	-0.1	-1.9	-0.4	-5.2	0.0	-1.4

Note: * Calculated with EMFAC2007; ** Does not include fugitive dust calculations

Transportation Control Measures

TCMs are measures that are specifically identified and committed to in the applicable implementation plan that are either one of the types listed in CAA section 108, or any other measures for the purpose of reducing emissions or concentrations of air pollutants from transportation sources by reducing vehicle use or changing traffic flow or congestion conditions. Vehicle technology-based, fuel-based, and maintenance-based measures which control the emissions from vehicles under fixed traffic conditions are not TCMs. TCMs in this plan include the following three main categories of transportation improvement projects and programs:

- High occupancy vehicle (HOV) measures,
- Transit and systems management measures, and

- Information-based transportation strategies.

The 2012-2035 RTP/SCS includes TCM type projects throughout the entire Plan horizon (i.e., 2035) and are all part of the regional transportation strategy for the 2012 South Coast PM2.5 AQMP. Those TCM type projects which have funding programmed for right of way or construction in the first two years of the prevailing FTIP are considered committed for air quality planning purposes in the applicable SIP. Attachment A of this Appendix illustrates the currently committed TCMs that are derived from the TCM projects of the 2011 FTIP, as amended.

TCM Emissions Reduction Benefits To estimate the emission benefits of TCMs, the socio-economic data variables of the 2012-2035 RTP/SCS were held constant while the transportation network was modified to account for the TCMs in the Plan (both TCM-type projects and committed TCMs). In other words, the TCM emissions reduction benefits are the difference between the 2012-2035 RTP/SCS which includes TCMs and the AQMP baseline which is defined as RTP minus TCMs. It should be noted that this analysis is done for illustrative purposes as the regional transportation strategy is appropriately viewed on a systems-level basis, and not by its components since each of the individual transportation improvements and strategies affect each other and the system.

Compared to previous AQMPs/SIPs, potential future improvements in air quality deriving from TCMs is consistently diminishing for two reasons. On one hand, motor vehicle emissions have and will continue to be substantially reduced through technology. On the other hand, most of the TCM projects in the South Coast Air Basin were adopted into the SIP to meet the one-hour ozone standard by 2010 and have already been implemented. Thus, the emission reductions associated with these projects are now included in the baseline emissions and no longer show up in the TCM benefit values. Table 2 shows the results of the TCM modeling analysis for years 2014, 2019, and 2023.

Table 2 TCM Emissions (annual average) (tons per day) *

	VOC (ROG)			NOx			PM _{2.5} **		
	2014	2019	2023	2014	2019	2023	2014	2019	2023
2012 RTP/SCS	137.5	110.7	93.7	285.9	194.1	157.7	15.2	14.8	13.5
RTP/SCS without TCM	137.8	111.1	94.4	286.6	195.5	159.2	15.3	15.1	13.9
TCM Reduction	-0.3	-0.4	-0.7	-0.7	-1.4	-1.5	-0.1	-0.3	-0.4

Note: * Calculated with EMFAC2007; ** Does not include fugitive dust calculations

Section III. Reasonably Available Control Measure Analysis

Introduction

Clean Air Act Section 172(c)(1) requires SIPs to provide for the implementation of all reasonably available control measures (RACM) as expeditiously as practicable. Guidance on interpreting RACM requirements in the context of the 1990 Amendments was set forth in the General Preamble (57 FR 13498, 13560) in 1992. In the General Preamble, U.S. Environmental Protection Agency (EPA) interpreted section 172(c)(1) as imposing a duty on States to consider all available control measures and to adopt and implement measures that are reasonably available for implementation in a specific nonattainment area. It also retained an earlier interpretation of RACM that it would not be reasonable to require the implementation of measures that do not advance the date for attainment.

With regard to TCMs, EPA revised earlier guidance by indicating that it is inappropriate to presume that all Section 108(f)(1)(A) measures of the CAA are available in all nonattainment areas. Instead, States should consider Section 108(f)(1)(A) measures as potential options that are not exhaustive, but indicative of the types of measures that should be considered. In addition, any measure identified as reasonably available during the public comment period should also be considered for implementation. EPA indicated that States could reject measures as not reasonably available for reasons related to local conditions. States are required to justify why available measures were not considered RACM and not adopted in the SIP.

To meet the RACM requirements articulated in the EPA guidance described above, this RACM analysis was performed using several steps. First is a description of the process by which SCAG and related transportation agencies in the South Coast Air Basin identify, review, and make enforceable commitments to implement TCMs. Second is the assembly and review of a list of control measures recently implemented in other ozone nonattainment areas. This effort involved a review of measures implemented in California nonattainment areas as well as those located in Arizona, Colorado, Georgia, New York, Texas, and Washington D.C., and the organization of those measures in the 16 categories specified in CAA Section 108(f). The third step is to determine RACM measures by contrasting the list of candidate measures with measures implemented to date in the South Coast Air Basin, as well as any new commitments in the current AQMP. The fourth step is to provide a reasoned justification for any of the available measures that have yet to be implemented. These justifications must address criteria described in the above-cited guidance.

SCAG RACM/TCM Development Process

While the SCAG Region has an extensive, systematic TCM development program continually updated through the FTIP process, areas are obligated during SIP preparation to evaluate TCMs and determine whether they qualify as RACM.

The RACM process relies predominantly on the continuous updating and addition process for TCMs in the South Coast Air Basin. The TCM process was established for the South Coast Air Basin by replacing a process that developed TCMs each time a SIP was produced with a

continuous ongoing TCM process. This process continues to govern the selection and implementation of TCMs today. TCMs are continuously identified and reviewed throughout the transportation planning process. SCAG's ongoing public outreach effort, including an involved interagency input process via the TCWG, helps ensure that the process to identify and review TCMs is robust, inclusive, and comprehensive. Development of TCMs arises from multiple processes and multiple sources, which include CTCs, subregional agencies, task forces, committees, and the public. These funding and scheduling incentives ensure that TCMs are developed, sponsored, and clearly identified throughout the process.

Assembly and Review of Candidate RACM

EPA and related court decisions have maintained that TCMs considered RACM must be measures that 1) advance the attainment date, typically by at least one year and 2) are technologically and economically feasible. Measures must pass both the advance attainment and technical/economic feasibility tests to be deemed RACM.

U.S. EPA guidance documents provide help in identifying the type of measures to be considered. CAA Section 108(f)(1)(A) provides a list of sixteen categories of TCMs that are potential options that should be considered indicative types of control measures:

- i. Programs for improved use of public transit;*
- ii. Restriction of certain roads or lanes to, or construction of such roads or lanes for use by, passenger buses or high occupancy vehicles;*
- iii. Employer-based transportation management plans, including incentives;*
- iv. Trip-reduction ordinances;*
- v. Traffic flow improvement programs that achieve emission reductions;*
- vi. Fringe and transportation corridor parking facilities, serving multiple occupancy vehicle programs or transit service;*
- vii. Programs to limit or restrict vehicle use in downtown areas or other areas of emission concentration, particularly during periods of peak use;*
- viii. Programs for the provision of all forms of high-occupancy, shared-ride services, such as the pooled use of vans;*
- ix. Programs to limit portions of road surfaces or certain sections of the metropolitan area to the use of non-motorized vehicles or pedestrian use, both as to time and place;*
- x. Programs for secure bicycle storage facilities and other facilities, including bicycle lanes, for the convenience and protection of bicyclists, in both public and private areas;*
- xi. Programs to control extended idling of vehicles;*
- xii. Programs to reduce motor vehicle emissions, consistent with Title II of the Clean Air Act, which are caused by extreme cold start conditions;*
- xiii. Employer-sponsored programs to permit flexible work schedules;*
- xiv. Programs and ordinances to facilitate non-automobile travel, provision and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts of a locality, including programs and*

ordinances applicable to new shopping centers, special events, and other centers of vehicle activity;

- xv. Programs for new construction and major reconstruction of paths, tracks or areas solely for the use by pedestrian or other non-motorized means of transportation, when economically feasible and in the public interest; and*
- xvi. Programs to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks.*

EPA guidance has emphasized that these sixteen measures are an illustrative, but not exhaustive list. Instead, TCMs need to be evaluated on an area-by-area basis to determine which are reasonably available. In addition to the measures listed above, the 1992 General Preamble of the CAA cite other sources to include TCMs that were a) suggested during public comments (e.g. at workshops, public hearings, in written comments, etc.); b) adopted in other nonattainment areas of the country; and c) specifically identified by the EPA (i.e. EPA TCM database, support documents for rulemaking, etc.).²

To develop a list of candidate RACM, SCAG performed a comprehensive review of available TCMs in California, as well as in other states. SCAG reexamined the candidate RACM identified during the comprehensive RACM analysis performed for the 2007 AQMP. Additionally, SCAG coordinated with other MPOs and air quality districts to identify measures that are being implemented in the following other nonattainment areas:

- **Maricopa County, Arizona:** Maricopa Association of Governments. Eight-Hour Ozone Resignation Request and Maintenance Plan for the Maricopa Nonattainment Area, February, 2009.
- **Bay Area, California:** Bay Area Air Quality Management District. Revised San Francisco Bay Area Ozone Attainment Plan for the 1-Hour National Ozone Standard, October 24, 2001.
- **Sacramento, California:** Sacramento Metropolitan Air Quality Management District. Sacramento Regional 8-Hour Ozone Attainment and RFP Plan, December 19, 2008. EPA approval pending.
- **San Joaquin Valley, California:** San Joaquin Valley Air Pollution Control District. 2007 Ozone Plan, April 30, 2007.
- **Denver Metropolitan Area, Colorado:** North Front Range Metropolitan Organization. Denver Metro Area and North Front Range Ozone Action Plan, December 12, 2008.
- **Atlanta Metropolitan Area, Georgia:** Georgia Department of Natural Resources, Environmental Protection Division. Proposed Georgia's State Implementation Plan for the Atlanta 8-Hour Ozone Nonattainment Area, March 26, 2009. EPA approval pending.
- **New York Metropolitan Area, New York:** New York State Department of Environmental Conservation Ozone (8-Hour NAAQS) Attainment Demonstration for NY Metro Area, August 9, 2007.
- **Dallas-Fort Worth Area, Texas:** Texas Commission on Environmental Quality. Revisions to the State of Texas Air Quality Implementation Plan for the Control of Ozone

² Seitz, John S. (December 2, 1999). Memo from John Seitz: Guidance on the Reasonably Available Control Measures (RACM) Requirement and Attainment Demonstration Submissions for Ozone Nonattainment Areas. Available at: <http://www.epa.gov/ttn/oarpg/t1/memoranda/revracm.pdf>.

Air Pollution, Dallas-Forth Worth 8-Hour Ozone Nonattainment Area, December 7, 2011. EPA approval pending.

- **Houston-Galveston Area, Texas:** Texas Commission on Environmental Quality. Revisions to the State of Texas Air Quality Implementation Plan for the Control of Ozone Air Pollution, Houston-Galveston-Brazoria 1997 8-Hour Ozone Nonattainment Area, March 10, 2010. EPA approval pending.
- **Washington D.C.:** Metropolitan Washington Council of Governments (MWCOG). Plan to Improve Air Quality in the Metropolitan Washington, DC-MD-VA Region: State Implementation Plan (SIP) for 8-Hour Ozone Standard, May 23, 2007.

Additionally, TCMs were discussed and reviewed at numerous TCWG meetings as part of the 2011 FTIP, 2012-2035 RTP/SCS, and 2012 AQMP. Further, SCAG has an extensive and robust public participation process for the development of the RTP/FTIP through ongoing public meetings, and technical, advisory, and policy committees. These groups generally meet on a monthly basis and provide explicit opportunities for the public to participate and contribute.

In summary, SCAG performed the RACM analysis based on information reviewed from the following sources:

- CAA Section 108(f)(1)(A)
- 2007 South Coast AQMP RACM Analysis
- Other nonattainment areas in California
- Other nonattainment areas outside California
- RTP/FTIP Updates
- Interagency Consultation (TCWG)

The candidate measures were reviewed to determine which can be considered RACM. As discussed above, the RACM TCM requirement consists of two core criteria that must be satisfied: 1) TCMs must advance attainment of the air quality standards; and 2) TCMs must be both technically and economically feasible. EPA has not provided specific definitions on these core criteria, but has preferred to allow flexibility in each region's determination.

In practice, agencies have based their determination of the first criteria on whether a measure or group of measures would help an area achieve attainment one year earlier than in the absence of the measure or group of measures. In other words, TCM implementation must significantly reduce emissions to facilitate attainment of the NAAQS one year earlier than without the TCMs. Considering the magnitude of the emissions reductions necessary to demonstrate attainment in the South Coast Air Basin, the implementation of TCMs is not expected to meet this criterion. Technical feasibility has been determined in terms of local factors, such as environmental impacts, availability of control measures, and ability to achieve the emission reductions. Project cost-effectiveness has been considered a determining factor to determine economic feasibility.

Determining RACM Measures

For this step of the RACM analysis, SCAG compared the list measures implemented within the South Coast Air Basin with those implemented in other areas. SCAG then organized measures, including candidate measures and those measures currently implemented in the region, according to the sixteen categories specified in Section 108(f)(1)(A) of the CAA. No formal requirement exists on how to organize TCMs. However, SCAG utilized this organization scheme as a way to highlight those measures that fall within the sixteen CAA categories, which are formally recognized as "TCMs" and subject to CAA and federal conformity requirements. SCAG found a small number of candidate measures that were not currently implemented in the region and not included in the 2007 AQMP RACM analysis. In addition, a new category titled "Other Measures and Programs" was added to the list of measures. This category includes TCMs that do not fall in any of the sixteen Section 108(f) categories. New measures that were in addition to those reviewed as part of the 2007 RACM analysis were highlighted in bold font as shown in Attachment B.

For this RACM analysis, SCAG also reviewed statewide and South Coast AQMD measures that have been adopted since the last RACM analysis. Although these measures are out of the realm of SCAG's funding authority, they are discussed below for completeness. Statewide mobile source measures are also covered in California RACM analysis completed for the latest ozone SIP revision for the South Coast Air Basin. Table 3 shows on-road TCMs and mobile source measures that were adopted by the ARB and are currently being implemented in the SCAG region.

Table 3 Adopted California Transportation Control Measures

RACM	Implementing Nonattainment Area	Implemented in SCAG?
California Diesel Fuel Regulation	ARB	Yes
On-Road Heavy-Duty Diesel Vehicles Regulation	ARB	Yes
California Reformulated Gasoline	ARB	Yes
Low Emission Vehicle Standards (LEV II)	ARB	Yes
Transportation Refrigeration Unit ATCM	ARB	Yes
School Bus Idling ATCM	ARB	Yes
Fleet Rule for Transit Agencies	ARB	Yes
Drayage Truck Regulation	ARB	Yes
Hybrid Truck and Bus Voucher Incentive Program	ARB	Yes
Clean Vehicle Rebate Project	ARB	Yes
Solid Waste Collection Vehicle Rule	ARB	Yes
Heavy-Duty Vehicle Inspection Program	ARB/BAR	Yes
Periodic Smoke Inspection Program	ARB/BAR	Yes
School Bus Retrofit Program	ARB/SCAQMD	Yes
Goods Movement Program/Proposition 1B	ARB/CTC/SCAQMD	Yes

Reasoned Justification

The fourth step is to provide a reasoned justification for any of the available measures that have yet to be implemented or will not be implemented. In 1999, EPA issued a memorandum entitled “Guidance on the Reasonably Available Control Measures Requirement and Attainment Demonstration Submissions for Ozone Nonattainment Areas.”³ In this memorandum, EPA states that in order to determine whether a state has adopted all RACM necessary for attainment and as expeditiously as practicable, the state must explain why the selected implementation schedule is the earliest schedule based on the circumstances of the area. This indicated that States could reject measures as not reasonably available for reasons related to local conditions. In such cases, States are obligated to provide justification as to why potentially reasonable measures have not been adopted. Valid reasons for rejecting a measure include that it would not advance the attainment date, it is economically infeasible, or it is technologically infeasible.

The complete listing of all candidate measures evaluated for RACM determination is included in Attachment B. A “Measure Number” is assigned for each strategy for ease of discussion (not rank in priority). The “Description” column provides a brief description of the relevant measure in discussion. “Has It Been Implemented?” confirms whether the measure is currently implemented in the SCAG region. The final column “Reasoned Justification for Not Implementing” provides a reasoned justification for those measures that were not considered RACM. SCAG appropriately considered a number of factors that included technical and economic feasibility, enforceability, geographic applicability, and ability to provide emission reductions. Of the TCMs that were deemed candidate measures, none were found to meet the criteria for RACM implementation.

Conclusion

CAA Section 172(c)(1) requires SIPs to provide for the implementation of all RACM as “expeditiously as practicable.” EPA and related court decisions have maintained that TCMs considered RACM must be measures that 1) advance the attainment date, typically by at least one year and 2) are technologically and economically feasible. Measures must pass both the advance attainment and technical/economic feasibility tests to be deemed RACM.

Based on a comprehensive review of TCM projects in other nonattainment areas or otherwise identified, it is determined that the TCMs being implemented in the South Coast Air Basin are inclusive of all RACM. None of the candidate measures reviewed herein and determined to be infeasible meets the criteria for RACM implementation.

SCAG and the local transportation agencies have in place a comprehensive, formal process for identifying, evaluating, and selecting TCMs. The regular RTP, FTIP, and AQMP/SIP public update processes ensure that TCM identification and implementation is a routine consideration that helps SCAG and the AQMD demonstrate attainment of applicable NAAQS.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 1. Programs for Improved Public Transit					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
1.1	Regional Express Bus Program	Purchase of buses to operate regional express bus services.	Yes		CTCs (MTA, OCTA), Transit Operators
1.2	Transit access to airports	Operation of transit to airport to serve air passengers.	Yes		Transit Operators, CTCs (MTA, SCRRRA)
1.3	Accelerate Bus Retrofit Program	Accelerate application of retrofit of diesel-powered buses to achieve earlier compliance with state regulations.	Yes		CTCs (MTA, OCTA), Transit Operators
1.4	Mass transit alternatives	Major change to the scope and service levels.	Yes		SCAG, CTCs
1.5	Expansion of public transportation systems	Expand and enhance existing public transit services.	Yes		CTCs
1.6	Transit service improvements in combination with park-and-ride lots and parking Management	Local jurisdictions and transit agency improve the public transit system and add new park-and-ride facilities and spaces on an as needed basis.	Yes		CTCs (MTA, SCRRRA)

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 1. Programs for Improved Public Transit					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
1.7	Free transit during special events	Require free transit during selected special events to reduce event-related congestion and associated emission increases.	No <i>(The Mobile Source Air Pollution Reduction Review Committee has been co-funding free event center shuttle service demonstration projects)</i>	The Legislature significantly reduced authority of AQMD to implement indirect source control measures through revisions to the Health & Safety Code (HSC 40717.8). Transit agencies should decide individually whether this measure is economically feasible for them.	
1.8	Require that government employees use transit for home to work trips, expand transit, and encourage large businesses to promote transit use	Require all government employees use transit a specified number of times per week, or expand transit, and encourage business to promote transit use.	Yes		CTCs
1.9	Increase parking at transit centers or stops	Encourage transit convenience by providing additional parking at transit centers.	Yes		CTCs
1.10	Expand regional transit connection ticket distribution	Provides interchangeability of transit ticket.	Yes		CTCs, Metrolink

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 2. Restriction of Certain Roads or Lanes to, or Construction of Such Roads or Lanes for Use By, Passenger Buses or High Occupancy Vehicles					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
2.1	Update High Occupancy Vehicle (HOV) Lane Master Plan	Analysis of increased enforcement, increasing occupancy requirements, conversion of existing HOV lanes to bus only lanes and/or designation of any new carpool lanes as bus-only lanes; utilization of freeway shoulders for peak-period express bus use; commercial vehicle buy-in to HOV lanes; and appropriateness of HOV lanes for corridors that have considered congestion pricing or value pricing.	Yes		SCAG, Caltrans, CTCs
2.2	Fixed lanes for buses and carpools on arterials	Provide fixed lanes for buses and carpools on arterial streets where appropriate.	Yes		CTCs (MTA, OCTA), LA City
2.3	Expand number of freeway miles available, allow use by alternative fuel vehicles, changes to HOV lane requirements and hours	Various measures evaluated in many ozone nonattainment areas. Specifics vary according to freeway system, use patterns and local characteristics.	Yes		ARB, Caltrans

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 3. Employer-Based Transportation Management Plans, Including Incentives					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
3.1*	Commute solutions	The federal law that complements parking cash-out is called the <i>Commuter Choice Program</i> . It provides for benefits that employers can offer to employees to commute to work by methods other than driving alone.	Yes		Employer, AQMD
3.2*	Parking cash-out	State law requires certain employers who provide subsidized parking for their employees to offer a cash allowance in lieu of a parking space.	Yes		Employer, AQMD
3.3*	Employer Rideshare Program Incentives	Employer rideshare incentives and introduction of strategies designed to reduce single occupant vehicle trips. Examples include: public awareness campaigns, Transportation Management Associations among employers, alternative work hours, and financial incentives.	Yes		Employer, AQMD
3.4*	Implement Parking Charge Incentive Program	Evaluate feasibility of an incentive program for cities and employers that convert free public parking spaces to paid spaces. Review existing parking policies as they relate to new development approvals.	Yes		Cities, Counties, Employer
3.5*	Preferential parking for carpools and vanpools	This measure encourages public and private employers to provide preferential parking spaces for carpools and vanpools to decrease the number of single occupant automobile work trips. The preferential treatment could include covered parking spaces or close-in spaces.	Yes		Employer, AQMD

* This measure relates to AQMD Rule 2202, *On-Road Motor Vehicle Mitigation Options*. Administered by AQMD, Rule 2202 provides a menu of options for employers in choosing how they will comply. Individual employers implement the mitigation option(s) that they have chosen.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 3. Employer-Based Transportation Management Plans, Including Incentives					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
3.6*	Employee parking fees	Encourage public and private employers to charge employees for parking.	Yes		Employer, AQMD
3.7	Merchant transportation incentives	Implement “non-work” trip reduction ordinances requiring merchants to offer customers mode shift travel incentives such as free bus passes and requiring owners/managers/developers of large retail establishments to provide facilities for non-motorized modes.	No	Require state legislation.	
3.8*	Purchase vans for vanpools	Purchase a specified number of vans for use in employee commute travel.	Yes		Employer, AQMD
3.9*	Encourage merchants and employers to subsidize the cost of transit for employees	Provide outreach and possible financial incentives to encourage local employers to provide transit passes or subsidies to encourage less individual vehicle travel.	Yes		Employer, AQMD
3.10*	Compressed work weeks	Work 80 hours in 9 days, or 40 hours in 4 days, or 36 hours in 3 days in lieu of working 40 hours in 5 days.	Yes		Employer, AQMD
3.11*	Telecommuting	Goal of specified percentage of employees telecommuting at least once per week.	Yes		Employer, AQMD
3.12	Income Tax Credit to Telecommuters	Provide tax relief to employees telecommuting to work.	No	Requires state legislation.	

* This measure relates to AQMD Rule 2202, On-Road Motor Vehicle Mitigation Options. Administered by AQMD, Rule 2202 provides a menu of options for employers in choosing how they will comply. Individual employers implement the mitigation option(s) that they have chosen.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 4. Trip Reduction Ordinance

In December 1995, Congress changed the Clean Air Act Amendments to make the Employee Commute Option program voluntary (no longer mandatory). California State Law prohibits mandatory employer based trip reduction ordinance programs (SB437). (HSC 40717.9) To account for these restrictions, SCAQMD Rule 2202 provides employers with a menu of options to reduce mobile source emissions generated from employee commutes. Rule 2202 complies with federal and state Clean Air Act requirements, HSC 40458, and HSC 182(d)(1)(B) of the federal Clean Air Act. Nevertheless, some jurisdictions continue to implement Trip Reduction Ordinances. For example, the City of Santa Monica requires new and existing non-residential development projects to adopt Emission Reduction Plans and pay transportation impact fees to reduce traffic congestion and improve air quality in the city.

Section 108 (f) 5. Traffic Flow Improvement Programs That Achieve Emissions Reductions					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
5.1	Develop Intelligent Transportation Systems	The term “Intelligent Transportation Systems” includes a variety of technological applications intended to produce more efficient use of existing transportation corridors.	Yes		CTCs, Caltrans
5.2	Coordinate traffic signal systems	This measure implements and enhances synchronized traffic signal systems to promote steady traffic flow at moderate speeds.	Yes		CTCs, Counties, and Cities
5.3	Reduce traffic congestion at major intersections	This measure implements a wide range of traffic control techniques designed to facilitate smooth, safe travel through intersections. These techniques include signalization, turn lanes or median dividers. The use of grade separations may also be appropriate for high volume or unusually configured intersections.	Yes		CTCs, Counties, and Cities
5.4	Site-specific transportation control measures	This measure could include geometric or traffic control improvements at specific congested intersections or at other substandard locations. Another example might be programming left turn signals at certain intersections to lag, rather than lead, the green time for through traffic.	Yes		CTCs, Counties, and Cities

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 5. Traffic Flow Improvement Programs That Achieve Emissions Reductions					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
5.5	Removal of on-street parking	Require all commercial/industrial development to design and implement off-street parking.	Yes		CTCs, Counties, and Cities
5.6	Reversible lanes	Implement reversible lanes on arterial streets to improve traffic flow where appropriate.	Yes		CTCs, Counties, and Cities
5.7	One-way streets	Redesignate streets (or portions of in downtown areas) as one-way to improve traffic flow.	Yes		CTCs, Counties, and Cities
5.8	On-Street parking restrictions	Restrict on-street parking where appropriate.	Yes		CTCs, Counties, and Cities
5.9	Bus pullouts in curbs for passenger loading	Provide bus pullouts in curbs, or queue jumper lanes for passenger loading and unloading.	Yes		CTCs, Counties, and Cities
5.10	Additional freeway service patrol	Operation of additional lane miles of new roving tow truck patrols to clear incidents and reduce delay on freeways during peak periods.	Yes		CTCs, CHP
5.11	Fewer stop signs, remove unwarranted and "political" stop signs and signals	Improve flow-through traffic by removing stop signs and signals. Potential downside in safety issues.	Yes		CTCs, Counties, and Cities
5.12	Ban left turns	Banning all left turns would stop the creation of bottlenecks although slightly increase travel distances.	No	No clear demonstration of air quality emissions benefits.	
5.13	Changeable lane assignments	Increase number of one-way lanes going in congested flow direction during peak traffic hours.	Yes		Caltrans, CTCs, Counties, and Cities
5.14	Adaptive traffic signals and signal timing	Self explanatory.	Yes		Counties, Counties, and Cites

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 5. Traffic Flow Improvement Programs That Achieve Emissions Reductions					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
5.15	Freeway bottleneck improvements (add lanes, construct shoulders, etc.)	Identify key freeway bottlenecks and take accelerated action to mitigate them.	Yes		Caltrans, SCAG
5.16	Minimize impact of construction on traveling public. Have contractors pay when lanes are closed as an incentive to keep lanes open.	Prohibit lane closures during peak hours, limit work to weekends and/or nights.	Yes		Caltrans
5.17	Internet provided road and route information	Reduce travel on highly congested roadways by providing accessible information on congestion and travel.	Yes		CTCs, Caltrans, Counties, Cities
5.18	Regional route marking systems to encourage underutilized capacity	Encourage travel on local roads and arterials by better route marking to show alternatives.	Yes		Caltrans, Counties, Cities
5.19	Congestion management field team to clear incidents	Self explanatory.	Yes		CTCs, CHP
5.20	Use dynamic message signs to direct/smooth speeds during incidents	Self explanatory.	Yes		Caltrans
5.21	Get real-time traffic information to trucking centers and rental car agencies	Reduce travel in congested areas by providing information directly to high volume travelers.	Yes		CTCs, Caltrans

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 5. Traffic Flow Improvement Programs That Achieve Emissions Reductions					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
5.22	55 mph speed limit during ozone season	Self explanatory	No	Reductions in freeway speeds are governed by California Vehicle Code 22354, which authorizes Caltrans to lower speeds after doing an engineering and traffic survey, which shows that the legislatively- set maximum speed of 65 mph, is more than is reasonable or safe. No consideration of emissions is contemplated under this statute. This measure is not feasible until the statute is changed.	
5.23	Require 40 mph speed limit on all facilities	Depends on area's emission factors.	No	The California Vehicle Code Sections 22357 and 22358 mandates a methodology for setting speed limits for local areas. This measure is not feasible until the statute is changed.	
5.24	Require lower speeds during peak periods	Self explanatory.	No	The California Vehicle Code Sections 22357 and 22358 mandates methodology for setting speed limits for local areas. This measure is not feasible until the statute is changed.	
5.25	On-street parking restrictions	Restrict on-street parking where appropriate.	Yes		State, Counties, and Cities

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 6. Fringe and Transportation Corridor Parking Facilities Serving Multiple Occupancy Vehicle Programs or Transit Service					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
6.1	Park-and-ride lots	Develop, design, and implement new park-and-ride facilities in locations where they are needed.	Yes		CTCs, Transit Operators, SCRRRA
6.2	Park-and-ride lots serving perimeter counties	Specific to a locality.	Yes		CTCs, Transit Operators, SCRRRA

Section 108 (f) 7. Programs to Limit or Restrict Vehicle Use in Downtown Areas or Other Areas of Emission Concentration Particularly During Periods of Peak Use					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
7.1	Off-peak goods movement	Restrict truck deliveries by time or place in order to minimize traffic congestion during peak periods.	Yes		PierPass A non-profit organization of marine terminal operators at the Ports of Los Angeles and Long Beach.
7.2	Truck restrictions during peak periods	Restrict truck travel during peak periods in order to minimize traffic congestion.	Yes		See Measure 7.1
7.3	Involve school districts to encourage walking/bicycling to school	Decrease vehicle emissions due to school trips by reducing these trips through education and out-reach programs.	Yes		School Districts

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 7. Programs to Limit or Restrict Vehicle Use in Downtown Areas or Other Areas of Emission Concentration Particularly During Periods of Peak Use					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
7.4	Adjust school hours so they do not coincide with peak traffic periods and ozone seasons	Measure to reduce travel during peak periods and ozone-contributing periods in the early morning.	No	School hours are dictated by many variables, including overcrowding and year-round schooling. This measure is not feasible.	
7.5	Area-wide tax for parking	Reduce driving by limiting parking through pricing measures.	Yes		Counties, Cities
7.6	Increase parking fees	Reduce driving by limiting parking through pricing measures.	No	Attorney General ruled AQMD lacks authority to implement this measure.	
7.7	Graduated pricing starting with highest in Central Business District	Charge the most for parking in the central business or other high volume areas in a city to discourage vehicle travel in these areas.	Yes		Market Driven
7.8	Buy parking lots and convert to other land use	Limit parking by converting available parking to other land uses to discourage driving.	Yes		Counties and Cities
7.9	Limit the number of parking spaces at commercial airlines to support mass transit	Reduce airport travel by limits on parking at airports.	No	Regulatory agencies do not have the legal authority to make local land use decisions. It is at the discretion of the regional or local airport authority to make local land use decisions pertaining to airports. Additionally, It is necessary to have significant mass transit available at airports before this measure can be implemented.	

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 7. Programs to Limit or Restrict Vehicle Use in Downtown Areas or Other Areas of Emission Concentration Particularly During Periods of Peak Use					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
7.10	No Central Business District (CBD) vehicles unless LEV or alt fuel or electric	Define high-use area and ticket any vehicles present unless they are low emitting, alternative fueled or electric.	No	The Legislature significantly reduced authority to implement indirect source control measures through revisions to the Health & Safety Code (40717.6, 40717.8, and 40717.9).	
7.11	Auto restricted zones	No vehicles allowed in certain areas where high emissions, congestion or contribution to ozone problems.	Yes		Counties and Cities
7.12	Incentives to increase density around transit centers	Lower travel by increasing residential and commercial density in areas near transit.	Yes		Counties and Cities
7.13	Land use/air quality guidelines	Guidelines for development that contributes to air quality goals.	Yes		ARB, AQMD, SCAG
7.14	Cash incentives to foster jobs/housing balance	Specific to locality – encouraged by California Clean Air Plan.	No	No dedicated source of funding for this measure.	
7.15	Trip reduction oriented development	Land use decisions that encourage trip reductions.	Yes		Counties, Cities, CTCs
7.16	Transit oriented development	Land use decisions that encourage walkable communities and multi-modal transit systems.	Yes		Counties, Cities, CTCs
7.17	Sustainable development	Land use decisions that create equitable standards of living to satisfy the basic needs of all peoples, all while taking the steps to avoid further environmental degradation.	Yes		Counties, Cities, CTCs

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 8. Programs For the Provision of All Forms of High-Occupancy, Shared-Ride Services					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
8.1*	Financial Incentives, Including Zero-Bus Fares	Provide financial incentives or other benefits, such as free or subsidized bus passes and cash payments for not driving, in lieu of parking spaces for employees who do not drive to the workplace.	Yes		AQMD, Employer
8.2	Internet ride matching services	Provide match-lists, route info, hours and contact information over the internet to assist individuals in joining or developing carpools.	Yes		CTCs, SCAG
8.3*	Preferential parking for carpoolers	Provide free, covered, near-building or similar incentives to carpoolers.	Yes		AQMD, Employer
8.4*	Credits and incentives for carpoolers	Self-explanatory – form depends on locality.	Yes		AQMD, Employer
8.5*	Employers provide vehicles to carpoolers for running errands or emergencies	Having vehicles available for workday errands makes it easier to go to work without one.	Yes		AQMD, Employer
8.6	Subscription services	Free van services to provide transportation for the elderly, handicapped or other individuals who have no access to transportation.	Yes		County, Employer
8.7	School car pools	Self explanatory and voluntary	No	Not economically feasible and insufficient resources available for implementation.	
8.8*	Guaranteed ride home	Self explanatory.	Yes		AQMD, Employer

* This measure relates to AQMD Rule 2202, On-Road Motor Vehicle Mitigation Options. Administered by AQMD, Rule 2202 provides a menu of options for employers in choosing how they will comply. Individual employers implement the mitigation option(s) that they have chosen.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 8. Programs For the Provision of All Forms of High-Occupancy, Shared-Ride Services					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
8.9	Transit Voucher Program	Transit vouchers for elderly and low income commuters.	Yes		CTCs, SCAG

Section 108 (f) 9. Programs to Limit Portions of Road Surfaces or Certain Sections of the Metropolitan Area to the Use of Non-Motorized Vehicles or Pedestrian Use, Both as to Time and Place					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
9.1	Establish Auto-Free Zones and pedestrian malls	Establish auto free zones and pedestrian malls where appropriate.	Yes		Counties and Cities
9.2	Encouragement of pedestrian travel	This measure involves encouraging the use of pedestrian travel as an alternative to automobile travel. Pedestrian travel is quite feasible for short shopping, business, or school trips.	Yes		CTCs, Counties, Cities, SCAG
9.3	Bicycle/Pedestrian Program	Fund high priority projects in countywide plans consistent with funding availability.	Yes		CTCs, Counties, and Cities
9.4	Close certain roads for use by non-motorized traffic	During special events, weekends, or certain times of the day, close some roads to all but non-motorized traffic.	Yes		Counties, and Cities

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 9. Programs to Limit Portions of Road Surfaces or Certain Sections of the Metropolitan Area to the Use of Non-Motorized Vehicles or Pedestrian Use, Both as to Time and Place					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
9.5	Encouragement of bicycle travel	Promotion of bicycle travel to reduce automobile use and improve air quality. Bikeway system planning, routes for inter-city bike trips to help bicyclists avoid other, less safe facilities. Another area for potential actions is the development and distribution of educational materials, regarding bicycle use and safety.	Yes		SCAG, CTCs, Counties, and Cities
9.6	Free bikes	Provide free bikes in the manner of Boulder, CO. Simple utilitarian bikes that can be used throughout the metro area and dropped off at destination for use by anyone desiring use.	No	Evidence suggests that bicycle theft is a problem in other programs and renders the measure technically and economically infeasible.	
9.7*	Cash rebates for bikes	Provide financial incentives to purchase bicycles and thereby encourage use.	Yes		Employer
9.8	Close streets for special events for use by bikes and pedestrians	Self Explanatory.	Yes		Counties and Cities
9.9	Use condemned dirt roads for bike trails	Self Explanatory.	No	Not applicable because there are no condemned dirt roads in the region.	

* This measure relates to AQMD Rule 2202, On-Road Motor Vehicle Mitigation Options. Administered by AQMD, Rule 2202 provides a menu of options for employers in choosing how they will comply. Individual employers implement the mitigation option(s) that they have chosen.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 10. Programs for Secure Bicycle Storage Facilities and Other Facilities, Including Bicycle Lanes, for the Convenience and Protection of Bicyclists, in Both Public and Private Areas					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
10.1*	Bike racks at work sites	Self Explanatory.	Yes		AQMD, Employer
10.2	Bike racks on buses	Bike racks would be placed on a to-be-determined number of buses to increase bicycle travel.	Yes		CTCs, Transit Operators, SCRRA
10.3	Regional bike parking	Bike Transit Centers	Yes		CTCs
10.4	Development of bicycle travel facilities	Encourages a variety of capital improvements to increase bicycle use. Off-street bikeways where high-speed roadways preclude safe bicycling. Clearly mark travel facilities with signs and provide adequate maintenance.	Yes		CTCs, Transit Operators, SCRRA
10.5	Expedite bicycle projects from RTP	Create bicycle and pedestrian master plan and build out at an accelerated rate to achieve benefits in time for attainment deadline.	Yes		SCAG, CTCs, Counties, Cities
10.6	Provide bike/pedestrian facilities safety patrols	Self Explanatory.	Yes		Counties and Cities
10.7	Inclusion of bicycle lanes on thoroughfare projects	Self Explanatory.	Yes		State, Counties, and Cities
10.8	Bicycle lanes on arterial and frontage roads	Self Explanatory.	Yes		State, Counties, and Cities
10.9	Bicycle route lighting	Self Explanatory.	Yes		State, Counties, Cities

* This measure relates to AQMD Rule 2202, On-Road Motor Vehicle Mitigation Options. Administered by AQMD, Rule 2202 provides a menu of options for employers in choosing how they will comply. Individual employers implement the mitigation option(s) that they have chosen.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 11. Programs to Control Extended Idling of Vehicles					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
11.1	Limit excessive car dealership vehicle starts	Require car dealers to limit the starting of vehicles for sale on their lot(s) to once every two weeks. Presently, a number of new and used car dealers start their vehicles daily to avoid battery failure and assure smooth start-ups for customer test drives.	No	This measure was investigated by the AQMD and it was determined that in contrast to colder climates where vehicles are started on a daily basis, vehicles in the South Coast started much less frequently. For this reason it was determined not to be technically feasible.	
11.2	Encourage limitations on vehicle idling	Encourage limitations to limit extended idling operations.	Yes		ARB
11.3	Turn off engines while stalled in traffic	Public outreach or police-enforced program.	No	This measure raises safety and congestion concerns. No clear demonstration of air quality emissions benefits.	
11.4	Outlaw idling in parking lots	Self-explanatory and police enforced program.	No	Enforcement of idle restrictions is a low priority for police relative to their other missions. The cost effectiveness of this measure has not been demonstrated. It is not economically feasible.	
11.5	Reduce idling at drive-throughs; ban drive-throughs	Mandate no idling or do not allow drive-through windows during ozone season.	No	No clear demonstration of air quality emissions benefits. This measure is not economically feasible.	

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 11. Programs to Control Extended Idling of Vehicles					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
11.6	Promote use of pony engines	Use special battery engines to keep air conditioning and other truck systems working while truck not in use.	Yes		ARB
11.7	Idle restrictions at airport curbsides	Self-explanatory and police enforced.	Yes		Airport authority
11.8	Truck Stop Electrification	Provide electric charging stations for at truck stops to power heating/AC units and other on-board equipment.	Yes		ARB

Section 108 (f) 12. Program to Reduce Motor Vehicle Emissions Consistent with Title II, Which Are Caused by Extreme Cold Start Conditions	
Not applicable. The definition of an "extreme cold start" specifies temperatures below 20 degrees Fahrenheit.	Not applicable in the South Coast - No extreme cold start conditions

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 13. Employer-sponsored programs to permit flexible work schedules					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
13.1*	Alternative work schedules	Enables workers to choose their own working hours within certain constraints. Flextime provides the opportunity for employees to use public transit, ridesharing, and other Nonmotorized transportation. A related strategy, staggered work hours, is designed to reduce congestion in the vicinity of the workplace. Alternative workweeks have been implemented extensively by large private and public employers.	Yes		AQMD, Employer
13.2*	Modifications of work schedules	Implement alternate work schedules that flex the scheduled shift time for employees. Encourage the use of flexible or staggered work hours to promote off-peak driving and accommodate the use of transit and carpooling.	Yes		AQMD, Employer
13.3*	Telecommunications-Telecommuting/Teleconferencing	Encourage the use of telecommuting-telecommuting/teleconferencing in place of motor vehicle use where appropriate.	Yes		AQMD, Employer

* This measure relates to AQMD Rule 2202, On-Road Motor Vehicle Mitigation Options. Administered by AQMD, Rule 2202 provides a menu of options for employers in choosing how they will comply. Individual employers implement the mitigation option(s) that they have chosen.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 14. Programs and Ordinances to facilitate Non-automotive travel, provision to and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
14.1	Areawide public awareness programs	This measure focuses on conducting ongoing public awareness programs throughout the year to provide the public with information on air pollution and encourage changes in driving behavior and transportation mode use.	Yes		AQMD
14.2	Special event controls	This measure would require new and existing owners/operators of the special event centers to reduce mobile source emissions generated by their events. A list of optional strategies would be available that reduce mobile source emissions. The definition of "special event center" could be developed through the rule development process.	Yes		Counties, Cities, Special Event Operators
14.3	Land Use/development alternatives	This measure includes encouraging land use patterns, which support public transit and other alternative modes of transportation. In general, this measure would also encourage land use patterns designed to reduce travel distances between related land uses	Yes		ARB, SCAG, AQMD, Counties, Cities
14.4	Voluntary No-Drive Day programs	Conduct voluntary No-Drive Day programs during the ozone season through media and employer based public awareness activities.	Yes		CTCs
14.5**	New Development Air Quality Impact Evaluation	Evaluate air quality impacts of new development and recommend or require mitigation for significant adverse impacts.	Yes		AQMD, Counties, Cities, CEQA Lead Agencies

** AQMD and SCAG recommend mitigation as commenting agencies on new development projects; cities and counties require mitigation under their discretionary authority as lead agency.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 14. Programs and Ordinances to facilitate Non-automotive travel, provision to and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
14.6	Transportation for Livable Communities (TLC)/Housing Incentive program	Program provides planning grants, technical assistance, and capital grants to help cities and Nonprofit agencies define and implement transportation projects that support community plans including increased housing near transit.	Yes		SCAG, State
14.7	Incentives to increase density around transit centers	Lower travel by increasing residential and commercial density in areas near transit.	Yes		Counties, Cities, CTCs
14.8	Incentives for cities with good development practices	Provide financial or other incentive to local cities that practice air quality-sensitive development.	Yes		Counties, Cities
14.9	Increase state gas tax	Self Explanatory.	No	Need state legislation.	
14.10	Pay-As-You-Drive Insurance	Self Explanatory.	No	Need state legislation. No clear demonstration of air quality emission benefits so does not advance attainment date..	

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 15. Programs for new construction and major reconstructions of paths, tracks or areas solely for the use by pedestrian or other Non-motorized means of transportation when commercially feasible and in the public interest					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
15.1*	Encouragement of pedestrian travel	Promote public awareness and use of walking as an alternative to the motor vehicle.	Yes		AQMD, SCAG, CTCs, Employer
15.2	Pedestrian and bicycle overpasses where safety dictates	Ongoing implementation as development occurs.	Yes		Counties, Cities

Section 108 (f) 16. Program to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
16.1	Counties assess ten dollar license plate fee to fund repair/replacement program for high-emitters	Self explanatory.	Yes		ARB, BAR**
16.2	Buy vehicles older than 1975	Self explanatory.	Yes		ARB, AQMD***
16.3	Demolish impounded vehicles that are high emitters	Self explanatory.	No	Not economically feasible.	

* This measure relates to AQMD Rule 2202, On-Road Motor Vehicle Mitigation Options. Administered by AQMD, Rule 2202 provides a menu of options for employers in choosing how they will comply. Individual employers implement the mitigation option(s) that they have chosen.

** Similar program administered with different funding source as part of smog check.

*** Voluntary car scrapping programs to generate credits.

Attachment B: 2012 South Coast PM2.5 AQMP Reasonably Available Control Measure (RACM) Analysis - TCMs

Section 108 (f) 16. Program to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks					
Measure #	Measure Title	Description	Has It Been Implemented	Reasoned Justification for Not Implementing Measure	Implementing Agency or Agencies
16.4	Do whatever is necessary to allow cities to remove the engines of high emitting vehicles (pre-1980) that are abandoned and to be auctioned	Self explanatory.	No	Not economically feasible.	
16.5	Accelerated retirement program	Identify high emitting vehicle age groups and develop a program to remove them from use.	Yes		ARB, AQMD

**DRAFT FINAL 2012 AQMP
APPENDIX V**

MODELING AND ATTAINMENT DEMONSTRATIONS

NOVEMBER 2012

**SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT
GOVERNING BOARD**

CHAIRMAN: WILLIAM A. BURKE, Ed.D.

MODELING OVERVIEW

Introduction

Modeling Methodology

Uncertainties Associated with the Technical Analysis

Document Organization

INTRODUCTION

This appendix to the Draft Final 2012 AQMP provides the details of the modeling attainment demonstrations presented in Chapter 5 of the main document. The federal Clean Air Act (CAA) sets forth specific requirements to use air quality simulation modeling techniques to estimate future air quality in areas that do not meet the air quality standards. This Draft Final 2012 AQMP provides the future year attainment demonstration for the 24-hour average PM_{2.5} standard and additional analyses to update future year projections of the annual PM_{2.5} and 8-hour ozone standards.

The South Coast Air Basin (Basin) is currently designated nonattainment for PM_{2.5}, ozone (8-hours), and PM₁₀. On April 28, 2010, CARB forwarded the District's request to U.S. EPA to redesignate the Basin as attainment for PM₁₀. Air quality monitoring data measured from 2005 through 2007 indicated that the standard had been achieved and that the Basin has not experienced any violations of the 24-hour average PM₁₀ standard, except during a few exceptional events. Future year projections of PM₁₀ provided in the 2007 AQMP and the updated attainment demonstration included in the redesignation request provide the basis for a PM₁₀ maintenance plan for the Basin. EPA's final approval of the redesignation request is currently pending.

The 2007 modeling attainment demonstrations served as an update of the 2003 AQMP ozone, PM₁₀ and carbon monoxide plans for the South Coast Air Basin and other portions of the Southeast Desert Modified Nonattainment Area that are under the District's jurisdiction and were submitted as part of the California State Implementation Plan (SIP). The Final 2007 AQMP provided attainment demonstrations for 8-hour ozone, PM_{2.5}, and PM₁₀. This plan provides the attainment demonstration to address the 2006 revision to the 24-hour PM_{2.5} standard which reduced the level from 65 µg/m³ to the current 35 µg/m³. This analysis reflects the updated baseline and future year emissions inventories, estimated revisions to the attainment demonstration methodology, new technical information and enhanced air quality modeling techniques, and the control strategy provided in Chapter 4 and Appendix IV of the Draft Final 2012 AQMP.

Note that the baseline adjustment deriving from emissions reductions from mobile source incentive programs is not yet reflected in the modeling results presented in this chapter. It is expected that controlled 24-hour PM_{2.5} design values will decrease approximately 0.2 - 0.3 µg/m³ when these adjustments are included in the

model, primarily associated with ambient ammonium nitrate reductions. The Final 2012 AQMP modeling results will fully reflect the impact of this baseline adjustment.

Background

The Basin is currently designated nonattainment for PM_{2.5}, and extreme nonattainment for ozone. The District's goal is to develop an integrated control strategy which: 1) ensures that ambient air quality standards for all criteria pollutants are met by the established deadlines in the federal Clean Air Act (CAA); and 2) achieves an expeditious rate of reduction towards the state air quality standards. The overall control strategy is designed so that efforts to achieve the standard for one criteria pollutant do not slow or counteract efforts to achieve the standard for another. A two-step modeling process, consistent with the approach used in the 2007 AQMP, has been conducted for the Draft Final 2012 AQMP. First, future year 24-hour average PM_{2.5} are simulated for 2014, 2017 and 2019 to determine the earliest possible date for attainment. (If attainment cannot be demonstrated by 2014, U.S. EPA can grant up to an additional 5-years to demonstrate attainment of the 24-hour standard. However, the length of the extension is contingent upon the earliest year beyond 2014 that attainment can be demonstrated implementing all feasible control measures).

Concurrently, simulations are also conducted to confirm that the annual average PM_{2.5} concentrations will meet the 15 µg/m³ standard by 2014, and demonstrate progress in following years. The update to the annual PM_{2.5} modeling is not intended to replace the approved modeling attainment demonstration submitted in the 2007 AQMP. The updated modeling is included to provide insight into the level of compliance with the current standard in future years, and provide a first glance at the impact that proposed revisions to lower the standard will have on attainment status. U.S. EPA recently proposed revisions to the federal annual PM_{2.5} standard that will lower the standard to a value between 12 and 13 µg/m³. While the exact attainment date has not been published, the proposed rule will likely provide 5 years after designation to demonstrate attainment of new the annual standard. As with the current 24-hour PM_{2.5} standard, U.S. EPA can grant up to an additional 5-years to demonstrate attainment of the annual standard. That would set an attainment date no later than 2023. The annual PM_{2.5} simulations presented in this section for model years beyond 2014 are included to demonstrate the continued progress towards meeting the range of the new federal standard by the early 2020's.

Finally, the future year 8-hour average ozone emissions control strategy builds upon the PM_{2.5} strategy to demonstrate attainment of the federal 8-hour average ozone standard in 2024. There is no federal requirement to update the current ozone attainment demonstration at this time; however an update to the 8-hour average ozone SIP that demonstrates attainment of the 75 ppb standard is scheduled to be submitted no later than December 2015. The deadline for the Basin to attain the 75 ppb standard is likely to be 2032, 8-years after the attainment date for the previous 80 ppb federal standard in 2024. It is critical to conduct preliminary analyses to assess the current control strategy given the extent of required emissions reductions needed to meet the 80 ppb standard in 2024.

Model Selection

During the development of the 2003 Plan, the District convened a panel of seven experts to independently review the regional air quality modeling conducted for ozone and PM₁₀. The consensus of the panel was for the District to move to more current state-of-the-art dispersion platforms and chemistry modules. At that time, the model selected for the 2007 AQMP ozone attainment demonstrations was the Comprehensive Air Quality Model with Extensions (CAMx) [Environ, 2002], using SAPRC99 chemistry. For PM_{2.5}, the 2007 AQMP used the CAMx “one atmosphere” approach which coupled CB-IV gas phased chemistry and a static two-mode particle size aerosol module as the particulate modeling platform. The CAMx “one atmosphere” chemistry approach better preserved mass consistency taking advantage of an advanced dispersion platform.

In the 2007 AQMP, CAMx coupled with the SAPRC99 chemistry was simulated to demonstrate attainment of the federal ozone standard. A total of 36 days were simulated covering 6 ozone episode periods from which 19 days meeting performance criteria were selected for inclusion in the attainment demonstration. Future year ozone projections were developed using the CAMx/SAPRC99 couple supported by MM5 meteorological data fields and day specific emissions inventories.

The 2007 AQMP PM_{2.5} attainment demonstration incorporated the CAMx/CB-IV chemistry and aerosol modules together with the MM5 meteorological fields. The PM_{2.5} analyses relied on average week day and weekend day emissions profiles that were adjusted for monthly averaged temperature and humidity. The annual and episodic PM_{2.5} demonstrations were based on 365 days of particulate simulation. It is important to note that PM_{2.5} and ozone attainment demonstrations were run

independently due to differences in the computational requirements resulting from separate modeling domains and definitions of vertical structure.

In keeping with the recommendations of the expert panel as well as the Scientific Technical Peer Modeling Review Committee, the Draft Final 2012 AQMP has continued to move forward to incorporate current state-of-the-art modeling platforms to conduct regional modeling analyses in support of the PM_{2.5} attainment demonstrations and ozone update. The Draft Final 2012 AQMP PM_{2.5} attainment demonstration has been developed using the U.S. EPA supported Community Multiscale Air Quality (CMAQ) (version 4.7.1) air quality modeling platform with SAPRC99 chemistry, and the Weather Research and Forecasting model (WRF) (version 3.3) meteorological fields. (Comprehensive descriptions of the CMAQ modeling system are provided by U.S. EPA at their SCRAM website: <http://www.epa.gov/scram001/>. Additional descriptions of the SAPRC99 chemistry module are provided at the UCR website: <http://www.engr.ucr.edu/~carter/SAPRC/>. Documentation of the NCAR WRF model is available from UCAR website: <http://www.wrf-model.org/>). Supporting PM_{2.5} and ozone simulations were also conducted using the most current, publicly available version of CAMx (Environ, Inc, version 5.3) which also used SAPRC99 chemistry and WRF meteorology. The model analyses were conducted on an expanded domain, with increased resolution in the vertical structure for a 4 x 4 km grid size.

MODELING METHODOLOGY

Design Values

EPA guidance recommends the use of multiple year averages of design values, where appropriate, to dampen the effects of single year anomalies to the air quality trend due to factors such as adverse or favorable meteorology or radical changes in the local emissions profile. The trend in the Basin 24-hour PM_{2.5} design values, determined from routinely monitored Federal Reference Monitoring (FRM), from 2001 through 2011 (Figure V-1-1) depicts sharp reductions in concentrations over the period. The 24-hour PM_{2.5} design value for 2001 was 76 µg/m³ while the 2008 design value (based on data from 2006, 2007 and 2008) is 53 µg/m³. Furthermore, the most current design value computed for 2011 has been reduced to 38 µg/m³. The annual PM_{2.5} design value has demonstrated a reduction of 13.6 µg/m³ over the 10-year period from 2001 through 2011. In each case, the trend in PM_{2.5} levels is steadily moving in the direction of air quality improvement.

The trend of Basin ozone design values is presented in Figure V-1-2. The design values have averaged a reduction of approximately three parts per billion over the 14-year period; however the most recent design value (107 PPB) continues to exceed the 1997 8-hour ozone standard by 34 percent and the 2006 ozone standard by 43 percent.

In its modeling guidance, U.S. EPA has recommended that a multiple year weighted design value be used in attainment demonstrations. It is reasonable to use a representative design value that is not fixed in a multiple year average that overly reflects data that are not consistent with the current air quality trend or unusual weather. The PM_{2.5} attainment demonstrations presented in the 2007 AQMP relied on 2005 design values based on monitoring data between 2003 and 2005. In general, the 2005 design value was more consistent with the monitoring data observed in 2004, the center year in the design value calculation. The 2007 AQMP attainment demonstrations were anchored to a 2005 emissions data set and particulate speciation profiles obtained from an extensive monitoring program conducted over the course of 2005. Had the 2006 PM_{2.5} data been available for inclusion in the analysis, the revised weighted annual design value centered around 2005 (including data from 2004 through 2006) would be 22.7 $\mu\text{g}/\text{m}^3$, essentially the same value as the 2005 design of 22.6 $\mu\text{g}/\text{m}^3$.

FIGURE V-1-1

South Coast Air Basin 24-Hour Average and Annual PM_{2.5} Design Values

(Each value represents the 3-year average of the highest annual average PM_{2.5} concentration).
The dotted lines represent 24-hr and annual standards, respectively.

FIGURE V-1-2

South Coast Air Basin 8-Hour Average Ozone Design Values
(Each value represents the 3-year average of the 4th highest 8-Hour Average Ozone concentration) standard line needs adjustment and explanation

The Draft Final 2012 AQMP relies on a set of 5-years of monitored particulate data centered on 2008, the base year selected for the emissions inventory development and the anchor year for the future year PM_{2.5} projections. In July, 2010, U.S. EPA proposed revisions to the PM_{2.5} 24-hour average modeling attainment demonstration guidance. In the 2007 AQMP attainment demonstrations, maximum quarterly concentrations equal to or less than the yearly 24-hour average design value were incorporated in the future year design projection. Since the 24-hour attainment demonstration used the 2005 design value, the future year design projection was based on 3-years of quarterly PM_{2.5} data observed from 2003 through 2005. A total of 12 quarterly design values were used in the projection of the 2015 attainment demonstration.

The new guidance suggests using 5-years of data, but instead of directly using quarterly calculated design values, the procedure requires the top eight daily PM_{2.5} concentrations days in each quarter to reconstruct the annual 98th percentile values. The logic in the analysis is twofold. First, by selecting the top eight values in each quarter, the 98th percentile concentration is guaranteed to be included in the calculation. Second, the analysis projects future year concentrations for each of the

32 days in a year (160 days over 5-years) to test the response of future year PM_{2.5} to the proposed control strategy. Since the 32 days in each year include different meteorological and particulate species profiles, it is expected that those individual days will respond independently to the projected the future year emissions profile and that a new distribution of PM_{2.5} concentrations will result. The methodology uses the projected air quality for the 32 days in each year to build a new annual 24-hour 98th percentile concentration, not necessarily occurring on the same day exhibiting the 98th percentile in the base year. The five years of projected 98th percentile concentrations are weighted to create a new future year 24-hour PM_{2.5} design value to test attainment of the standard. Overall, the process is more robust in that the analysis is examining the impact of control strategy implementation on 10 times the number of days, covering a wider variety of potential meteorology and emissions combinations.

It is important to note that the use of the quarterly design values for a 5-year period centered around 2008 were also used in the projection of the future year annual average PM_{2.5} concentrations. The revised PM_{2.5} guidance did not modify the procedures used to calculate the future year annual average PM_{2.5} concentrations. The future year design value reflects the weighted quarterly average concentration calculated from the projections of 5-years of days (20 quarters).

The weighted 2008 24-hour and annual PM_{2.5} 8-hour ozone design values for the Basin are presented in Chapters 5, 6, and 7 of this appendix, respectively.

Relative Response Factors and Future Year Design Values

To bridge the gap between air quality model output evaluation and applicability to the health based air quality standards, EPA guidance has proposed the use of relative response factors (RRF). The RRF concept was first used in the 2007 AQMP modeling attainment demonstrations. The RRF is simply a ratio of future year predicted air quality with the control strategy fully implemented to the simulated air quality in the base year. The mechanics of the attainment demonstration are pollutant and averaging period specific. For 24-hour PM_{2.5}, the top 10 percentile of modeled concentrations in each quarter of the simulation year are used to determine the quarterly RRF. For the annual average PM_{2.5}, the quarterly average RRFs are used for the future year projections. For the 8-hour average ozone simulations (to be further discussed in Chapter 10 of this document) the aggregated response of several

episode days to the implementation of the control strategy are used to develop an averaged RRF for projecting a future year design value. Simply stated, the future year design value is estimated by multiplying the non-dimensional RRF to the base year design value. Thus, the simulated improvement in air quality, based on multiple meteorological episodes, is translated to a simple metric that directly determines compliance of the standard. Equations V-1 and V-2 summarize the calculation.

Equation V-1.

$$\text{RRF} = \text{Future-Year Model Prediction} / \text{Base-Year Model Prediction}.$$

Equation V-2.

$$\text{Attainment Demonstration} = \text{RRF} \times \text{Design Value} \leq \text{Air Quality Standard}.$$

The modeling analyses described above use the RRF and design value approach to demonstrate future year attainment of the standards.

Regional Modeling

The Draft Final 2012 AQMP employs the CMAQ air quality modeling platform with SAPRC99 chemistry and WRF meteorology as the primary tool used to demonstrate future year attainment of the 24-hour average PM_{2.5} standard. Unlike the 2007 AQMP attainment demonstrations, PM_{2.5} and ozone were modeled jointly in one year-long simulation covering 366 days and 8784 hours. Predicted daily maximum values of 24-hour PM_{2.5} and 8-hour ozone were calculated from the respective running 24-hour and 8-hour average simulated concentrations.

The Draft Final 2012 AQMP modeling attainment demonstrations using the CMAQ platform were conducted using a vastly expanded modeling domain compared with the analysis conducted for the 2007 AQMP modeling attainment demonstration. The simulations were conducted using a Lambert Conformal grid projection where the western boundary of the domain was extended to 084 UTM, over 100 miles west of the ports of Los Angeles and Long Beach. The eastern boundary extended beyond the Colorado river, while the northern and southern boundaries of the domain extend to the San Joaquin Valley and the Northern portions of Mexico (3543 UTM). The grid size has been reduced from 5 x 5 kilometers to 4 x 4 kilometers, and the vertical

resolution has been increased to 18 layers. Figure V-1-1 depicts the modeling domain which includes a grid of 154 cells from west to east and 102 cells from south to north.

The final WRF simulated meteorological fields were generated for the identical domain, layer structure and grid size. The vertical structure of the modeling domain was increased to 18 layers after conducting several optimizing simulations. The WRF simulations were initialized from NCEP analyses and run for 4-day increments with 1-day spinup. Four dimensional data assimilation (FDDA) was conducted with vertical sounding and surface measurements. The base WRF simulation was simulated using a vertical structure that included 30 layers extending from the surface to 19 km. A systematic analysis of the impact of layer collapsing from 30 layers to a lesser number was conducted to optimize the number of levels that would best retain the WRF meteorological characterization yet provide enhanced resolution for the CMAQ air quality simulation.

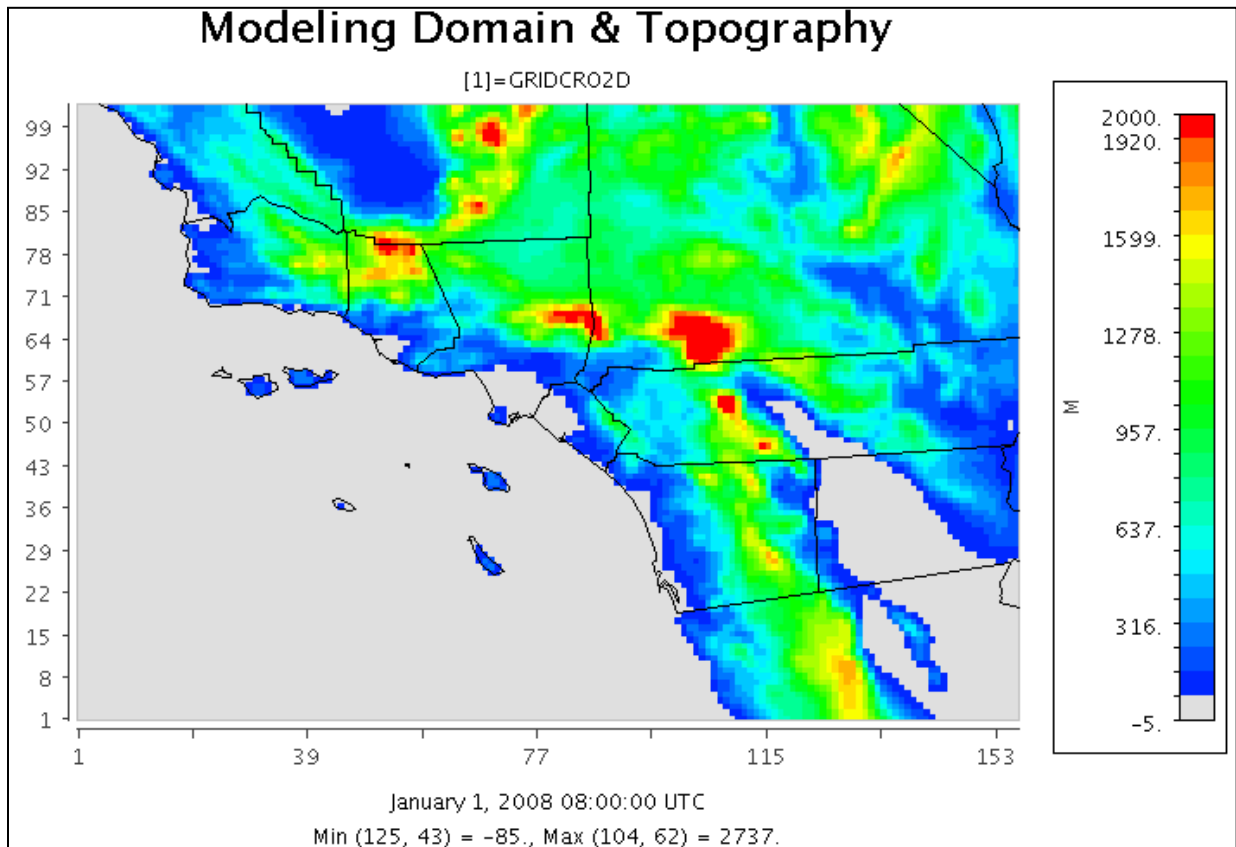

Figure V-1-3
2012 AQMP Regional Modeling Domain

Lateral and vertical boundary conditions were designated using an “U.S. EPA clean boundary profile.” The analysis tested the use of MOZART (Model of Ozone and Related Chemical Tracers, [Horowitz, L.W., et. Al., 2003]), global chemical simulation model output to specify the lateral and vertical boundary conditions used for the CMAQ modeling. Grid scale matching using MOZART at 60 x 60 km compared with the CMAQ 4 x 4 km grid introduced significant uncertainty to the boundary concentration profiles and subsequent regional simulations. Background simulations including the MOZART boundary specification while excluding anthropogenic emissions depicted large variations in background concentrations. Discussions conducted at the Scientific Technical Modeling Peer Review Advisory Group suggested that a finer scale MOZART output might dampen the variable impact to the regional air quality simulations. While this recommendation was acknowledged, the resources and time requirements needed to generate new global modeling output were prohibitive. The final simulations reverted to the more stable clean boundary assumption.

The atmospheric chemistry package used in the CMAQ simulations relied on SAPRC99 gas phase chemistry coupled with Acid Deposition Model (**RADM**) aqueous chemical mechanism, AE5 aerosol chemistry, and SOAP secondary organic chemistry with the Euler Backward Iterative (EBI) gas phase chemistry solver. The aerosol size distribution algorithm utilized a tri-modal distribution to represent nuclei, fine and coarse particles. The analysis was also conducted using the CAMx modeling platform using the “one atmosphere” approach comprised of the SAPRC99 gas phase chemistry and a static two-mode particle size aerosol module as the particulate modeling platform. Parallel testing was conducted to evaluate the CMAQ performance against CAMx and the results indicated that the two model/chemistry packages performance were similar. The CAMx results are provided as a component of the weight of evidence discussion and are presented as an attachment to this document.

Weight of Evidence

PM_{2.5} modeling guidance strongly recommends the use of corroborating evidence to support the future year attainment demonstration. The weight of evidence demonstration for the Draft Final 2012 AQMP includes brief discussions of the observed 24-hour PM_{2.5} levels, emissions trends, and future year PM_{2.5} predictions.

UNCERTAINTIES ASSOCIATED WITH THE TECHNICAL ANALYSIS

As with any plan update, there are uncertainties associated with the technical analysis. The following paragraphs describe the primary contributors to such uncertainties as well as some of the safeguards built in to the air quality planning process to manage and control such uncertainties.

Demographic and Growth Projections

Uncertainties exist in the demographic and growth projections for the future years. As projections are made to longer periods (i.e., over ten or more years), the uncertainty of the projections become greater. Examples of activities that may contribute to these types of uncertainties include the rate and the type of new sources locating in the Basin and their geographic distribution, future year residential construction, military base reuse and their air quality impact, and economic conditions.

Ambient Air Quality Monitoring Data

Generally, ambient air quality measurements are accurate to within plus or minus half of a unit of measurement (e.g., for ozone usually reported in units of parts-per-hundred million (pphm) would be accurate to within ± 0.5 pphm or ± 5 ppb). Due to this uncertainty and associated rounding conventions, the Basin's 8-hour attainment status based on ambient monitoring data would be achieved if all ozone monitors reported ozone concentration levels less than or equal to 84 ppb. Similar uncertainty is observed in particulate data measurements and laboratory analysis. For example, PM_{2.5} is comprised of six primary constituents (NH₄⁺, NO₃, SO₄⁻, OC, EC and crustal), as well as bonded water and total mass. Each of the primary species has individual uncertainty associated with the laboratory analysis procedure used to analyze concentration, the type of filter media to collect the sample and the total mass collected can be affected by minor changes in the volumetric flow that fall within the approved instrument calibration range. As a consequence, the sum of the total species may not add up to or may exceed the filter measured mass.

Emissions Inventory

While significant improvements have been realized in mobile source emissions models, uncertainties continue to exist in the mobile source emissions inventory estimates. EMFAC2011 on-road mobile source emission estimates have improved

with each new EMFAC release. On-road mobile source emissions have inherent uncertainties with the current methodologies used to estimate vehicle miles traveled, the impacts of fuel additives such as ethanol, and day-of-week diurnal profiles of traffic volume. Stationary (or point) source emission estimates have less associated uncertainties compared to area source emission estimates. Major stationary sources report emissions annually whereas minor stationary and area source emissions are, in general, estimated based on a top down approach that relies on production, usage or activity information. Area source emissions including paved road dust and fugitive dust have significant uncertainties in the estimation of particulate (PM_{2.5}) emissions due to the methodologies used for estimation, temporal loading and weather impacts.

Air Quality and Meteorological Models

The air quality models used for ozone and particulate air quality analysis are state-of-the-art, comprehensive 3-dimensional models that utilize 3-dimensional meteorological models, complex chemical mechanisms that accurately simulate ambient reactions of pollutants, and sophisticated numerical methods to solve complex mathematical equations that lead to the prediction of ambient air quality concentrations. While air quality models progressively became more sophisticated in employing improved chemical reaction modules that more accurately simulate the complex ambient chemical reaction mechanisms of the various pollutants, such improved modules are still based on limited experimental data which carry associated uncertainties. In order to predict ambient air quality concentrations, air quality models rely on the application of sophisticated numerical methods to solve complex mathematical equations that govern the highly complex physical and chemical processes that also have associated uncertainties. Layer averaging of model output reduces the sensitivity of the model to changing patterns in the vertical structure.

Are There Any Safeguards Against Uncertainties?

Yes. While completely eliminating uncertainties is an impossible task, there are a number of features and practices built into the air quality planning process that manage and control such uncertainties and preserve the integrity of an air quality management plan.

The concerns regarding uncertainties in the technical analysis are reduced with future AQMP revisions. Each AQMP revision employs the best available technical information. Under state law, the AQMP revision process is a dynamic process with

revisions occurring every three years. The AQMP revision represents a “snapshot in time” providing the progress achieved since the previous AQMP revision and efforts still needed in order to attain air quality standards.

Under the federal Clean Air Act, a state implementation plan (SIP) is prepared for each criteria pollutant. The SIP is not updated on a routine basis under the federal Clean Air Act. However, the federal Clean Air Act recognizes that uncertainties do exist and provides a safeguard if a nonattainment area does not meet an applicable milestone or attain federal air quality standards by their applicable dates. Contingency (or backstop) measures are required in the AQMP and must be developed into regulations such that they will take effect if a nonattainment area does not meet an applicable milestone or attainment date. In addition, federal sanctions may be imposed until an area meets applicable milestone targets.

In September 2006, U.S. EPA released an updated guidance document on the use of modeled results to demonstrate attainment of the federal ozone, PM_{2.5} and regional haze air quality standards. The guidance document recognized that there will be uncertainties with the modeling analysis and recommends supplemental analysis or weight of evidence discussion that corroborates the modeling attainment analysis where attainment is likely, even if the modeled results are inconclusive. Table V-1-1, is taken directly from the modeling guidance document to illustrate the value of supplemental analyses. Where possible, the U.S. EPA recommends that at least one “mid-course” review of air quality, emissions and modeled data be conducted. A second review, shortly before the attainment date, should be conducted also. Statistical trend analyses of monitored data can also provide support for assessing the likelihood for future year attainment. The District will undertake such actions at the appropriate times.

DOCUMENT ORGANIZATION

This document provides the federal attainment demonstration for 24-hour PM_{2.5} and additional analyses for annual PM_{2.5} and ozone. Chapter 2 provides the Modeling Protocol which summarizes the key elements that have been revised relative to the 2007 AQMP Modeling protocol. Chapter 3 provides a discussion of the meteorological modeling, including model performance and the impact of modifications to the land usage profiles. Chapter 4 provides a brief summary of the modeling emissions, including characterization of the daily/diurnal emissions profiles and OGV emissions. Chapter 5 provides the 24-hour PM_{2.5} attainment

demonstration meeting the 2014 attainment date. The chapter includes a characterization of the particulate species profile, discussion of the revised attainment demonstration methodology, and selected future year particulate impacts. A series of alternative emissions simulations are also presented to test the sensitivity of the proposed control strategy and to simulate the impacts of CEQA alternatives to the proposed plan. Chapter 6 provides an update to projected annual PM_{2.5} concentrations for the different future year emissions scenarios. Similarly, Chapter 7 will provide an update to the future year 8-hour ozone projections based on the CMAQ modeling analyses. The ozone analysis includes discussions of the representativeness of the 2008 meteorological year, base-year modeling performance, and projections of future year concentrations for baseline emissions as well as the implementation of the short-term control strategy. The ozone analysis will also provide updated isopleth analyses and a discussion of future year carrying capacities for the current and proposed ozone standards. As with the particulate analyses, weight of evidence discussions for ozone will be incorporated in Chapter 5. Chapter 8 provides a brief summary of the analysis.

Table V-1-2 lists the Attachments to this document. CAMx simulation analyses will be included as an attachment in the final document.

TABLE V-1-1

Guidelines for Weight of Evidence Determinations (U.S. EPA, 2006)

Results of Modeled Attainment Test			Supplemental Analyses
Ozone	Annual PM2.5	24-Hour PM2.5	
Future Design Value < 82 ppb, all monitoring sites	Future Design Value < 14.5 $\mu\text{g}/\text{m}^3$, all monitoring sites	Future Design Value < 62 $\mu\text{g}/\text{m}^3$, all monitoring sites	Basic supplemental analyses should be completed to confirm the outcome of the modeled attainment test
Future Design Value 82 - 87 ppb, at one or more sites/grid cells	Future Design Value 14.5 – 15.5 $\mu\text{g}/\text{m}^3$, at one or more sites/grid cells	Future Design Value 62 – 67 $\mu\text{g}/\text{m}^3$, at one or more sites/grid cells	A weight of evidence demonstration should be conducted to determine if aggregate supplemental analyses support the modeled attainment test
Future Design Value > 87 ppb, at one or more sites/grid cells	Future Design Value > 15.5 $\mu\text{g}/\text{m}^3$, at one or more sites/grid cells	Future Design Value > 67 $\mu\text{g}/\text{m}^3$, at one or more sites/grid cells	More qualitative results are less likely to support a conclusion differing from the outcome of the modeled attainment test.

CHAPTER 2

MODELING PROTOCOL

Background

Draft Final 2012 AQMP Modeling Protocol

BACKGROUND

One of the basic requirements of a modeling attainment demonstration is the development of a comprehensive modeling protocol that defines the scope of the regional modeling analyses including the attainment demonstration methodology, modeling and chemical platforms employed, emission inventories and physical characteristics of the domain simulated. The protocol also defines the methodology to assess model performance and the selection of the periods to be simulated. The 2007 AQMP provided a comprehensive discussion of the modeling protocol used as guidance in the development of the ozone, PM_{2.5}, and PM₁₀ modeling attainment demonstrations. The 2007 AQMP Modeling Protocol for Ozone and Particulate Matter Modeling in Support of the South Coast Air Quality Management District 2007 Air Quality Plan Update which is provided as Attachment-3 in Appendix V of that document serves as the foundation of the Draft Final 2012 AQMP modeling protocol. Modifications made to that protocol to address the requirements of the Draft Final 2012 AQMP attainment demonstrations are presented in this chapter.

The 2007 AQMP modeling protocol was finalized in May of 2006, prior to the release of U.S. EPA's "Guidance on the Use of Models and Other Analyses for Demonstrating Attainment of the Air Quality Goals for Ozone, PM_{2.5}, and Regional Haze." Together, the two guidance documents steered the development of the 2007 ozone and PM_{2.5} attainment demonstrations that have since been approved by U.S. EPA in the California SIP. In a letter dated June 28, 2011, U.S. EPA issued a revision to the modeling attainment demonstration methodology for 24-hour PM_{2.5} entitled "Update to the 24 Hour PM_{2.5} NAAQS Modeled Attainment Test." The revision outlined an overhaul to the structure of the attainment demonstration but did not propose any modifications to the underlying regional modeling analyses. The revised guidance was referenced in the updated 24-hour PM_{2.5} implementation guidance "Implementation Guidance for the 2006 24-Hour Fine Particle (PM_{2.5}) National Ambient Air Quality Standard" dated March 2, 2012.

DRAFT FINAL 2012 MODELING PROTOCOL

Table V-2-1 provides a side-by-side comparison of the Draft Final 2012 AQMP and 2007 AQMP modeling protocols. The differences between the modeling structure focus on a limited number of areas. In general, changes to emissions inventories,

future-year simulations and episode selection evaluation are specific to the base year selected and the level of the non-attainment designation. As such, these changes are expected to occur as part of each modeling update. The more substantive changes to the Draft Final 2012 AQMP protocol reflect the use of CMAQ as the primary modeling platform, WRF as the meteorological modeling platform and the changes to the size of the modeling region, vertical structure and grid size.

For this set of modeling analyses, CMAQ was selected as the primary dispersion modeling platform. One element in the decision to use CMAQ as the primary modeling platform was the fact that it was a publicly available model with numerous computational features and ongoing support in the modeling community. When evaluated for possible use in the attainment demonstration, both CMAQ and CAMx exhibited similar model performance in predicting 24-hour and annual PM_{2.5} levels. CMAQ however tended to predict monitored ozone concentrations with higher accuracy than the CAMx simulations. The migration to WRF from MM5 as the primary meteorology modeling tool follows its ongoing use as the mainstay in weather forecasting by the NWS, and its continuing development and support by NOAA and U.S. EPA.

The most significant changes to the modeling analyses in the Draft Final 2012 AQMP, compared with that defined in 2007 AQMP, occur in the size of the domain, reduced grid size and increased vertical structure. First and foremost, both PM_{2.5} and ozone will be simulated together using the same domain specification. The size of the domain has been expanded 65 km further west to attempt to incorporate clean boundaries into the modeling region, and 40 km to the south to include a greater percentage of northern Mexico emissions. Moreover, the grid size has been reduced from 5 x 5 km to 4 x 4 km. The reduced grid size better enabled the merging of the statewide emissions inventory which is set at the 4 km grid scale based on a Lambert Conformal projection. Table V-2-2 provides the characteristics of the modeling domain and Figure V-1-1 provides a comparison of the Draft Final 2012 AQMP modeling to the PM_{2.5} and ozone modeling domains simulated in the 2007 AQMP attainment demonstrations.

One clear benefit from the modification to the grid size was the smoother coupling of the meteorological modeling field development. The WRF analyses are initialized from NECP model output at 36 km grid level, then scaled downward based on a 3:1 scaling ratio to a 12 km grid inner-modeling domain covering most of California to set the regional meteorological boundary conditions for the 4 km grid modeling domain. Finally, the layer structure in the vertical domain for the modeling region has been increased to 18 layers from the previous 16 layers used for the 2007 AQMP ozone simulations, and from the eight layers used in the CAMx PM2.5 attainment demonstration simulations. Table V-2-3 provides a definition of the 18 layer vertical structure used in the air quality simulations. Also listed is the corresponding 30 layer structure of the WRF modeling vertical domain that matches the CMAQ domain at the top height.

By and large, the greatest impact to the modeling analyses resulting from the changes summarized in the protocol and in Table V-2-2 is the impact on the computational requirements to simulate a year's air quality. Since PM2.5 is common to all multi-pollutant analyses, the Draft Final 2012 AQMP simulations required 8 times the computational resources to complete a simulation compared with the 2007 AQMP PM2.5 attainment demonstration. Figure V-2-2 depicts a typical model simulation configuration of the computation system. A total of 15 servers and 200 CPU's were used in the simulations.

METEOROLOGICAL MODELING AND SENSITIVITY ANALYSES

Overview

Meteorological Modeling Configuration

Sensitivity Tests for Numerical Parameterization

Land Use Representation

Statistical Performance Evaluation

Sensitivity Tests

OVERVIEW

This chapter provides a description of the meteorological modeling that serves as the foundation of the Draft Final 2012 AQMP modeling analysis. As previously discussed, the Draft Final 2012 AQMP regional modeling relied on WRF model applications for 2008. The previous 2007 AQMP attainment demonstrations relied on National Center for Atmospheric Research (NCAR)/Penn State University (PSU) Mesoscale Model 5 (MM5) meteorological fields. The migration to WRF was based on two factors: First, WRF is the state-of-the-art meteorological forecast model used by the NWS and scientific community. It is under continual review and benefits from updates to critical modeling parameters. Second, MM5 is no-longer supported as a regional meteorological model although it is still posted at the U.S EPA SCRAM website. In moving to a new meteorological model, several analyses were conducted to compare WRF and MM5 meteorological fields to confirm the portability of the CMAQ modeling system to the new model. This chapter describes the meteorological model, the comparison between WRF and MM5, selection of the vertical stability parameterization, land use, and initial and boundary conditions used in the 24-hour PM_{2.5} attainment demonstration and companion annual PM₅ and 8-hour ozone updates.

METEOROLOGICAL MODELING CONFIGURATION

WRF was employed to produce meteorological fields for chemical transport models. The WRF is a 3-D prognostic model that solves the Navier-Stokes' equation, accounts for thermodynamics, conserves mass, and incorporates radiative energy transfer. WRF has been applied to a wide range of phenomena, such as regional climate, monsoons, cyclones, mesoscale fronts, land-sea breezes and mountain-valley circulations. Among two platforms available in WRF – Advanced Research WRF (ARW) and Non-hydrostatic Mesoscale Model (NMM), ARW was chosen for the current modeling analyses.

WRF simulations were conducted with three nested domains of which grid resolutions were 36, 12 and 4 km. The innermost domain has 163 by 115 grid points in abscissa and ordinate, respectively, which spans 652 km by 460 km in east-west and north-south directions, respectively. Geographically, the domain encompasses the greater Los Angeles and suburban areas, its surrounding mountains, and seas off the coast of the Basin as shown in Figure V-3-1. The relative locations and sizes of the three nested grids are given in Figure V-3-1 as well. The model employed 30 layers vertically with the lowest computational layer being approximately 18 m above ground level (agl) and

the top layer at 50 hPa. Note that default modeling top height is 50 hPa in WRF, while that in MM5 is 100 hPa. The National Center for Environmental Prediction (NCEP) North American Model (NAM) model output (Grid 212, 40 km grid spacing), together with vertical soundings and surface measurements, were used to compile initial and boundary values for the outermost domain as well as for the Four Dimensional Data Assimilation (FDDA) to WRF. The cloud radiation, and simple ice cloud physics were chosen for simulations after carefully considering various available options in WRF. Kain-Fritsch cumulus schemes were employed to the outer two domains, while no cumulus parameterization was used for the innermost domain. The selections of PBL and LSM schemes are discussed further in the next section.

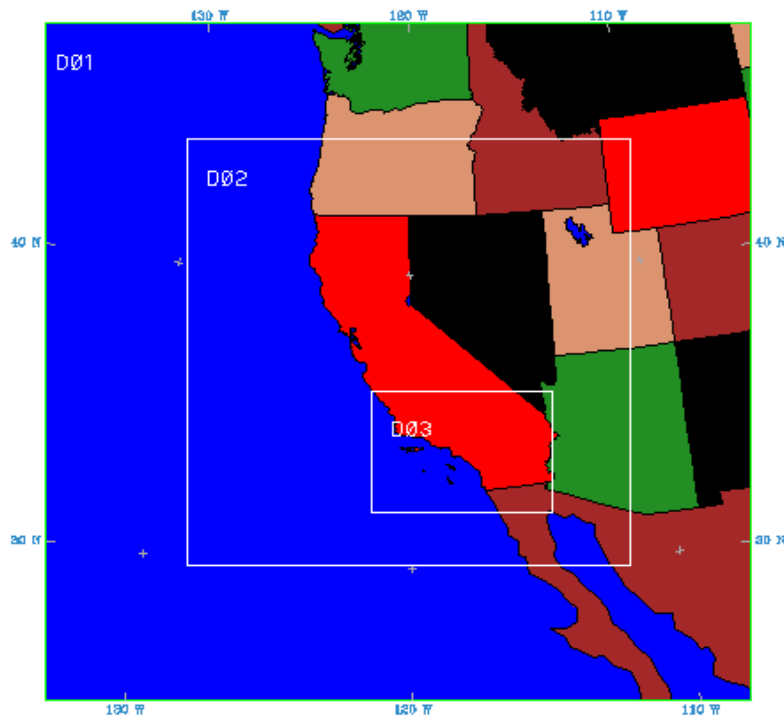

Figure V-3-1

Three nested modeling domains employed in the WRF simulations.

SENSITIVITY TESTS FOR NUMERICAL PARAMETERIZATIONS

Modeling Framework: MM5 vs. WRF

MM5 is a mesoscale meteorological model that has been applied to wide variety of phenomena and wide spectrum of geographical and climatological situations, until it was officially replaced by WRF. As evident from the development history, WRF shares a fundamental platform with MM5. MM5 uses terrain following sigma-coordinate, while WRF uses a vertical coordinate that is a hybrid of terrain following z^* and pressure coordinate. Both MM5 and WRF use a non-hydrostatic equation. A hydrostatic version of MM5 is available only till MM5 version 2. The 2007 AQMP used MM5 version 3 non-hydrostatic model, while a hybrid approach using objective analysis from observations was evaluated as a weight of evidence. WRF provides similar parameterizations to those available in MM5, and more new schemes have been developed and updated constantly. Among them, we chose numerical schemes that are similar to those available in MM5 framework. In terms of planetary boundary layer (PBL) schemes, the Yon-Sei University (YSU) scheme is a continuation, but the updated version of Medium Range Forecast (MRF) scheme and Mellor-Yamada-Janjic (MYJ) turbulent kinetic energy (TKE) scheme is a continuation of ETA meteorological forecast model scheme in MM5. The comparison presented in Figures V-3-2 and V-3-3 was simulated with MM5-MRF and WRF-YSU schemes. For continuity, the dates used in the simulation comparison were the primary 8-hour ozone modeling episodes evaluated in the 2007 AQMP.

Five-layer thermal diffusion scheme (also referred as ‘slab’) was used in both simulations. The two models were applied to the periods of July 14-18, August 2-8, and August 25-29, 2005, which were among highest ozone episodes that were identified and tested extensively in the 2007 AQMP. The statistical measures presented in the Figures are averages of the simulation period per episode. For example, the July simulations includes the period of July 14-18 so that it had 120 pair of hourly data, while the August episodes covered August 2-9 and 25-30 respectively. All three statistical measures should be zero in a perfect situation, therefore, the smaller the sum of the error measures were, the better the model performed against given observations. The locations of National Weather Services (NWS) METAR measurements used as the baseline for evaluations in addition to the District’s routine monitoring station data are given in Figure V-3-4.

Figure V-3-2

RMSE, gross error and bias of near surface wind speeds simulated with MM5 and WRF. MM5 is noted as MRF and WRF is noted as YSU, respectively, followed by the selected PBL scheme.

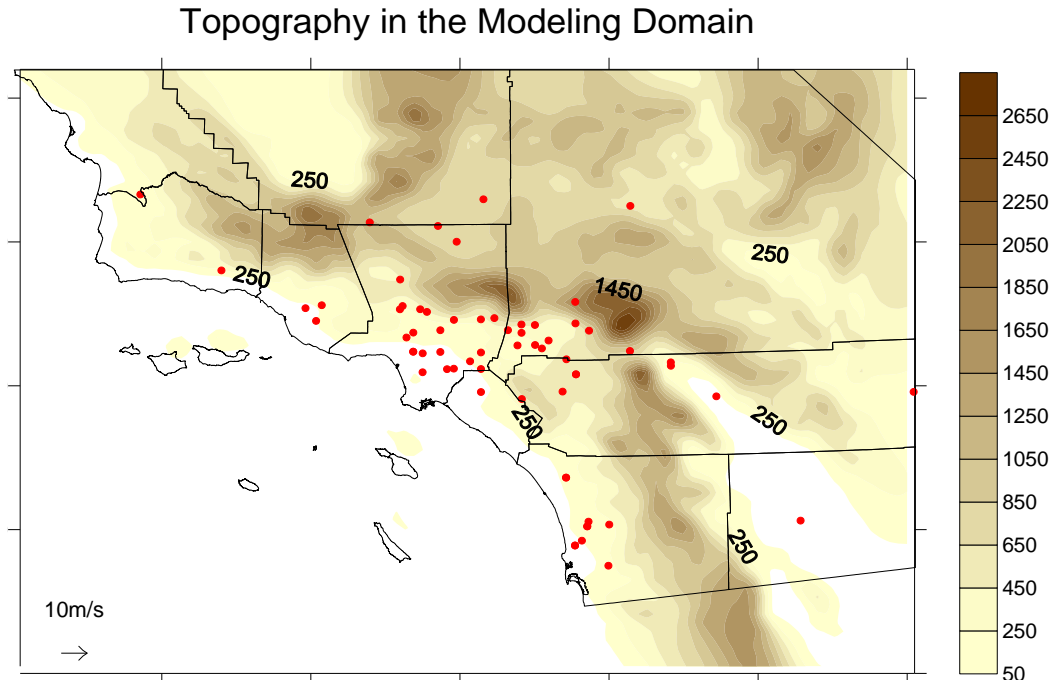

Figure V-3-3

RMSE, gross error and bias of near surface temperature simulated with MM5 and WRF. MM5 is noted as MRF and WRF is noted as YSU, respectively, followed by the selected PBL scheme.

**Figure V-3-4**

NWS METAR stations within the innermost modeling domain.

As evident in Figures V-3-2 and V-3-3, the performance varies from case to case. In terms of wind prediction, the MM5 model with the MRF PBL scheme outperformed in the July episode, while the opposite occurred in the August 2-8 case. The difference became more distinctive in the temperature predictions. This was partly caused by the fact that a scalar variable responds to a mixing scheme more directly than a vector variable which is a combination of complex force functions. WRF represented with the YSU scheme showed far smaller errors in the latter August case, yet, it showed almost 20% larger error in the early August case. This result suggested that, even though modeling performance varies from case to case, no systematic bias existed in WRF or MM5 simulations applied in Southern California.

PBL Parameterization

WRF, like its predecessor MM5, is a community model for which source code is open to the general public such that improvements to an existing scheme or a new scheme are constantly introduced. This leads to multiple options for physical processes, dynamics, and numerical solutions. WRF version 3.3 provides 11 schemes for the PBL and four different Land Surface Models (LSM's) for application with air quality models. Each scheme has advantages and disadvantages in simulating specific phenomenon, weather

conditions and geographic regions. In addition to numerical schemes, another question is the level of data assimilation to be conducted in the retrospective modeling. Four dimensional data assimilation is a common tool to enhance modeling performance.

It has to be kept in mind that the observations used in the data assimilation should not be used to evaluate the performance of the modeling to avoid auto-correlation with the data of which signal is already embedded in the modeled field. Also, measurement data is not free of error. Different monitoring networks have different measurement protocols that include different measurement heights, averaging time periods, time stamps, etc. Given that data is highly sensitive to measurement height, especially in the surface layer, special attention is required to prepare and use surface measurements. At the same time, while data assimilation generally improves modeling performance, a strong nudging is undesirable since the nudging term is not part of fundamental governing equations and therefore, it introduces imbalance in the physics and dynamics fields.

Therefore, considering the complexity and importance of the modeling configuration, we conducted a series of sensitivity tests to optimize the configuration for the Basin. The tests included the performance of numerical parameterizations, the level of data assimilation, and the validity of measurements to evaluate the modeling performances. In terms of numerical schemes, we primarily focused on PBL and LSM, given that the majority of emissions and related air pollution episodes occur below the atmospheric boundary layer. The PBL schemes tested in this study were YSU and Mellor-Yamada-Janjic (MYJ) schemes from WRF and the Blackadar scheme from MM5. The MRF/YSU scheme has 1st order closure with a non-local mixing term to accommodate large eddies developed during convective periods (Hong and Pan, 1996). During the nocturnal stable period, the YSU scheme goes back to the local approach using traditional K-theory.

MYJ has the parameterization of turbulence for both the PBL and the free atmosphere that is represented as a nonsingular implementation of the Mellor-Yamada Level 2.5 turbulence closure model. The TKE production/dissipation differential equation is solved iteratively, and the empirical constants have been revised based on Janjic (1994, 2002). A TKE based scheme has an advantage of having the explicitly predicted TKE, which is later utilized in retrieving boundary layer depth and formulating the effects of urban morphology.

Blackadar is a non-local mixing scheme that quantifies the vertical eddy fluxes of heat, moisture, and momentum using a hybrid non-local and first-order closure. For nocturnal periods, wherein the atmospheric stratification is usually stable or at most marginally

unstable, a first-order closure is used; here the eddy transfer coefficient K is a function of the Richardson number. For the free convection regime, the vertical convective transfer of heat, moisture and momentum is not determined by local gradients, but by the thermal structure of the whole mixed layer and the surface heat flux. Accordingly, the vertical exchanges are realized between the lowest layer and each level of the mixed layer, instead of between adjacent layers as assumed in the K -theory. The mixing intensity is defined as the fraction of mass exchanged per unit time between the surface layer and other PBL layers. It is directly related to the heat flux at the top of the surface layer and the vertically integrated potential temperature difference between the surface layer and the top of the mixed layer (Blackadar 1979; Zhang and Anthes 1982) .

The performances of PBL schemes were compared against METAR surface meteorological measurements at the site depicted in Figure V-3-4. As discussed in the previous section, YSU is the continuation of MRF of the MM5 model and MYJ is a successor of ETA scheme available in MM5. Blackadar scheme showed the least amount of gross error and RMSE in wind speed predictions. No significant difference existed among the other PBL schemes (Figure V-3-5). For temperature prediction, the ETA scheme showed inferior performance as denoted by the largest errors (Figure V-3-5b). The two WRF schemes – non-local K -theory (YSU) and the local TKE scheme (MYJ) essentially yielded the same result. Yet, considering low computational cost of the YSU scheme and discontinuation of Blackadar scheme in WRF, YSU was chosen as a default PBL scheme for the current attainment demonstration.

Land Surface Model

Three land surface models (LSM) were considered for WRF modeling: the five-layer thermal diffusion scheme ('slab' model), and the Noah and Pleim-Xiu schemes. The slab model is the simplest among the three. It calculates soil temperature as a result of thermal diffusion between layers, which are defined at the depths of 0.01, 0.02, 0.04, 0.08, and 0.16 m with the deepest layer being a fixed substrate. The Noah scheme predicts the soil temperature and moisture prognostically in four layers (Chen and Dudhia, 2001).

Figure V-3-5

Gross errors and RMSE's of (a) 10 m wind and (b) 2 m temperature from different PBL parameterizations applied to 2005 July Ozone episode. The errors are averages over the entire simulation period and monitoring stations.

By comparison to the effect of using different PBL schemes, modifications to the LSM caused significant responses in near surface variables. First, wind was generally over-predicted during the daytime and under-predicted during the nighttime. The difference between the two schemes was signified during the nocturnal stable period, which occurred in temperature predictions as well. As for wind, the Noah showed a better agreement with observations (Figure V-3-6a), while temperature prediction was worse (Figure V-3-6b). The 5-layer slab model agreed better with the measurements, as evident in the warmer surface temperature fields and the convective boundary layer predicted to be deeper in the Noah scheme (Figure V-3-6c).

Figure V-3-6a

Time series of Basin-wide averaged wind speeds simulated with five-layer thermal diffusion (referred as ‘slab’ in the inset) and Noah land surface scheme for July 14-17, 2005.

Figure V-3-6b

Time series of Basin-wide averaged temperature simulated with five-layer thermal diffusion (referred as 'slab' in the inset) and Noah land surface scheme for July 14-17, 2005.

Figure V-3-6c

Time series of Basin-wide averaged mixed layer depth simulated with five-layer thermal diffusion (referred as 'slab' in the inset) and Noah land surface scheme for July 14-17, 2005.

Considering the notable performance differences in the land surface schemes, the choice of LSM was inconclusive since the one that performed better with respect to winds showed larger deviations in temperature. Therefore, we applied the two meteorological fields to the chemical transport model, CMAQ, to evaluate the effects on dispersion. The relatively inert characteristics of carbon monoxide (CO) make it suitable to evaluate transport only. CO concentrations predicted by CMAQ with two different meteorological fields were compared (Figure V-3-7). While differences existed in meteorological fields, the impact on dispersion was relatively small. For a six-day period from July 14 to July 19, 2005, the two schemes showed almost equivalent performance with the only exceptions in the high value range. The slab model predicted higher concentrations, which was, in part, attributed to the shallow mixing in the model relative to the Noah scheme.

Figure V-3-7

Scatter plot of 1-hour CO concentrations simulated with the slab and the Noah scheme over the period of July 14-19, 2005.

Initial Guess Field

Global Forecast System (GFS) and North American Model (NAM), both widely used operational weather forecast models were evaluated to be used as initial guess fields for WRF. We used WRF and subsequent chemical transport modeling in the retrospective mode in the attainment demonstrations such that 3-D analysis fields were available. Therefore, analysis fields were chosen over direct forecast model output, unless a block of missing data occurred. In such case, forecast fields were used to replace the gap. The analysis fields were compiled to be used as the initial value, the lateral boundary value and 3-D analysis nudging fields. In our application, the NAM provided fields compared well with the GFS fields (Figure 8). Given the fact that synoptic forcing becomes more important during winter months than in summer in Southern California, the same experiments were repeated for a month of December 2008. The performance of the two tests was essentially identical, so the NAM analysis field was selected as the primary initial guess field.

LAND USE REPRESENTATION

The land use databases available in WRF are the U.S. Geological Society (USGS) default and the Moderate Resolution Imaging Spectroradiometer (MODIS) satellite based dataset. The USGS dataset has been the default dataset for mesoscale modeling for MM5, a predecessor to WRF. While it is a ready-to-use off-the shelf database, some data representations are several-decades old and consequently do not reflect changes in the areas that have experienced rapid development in recent years. The South Coast Air Basin, especially in parts of Riverside, San Bernardino and the San Fernando Valley areas, have experienced rapid development in the last decade that turned shrub and grassland into suburban housing units and impervious land cover. Accordingly, the location and extent of urban representation is often inaccurate in the Basin. Figure V-3-9 presents the land use distribution in the innermost modeling domain. The urban category represented in dark red is confined to near downtown Los Angeles and appears at a few more spots in Orange, Riverside and San Bernardino Counties.

The majority of open space depicted in the USGS data base between urbanized Los Angeles and Riverside counties has been presented as land use category 7, 8, and 9 which are, respectively, grass, shrub, and mixed shrub/grassland (Table V-3-1). Comparing with land cover retrieved from USGS Land Use Land Cover database 2001 (Figure V-3-10), medium and low intensity developed categories identified in the recent database almost did not exist in the USGS default data. These changes in the recent years are further evident in Figure V-3-11, which are retrieved from NOAA southern coastal land cover land use (2000).

The satellite based dataset provides the most up-to-date land use representation which reflects the recent changes discussed above. The MODIS based land use given in Figure V-3-12 shows an expanded size and shape of urban use compared to Figure V-3-9. Table V-3-2 provides the MODIS index legend. Yet, while the shape and location of “urban” built-up area differs between the satellite-based and USGS dataset, both provide only a single category that represents urban built-up areas for use in the in WRF modeling. The single category specification of urban land use may not adequately characterize the diversity that exists in the “urban” area, ranging from high rises in downtown commercial districts to single story houses in suburban residential areas. According to Grimmond and Oke (1999), the surface roughness length in a residential neighborhood in San Gabriel is approximately 7 m, while that of a metropolitan downtown area in Vancouver is approximately 20 m. The surface roughness length assigned to “urban” in default WRF model is 0.8 m, which is valid only in an area in

which building height is approximately 8 m, essentially the height of a two- to three-story building.

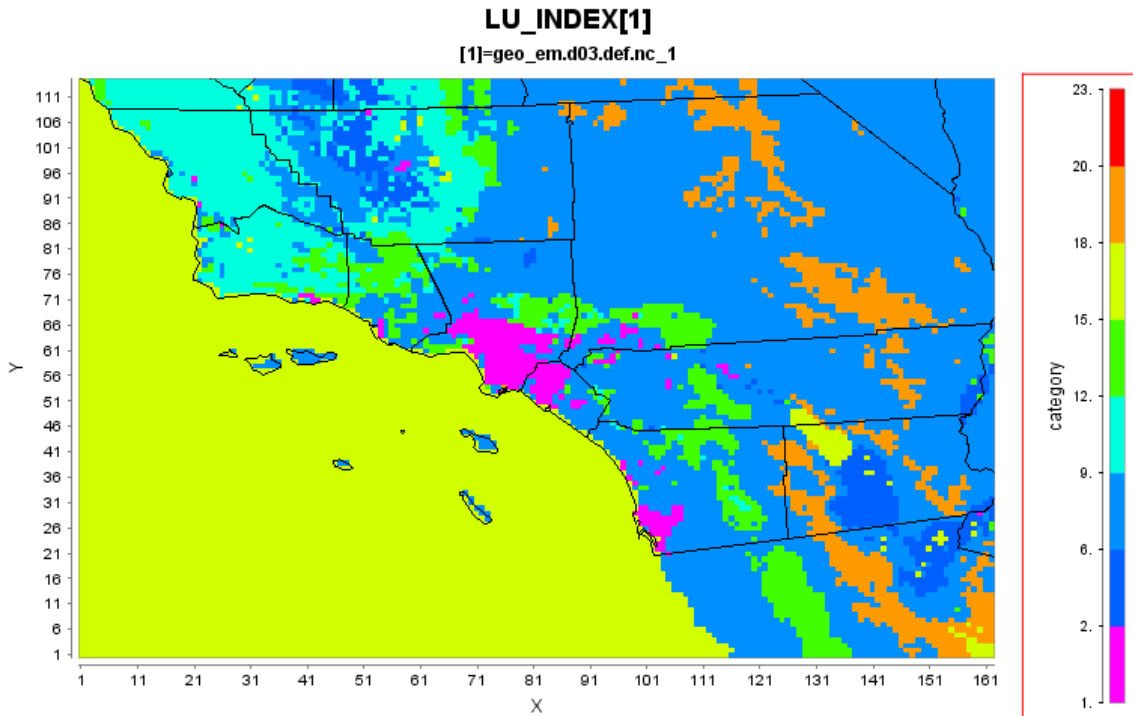

Figure V-3-9

Land use distribution based on USGS 24 category.

(The legend index is given in Table V-3-1).

This is hardly applicable to a downtown high rise district or a suburban residential neighborhood. Therefore, a need was recognized to introduce a new category that distinguishes suburban neighborhood from downtown commercial districts. The Draft Final 2012 AQMP introduced a new category, “suburban” to reduce the gap between the highly impervious commercial area and a suburban housing neighborhood that has altered surface energy balance by artificially introducing irrigation and imperviousness. The ‘urban’ category was assigned with a higher surface roughness length of 1.5 m instead of the default 0.8 m to better characterize the impacts of taller buildings (e.g., high rise skyscrapers) in a commercial district. The ‘suburban’ category was assigned a 0.7 m roughness length considering most suburban housing is single to double story. The location and extent of the new suburban category is depicted in Figure V-3-13.

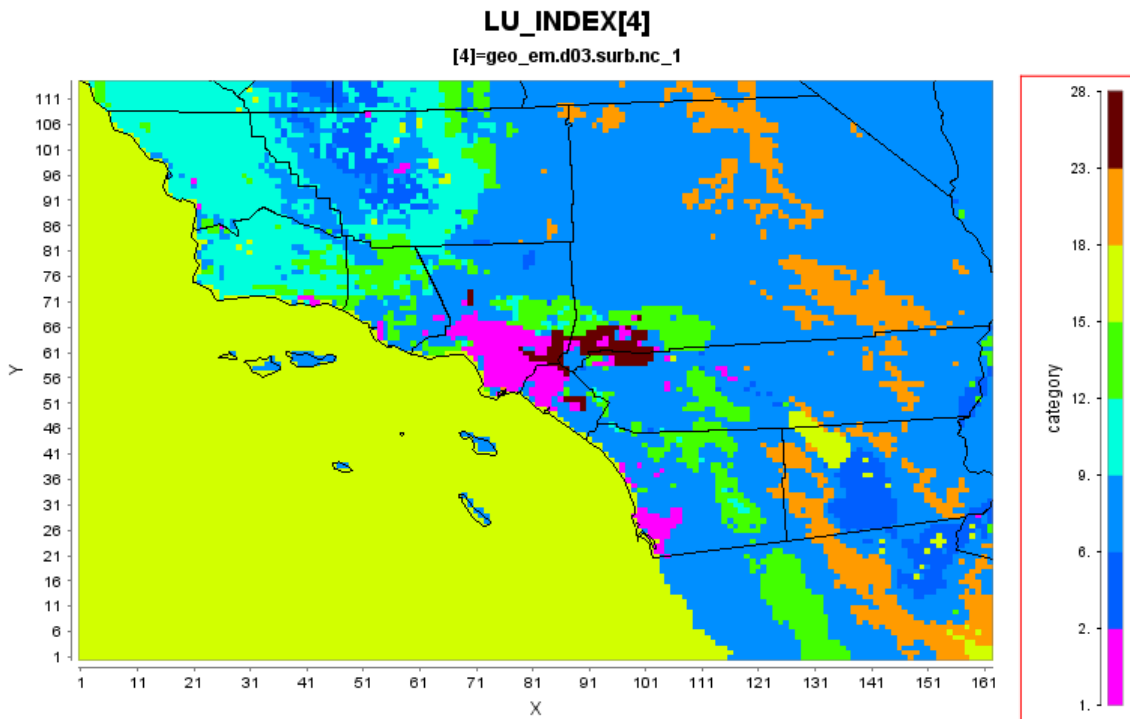

Figure V-3-13

USGS 24 land use category with added suburban category which was marked in dark brown color

In general, the updated land use showed better agreement with observations (Figure V-3-14). Over-prediction of wind was evident during the daytime when the slab model was used with the USGS default land use. This was significantly improved with the updated suburban land use. Neither temperature nor PBL show as large an improvement as seen in the winds. Compared to the Noah land surface model, the slab model showed weaker wind speed, lower temperature and consequently lower mixed layer depth during the daytime, which was consistent to the discussions presented in the previous section and Figure V-3-6. The difference between the two Noah simulations – one with the default USGS and the other with MODIS data was induced by land use difference. The expanded urban category in the MODIS based data exerted larger amount of surface friction which resulted in weaker wind speed. This effect occurred in the slab model with suburban simulation, as well. The Noah-MODIS was distinctively differently in nocturnal temperature. The Noah-MODIS simulated warmer nocturnal condition, which is partly due to the urban heat island effect. Interestingly, this nocturnal warm temperature did not agree well with measurements. Such warmer nocturnal temperatures did not exist in the slab-suburban run. The discrepancy between the simulations appears

to have resulted more from the numerical scheme (Noah vs. slab) selected rather than land use changes. Overall, the slab model outperformed Noah scheme.

STATISTICAL PERFORMANCE EVALUATION

A set of statistical variables were generated using the METSTAT software to evaluate the WRF modeling performance quantitatively. The list of statistical parameters included bias, gross error and root mean square error and the Index of Agreement (IOA). The IOA was calculated following the approach of Willmont (1981). This metric condenses all the differences between model estimates and observations within a given analysis region and for a given time period (hourly and daily) into one statistical quantity. It is the ratio of the total RMSE to the sum of two differences – between each prediction and the observed mean, and each observation and the observed mean. The index of agreement has a theoretical range of 0 to 1; with a score of 1 suggesting perfect agreement.

The graphical presentation of the WRF performance evaluation for the month of June 2008 is depicted in Figure V-3-15. Shown in the figure are bias, RMSE and index of agreement for near surface wind, temperature and water vapor mixing ratio. Briefly, temperature prediction accuracy was high with an IOA greater than 0.9. The wind speed bias was nominally directed towards lower predicted speeds with a mean IOA on the order of 0.7. Wind direction was reasonably captured on the majority of days with bias falling within 15-30 degrees on average. The WRF humidity simulations depicted a

tendency to overestimate vapor content with a moderate degree of diurnal variability. The humidity IOA averaged approximately 0.5 for the June period.

The METSTAT WRF evaluation compares well to the MM5 meteorological fields generated for the 2007 AQMP attainment demonstrations. In general average IOA estimates are slightly higher for the Draft Final 2012 AQMP WRF simulation. Gross error in the temperature prediction is approximately half of the 2007 MM5 estimates and wind speed error is approximately the same, but with the WRF tendency to be slightly under-predicted where the MM5 simulations were over-estimated. Both models exhibited IOAs of approximately 0.5 for the prediction of water vapor (absolute humidity).

Overall, the daily WRF simulation for 2008 provided representative meteorological fields that well characterized the observed conditions. These fields were used directly in the CMAQ joint particulate and ozone simulations. The fall and winter month's graphical and statistical meteorological characterization of the wind, temperature and humidity fields are presented in Attachment 1 to this document.

SENSITIVITY TESTS

A series of sensitivity tests were conducted to ensure the best performance of CMAQ. They include an inter-comparison of modeling platforms, the effect of lateral boundary values, vertical computational layer collapsing, the performance of vertical mixing schemes, and mass conservation. Among them, given the significance of the tests, the modeling platform inter-comparison and the effect of lateral boundary values are discussed here in detail.

Modeling Platform Inter-Comparison: CMAQ vs. CAMx

Comprehensive Air Quality Model with extensions (CAMx), including its predecessor Urban Airshed Model (UAM) has been applied to many air pollution episodes in California and has demonstrated its capability as a tool for attainment demonstration successfully. The District employed CAMx for the attainment demonstration in the 2007 AQMP. On the contrary, CMAQ has not been used for a regulatory purpose in the state of California nor in the Basin before. Still, it has been widely applied in other states in a regulatory context. Its large user community enables a robust evaluation of existing schemes and a fast adaption of newly developed parameterizations in the CMAQ framework. In this context, we intended to ensure that CMAQ provides the performance equal to or better than the one demonstrated in the 2007 AQMP. The options used in CMAQ were SAPRC99 chemical mechanism, Euler Backward Iterative (EBI) chemical solver, aero5 aerosol module, Piecewise Parabolic Method (PPM) advection scheme in both horizontal and vertical direction, and Asymmetric Convective Model version-2 (ACM2) vertical diffusion scheme. CAMx was configured to have the same chemical mechanism, chemistry solver, and advection and diffusion schemes.

The maximum 8-hour ozone recorded during the period from June 1st to August 31st of 2008 was 131 ppb recorded at Crestline (Figure V-3-16). The basin-wide maximum concentrations typically occur at Crestline, while Santa Clarita, Glendora, and San Bernardino valleys supplant Crestline as the maximum station when meteorological conditions favor it. In general, CMAQ reproduced the day-to-day variation reasonably well except for a few days at the end of June and the beginning of July in which a large high bias was evident. (CMAQ ozone simulation performance is discussed at length in Chapter 7). These high bias cases are further discussed in the following section. Comparing the two models, CAMx showed significantly lower predictions over the entire period. The bias was distinctive throughout the Basin as well, though the bias tended to increase in the eastern Basin. The Crestline site showed over 20 ppb differences at times, while the difference was rarely over 20 ppb at the Anaheim

location. Subsequent analysis indicated no involvement of systematic or nonsystematic errors in the input data and modeling configurations. In terms of performance statistics, CMAQ yielded better agreement with observations.

Figure V-3-16

Basin-wide maximum 8-hr ozone during the period of June 1 to August 31, 2008.

Lateral Boundary Values

Given the importance of lateral boundary values and the uncertainties associated with them, a set of lateral boundary values were tested using CMAQ. They were (1) global chemical model results, (2) U.S. EPA clean boundary values, and (3) climatological profiles retrieved from a special measurement campaign conducted in the Basin. Global chemical transport models, such as the Model for Ozone and Related chemical Tracers (MOZART), GEOS-Chem, Regional Air Quality Modeling System (RAQMS), are increasing in their use to drive regional air quality model simulation. Among them, MOZART was used in the current study due to the availability of its output for the modeling year 2008 and accessibility to its interface processor that converts the MOZART output to CMAQ chemical species and format. The clean boundary values were the same ones employed in the 2007 AQMP. The details were provided in Table V-4-7, Appendix V of the 2007 AQMP (SCAQMD, 2007). Aircraft measurements

were taken during a campaign conducted covering periods of 2009 and 2010 along the coast of Southern California, extending offshore out to 100 miles over the ocean. The campaign was designed to have approximately two flights per month; the data were compiled into a climatological profile of ozone and photochemical oxidants (Baxter et al, 2010).

The boundary values retrieved from MOZART are illustrated in Figures V-3-17 through V-3-19. The values were averaged along the northern, southern, eastern and western perimeters of the modeling domain to characterize the general behavior of MOZART along the lateral boundaries. Among the four sides, the east boundary showed the highest concentrations which reflect anthropogenic emissions from the Basin. The vertical variation of ozone set the lowest values in the upper boundary layer, gradually increasing in concentration with height to a maximum concentration at the model top layer. Note that the model top layer is 50 hPa (approximately 20 km) in the lower stratospheric ozone layer. CO and NO₂ had the highest concentration within the boundary layer due to anthropogenic emissions at the ground level.

Through the first 10-layers, the U.S. EPA clean boundary ozone concentration split the MOZART extracted west and east values, while CO and NO₂ from the clean boundary were higher than the MOZART. The climatological profiles compiled from aircraft measurements are presented in Figure V-3-20. A layer of high ozone exists around 600 m above ground level, which corresponded to the height of the sea breeze return flow. The return flow contained high levels of photochemical oxidants that were produced in the Basin during the daytime. This air mass, like the residual layer, stayed inert due to decoupling from surface emissions. This mechanism resulted in the high ozone peak aloft above the marine layer. Easterly winds measured by a radar wind profiler supported a multiple layer structure and the location of the return flow (Baxter et al, 2010). Note that the profile was taken at an Oxnard airport which is located by the shore. Figure V-3-20 suggested that seasonal variation from month to month was evident, but not significant. Therefore, the average profile for the period of May through September was selected and digitized into the modeling grids (Figure V-3-21).

The differences among the lateral boundary values were the largest in the free atmosphere and geographically near the boundaries. Figure V-3-22 illustrates the large differences aloft and the downward mixing to the surface level. The influence of ozone fumigation to ground level near the center of the Basin was several ppb in concentration as shown in Figure V-3-23. The MOZART-retrieved and aircraft-based runs predicted higher surface ozone than the clean boundary, which was attributed to the higher concentration aloft that was entrained into the lower boundary layer via convection.

The western boundary appeared to be set far enough offshore to minimize spurious influence of the boundary values transported into the Basin. Despite the large differences between the MOZART and the aircraft boundaries, surface ozone from the two simulations were almost identical (Figure V-3-23).

Figure V-3-17

A vertical cross-section of 1-hr ozone differences between MOZART and the clean boundary values along the red line indicated in the lower plot.

Figure V-3-23

Scatter plot of simulated and observed 1-hour maximum ozone within the Basin.

The impact of the boundary contribution was further analyzed to explore its possible role in the over-predictions identified in Figure V-3-16. The daily MOZART boundaries, shown in Figure V-3-24, contained values that were as high as 110 ppb. These are compared with published and simulated Basin summer boundary ozone values less than 50 ppb. Note that MOZART (version 4), used in the current study, was based on GEOS-5 meteorological fields. The high boundary concentrations extracted from MOZART on June 21st and July 9th coincided with the simulated high-bias episodic ozone peaks in Figure V-3-16. A set of sensitivity simulations were generated including only biogenic emissions and both clean boundary conditions and MOZART defined boundaries. A comparison of the simulation results is shown in Figure V-3-25. The higher MOZART background values seriously impacted regional ozone formation, particularly on the July 9th episode. Also, the simulation including MOZART with biogenic emissions illustrated a decreasing trend over the three month period, which was less evident in the clean boundary simulation. The general decreasing trend was expected to reflect lower biogenic emissions and deeper midsummer mixing of the atmosphere.

The spurious behavior of MOZART was partly attributed to the way the global model was applied to the CMAQ. Due to computational limitations, the CMAQ model used a single domain, but was not configured in a nested way. This abrupt scaling down from a global model to a fine scale regional grid appears to have impacted the spatially allocated background concentrations characteristic of urban emissions profiles. As a consequence, higher levels of background ozone introduced over the northern boundary resulted in erroneously higher projected surface ozone concentrations.

Figure V-3-26 presents the scatter plot of the simulations conducted using the MOZART and clean boundary assumptions. The clean boundary assumption was able to eliminate many of the severely over predicted data points that appeared in the upper portion of the one-to-one mapping line. Accordingly, the clean boundary assumption was chosen as the default lateral boundary value.

CHAPTER 4

MODELING EMISSIONS, BOUNDARY, AND INITIAL CONDITIONS

Modeling Emissions Inventory

Inventory Profile

California Environment Quality Act (CEQA) Alternative Emissions

Boundary and Initial Conditions

MODELING EMISSIONS INVENTORY

Table V-4-1 provides the baseline and controlled modeling emissions inventories used in the attainment demonstration and alternative analyses. The CMAQ simulations were based on the annual average inventory, with adjustments made for weekly and daily temperature variations. A brief characterization of the annual day emissions used for the modeling analysis follows. An extensive discussion of the overall emissions inventory is summarized in Appendix III of the Draft Final 2012 AQMP.

INVENTORY PROFILE

Baseline modeling inventories for the historical year 2008 and the future years 2014, 2017, 2019, 2023, 2030 and 2035 are discussed in this section. The baseline emissions projection assumes no further emission controls. These projections reflect the emissions resulting from increases in population and vehicle miles traveled (VMT), as well as the implementation of all adopted rules and regulations up through June 2012. The controlled emission projections reflect the benefits of implementation of the Draft Final 2012 AQMP control measures relative to future baseline emissions. Detailed descriptions of the control measures are provided in Chapter 4 and Appendix IV of the Draft Final 2012 AQMP.

Appendix III contains emission summary reports by source category for the historical base year and future baseline scenarios used in this modeling analysis. Attachments 5 and 6 of this appendix contain the Controlled Emission Projection Algorithm (CEPA) emissions summary report by source category for the future (2014 and 2023) controlled scenarios for the annual average emissions inventory. It should be noted that the inventories reported here may be slightly different than those reported in the Draft Final 2012 AQMP (Chapter 3) and Appendix III, since the inventories used for modeling reflect day-specific conditions. Day specific point, mobile and area emissions inventories were generated for each day in the 2008 base year. Mobile source emissions were temperature corrected by grid cell using a VMT weighted scheme. County-wide area source emissions were temperature corrected and gridded using the spatial emissions surrogate profiles developed for the Draft Final 2012 AQMP.

Day specific modeling emissions inventories were generated for each day in 2008 for the CMAQ (and CAMx) simulations. Mobile source emissions were generated using CARB's EMFAC2011 emissions factors coupled with SCAG's traffic analysis zone data. Off-road emissions were calculated using CARB's off road model. It is important to note that both EMFAC2011 and the off-road models were modified to account for

CARB’s emissions estimation methodology changes reflecting the 2010 adoption of the CARB on-road heavy duty vehicle and off-road mobile source rules. The on-road mobile source emission data incorporate day specific ambient temperature input to correct for evaporative emissions.

Table V-4-1

Annual Average Day Emissions Inventory (tons/day)

Year	VOC	NOX	CO	SOX	PM2.5	NH3
(a) Baseline						
2008	593	754	2880	54	80	109
2014	451	506	2095	18	70	103
2017	427	442	1862	18	70	100
2019	414	394	1708	18	70	98
2023	406	322	1584	18	70	97
2030	407	283	1502	20	72	98
2035	386	279	1473	22	72	98
(b) Controlled						
2014	451	490	2095	18	58*	103
2023	400	296	1584	18	70	97

* Winter episodic day emissions reductions

Annual Emissions Profiles

Day specific emissions were generated for all days in 2008. Figure V-4-1 illustrates the total CO and NOx emissions contained in the modeling domain for each day in 2008. CO emissions are indicative of the on-road mobile source inventory while NOx further incorporates signatures of stationary and off-road emissions. Note that the emissions totals in tons per day are roughly double the totals presented in Table V-4-1. This is because the values in Table V-4-1 represent basin-wide total emissions while those in Figure V-4-1 is the total from the modeling domain. The profile clearly depicts a changing emissions pattern with two distinct cycles represented: a weekly cycle, illustrated by Sunday through Saturday peaks and valleys, and day-to-day variations in

emissions within the weekly cycle. Figure V-4-1 also includes emissions from 2008 wild fires that occurred in the modeling domain.

Figure V-4-1

2008 daily CO and NOx emissions in the modeling domain.

Diurnal Emissions Profiles

Where applicable, point, area and off-road mobile sources were adjusted to a day-of-week throughput profile consisting of a Monday-Friday, Saturday and Sunday schedule. Figure V-4-2 depicts the day-of-week and hour-of-day NOx emissions patterns for stationary, on-road, and off-road sources with ocean going vessels (OGVs) independently represented. The peak emissions occur mid-week (Tuesday through Thursday) while emissions on Saturday and Sunday decrease by about 30 percent. Based on CALTRANS data, NOx emissions from heavy-duty vehicles are reduced by more than 60 percent on Saturdays with further reductions occurring on Sundays. Increases in off-road mobile source activities (e.g. pleasure craft and recreational vehicles) account for the bulk of the VOC increase on both Saturdays and Sundays.

Monday and Friday are transitional days with on-road emissions slightly lower than mid-week with slightly modified diurnal profiles. Off-road emissions are relatively consistent throughout the week whereby weekend reductions in some off-road categories (e.g. construction) are replaced by weekend activity emissions (e.g. recreational vehicles and boats). In general, OGV emissions are constant with shipping activities ongoing as a function of arrivals and departures. The largest stationary source contributions (e.g.

refineries, power generation and residential combustion) represent daily usage and do not vary much over the course of the week.

Figure V-4-2

Diurnal NOx emissions (tons per hour) in the modeling domain: Sunday - Saturday.

Spatial Distribution

Figures V-4-3 through V-4-6 provide the spatial distribution of NOx emissions for the stationary (including area sources), OGV, off-road and on-road categories. Area sources in the modeling domain are typically assigned to a surrogate distribution profile (maintained by CARB) to allocate the daily emissions. Area source NOx emissions are included in the stationary source projection depicted in Figure V-4-3.

Paved and Unpaved Road Dust Emissions

U.S. EPA recently revised its AP-42 methodology to estimate paved road dust whereby the new method removed the factor addressing tire and break ware (to address potential double counting) but retained a California usage profile and adjustments for rain and silt loading.

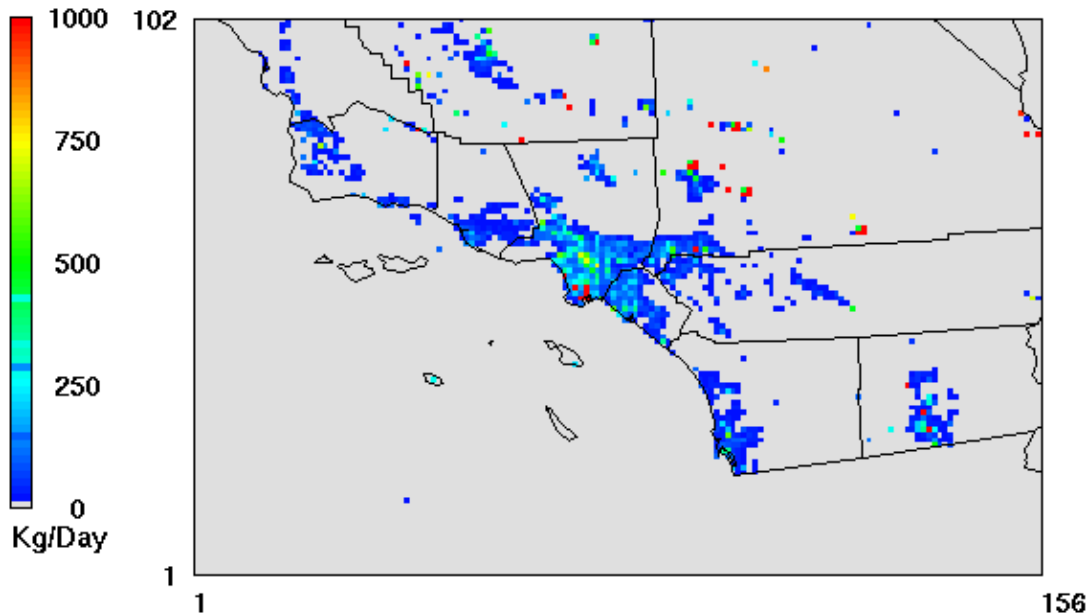

Figure V-4-3

Stationary source NOx emissions (Kg per day) in the modeling domain

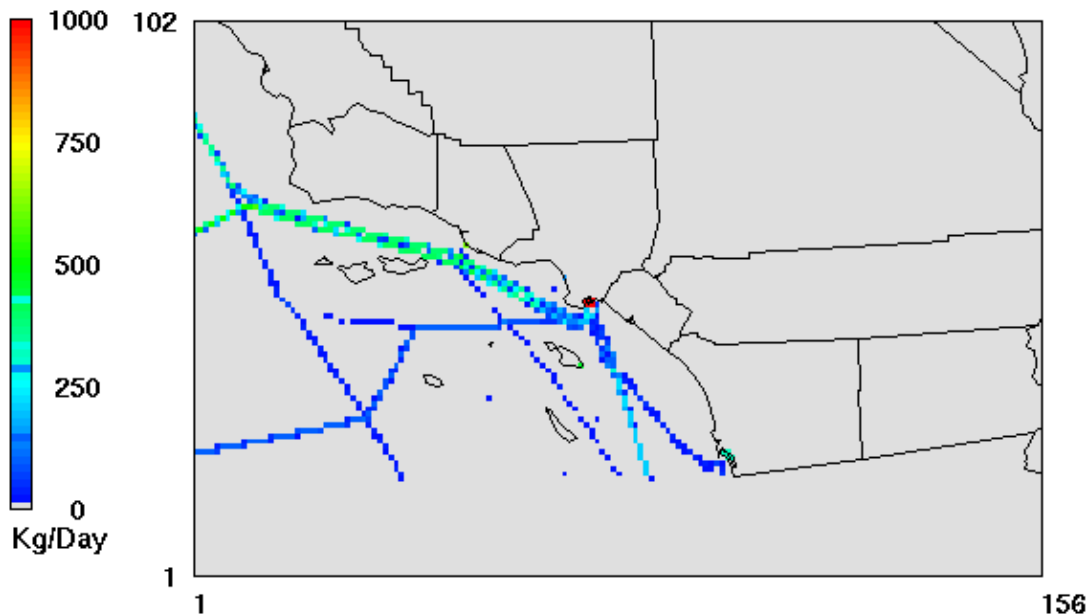

Figure V-4-4

OGV NOx emissions (Kg per day) in the modeling domain

Figure V-4-5

Off-Road NOx emissions (Kg per day) in the modeling domain

Figure V-4-6

On-Road NOx emissions (Kg per day) in the modeling domain

In addition, the base year paved road dust emissions are a function of VMT. As with the three preceding AQMPs, paved road dust emissions were adjusted to reflect a cap on emissions growth for high VMT road types in future years. Based on CARB's latest assessment (California Air Resources Board. 2012. Miscellaneous Process Methodology 7.9, Entrained Paved Road Travel, Paved Road Dust. July), the Draft Final 2012 AQMP continued this type of adjustment by leaving paved road dust constant on all roads unless there was a change in centerline miles; any emission change in future years would be calculated using the ratio of future-to-current centerline miles (see Appendix III, Table III-2-6).

Unpaved road dust was allocated based on GIS land use profiles.

Ammonia Inventory Adjustments

Selected revisions were made to the spatial distribution and emissions categories defining the ammonia inventory. In general, the total ammonia in the inventory was reduced from 119 TPD in the 2007 AQMP inventory to 109 TPD in the Draft Final 2012 AQMP. Shifts in ammonia emissions occurred in several categories with livestock; fertilizer and on-road emission lowered, being partially offset by increases in the industrial and composting sectors. Table V-4-2 provides a summary comparison of the 2002 and 2008 ammonia inventories from the 2007 AQMP and the Draft Final 2012 AQMP.

Table V-4-2

Annual Average Day Ammonia Emissions Inventory (tons/day)

Source Category	2007 AQMP	Draft Final 2012 AQMP
	2002 Inventory	2008 Inventory
Livestock	26	18.6
Soil	1.4	1.8
Domestic	25.1	25.1
Landfill	1.1	3.6
Composting	9.7	17.8
Fertilizer	6.1	1.5
Sewage Treatment	0.1	0.2
Wood Combustion		0.1
Industrial	13.2	20.2
On-Road Mobile	36.1	19.9
Off-Road Mobile		0.1
Total	118.8	108.9

Biogenic Emissions

Daily biogenic VOC emissions inventories were developed by CARB using the Model of Emissions of Gases and Aerosols from Nature (MEGAN) emissions model. The biogenic inventories were calibrated based on spatially resolved daily temperature. Figure V-4-7 provides the daily total emissions of isoprene and terpenes, measured in millions of moles, for the modeling domain. The trend shows higher emissions for the spring and summer months with several peaks occurring in May and later June when temperatures in Southern California were unseasonably high. The areas with the greatest contribution to the biogenic emissions inventory are depicted by the color lime green in the general land use characterization provided in Chapter 3 (Figure V-3-9).

Figure V-4-7

2008 daily biogenic VOC emissions in the modeling domain:
Depicted are Isoprene and terpenes (millions of moles per day).

Ocean Going Vessels

During 2008, OGV emissions, most notably SO_x, varied significantly over the course of the year. Compliance with CARB's marine vessel low sulfur fuel rule was challenged in the courts. As a consequence OGV emissions varied from a relatively low value (approximately 15 TPD) to emissions in excess of 40 TPD when compliance was not enforced and bunker fuel was in use. Figure V-4-8 depicts the vessel weighted profile of OGV SO_x emissions estimated from the schedule of rule enforcement during 2008 in the compliance zone waters 24-nautical miles offshore of the Ports of Los Angeles and Long Beach. The time series accounts for port vessel arrivals and departures by day-of-week, month of year, and vessel tonnage category. The general emissions profile depicted in Figure V-4-8 was used with adjustments to the total SO_x tonnage to generate the gridded SO_x OGV emissions for modeling.

Figure V-4-8

2008 daily vessel weighted OGV SO_x emissions in the modeling domain.

CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) ALTERNATIVE EMISSIONS

As part of the CEQA requirements for project assessment, the analysis must consider alternatives to the proposed project and hence alternative emissions scenarios. The Draft Final 2012 AQMP has identified three viable alternatives to the proposed plan to achieve attainment of the federal 24-hour PM_{2.5} standard within the prescribed time frame. The first alternative is a 2019 no-project alternative which relies on rules and regulations already in place to reduce baseline emissions to a level sufficient to attain the standard by 2019. The second alternative requires local emissions to be controlled nearby the design site in Mira Loma for a 2017 attainment year. The controls include tighter forecast triggers for restrictions on wood burning in fireplaces and woodstoves as well as open burning, and incentive-based accelerated local heavy duty truck clean up. The third alternative targets regional acceleration of heavy duty truck NO_x reductions by 2017 as a replacement to the local control program. Table V-4-3 provides the CEQA alternate emissions scenarios simulated for the Program Environmental Impact Report.

BOUNDARY AND INITIAL CONDITIONS

As discussed in Chapters 2 and 3, the initial concept for establishing boundary conditions for the regional modeling analyses focused on using global chemical simulation model output to define key species concentrations at the edge of the modeling domain. MOZART was selected to provide the characterization. However after evaluation it was discontinued in favor of using an U.S. EPA “clean boundary” US EPA (1991) approach that has been incorporated in previous attainment demonstrations.

Table V-4-4 summarizes the boundary profile concentrations used in the regional simulations. The boundary conditions were adjusted to match the ROG SAPRC profile. Initial conditions were established from ambient data monitored at AQMD and other district stations in their respective monitoring networks. For the future year scenarios, the boundary, region top and ambient air quality concentrations were adjusted to reflect projected emissions reductions from the 2008 base-year.

Table V-4-3

CEQA Alternatives Annual Average Day Emissions Inventory (tons/day)

Year	VOC	NOX	CO	SOX	PM2.5	NH3
(a) Alternative 1	No Project Alternative

FEDERAL 24-HOUR PM_{2.5} ATTAINMENT DEMONSTRATION PLAN

Introduction

FRM 24-Hour PM_{2.5}

Performance Evaluation

24-Hour PM_{2.5} Modeling Approach

Future Air Quality

CEQA Alternate Simulations

Weight of Evidence

Summary and Control Strategy Choices

INTRODUCTION

The attainment demonstration presented in this chapter is applicable to the federal 24-hour PM_{2.5} standard. The annual PM_{2.5} attainment demonstration provided in the 2007 AQMP was approved by U.S. EPA on September 30, 2011. An update of the model simulation results for the annual PM_{2.5} standard is presented in Chapter 6.

The initial sections of this chapter describe the PM_{2.5} Federal Reference Method (FRM) monitoring data and sampling network, the historical trend of 24-hour PM_{2.5} design values, revisions to the speciated monitoring attainment test (SMAT) and Sandwich data analyses, and the CMAQ modeling methodology. The subsequent sections of this chapter provide the 24-hour PM_{2.5} attainment demonstration, the unmonitored area analysis, and supporting weight of evidence analyses.

24-HOUR PM_{2.5} Sampling

PM_{2.5} FRM Sampling

The district maintains a sampling network of Federal Reference Method (FRM) PM_{2.5} at 20 sites throughout the Basin and Coachella Valley. This network is supplemented by Federal Equivalent Method (FEM) continuous PM_{2.5} monitors at a subset of these locations to provide data for public reporting and for forecasting algorithms. The FRM samplers are designated as the primary samplers, and thus FRM data is used for design value calculations and the attainment demonstration.

Speciated PM_{2.5} Sampling.

The District adopted a Multi-Channel Fine Particulate (MCFP) sampling system for the PTEP monitoring program in 1995, and the TEP 2000 program in 1998-1999. New PM samplers, speciated air sampling system (SASS) samplers, were deployed for two years at ten sites in the Basin to conduct the Multiple Air Toxics Exposure Study III (MATES III) beginning in April, 2004. The SASS sampler collects PM_{2.5} particles on 47mm quartz and Teflon filters simultaneously within the same sampler for 24-hour duration for subsequent laboratory chemical analysis. After the MATES III study, PM speciation sampling was changed from a one-in-three day to a one-in-six day schedule, and reduced to four permanent speciation-sampling sites. However, a monitoring campaign at multiple sites in the Port area included PM_{2.5} speciation in the 2007-2008 timeframe. Furthermore, an enhanced speciation

campaign in 2009 returned to the one-in-three day schedule at seven sites for one year only.

PM2.5 speciation data measured as individual species at six sites in the District air-monitoring network during 2008 provided the PM2.5 chemical characterization for evaluation and validation of the CMAQ annual and episodic modeling. The six sites include the historical PM2.5 maximum location (Riverside-Rubidoux), the stations experiencing many of the highest county concentrations (among the 4-county jurisdiction including Fontana, North Long Beach and Anaheim) and monitoring in locations influenced by goods movement (South Long Beach) and mobile source impacts (Central Los Angeles). It is important to note that the close proximity of Mira Loma to Rubidoux and the common in-Basin airflow and transport patterns enables the use of the Rubidoux speciation data as representative of particulate speciation at Mira Loma. Both sites are directly downwind of the dairy production areas of Chino and the warehouse distribution centers located in the northwestern corner of Riverside County. Speciated data monitored at the selected sites for 2006-2007 and 2009-2010 were analyzed to corroborate the applicability of using the 2008 profiles. PM2.5 mass, ions, organic and elemental carbon, and metals, for a total of 43 chemical species, were analyzed from a one-in-six day sampling schedule at 6 sites.

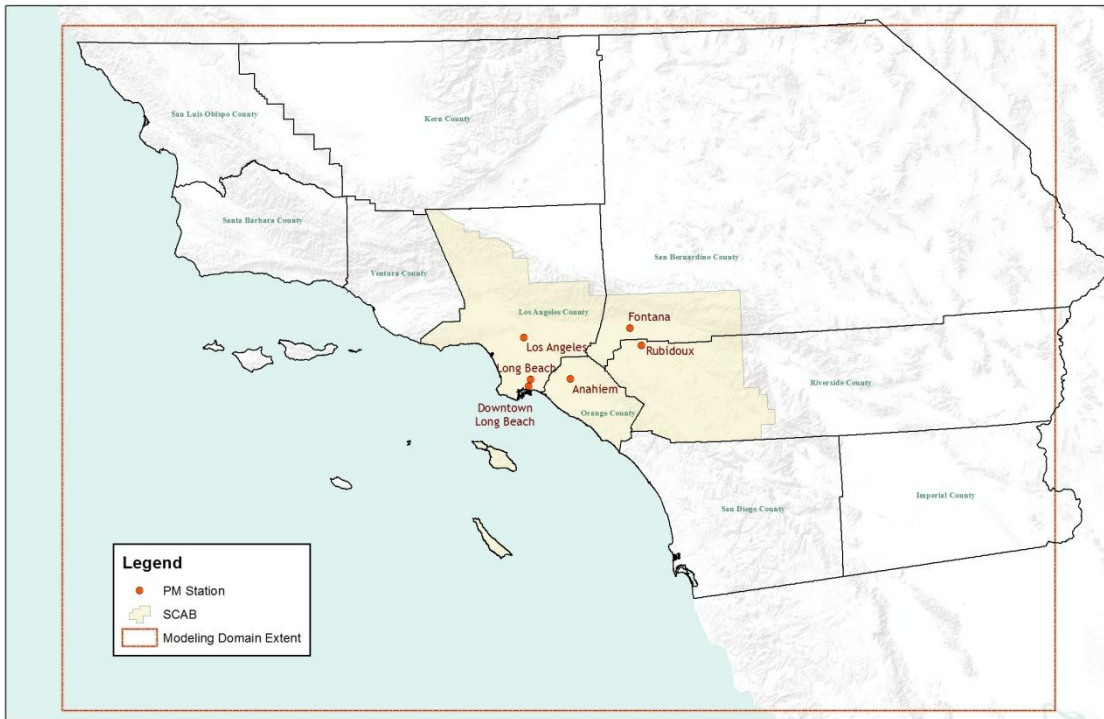

Figure V-5-1

SASS Sampling Sites in the Basin

2008 PM_{2.5} speciation data measured by the SASS sampler is used to derive the species fractions that are required for the PM_{2.5} attainment demonstration. U.S. EPA's PM_{2.5} modeling guidance recommends calculating future year PM_{2.5} design values by multiplying quarterly, species specific RRFs to the base year speciated design values for each quarter for each monitoring site. Base year design values are determined from the FRM mass data, however the FRM filters are not chemically speciated. Therefore, the guidance document recommends multiplying the species fractions that are measured in a speciation sampler such as the SASS to the FRM mass data to derive chemically speciated design values for the FRM data. In the following sections, 24-hour and annual average species concentrations measured by the SASS sampler are summarized and the chemically speciated FRM data are derived for the future year design value calculations.

As previously described in Chapter 1, U.S. EPA recently updated the 24-hour PM_{2.5} attainment test, replacing Section 5.2 of the 2007 PM_{2.5} modeling guidance. The

new guidance recommends using the 8 highest days of FRM data per quarter for each year for each FRM site for calculation of the daily design values to ensure that the 98th percentile concentration day for the year is included in the analysis. This resulted in 32 days of FRM data for each year for each site. Tables V-5-1 through V-5-7 list the 2008 FRM data subset included as a component of the attainment analysis. Data from 2006, 2007, 2009 and 2010 complete the data requirement for the revised attainment test. In total, 160 days of data at each site are included in the calculation. Table V-5-8 provides the 5-year weighted 24-hour PM_{2.5} design values for the seven sites evaluated. The weighting scheme centered on 2008 is as follows: 1/3 weight for 2008; 2/9 weight each for 2007 and 2009, and 1/9 weight each for 2006 and 2010.

In some cases, the FRM and SASS monitoring locations do not overlap. (The FRM network has 21 stations where the SASS network size has varied in time, being limited to 6 sites in 2008). Five of the SASS sites are co-located with the FRM sites. The Downtown Long Beach SASS site was located near the South Long Beach FRM. Similarly, the Mira Loma FRM design site is located in the upwind adjacent grid cell to the Rubidoux SASS sampler. The PM_{2.5} guidance document recommends estimating speciated concentrations from a nearby speciation monitor when an FRM site does not have speciation data. Therefore, the Mira Loma FRM data is speciated using the Rubidoux SASS data and the South Long Beach FRM used the Downtown Long Beach speciation data.

Rubidoux	44.1

The revised guidance updated the quarterly species fractions on “high” days, which are required for the 24-hour modeled attainment test. The new guidance recommends using the top 10% of days in each quarter as the “high” days, resulting in 4 days per quarter for the 2008 SASS data. Figures V-5-2 through V-5-7 depict the species breakdown from the average top 4 PM_{2.5} concentrations for each quarter for six sites in the Basin. The data show the unadjusted direct measurements of the chemical species at each site. In general, concentrations in the fourth or first quarter are higher than that of the other quarters and secondary ammonium, nitrate and sulfate can comprise about half of the total PM_{2.5} concentrations. They also show that organic carbon (OC) is the highest single component, which is also close to half of the total concentration in some quarters and sites.

OC as measured by a SASS sampler is believed to be highly uncertain with a mostly positive sampling artifact. The flow rate of the SASS sampler (6.7 lpm) used to collect OC is approximately 2.5 times lower than that of the FRM sampling system (16.7 lpm), which provides the official PM_{2.5} mass measurement. The slower flow rate in the SASS sampler reduces the pressure drop across the filter and increases the adsorption of organic vapor on the quartz filter medium. The FRM uses a Teflon filter for mass measurements which is much less subject to organic vapor adsorption. Therefore, the OC collected by the SASS sampler is higher than that collected by the FRM sampler, often leading to an overbalance of the sum of the PM_{2.5} species

relative to FRM mass. There are also uncertainties in the measurements and the speciation analyses for all species; however, the greatest uncertainty in species concentration is associated with the measurement and analysis of OC.

U.S. EPA recommends estimating uncertain OC concentrations through an adjustment that is discussed as part of the “Sandwich” method in the 2007 AQMP and U.S. EPA’s PM_{2.5} modeling guidance document (Frank, 2007). According to the “Sandwich” method, OC is estimated from the difference between the measured mass and the sum of all chemical species, water and a filter blank of 0.5 ug/m³. The new species fractions for each quarter for each site are calculated by estimating OC, which are then applied to the 32 highest FRM data. Figures V-5-8 through V-5-13 depict the 2008 species fractional splits for the 6 primary components and water vapor for the six SASS sites after the “Sandwich” method was applied.

PERFORMANCE EVALUATION

EPA guidance assesses model performance on the ability to predict the PM_{2.5} component species and the total mass. No specific performance criteria thresholds are recommended in EPA’s modeling guidance document. This is because the model uses relative response factors rather than direct predictions. Performance is evaluated by examining key statistics and graphical representations of the differences between model predicted concentrations and observations. The statistics examine model bias and error, while graphical representations of error, model prediction time series, and concentration scatter plots supplement the methods of model performance evaluation. The CMAQ modeling results presented for each station are based on the same “1-cell” basis.

PM_{2.5} Component Species Performance Evaluation

The CMAQ 2008 base-year 24-hour PM_{2.5} performance statistics are presented in Tables V-5-9 through V-5-14. The analysis includes predicted concentrations and observations for the six component species and total mass at the 6 SASS sites. (Note

that the “others” category collectively includes crustal compounds-metals, sea salt, estimated water vapor and the filter blank). Also presented in the tables are estimates of bias and error for each component at each monitoring site. Quarterly statistics are provided in Attachment 3 to this document.

Figure V-5-14 provides a “soccer goal” graphical representation of error for model performance. Figures V-5-15 through Figure V-5-18 present the time series of model predicted vs. observations for each component at the SASS monitoring sites. Figure V-5-19 through Figure V-5-24 present the scatter-plots of prediction accuracy for each component at the SASS monitoring sites.

The three western Basin Los Angeles County sites analyzed had a total mass absolute prediction accuracy that exceeded 25 percent of the observed average. Prediction accuracy estimated for the three remaining sites measured approximately 20 percent or lower. In general, normalized bias was lowest for nitrate and highest for sulfate. The only systematic bias was evident for EC, whereby the tendency was to under predict observations.

One element observed during the 2008 simulation evaluation was that the eastern portion of the Basin predicted low concentrations of secondary aerosols when high wind “Santa Ana” conditions were observed. This generalized wind condition also impacted the western portion of the Basin but to a lesser extent. The days impacted by the high winds were clustered in the first and fourth quarters. Figure V-5-25 illustrates the frequency of the observed Santa Ana wind events.

Annual Average SSI Mass Performance Evaluation

Table V-5-15 summarizes the performance of the CMAQ simulation in predicting annual average PM2.5 vs. FRM observed annual average mass at the monitoring network sites not having parallel SASS sampling. The goal of this analysis is to demonstrate that the model is consistent in the simulation of PM2.5 at the key sites and across the modeling domain. The general tendency of the simulation was to over-predict annual observed FRM PM2.5 in south central portion of metropolitan Los Angeles County and western San Gabriel Valley. Several sites in the east Basin tend to be under predicted, but by less than 30 percent. Burbank, Ontario, and Riverside Magnolia exhibited prediction accuracy within 10 percent of observations. It is important to remember that the attainment demonstration is based on a relative response factor and not direct future year simulated concentrations.

Base-Year Model Performance Stress Test Evaluation

EPA’s modeling guidance as well as the Draft Modeling Protocol outline a series of basic stress tests that can be applied to the base case simulation to determine the level of sensitivity of model performance to key parameters defining the simulations. These stress tests include modifying the boundary conditions, and introducing gross changes in the meteorological and emissions profiles. The goal for these analyses is to see if any one factor is unduly biasing model performance and in doing so jeopardizing the validity of the analysis. Table V-5-16 summarizes the suite of performance stress tests applied to the CMAQ (and CAMx) PM2.5 simulations. Chapter 3 provides a summary of selected tests applied to the WRF meteorological

model. The outcome of the CMAQ testing indicated that the model responded in an expected manner to the changes in simulation parameters and emissions profiles outlined in the stress tests.

TABLE V-5-15

CMAQ Predicted and FRM Observed 2008 Base-Year Annual Average PM_{2.5} (µg/m³)

TABLE V-5-16

Selected CMAQ PM2.5 Model Performance Stress Tests

Stress Test Methodology

Boundary conditions only: no anthropogenic emissions with and selected without biogenic emissions

1. Ultra Clean Boundaries
2. EPA Clean Boundaries
3. MOZART Boundaries

Boundary conditions and anthropogenic emissions: no biogenic emissions

Boundary conditions and anthropogenic emissions: 50% biogenic emissions

Shipping emissions split by layers

1. All layer 1
2. Zero layer 1, 100% layer 2
3. 30 % layer 1, 70% layer 2

No emissions in Orange County

No emissions from the Ports of Los Angeles and Long Beach

No livestock emissions

Eliminating all anthropogenic emissions from 49 cells surrounding Mira Loma

No prescribed fires and agricultural burning

Selected restrictions on fireplace/wood stove burning

1. No Riverside and San Bernardino Counties
 2. No Basin burning

24-HOUR PM2.5 MODELING APPROACH

CMAQ simulations were conducted for each day in 2008. The simulations included 8784 consecutive hours from which daily 24-hour average PM2.5 concentrations (0000-2300 hours) were calculated. A set of RRFs were generated for each future

year simulation. RRFs were generated for the ammonium ion (NH₄), nitrate ion (NO₃), sulfate ion (SO₄), organic carbon (OC), elemental carbon (EC) and a combined grouping of crustal, sea salts and metals (Others). A total of 24 RRFs were generated for each future year simulation. Water vapor was determined using U.S. EPA's regression model approximation of the AIM model based on simulated concentrations of the ammonium, nitrate and sulfate ions.

Future year concentrations of the six component species were calculated by applying the model generated quarterly RRFs to the speciated 24-hour PM_{2.5} (FRM) data sorted by quarter for each of the five years used in the design value calculation. The 32 days in each year were then re-ranked to establish a new 98th percentile concentration. The resulting future year 98th percentile concentrations for the 5-years were subjected to weighted averaging for the attainment demonstration.

Future year PM_{2.5} 24-hour average design values are presented for 2014, and 2019 to (1) demonstrate the future baseline concentrations if no further controls are implemented; (2) identify the amount of air quality improvement needed to advance the attainment date to 2014; and (3) confirm the attainment demonstration with implementation of the proposed PM_{2.5} control strategy.

FUTURE AIR QUALITY

Under the federal Clean Air Act, the Basin must comply with the federal PM_{2.5} air quality standards by December 2014 [Section 172(a)(2)(A)]. An extension of up-to five years (until 2019) could be granted if attainment cannot be demonstrated with implementation of all feasible measures to advance attainment.

A simulation of 2014 baseline emissions was conducted to assess the extent of the 24-hour PM_{2.5} problem in the Basin. The simulation used the projected emissions for 2014 which include all adopted control measures that will be implemented prior to and during 2014. The resulting 2014 future-year Basin design value (37.3 µg/m³) failed to meet the federal standard of 35 µg/m³. As a consequence additional controls are needed to attain the standard by 2014.

Simulation of the 2019 baseline emissions indicates that the Basin will attain the federal 24-hour PM_{2.5} standard in 2019 without additional controls. However, with the Draft Final 2012 AQMP proposed PM_{2.5} control program in place, the 24-hour PM_{2.5} simulations project that the 2014 design value will be 34.3 µg/m³, thus advancing the attainment date from 2019 to 2014.

Figure V-5-26 depicts future 24-hour PM_{2.5} air quality projections at the Basin design site (Mira Loma) and six other PM_{2.5} monitoring sites having comprehensive particulate species characterization. Shown in the figure are the baseline designs for 2008 along with projections for 2014 with and without proposed control measures in place. All of the sites with the exception of Mira Loma will meet the 24-hour PM_{2.5} standard by 2014 without additional control measures. With implementation of the proposed control measures, all sites in the Basin demonstrate attainment in 2014.

Table V-5-17 provides the RRFs developed from the 2008 base year and 2014 controlled simulations. Tables V-5-18 and V-5-19 provide the CMAQ/SMAT projected future year PM_{2.5} by component species for 2014 with (controlled) and without (base-line) proposed control measures implemented. Tables V-5-20, V-5-21 and V-5-22 provide the projected controlled future year 24-hour PM_{2.5} design values by component species for 2019, 2023 and 2030. Projected 24-hour PM_{2.5} (2019 and beyond) indicates that the Basin will remain in attainment with the standard, with the addition of the short term ozone measures but without the need for continued episodic controls being implemented.

Spatial Projections of PM2.5 Design Values

Figure V-5-27 provides a Basin-wide perspective of the spatial extent of 24-hour PM2.5 levels in the base year 2008. Figures V-5-28 and V-5-29 show future predicted 24-hour design values in 2014 for base-line emissions and with the proposed control program in place. Several areas around the northwestern portion of Riverside and southwestern portion of San Bernardino Counties depict grid cells with weighted PM2.5 24-hour design values exceeding 35 $\mu\text{g}/\text{m}^3$ in 2008. By 2014, the number of grid cells with concentrations exceeding the federal standard is restricted to a small region surrounding the Mira Loma monitoring station in northwestern Riverside County. With the control program fully implemented in 2014, the Basin does not exhibit any grid cells exceeding the federal standard.

Unmonitored Area Analysis

U.S. EPA modeling guidance requires that the attainment demonstration include an analysis that confirms that all grid cells in the modeling domain meet the federal standard. This “unmonitored area analysis” is essential since speciation monitoring is conducted at a limited number of sites in the modeling domain. Variance in the species profiles at selected locations coupled with the differing responses to emissions control scenarios are expected to result in spatially variable impacts to PM_{2.5} air quality in any grid cell. As described earlier in this chapter, speciation profiles from SASS sites in adjacent or collocated grid cells are used in the formal attainment demonstration for Mira Loma and also South Long Beach. With interpolation of the SASS speciation profiles, attainment demonstrations can be directly conducted for the remaining grid cells where FRM mass data has been collected over the 5-year period (2006-2010). To date, no specific test has been proposed by U.S. EPA to address testing attainment at grid cells where no speciated and/or FRM data is available. The form of the revised attainment test adds complication in that it requires assessing the impacts for 32 days per year, for five years, at each unmonitored grid cell.

The methodology used to assess the unmonitored grid cell impact follows. First, a subset of the full modeling domain covering the Basin was selected for the analysis. The western most grid column (70) was aligned with coastal Los Angeles. The eastern most column (100) touched Banning Pass, the southern boundary was located in row 45 in Northern San Diego, and the northern most row (65) corresponding to the northern portion of the San Fernando Valley extending across the San Gabriel and San Bernardino Mts. A review of the 24-hour PM_{2.5} FRM data and design values from sites located outside of this inner domain indicated that concentrations were significantly lower than in those observed in the primary non-attainment portion of the Basin.

The next task included spatial interpolation (1/r) of the six SASS speciation splits to define the split profiles for each grid cell. The split percentages were then multiplied by the simulation derived RRFs, for each of the four seasons. FRM data, based on every third day sampling from 21 Basin monitoring sites were extracted from the U.S. EPA's AQS database for each year of the 5-year period. The highest 8 concentrations sampled in each quarter were selected to generate a data set that included 160 days. The data for each day were then interpolated throughout the inner-domain using an inverse distance weighted scheme (1/r) to develop a matrix of grid specific 24-hour PM_{2.5} concentrations for all 160 days. Note that extraction of data on a frequency of every third day was selected so that there was consistency in the numbers of FRM data samples used in the analysis. In general, the number of valid yearly samples using the third day extraction was between 100-150 days, and thus allowed the analysis to focus on the projected 3rd highest value (of the 32 days evaluated) in each year as the 98th percentile value.

The interpolated FRM data were then multiplied by the seasonally sorted, RRF-interpolated species fractions to project the future year 24-hr PM_{2.5} distribution for each of the five years. The attainment calculation then tested the weighted 5-year average 98th percentile concentration at each grid. Table V-5-23 provides a summary of the unmonitored area analysis. Listed are the top 15 projected grid cell center concentrations for the 2014 controlled scenario and the respective 2008 interpolated center grid concentration. The second set of columns provides the list of grid cells with the maximum projected 2014 controlled 24-hour PM_{2.5} design value modeled as if every grid in the Basin had Mira Loma's species profile. This calculation was conducted to test the distance weighted interpolation hypothesis and the impacts of varying species profiles and RRFs.

The interpolated 2008 grid center design values and 2014 projected determined from the unmonitored area analysis lined up closely with the station design values. The 2014 controlled maximum projected 24-hour PM2.5 design of 31.2 $\mu\text{g}/\text{m}^3$ occurred at the center of the Mira Loma grid cell (89,58). Since no cell in the modeling domain was projected to have a 2014 controlled design value above that of cell (89,58), the Basin passes the unmonitored area portion of the 24-hour PM2.5 attainment demonstration.

This analysis demonstrates that the relative response to the control program is more effective in the Eastern Basin while portions of the western Basin do not exhibit the equivalent response to the implementation of the proposed control strategy.

Table V-5-23

Unmonitored Area Analysis

Grid I	Grid J	Interpolated 2008 Design	Projected 2014 Controlled Design
89	58	44.3	31.2

91	59	39.7	29.0

CEQA ALTERNATIVE SIMULATIONS

Table V-5-24 presents the projected 24-hour PM_{2.5} design values for the 2014 baseline, 2014 controlled and three CEQA Alternative emissions scenarios. For a description of the alternative scenarios, please see the 2012 Draft AQMP Draft Program Environmental Impact Report (PEIR). All of the CEQA alternative simulations demonstrate attainment of the 24-hour PM_{2.5} federal standard.

Table V-5-24

CEQA Alternative Simulated 24-Hour PM2.5 Design Values

	2014	2014 Controlled	Alt-12019	Alt-2: 2017	Alt-3: 2017

South Long Beach	26.7	24.8	25.8	25.8	25.9

WEIGHT OF EVIDENCE DISCUSSION

The weight of evidence discussion focuses on the historical trends of 24-hour PM2.5 concentrations and key precursor emissions to provide justification and confidence that the Basin will meet the federal standard by 2014.

Figure V-5-30 depicts the long term trend of observed Basin 24-hour average PM2.5 design values with the CMAQ projected design value for 2014. Also superimposed on the graph is the linear best fit trend line for the observed 24-hour average PM2.5 design values. The observed trend depicts a steady 49 percent decrease in observed design value concentrations between 2001 and 2011. The rate of improvement is just under 4 $\mu\text{g}/\text{m}^3$ per year. If the trend is extended beyond 2011, the projection suggests attainment of the PM2.5 24-hour standard in 2013, one year earlier than determined by the attainment demonstration. While the straight-line future year approximation may be optimistic, it offers insight to effectiveness of the ongoing control program and is consistent with the attainment demonstration.

Figures V-5-31 depicts the long term trend of Basin NOx emissions for the same period. Figure V-5-32 provides the corresponding emissions trend for directly emitted PM2.5. Base year NOx inventories for 2002 (from the 2007 AQMP) and 2008 experienced a 31 percent reduction while directly emitted PM2.5 experienced a 19 percent reduction over the 6-year period. The Basin 24-hour average PM2.5 design value experienced a concurrent 27 percent reduction between 2002 and 2008.

The projected trend of NO_x emissions indicates that this PM_{2.5} precursor associated with the formation of nitrate will continue to be reduced through 2019 by an additional 48 percent. Similarly, the projected trend of directly emitted PM_{2.5} shows a more moderate reduction of 13 percent through 2019. However, as discussed in the 2007 AQMP and in a later section of this chapter, directly emitted PM_{2.5} is a more effective contributor to ambient PM_{2.5} than NO_x on a per ton emitted basis. While the projected NO_x and direct PM_{2.5} emissions trends decrease at a reduced rate between 2012 and 2019, it is clearly evident that the overall significant reductions will continue to result in lower nitrate and direct particulate contributions to 24-hour PM_{2.5} design values.

Trend of Basin PM2.5 Emissions

SUMMARY AND CONTROL STRATEGY CHOICES

PM2.5 has five major emission types that contribute to the mass of the ambient aerosol including ammonia, NO_x, SO_x, VOC, and directly emitted PM2.5. Various combinations of reductions in these pollutants could all provide a path to clean air. The 24-hour PM2.5 attainment strategy presented in this Draft Final 2012 AQMP relies on a dual approach to first demonstrate attainment of the federal standard by 2019 and then focuses on controls that will be most effective in reducing PM2.5 to accelerate attainment to the earliest date possible. The 2007 AQMP control measures that have been implemented will result in substantial reductions of SO_x, direct PM2.5, VOC and NO_x emissions. Newly proposed short-term measures, discussed in Chapter 4 and Appendix IV of the 2012 Draft Final AQMP will provide additional regional emissions reductions targeting directly emitted PM2.5 and NO_x.

It is useful to assess the relative value of per ton precursor emission reductions considering the resulting ambient microgram per cubic meter improvements in PM2.5 air quality. As presented in the weight of evidence discussion, trends of PM2.5 and NO_x emissions suggest a direct response between lower emissions and improving air quality. The Final 2007 AQMP established a set of factors relating regional per ton precursor emissions reductions and the resulting ambient annual average PM2.5 improvements. The Draft Final 2012 AQMP CMAQ simulations provided a similar set of factors, but this time based on improvements to 24-hour PM2.5 levels. The analysis determined that VOC emissions reductions have the lowest return in terms of micrograms per cubic meter PM2.5 reduced per ton of emissions reductions, about one third of that of NO_x reductions. SO_x emissions reductions were about 8 times more effective than NO_x reductions. However, directly emitted PM2.5 emissions reductions were approximately 15 times more effective than NO_x reductions. It is important to note that the contribution of ammonia emissions is embedded as a component of the SO_x and NO_x factors since ammonium nitrate and ammonium sulfate are the resultant particulate species formed in the atmosphere. Table V-5-25 summarizes the relative importance of precursor emissions reductions to the resulting 24-hour PM2.5 air quality improvements. (A comprehensive discussion of the emission reduction factors is presented in Attachment 8 of this document).

Emissions reductions from existing programs and implementation of the 2012 AQMP PM_{2.5} control measures will result in projected 24-hour PM_{2.5} concentrations that meet the federal standard by 2014 at all locations in the Basin. Basin-wide curtailment of wood burning and open burning when the PM_{2.5} air quality is projected to exceed 30 µg/m³ in Mira Loma will effectively accelerate attainment at Mira Loma from 2019 to 2014.

TABLE V-5-25

Relative Contributions of Precursor Emissions Reductions to 2014 Simulated Controlled Future-Year 24-hour PM_{2.5} Concentrations

Precursor (TPD)	PM _{2.5} Component (µg/m ³)	Standardized Contribution to Mass
VOC	Organic Carbon	Factor of 0.3
NO _x	Nitrate	Factor of 1
SO _x	Sulfate	Factor of 7.8
PM _{2.5}	Elemental Carbon & Others	Factor of 14.8

CHAPTER 6

ADDITIONAL ANALYSES: UPDATED ANNUAL PM2.5 SIMULATIONS

Introduction

Annual PM2.5 Modeling Approach

Annual PM2.5

Future Annual PM2.5 Air Quality

CEQA Alternative Simulations

INTRODUCTION

As a component of the Draft Final 2012 AQMP, concurrent simulations were also conducted to update and assess progress towards the federal annual average PM2.5 standard given the new modeling platform and emissions inventory. This update provides a confirmation that the control strategy will continue to move air quality expeditiously towards attainment of the federal standards.

ANNUAL PM2.5 MODELING APPROACH

The Draft Final 2012 AQMP annual PM2.5 modeling employs the same approach to estimating the future year annual PM2.5 levels as was described in the 2007 AQMP attainment demonstration. Future year PM2.5 annual average air quality is determined using site and species specific quarterly averaged RRFs applied to the weighted quarterly average 2008 PM2.5 design values per U.S. EPA guidance documents.

In this application, CMAQ was used to simulate 2008 base year, 2014 base-line, and 2014 controlled annual average PM2.5 concentrations in the Basin. Projections of the annual average concentrations rely on the use of quarterly averaged PM2.5 levels, Quarterly average speciation profiles, and RRFs determined from quarterly average model simulation results. As with the 24-hour PM2.5 analysis, this analysis uses a 5-year weighted design value centered around 2008 (Table V-6-1). The future year design values reflect the weighted quarterly average concentration calculated from the projections of 5-years of days (20 quarters).

TABLE V-6-1

2008 Weighted Annual PM2.5 Design Values* ($\mu\text{g}/\text{m}^3$)

Monitoring Site	Annual*
Anaheim	13.1
Los Angeles	15.4
Fontana	15.7
North Long Beach	13.6
South Long Beach	13.2
Mira Loma	18.6
Rubidoux	16.7

* Calculated based on quarterly observed data between 2006 – 2010

ANNUAL PM_{2.5}

Annual average PM_{2.5} species concentrations at the six SASS sites are shown in Figure V-6-1. The lowest annual average PM_{2.5} concentration was observed at Anaheim and the highest annual average concentration was observed at Rubidoux. Sulfate shows small spatial variation, between 2 and 3 $\mu\text{g}/\text{m}^3$ at all sites. The highest sulfate concentration was observed at the South Long Beach and Long Beach sites. Ammonium and nitrate show the highest concentrations at Rubidoux and Fontana and the remaining sites show similar levels. Annual average concentrations also show that OC is the most abundant component, which is approximately equivalent to half of the total concentration. As measured by the SASS sampler, OC concentrations are believed to be uncertain as explained in Chapter 5 of this appendix.

Quarterly Average Data

As discussed in Chapter 5, U.S. EPA updated the 24-hour PM_{2.5} attainment test in June 2011. However, U.S. EPA has not recommended any updates to the annual PM_{2.5} attainment test described in Section 5.1 of the 2007 PM_{2.5} modeling guidance. Figures V-6-2 through V-6-7 show the 2008 unadjusted SASS data, processed for quarterly average concentrations from direct measurements of the chemical species at each site. In general, the third quarter is the highest at the inland sites of Fontana and Rubidoux. The sites in the western half of the Basin tend to have the highest average levels in the fourth quarter and to some extent the first quarter. With the exception of Fontana, the lowest observed average concentrations of PM_{2.5} were observed in the second quarter. In general, the second quarter tends to have the lowest concentrations due to spring storms and favorable atmospheric dispersion.

Secondary ammonium, nitrate and sulfate comprise between one-third and half of the total PM_{2.5} concentration. The species concentrations reflect seasonal weather patterns. Sulfate is highest in the third quarter and lowest in the first quarter while nitrate is highest in the first or fourth quarter and lowest in the second or third quarter. High nitrate concentrations in the fall or winter are caused by the favorable formation of ammonium nitrate under cool temperatures, high humidity and frequent nocturnal inversions. The higher values of sulfate typically occur under conditions of strong-elevated inversions and sea breeze transport toward inland, which is the characteristic of late spring and summer. The abundance of afternoon sunlight and

the persistence of morning fog and low clouds trigger both homogeneous and heterogeneous sulfate formation reactions to produce secondary sulfate.

PM2.5 Quarterly Average Species Concentrations ($\mu\text{g}/\text{m}^3$) at Rubidoux

OC comprises the greatest fraction of the mass measured in any quarter and any site and is approximately half of the total concentration in the first and fourth quarter due to poor dispersion from weak winds and low level inversions. However, OC concentrations measured with SASS sampler are believed to be highly uncertain and as a consequence are subject to the “Sandwich” method correction for component mass reconciliation. Figures V-6-8 through V-6-13 provide the corrected species fractions for each site and each quarter. Table V-6-2 lists annual and 5-year weighted quarterly average design values at each of the six SASS sites covering the period 2006 through 2010. Table V-6-3 lists the “Sandwich” applied 5-year weighted quarterly speciation FRM data for each station. As expected, the annual fractional contributions to the quarterly mass at each site differed from the “top-4” average.

Figure V-6-14 presents the ratio of the 24-hour to annual PM_{2.5} fractional species contributions averaged for the six SASS sites. In general, the 24-hour PM_{2.5} “others” category is consistently a smaller percentage than the annual PM_{2.5} “others” for all seasons. However total mass for the 24-hour episodes “others” category is a factor of 1.9 higher in concentration than the annual value. In contrast, both

ammonium and nitrate have higher fractions for the episodic 24-hour PM2.5 in all quarters except the third quarter when OC (primary and secondary) becomes the dominant constituent compared with the annual fraction. The episodic sulfate in the first quarter is a higher percentage than the annual but the ratio reverses for the final three quarters. This is consistent with the SOx OGV emissions profile presented in Chapter 4 of this appendix. On average, after the first quarter, daily SOx emissions increase dramatically so that the difference between episodic and a quarterly values for the annual PM2.5 show less contrast. Overall, the average concentrations of the top-4 average 24-hour PM2.5 concentrations for the secondary aerosol components were a factor of 2.4 higher than the quarterly annual concentrations. This illustrates the combined impact of secondary aerosol formation on episodic 24-hour PM2.5 levels.

Figure V-6-14

2008 Six site SASS average quarterly ratio of 24-hour to annual species fractional contributions to PM2.5 after the “Sandwich” correction

FUTURE ANNUAL PM2.5 AIR QUALITY

The base-line projections for the annual state and federal standards are shown in Figure V-6-15. All areas will be in attainment of the federal annual standard (15 $\mu\text{g}/\text{m}^3$) by 2014. The base-line 2014 design value is projected to be 7 percent below

the federal standard. However, as shown in Figure V-6-15, the Draft Final 2012 AQMP does not achieve the California standard of $12 \mu\text{g}/\text{m}^3$ by 2014. Additional controls would be needed to attain this state standard at the Mira Loma station.

Tables V-6-4 through V-6-7 provide the projected future year PM_{2.5} annual design values by component species for 2014, 2019, 2023 and 2030 with proposed controls implemented. Projected PM_{2.5} levels indicate that the Basin will remain in attainment with the current standard. U.S. EPA has proposed lowering the annual PM_{2.5} standard to a range between 12 and $13 \mu\text{g}/\text{m}^3$. The latest attainment date for the Basin is likely to be 2023 (with a 5-year extension). Projected PM_{2.5} annual design concentrations for 2023 and 2030 are expected to be below the upper range of the new proposed standard, but would exceed the lower end of the range of $12 \mu\text{g}/\text{m}^3$ without additional controls.

CEQA ALTERNATIVE SIMULATIONS

Table V-6-8 presents the projected annual PM2.5 design values for the 2014 controlled and three CEQA alternative emissions scenarios. Complete descriptions of the CEQA alternative scenarios can be found in the Draft PEIR for the Draft 2012 AQMP. All of the CEQA alternative simulations demonstrate attainment of the 24-hour PM2.5 federal standard.

CHAPTER 7

Additional Analyses: Updating 8-Hour Ozone Projections

Introduction

Ozone Representativeness

Base-Year Model Performance Evaluation

Ozone Modeling Approaches

Future Ozone Air Quality

Looking Beyond 2023

INTRODUCTION

The 2007 AQMP provided a comprehensive 8-hour ozone analysis that demonstrated future year attainment of the 1997 federal ozone standard (80 ppb) by 2023 with implementation of short-term measures and CAA Section 182(e)(5) long term emissions reductions. The analysis concluded that NO_x emissions needed to be reduced approximately 76 percent and VOC emissions reduced approximately 22 percent from the 2023 baseline in order to demonstrate attainment. The 2023 baseline VOC and NO_x summer planning emissions inventories included 536 and 506 TPD, respectively.

As presented in Chapter 3 of the Draft Final 2012 AQMP, 2023 baseline emissions of both precursor pollutants are estimated to be lower than those 2023 baseline established in the 2007 AQMP. The Draft Final 2012 AQMP baseline VOC and NO_x summer planning emissions for 2023 have been revised to 434 and 313 TPD, respectively. The emissions revision incorporated changes made to the on-road truck and off-road equipment categories resulting from recent CARB rulemaking. The new emissions inventory also reflects the impact of the economic slowdown and revisions to regional growth estimates. As a consequence, it is important to revisit the baseline projections for 2023 to investigate what impact the inventory revision had on the ozone attainment demonstration and equally important, what is the impact to the size of the proposed long term NO_x emissions reduction commitment.

OZONE REPRESENTATIVENESS

As a component of the PM_{2.5} attainment demonstration, the CMAQ modeling provided Basin-wide ozone air quality simulations for each hour in 2008. Past ozone attainment demonstrations evaluated a set of days characterized by restrictive meteorology or episodes occurring during concurrent intensive field programs. Of great importance, these episode periods needed to be rated in terms of how representative they were relative to the ozone standard being evaluated. For the now revoked 1-hour ozone standard, the attainment demonstration focused on a limited number of days closely matching the annual design value. Typically, the analysis addressed less than 5 days of simulations. The 2007 AQMP was the first to address the 8-hour ozone standard and the use of RRFs in the future year ozone projection. To provide a robust characterization of the RRFs for use in the attainment demonstration, the analysis simulated 36 days. The ozone modeling guidance recommends that a minimum of 5-days of simulations meeting modeling acceptance

criteria are used in a future year RRF calculation, but also recommends incorporating as many days as possible to fully capture both the meteorological variations in the ozone season and the response to different daily emissions profiles.

This update to the future year ozone projection focuses on 91 days of ozone air quality observed during June through August 2008. During this period, seven well defined multiday ozone episodes occurred in the Basin with 75 total days having daily Basin-wide maximum concentrations of 80 ppb or higher. More importantly, when assessed for a normalized meteorological ozone episode potential using a regression based weighting covering 30-years of data (1998-2010), as summarized in the 2003 AQMP, 8 days during the 2008 period were ranked above the 95th percentile in the long term distribution of potentials, and another 19 were ranked between the 90th and 94th percentile.

Figure V-7-1 depicts the time series of the daily Basin maximum and the Crestline (the Basin design station) daily maximum 8-hour ozone air quality during the three month period in 2008. The seven primary meteorological episodes which occur primarily between mid June and August are highlighted in the figure. It is important to note that the analysis not only focused on the seven periods or Crestline specifically. All station days meeting the acceptance criteria for calculating a daily RRF were included in the analysis. Several locations in the San Bernardino and Riverside Valleys exhibit similar transport and daily patterns of ozone formation as Crestline. The peak Basin 2008 8-hour average ozone concentration was observed at Santa Clarita on August 2nd with a value of 131 ppb along a distinctly different transport route.

FIGURE V-7-1

Observed Basin and Crestline Daily Maximum 8-Hr Average Ozone Concentrations: June 1 through August 31, 2008. (Shaded areas indicate multiple day regional ozone episodes).

Overall, the 91 day period provides a robust description of the 2008 ozone-meteorological season. Table V-7-1 lists the number of days each Basin station exceeded the 8-hour ozone standard during the June through August 2008 period. Also listed in Table V-7-1 are the 2008, 5-year weighted design values used in the future year ozone projections.

TABLE V-7-1

2008 Basin Weighted Design Values* and Number of Days Daily Maximum Concentrations Exceeded 80 ppb

BASE-YEAR OZONE MODEL PERFORMANCE EVALUATION

For the CMAQ performance evaluation the modeling domain is separated into nine sub-regions or zones. Figure V-7-2 depicts the sub-regional zones used for base-year simulation performance. The different zones present unique air quality profiles. In previous ozone modeling attainment demonstrations using a smaller modeling domain, the number and size of the zones were different. Seven zones represented the Basin and portions of Ventura County, the Mojave Desert and the Coachella Valley.

For the current analysis the Basin is represented by three of the zones: Zone 3 – the San Fernando Valley, Zone 4 – the Eastern San Gabriel, Riverside and San Bernardino Valleys, and Zone 5 – the Los Angeles and Orange County emissions source areas. Of the three areas, Zone 4 represents the Basin maximum ozone concentrations and the primary downwind impact zone. As such, the priority in evaluating model performance is focused on Zone 4. Zone 9 includes the Coachella Valley portion of the Salton Sea Air Basin.

FIGURE V-7-2
Performance Evaluation Zones

Statistical Evaluation

The statistics used to evaluate 1-hour average CMAQ ozone performance do not change from previous AQMPs and include the following:

<u>Statistic for O₃</u>	<u>Criteria (%)</u>	<u>Comparison Basis</u>
Normalized Gross Bias	≤ ±15	Paired in space and time
Normalized Gross Error	≤ 35	Paired in space (+2 grid cells) and time
Peak Prediction Accuracy	≤ ± 20	Unpaired in space and time

The same statistics are applied to the 8-hour average ozone.

The base year average regional model performance for June through August 2008 for Zones 3, 4, and 5 are presented in Tables V-7-2 to V-7-7 for days when Basin maximum 8-hour ozone levels were at least 85 ppb. Base year 8-hour ozone performance statistics for Zone 9 in the downwind Coachella Valley portions of the Salton Sea Air Basin are provided in Table V-7-8. Performance statistics are

presented for observed concentrations of 60 ppb or greater. Data for 1- and 8-hour average ozone concentrations for the sub regional peak concentrations are both provided in the tables.

The CMAQ ozone simulations generally meet the 1-hour average unpaired peak and normalized error model performance goal in all three zones on most days. Normalized bias tended to be negative, particularly in June. Zone-5 however showed a tendency for over prediction in all three months. Zone 4 displayed the best unpaired peak performance with 54 out of 58 days meeting the 20 percent criteria. Unpaired peak performance in Zones 3 and 5 lagged, with only 76 and 79 percent of the days meeting the criteria. Overall, the 8-hour average evaluation was slightly better, however observed 8-hour ozone did not exceed the 60 ppb threshold for inclusion in the analysis on more days in Zone 5.

Table V-7-2

June 2008 Base Year 1-Hour Average Ozone Performance for Days When Regional 8-Hour Maximum \geq 85 ppb

Graphical Evaluation

Figures V-7-3 through V-7-8 show the diurnal trends of observed and predicted 8-hour ozone for the each day from June 1 through August 31, 2008 for six stations following a transport route from the coastal area of the Basin to inland Crestline and Banning. Supplemental diurnal observed and predicted 8-hour ozone for all remaining air quality sites are provided as Attachment 3 to this appendix. In general, the coastal-metropolitan areas of the Basin show reasonable agreement between observed and predicted diurnal distributions for June but as observations trend well below 80 ppb in July and August, the performance shifts to over prediction. The San Gabriel and San Bernardino Valley sites are relatively unbiased with mixed but reasonably good performance – over predicting on some days while displaying the reverse on others. Performance at Crestline displays a slight bias towards under prediction but several peak days are well characterized. Banning is the eastern most Basin site and furthest removed from the main source of NOx emissions. Ozone predictions at Banning track the peak concentrations well but nighttime NOx scavenging is not well represented in the simulations.

Figure V-7-9 depicts the scatter plots of observed and predicted 8-hour daily maximum ozone for Zones 3, 4 and 5 merged for the three months. A minimum observed threshold of 60 ppb is used in the data selection. V-7-10 provides the same scatter plot for Zone 9. The general tendency is for peak prediction to fall within 10 percent of the centerline perfect fit. Zone 9 tends to exhibit under prediction.

Overall, it is important to note that the effects of prediction biases or errors are mitigated by the use of relative response factors for the attainment analysis.

OZONE MODELING APPROACH

The ozone modeling approach used in this update follows the same criteria employed for the 2007 AQMP attainment demonstration. Briefly, the set of 91 days from June 1 through August 30, 2008 were simulated as a subset of the annual PM_{2.5} simulations, and were analyzed to determine daily 8-hour average maximum ozone for the 2008 and 2023 emissions inventories. A separate 2023 simulation was conducted to assess future year ozone with VOC and NO_x emissions specified at the levels defined by the 2007 AQMP attainment demonstration carrying capacity (420 TPD VOC and 114 TPD NO_x). Finally, a set of simulations with incremental VOC and NO_x emissions reductions from 2023 baseline emissions was generated to create ozone isopleths for each station in the Basin. The ozone isopleths provide updated guidance for the formulation of the future control strategies, particularly in light of the challenge of demonstrating attainment with the current 75 ppb standard in a SIP to be submitted to U.S. EPA in 2015.

The ozone RRFs were calculated using the ratio methodology described for the PM_{2.5} modeling. Individual station day inclusion in the analysis was determined by three basic criteria: (1) the observed ozone concentration had to be \pm 30 percent of the station's weighted design value; (2) the absolute prediction accuracy of the base 2008 simulation for that day was required to be within 20 percent; and (3) the observed daily maximum concentration needed to be greater than 84 ppb. The criteria were designed to eliminate extreme values from entering the analysis and to only focus on station days where model performance met the long standing criteria for acceptance used in previous attainment demonstrations. Finally, only station days where ozone exceeded the 84 ppb threshold established to demonstrate attainment to the 1997 ozone standard as specified in the U.S. EPA Modeling Attainment Guidance Document were included in the analysis.

FUTURE OZONE AIR QUALITY

Table V-7-9 summarizes the results of the updated ozone simulations. Included in the table are the 2023 ozone baseline and 2023 controlled ozone projections from the 2007 AQMP ozone attainment demonstration modeling analysis approved by U.S. EPA as part of the SIP. The Draft Final 2012 AQMP base year ozone simulations reflect the changes made to the 2023 base year inventory. The Draft Final 2012 AQMP summer planning inventory has a higher ratio between VOC and NO_x emissions (1.39 vs. 1.05) although total tonnages of both precursor emissions are lower than presented in the 2007 AQMP. The higher VOC to NO_x ratio is indicative of a more reactive pollutant mix with average projected ozone design concentrations 9 percent higher than previously projected. One implication of this simulation is that moderate VOC emissions

reductions in the years between 2014 and 2023 will benefit regional ozone concentrations. Yet, the projected 2023 baseline design value of 108 PPB continues to exceed the federal standard by 35 percent. With the implementation of the Draft Final 2012 AQMP short term control measures and the Section 185(e)(5) long-term control measures, (defined in this update as the difference between the Draft Final 2012 AQMP 2023 baseline VOC and NO_x emissions and the corresponding 2007 AQMP ozone attainment demonstration carrying capacity for the Basin), projected regional ozone design values closely match those defined in the 2007 AQMP ozone attainment demonstration. Regardless, it will still require a 64 percent reduction in NO_x emissions and an additional 3 percent reduction in VOC emissions to attain the 1997 ozone standard. With controls in place, the updated analysis corroborates the approved 2007 AQMP ozone attainment demonstration in that it is expected that all stations in the Basin will meet the federal 8-hour ozone standard.

The east Basin stations in the San Bernardino Valley continue to have among the highest projected 8-hour controlled design values for this update. The 2023 controlled ozone design value at Glendora is also projected to exceed 80 ppb. Glendora, Upland, Fontana and San Bernardino are downwind receptors along the primary wind transport route that moves precursor emissions and developing ozone eastward by the daily sea breeze. The higher projected design value at Glendora reflects the higher VOC to NO_x ratio observed in the baseline inventory relative to the 2007 AQMP 2023 baseline inventory. The 2023 controlled design at Glendora for the Draft Final 2012 AQMP actually represents a greater response to emissions reductions than in the 2007 AQMP attainment demonstration. Future year projections of ozone for this update along the northerly transport route through the San Fernando Valley indicate that the ozone design value in the Santa Clarita Valley will be approximately 15 percent below the standard.

* Informational purpose only based on preliminary emissions inventories.

** Based on the city-station specific RRF's determined from the 19 episode day average.

*** Based on the average of the RRF's determined from the stations meeting the criteria having more than 5 episode days.

Spatial Projections of 8-Hour Ozone Design Values

The spatial distribution of ozone design values for the 2008 base year is shown in Figure V-7-11. Future year ozone air quality projections for 2024 with and without implementation of all control measures are presented in Figures V-7-12 and V-7-13. The predicted ozone concentrations will be significantly reduced in the future years in all parts of the Basin with the implementation of proposed control measures in the South Coast Air Basin.

Coachella Valley

The results of the CMAQ 8-hour ozone simulations conducted for 2014 and 2019 also indicate that the two Coachella sites, Palm Springs and Indio will meet the federal standard by the 2019 attainment date. The projected 2018 8-hour ozone design for the Coachella Valley portion of the Salton Sea Air Basin will be 84 ppb.

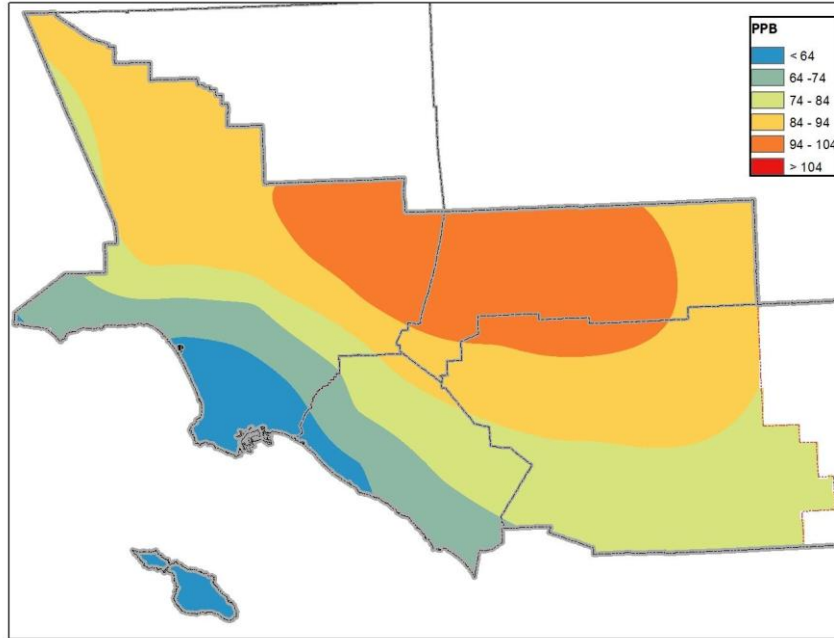

FIGURE V-7-12

Model-Predicted 2024 Baseline 8-Hour Ozone Design Concentrations (ppb)

FIGURE V-7-13

Model-Predicted 2024 Controlled 8-Hour Ozone Design Concentrations (ppb)

LOOKING BEYOND 2023

The 2006 8-hour ozone standard is 75 ppb. The 2007 AQMP was focused on attainment of the 1997 8-hour ozone standard of 80 ppb. As of the writing of this document, the 2006 8-hour ozone implementation rule has not been finalized by U.S. EPA. The likely attainment date for Basin attainment of the 75 ppb standard is 2032. It is important to consider how much additional emissions reductions will be required for future attainment of this new standard. Figure V-7-14 provides the ozone isopleth for Crestline generated from the set of ozone simulations conducted during this analysis. Relying on the NO_x heavy control strategy, it is projected that a reduction of NO_x emissions exceeding 70 percent of the 2023 baseline (313 TPD) will be required to meet the 75 ppb standard. Additional NO_x reductions will be required if the 8-hour ozone standard is lowered beyond 75 ppb.

CHAPTER 8

SUMMARY AND CONCLUSIONS

Comparison to State and Federal Standards

COMPARISON TO STATE AND FEDERAL STANDARDS

Figure V-8-1 shows the 2008 observed and 2014 model-predicted regional peak concentrations for 24-hour average and annual PM_{2.5} as percentages of the most stringent federal standard. The federal 24-hour and annual PM_{2.5} standards are predicted to be attained in 2014 with implementation of the Draft Final 2012 AQMP control measures. The California annual PM_{2.5} standard will not be attained before 2019. (see Figure V-8-2).

The challenge of attaining the proposed revision to the federal annual PM_{2.5} standard will depend on the final selection of a standard threshold at a value between 12 and 13 $\mu\text{g}/\text{m}^3$.

Given the changes made to the modeling platform, the number of episodes evaluated, and the distinct changes in the projected Draft Final 2012 AQMP 2023 baseline inventory, projected 8-hour ozone design values with implementation of the short and long term controls are very consistent with those presented in the 2007 AQMP attainment demonstration. Again, an approximate 65 percent reduction in NO_x emissions in 2023 will be required to meet the 1997 8-hour ozone standard of 80 ppb by 2024. More reductions will be required to meet the 2006 8-hour ozone standard by 2032.

2023 8-Hour Ozone Isopleths

The ozone isopleths, commonly referred as Empirical Kinetics Modeling Approach (EKMA) plots show ozone concentrations predicted under a given combination of VOC and NO_x emissions. The upper right corner represents the projected VOC and NO_x emissions in 2023 with full implementation of all adopted control measures (baseline). Moving down and left on each figure corresponds to relative emissions reductions of NO_x (down) and VOC (left). The lines within each figure represent the ozone design value at that location for a given amount of NO_x and VOC. The shape of the EKMA plots are different at different locations in the Basin due to the complex photochemical reactions involved in ozone formation. These O₃ isopleths are an important tool to provide guidance in the choice of control strategies by indicating the amount of reductions needed to meet the current and future air quality standards.

Relative Contributions of Precursor Emissions Reductions to Simulated Controlled Future-Year 24-hour PM_{2.5} Concentrations

Relative Contributions of Precursor Emissions Reductions to Simulated Controlled Future-Year 24-hour PM2.5 Concentrations

The concept of establishing relative weights of precursor emissions to simulated reductions in predicted PM2.5 was introduced in the 2007 AQMP. The procedure estimated per ton reductions of the five main contributing emissions to corresponding regional reductions of PM2.5 species concentrations. The five major precursors that contribute to the development of the ambient PM2.5 aerosol include ammonia, NOx, SOx, VOC, and directly emitted PM2.5. The contribution of ammonia emissions was embedded as a component of the SOx and NOx factors since ammonium nitrate and ammonium sulfate are the resultant particulates formed in the ambient chemical process. Various combinations of reductions in these pollutants could all provide a path to clean air.

In the 2007 AQMP the relative weights of the precursor emissions to reductions in PM2.5 species concentrations were calculated on a regional basis. Overall emissions reductions from the base year (2005) to the controlled 2014 emissions scenario were divided into the respective projected species concentration reductions averaged for a set of representative air quality stations distributed throughout the Basin. The analysis did not focus directly on the site reporting the maximum observed PM2.5 impact (Riverside-Rubidoux). The Final 2007 AQMP established a set of factors to relate regional per ton precursor emissions reductions to PM2.5 air quality improvements based on the annual average concentration. One TPD reduction of NOx was projected to reduce regional annual PM2.5 by 0.00345 $\mu\text{g}/\text{m}^3$. The Basin averaged conversion factors resulting from this analysis were submitted as part of the 2007 SIP (Appendix C, of the CARB staff report, "PM2.5 Reasonable Further Progress Calculations"¹) and approved by U.S. EPA. The normalized-equivalent NOx emissions conversion factors for annual PM2.5 in 2014 were as follows: VOC: 0.43, NOx: 1.0, directly emitted PM2.5: 9.86 and SOx: 15.03.

The Draft Final 2012 AQMP provides a similar set of factors, but this time directed at 24-hour PM2.5 based on the 2012 CMAQ simulation results for the precursor emission reductions from 2008 to the controlled 2014 scenario. The projected reductions in 24-hour PM2.5 component species concentrations from implementation

¹ <http://www.arb.ca.gov/planning/sip/2007sip/southcoast/staffrepappc.pdf>

of the control strategy in 2014 were averaged for six regionally representative locations having speciated data. These sites included Riverside-Rubidoux, downtown Los Angeles, Fontana, Long Beach, South Long Beach and Anaheim.

Riverside-Rubidoux was the historic PM_{2.5} maximum concentration location in the Basin (annual and 24-hour) and is located less than 8 km downwind of the Mira Loma monitoring station. Rubidoux and Mira Loma share a common emissions profile that is dominated by local dairy emissions coupled with mobile source emissions reflecting both freeway traffic and an emerging warehouse distribution center truck profile. The Fontana site shares the traffic and warehouse emissions profiles together with local emissions from industrial activities. The Fontana site will periodically be impacted from transported emissions from the dairy farms as well. Both Fontana and Rubidoux are downwind receptors of regional emissions from the major metropolitan sources that have incorporated a mix of primary and reactive chemical species.

By comparison, the metropolitan central Los Angeles site reflects a mix of emissions from heavy local and freeway traffic, railway and goods movement operations and significant industrial activities from a varying profile of small to large sources. The Long Beach site is in close proximity to three heavily traveled freeways including the commuter impacted I405 and the heavy diesel truck impacted I710. The site is also located directly downwind of refineries and rail transfer facilities. The South Long Beach monitor is directly impacted from goods movement trucking and rail emissions as well as the ocean going vessel (OGV) emissions emanating from the Ports of Los Angeles and Long Beach. The Anaheim site reflects a neighborhood profile including both freeway and local-residential traffic and light to moderate industrial activities. Both Anaheim and Los Angeles are downwind of OGV and port emissions. Typical Basin wind flow places Los Angeles as a receptor of these source emissions during the morning hours after which the rotation of the sea breeze targets the Anaheim area in the afternoon and early evening hours.

Calculation of the Draft Final 2012 AQMP relative contributions of the precursor emissions to the regionally averaged reductions in the component 24-hour PM_{2.5} species followed the procedure as in the 2007 SIP. Table 1 summarizes the relative precursor contributions to 2014 24-hour PM_{2.5} from 1-TPD emissions reduction to simulated reductions of VOC, NO_x, SO_x and directly emitted PM_{2.5}. (Again, it is

important to note that the reductions of ammonium are incorporated together with bonded water in the estimation of reduced regional sulfate and nitrate). Compared with the annual Basin averaged conversion factors included in the 2007 AQMP, 1-TPD of directly PM2.5 emissions reductions resulted in 6 times more reduction of mass for the 24-hour PM2.5. For the 2014 controlled scenario, 1-TPD of directly emitted PM2.5 resulted in an average 0.2132 $\mu\text{g}/\text{m}^3$ improvement in ambient PM2.5. 1-TPD reductions of VOC, NOx and SOx emissions resulted in between 2 to 4 times more mass reduction for the 24-hour PM2.5 than estimated for the Basin annual average concentration.

Table 2 provides the normalized NOx-equivalent conversion factors that relate the precursor emissions to PM2.5 species reduction factors to a common currency, NOx emissions. The 24-hour PM2.5 factors place a greater weight on the reduction of directly emitted particulate while maintaining the emissions contribution factor for VOC and nominally lowering the factor for SOx compared with the 2007 SIP factors for annual PM2.5. Overall the normalized-equivalent NOx emissions conversion factors for 24-hour PM2.5 for the 2014 controlled scenario were: VOC: 0..3, NOx: 1.0, SOx: 7.8 and directly emitted PM2.5: 14.8. As with the annual estimation, the factors are valid for the 2014 controlled emissions scenario. Figure 1 depicts the relative PM2.5 reductions for ammonium nitrate, ammonium sulfate, organic carbon and particulates projected from the 2008 base year to the simulated 2014 control scenario.

INTRODUCTION

The South Coast Air Basin (Basin) is classified as “Nonattainment” with respect to the 1997 PM_{2.5} National Ambient Air Quality Standards (NAAQS) of 15 µg/m³ annual average, and 65 µg/m³ 24-hour average, and the U.S. EPA has granted the Basin a one-time extension to April 5, 2015 to reach attainment.¹ In 2006, the U.S. EPA lowered the 24-hour PM_{2.5} standard to 35 µg/m³, and designated the Basin and 30 other areas as nonattainment, effective December 14, 2009. The Basin is required to submit an Air Quality Management Plan (AQMP) to U.S. EPA no later than 3 years after designation date, by December 14, 2012, to address the attainment strategies for the 2006 24-hour PM_{2.5} standard. In addition, the Basin must reach attainment within 5 years of the designation date, or by December 14, 2014. Table VI-1 provides a list of several nonattainment areas in the nation and the important milestone dates that require actions from the nonattainment air districts.

TABLE VI-1
PM_{2.5} NAAQS Designation and Implementation

Nonattainment Areas	<ul style="list-style-type: none"> — Los Angeles, South Coast Air Basin, CA — San Joaquin Valley, CA — New York, New Jersey, Long Island, CT 	<ul style="list-style-type: none"> — Los Angeles, South Coast Air Basin, CA — San Joaquin Valley, CA — Sacramento Metro, CA — San Francisco, CA — New York, New Jersey, Long Island, CT
Effective Date of Standards	September 1997	December 2006
Effective Date of Designations	April 2005	December 2009
SIPs Due Within 3 Years	April 2008	December 2012
Attainment Date Within 5 Years	April 2010	December 2014
Attainment Date With Extension	Up To April 2015	Up To December 2019

Particulate Matter (PM_{2.5}) Nonattainment Areas, www.epa.gov/airquality/greenbook/rnc.html, posted on 3/30/2012.

With regards to the ozone standards, on March 12, 2008, the U.S. EPA strengthened its ground-level 8-hour ozone standard from 0.08 parts per million (ppm) to a level of 0.075 ppm. On May 21, 2012, the U.S. EPA classified two areas in the country, the South Coast and the San Joaquin Valley, as “Extreme” nonattainment areas with respect

to the 2008 8-hour ozone standard.² The attainment dates for the 1997 and 2008 ozone standards are June 15, 2024 and December 31, 2032, respectively. Table VI-2 shows the classifications and attainment dates for several nonattainment areas in the nation. While an extreme nonattainment area has a period of 20 years from the date of designation to reach attainment, other areas that are classified as severe, serious, moderate and marginal must reach attainment sooner in 15 years, 9 years, 6 years and 3 years after the date of designation, respectively.³

TABLE VI- 2
8-Hour Ozone NAAQS Designation and Implementation

NONATTAINMENT AREA	1997 OZONE STANDARD		2008 OZONE STANDARD	
	Classification	Attainment	Classification	Attainment

New York, New Jersey, Long Island, CT	Moderate	June 2010	Marginal	December 2015
Washington (DC-MD-VA Area), District Columbia	Moderate	June 2010	Marginal	December 2015
San Francisco, CA	Marginal	June 2007	Marginal	December 2015

Note: Classifications of 8-Hour Ozone Nonattainment Areas, www.epa.gov/airquality/greenbook/gnc.html, posted on 3/30/2012. The designation date is December 31, 2012. Attainment dates are within 20 years after the date of designation for extreme area, 15 years after the date of designation for severe area, 9 years after the date of designation for serious area, 6 years after the date of designation for moderate area, and 3 years after the date of designation for marginal area.

To address multiple layers of attainment deadlines, the District is working in collaboration with CARB and the San Joaquin Valley to develop a joint “Vision of Clean Air” and formulate the attainment strategies for 24-hour PM2.5 standards in 2014-2019, 8-hour ozone standards in 2024-2032, and the state is committed to reduce greenhouse gases emissions by 2050. The District’s goal is to develop and incorporate

all feasible control measures while balancing costs and socioeconomic impacts to meet the requirements of the Clean Air Act (CAA) on a timely basis.

The CAA, Section 172(c)(1), sets the overall framework for the Reasonably Available Control Measures (RACM) analysis. The CAA requires the nonattainment air districts to:

“provide for the implementation of all reasonably available control measures as expeditiously as practicable (including such reductions in emissions from existing sources in the area as may be obtained through the adoption, at a minimum, of reasonably available control technology) and shall provide for attainment of the national primary ambient air quality standards.”

The U.S. EPA provided further guidance on the RACM in the preamble and the final “Clean Air Fine Particle Implementation Rule” to implement the 1997 PM_{2.5} NAAQS which were published in the Federal Register in November 1, 2005 and April 25, 2007, respectively.^{4, 5} The U.S. EPA’s long-standing interpretation of the RACM provision stated in the 1997 PM_{2.5} Implementation Rule is that the nonattainment air districts should consider all candidate measures that are available and technologically and economically feasible to implement within the nonattainment areas, including any measures that have been suggested; however, the districts are not obligated to adopt all measures, but should demonstrate that there are no additional reasonable measures available that would advance the attainment date by at least one year or contribute to reasonable further progress (RFP) for the area.

Regarding the approach of identifying emission reduction programs, the U.S. EPA recommends the nonattainment air districts to first identify the emission reduction programs that have already been implemented at the federal, other states and local air districts. Next, the U.S. EPA recommends the air districts to examine additional RACM/RACTs adopted for other nonattainment areas to attain the ambient air quality standards as expeditiously as practicable. The U.S. EPA also recommends the air districts evaluate potential measures for sources of direct PM_{2.5}, SO_x and NO_x first with a presumption that VOC and ammonia do not significantly contribute to the PM_{2.5} concentration in the nonattainment area. The PM_{2.5} Implementation Rule also requires the air districts establish RACM/RACT emission standards taking into consideration the condensable fraction of direct PM_{2.5} emissions after January 1, 2011. In addition, the U.S. EPA recognizes that each nonattainment area has its own profile of emitting sources, and thus neither requires specific RACM/RACT to be implemented in every nonattainment area, nor includes a specific source size threshold for the RACM/RACT

analysis. The U.S. EPA however recommends severe nonattainment air districts to evaluate controls for smaller sources if needed for attainment.

A RACM/RACT demonstration must be provided within the State Implementation Plan (SIP). For areas projected to attain within five years of designation, a limited RACM/RACT analysis including the review of available reasonable measures, the estimation of potential emission reductions, and the evaluation of the time needed to implement these measures is sufficient. The areas that cannot reach attainment within five years must conduct a thorough RACM/RACT analysis to demonstrate that sufficient control measures could not be adopted and implemented cumulatively in a practical manner in order to reach attainment at least one year earlier.

In regards to economically feasible, the U.S. EPA did not propose a fixed dollar per ton cost threshold and recommended the air districts to include health benefits in the cost analysis. As indicated in the preamble of the 1997 PM_{2.5} Implementation Rule:

“In regard to economic feasibility, U.S. EPA is not proposing a fixed dollar per ton cost threshold for RACM, just as it is not doing so for RACT...Where the severity of the nonattainment problem makes reductions more imperative or where essential reductions are more difficult to achieve, the acceptable cost of achieving those reductions could increase. In addition, we believe that in determining what are economically feasible emission reduction levels, the States should also consider the collective health benefits that can be realized in the area due to projected improvements.”

Subsequently, on March 2, 2012, the U.S. EPA issued a memorandum to confirm that the overall framework and policy approach stated in the PM_{2.5} Implementation Rule for the 1997 PM_{2.5} standards continue to be relevant and appropriate for addressing the 2006 24-hour PM_{2.5} standards.⁶

The objective of this Appendix is to demonstrate that the District has conducted a thorough RACM/RACT analysis to meet the requirement of the CAA following closely the policy and guidance approach provided by the U.S. EPA in its PM_{2.5} Implementation Rule in identifying and selecting the control measures for the Draft Final 2012 AQMP.

For the scope of this RACM analysis, District staff will closely study the attainment strategies for stationary and area sources, the rules and regulations of the air districts responsible for the nonattainment areas listed in Table VI-1 and Table VI-2 while taking into account all available candidate measures proposed by the U.S. EPA, CARB,

the Advisory Committee members, the technical experts in air pollution control as well as the public and variety of stakeholders. Staff selected the air districts listed on Table VI-1 and Table VI-2 based on the severity of their nonattainment status and their near-term attainment dates. The RACM analysis for Transportation Control Measures is conducted by SCAG as shown in Appendix IV-C and the RACM analysis for mobile sources conducted by the CARB is shown in the Attachment of this Appendix.

IDENTIFYING AND EVALUATING REASONABLY AVAILABLE CONTROL MEASURES

To demonstrate that the District has considered all candidate measures that are available and technologically and economically feasible to implement within the Basin, the District staff has conducted 6-steps analysis described below.

Step 1 - Air Quality Technology Symposium

District staff conducted the 2012 Air Quality Technology Symposium in September 2011 with participation of technical experts from a variety of areas and the public to solicit new and innovative concepts to assist the Basin in attaining the NAAQS) for PM_{2.5} by 2014-2019 and ozone by 2024-2032. In addition, the District's Planning, Rules Development and Area Sources Division conducted multiple internal meetings with the District's Technology Advancement Office and the Engineering & Compliance Division from September through November of 2011 to brainstorm ideas for feasible control measures. In addition, the District also conducted an on-going extensive outreach to engage a wide range of stakeholders in the process. In general, the following concepts were proposed:

- Promoting zero or near-zero emission measures and providing incentives for on-road and non-road mobile sources as well as goods movement;
- Further reducing VOC emissions from marine coatings, aerospace coatings, solvents and various consumer products, and focusing on reformulations or alternatives to VOC based-solvents;
- Conducting a mandatory technology review for NO_x RECLAIM, and further reducing NO_x emissions through the use of low NO_x burners, fuel cells, biogas control, distributed power generation applications, and assessment for all feasible measures, as well as incentives;

- Addressing energy-climate change and co-benefits, the need for electricity storage and smart grid, or new fossil-fueled peaking plants, to compensate for fluctuations in renewable energy supply, and the use of outreach to promote energy efficiency measures; and
- Influencing consumer behavior, expanding carpool programs, incentivizing with outreach, increasing gas tax, and promoting public-private participation and multi-agency collaboration.

Step 2 – U.S. EPA’s Suggested List of Control Measures

District staff reviewed for inclusion the control measure concepts suggested by the U.S. EPA for PM2.5 nonattainment areas described in the preamble of the PM2.5 Implementation Rule. As summarized in Table VI-3, the District either has an existing rule or developed a 2012 control measure for each control measure concept suggested by the U.S. EPA.

TABLE VI-3

Demonstration of Compliance with Control Measures Recommended by U.S. EPA

U.S. EPA’S CONTROL MEASURE CONCEPTS	2012 CONTROL MEASURES AND EXISTING RULES
STATIONARY SOURCE MEASURES	
Diesel engine retrofit, rebuild, replacement, with catalyzed particle filter	Rule 1470, Rule 1110.2
New or upgraded emission controls for direct PM2.5 (e.g., baghouse or electrostatic precipitator; improved monitoring methods)	Rule 1155, Rule 1156
New/upgraded emission controls for PM2.5 precursors (e.g., scrubbers)	2010 RECLAIM Amendment
Energy efficiency measures to reduce fuel consumption	Rule 1146, Rule 1146.1, Rule 1146.2, Rule 1114, Rule 1111, Control Measure EDU-01, INC-01
MOBILE SOURCE MEASURES	
On-road diesel engine retrofits for school buses and trucks using U.S. EPA-verified technologies	Refer to CARB’s Existing Rules and Control Measures
Non-road diesel engine retrofit, rebuild/replace with catalyzed particle filter	Refer to CARB’s Existing Rules and Control Measures

TABLE VI-3 (concluded)

Demonstration of Compliance with Control Measures Recommended by U.S. EPA

U.S. EPA'S CONTROL MEASURE CONCEPTS	2012 CONTROL MEASURES AND EXISTING RULES
MOBILE SOURCE MEASURES (continued)	
Diesel idling programs for trucks, locomotive, and other mobile sources	Refer to CARB's Existing Rules and Control Measures
Transportation control measures (including those listed in section 108(f) of the CAA as well as other TCMs), as well as other transportation demand management and transportation systems management strategies	Refer to SCAG's Control Measures
Programs to reduce emissions and accelerate retirement of high emitting vehicles, boats, lawn and garden equipment	Refer to CARB's Rules and Control Measures
Emissions testing and repair/maintenance programs for on-road vehicles	Refer to CARB's Rules and Control Measures
Emissions testing and repair/maintenance programs for non-road heavy duty vehicles and equipment	Refer to CARB's Rules and Control Measures
Programs to expand use of clean burning fuels	Refer to CARB's Rules and Control Measures
Opacity/emissions standards for gross-emitting diesel equipment or vessels	Refer to CARB's Rules and Control Measures
AREA SOURCE MEASURES	
New open burning regulations and/or measures to minimize emissions from forest and agricultural burning activities	Rule 444
Reduce emissions from woodstoves and fireplaces	Rule 445, Control Measure BCM-01
Regulate charbroiling/other commercial cooking operations	Control Measure BCM-02
Reduce solvent usage or solvent substitution	Control Measure CTS-02
Reduce dust from construction activities/vacant disturbed areas, paved and unpaved roads.	Rule 1157

Step 3 – Reasonably Available Control Technology (RACT)

As required by the CAA, Section 172(c)(1), the nonattainment areas must implement applicable RACTs. While RACM refers to measures which may be applicable to a wide range of sources, stationary as well as area and mobile sources, the U.S. EPA defines RACT as the lowest level of control specifically designed for stationary sources:

“lowest emission limitation that a particular source is capable of meeting by the application of control technology that is reasonably available considering technological and economic feasibility”.

The CAA, Section 172(c)(1) and Section 182, require nonattainment areas for ozone that are designated at moderate or above to adopt RACT for major sources. Nonattainment areas classified as serious, severe, or extreme must adopt control measures above and beyond the minimum RACT levels to fulfill attainment.

In addition, the CAA, Section 183, requires the U.S. EPA to provide guidance to the air districts on the “presumptive” RACT levels. As a result, the U.S. EPA developed several Control Techniques Guidelines (CTGs) for VOC sources, and Alternatives Control Techniques (ACT) documents for VOC and NO_x sources. Most of the CTGs were issued prior to 1990, and most of the ACT documents were issued in the mid-1990s. The CTGs contain mandated emission standards and work practices whereas the ACTs describe available control techniques and their cost effectiveness, but do not define “presumptive” RACT levels. The U.S. EPA is required to update existing CTG/ACTs, or develop new guidelines, on a frequent basis as new or updated control technologies become available.

The CAA, Section 182(b)(2), further requires the air districts to revise their SIPs to include the mandated RACT levels covered by the CTGs issued after November 15, 1990 and prior to the area’s date of attainment. The U.S. EPA’s final rule to implement the 8-hour ozone standard discusses RACT requirements which states that where a RACT SIP is required, the states must assure that RACT is met, either through a certification that previously required RACT controls represent RACT for 8-hour ozone standards, or through a new RACT determination.⁷ To satisfy this requirement, the District developed and submitted to CARB and U.S. EPA a demonstration and certification that the District’s rules and regulations fulfill the 8-hour ozone RACT requirements developed between 1990 and the beginning of 2006.⁸ The U.S. EPA approved the District’s RACT demonstration in December 2008.⁹

Subsequently, the U.S. EPA developed twelve new CTGs in 2006-2008 to update the requirements for several types of coatings, and staff again conducted an analysis comparing the current requirements in the District’s rules with those requirements in the new CTGs. The 12 new CTGs developed by the U.S. EPA are:¹⁰

- Flat Wood Paneling Coatings (2006)

- Flexible Packaging Printing Materials (2006)
- Industrial Cleaning Solvents (2006)
- Lithographic Materials and Letterpress Printing Materials (2006)
- Large Appliance Coatings (2007)
- Metal Furniture Coatings (2007)
- Paper, Film, and Foil Coatings (2007)
- Miscellaneous Metal Products Coatings (2008)
- Plastic Parts Coating (2008)
- Auto and Light-Duty Truck Assembly Coatings (2008)
- Fiberglass Boat Manufacturing Materials, and Miscellaneous (2008)
- Industrial Adhesives (2008)

District staff's analysis is summarized in Table VI-4. As shown in Table VI-4, three District's VOC rules, Rule 1130 – Graphic Arts, Rule 1115 – Motor Vehicle Assembly Line Coating Operations and Rule 1168 - Adhesives and Sealants have met or exceeded most, but not all, minimum requirements of the CTGs. Consequently, District staff has developed one or more control measures to address these issues. Staff estimates a potential reduction of 0.2 tons per day VOC associated with Rule 1130, and less than 0.01 tons per day VOC associated with Rule 1115, and no emission reduction estimate for Rule 1168 is available at this time. District staff is aware that additional assessments may be required, such as a determination that major VOC sources subject to Rules 1130, 1115, and 1168 met the minimum requirements in the CTGs, or a negative declaration that there are no sources in the area subject to the CTGs. These additional analyses will be provided during the rule development phase, or at the time of developing the 8-hour ozone AQMPs, whichever comes first.

TABLE VI-4
Evaluation of 2006-2008 U.S. EPA's VOC CTGs

CTG TITLE	DISTRICT RULE	EVALUATION
Flat Wood Paneling Coatings (2006)	Rule 1104 - Wood Flat Stock Coating Operations	Overall equivalency to CTG emission standards. No further action is needed. ¹
Flexible Packaging Printing Materials (2006); Lithographic Printing Materials and Letterpress Printing Materials (2006)	Rule 1130 - Graphic Arts	Regarding flexible packaging printing, the rule is more stringent than CTG, and thus no further action is needed. Regarding lithographic and letterpress printing, the CTG standards for alcohol content in fountain solution and overall control efficiency are more stringent. Staff estimated a potential reduction of 0.2 tpd and may pursue rule update as part of Control Measure MCS-01 – Application of All Feasible Measure Assessment if needed for ozone attainment. ¹
Industrial Cleaning Solvents (2006)	Rule 1171 - Solvent Cleaning Operations	District rule is more stringent than CTG. No further action is needed. ²
Large Appliance Coatings (2007); Metal Furniture Coatings (2007); and Miscellaneous Metal Products Coatings (2008)	Rule 1107 - Coating of Metal Parts and Products	District rule is equivalent or more stringent than CTGs, thus no further action is needed. ²
Paper, Film, and Foil Coatings (2007)	Rule 1128 - Paper, Fabric, and Film Coatings	District rule is more stringent than CTG. No further action is needed. ¹
Plastic Parts Coatings (2008)	Rule 1145 - Plastic, Rubber, Glass Coatings	District rule is equivalent or more stringent than CTG. No further action is needed. ¹
Auto and Light-Duty Truck Assembly Coatings (2008)	Rule 1115 - Motor Vehicle Assembly Line Coating Operations	CTG has more stringent limits for electro-deposition primer at 84 g/L (145 g/L in Rule 1115); sprayable primer, primer-surfacer, and topcoat at 144 g/L (180 g/L in Rule 1115); and trunk coatings, interior coatings, sealers, and deadeners at 650 g/L (Rule 1115 provides an exemption for these categories). However, Rule 1115 has a small inventory of about 0.01 tpd, thus no action is needed. ¹
Fiberglass Boat Manufacturing Materials, and Miscellaneous (2008)	Rule 1162 - Polyester Resin Operations	The rule has an overall equivalency to CTG based on more stringent transfer efficiency requirements. No further action is needed. ²
Industrial Adhesives (2008)	Rule 1168 - Adhesives and Sealants	CTG has more stringent limits for reinforced plastic composite at 200 g/L (250 g/L in Rule 1168); single-ply roof membrane adhesive primer at 250 g/L (450 g/L in Rule 1168); other adhesive primers at 250 g/L (420 g/L in Rule 1168); the control efficiency is 85% (80% in Rule 1168); and the work practices is limited only for stripping cured adhesives or sealants for Rule 1148. Staff may further pursue rule update as part of Control Measure MCS-01 – Application of All Feasible Measures Assessment or CTS-02 – Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants if needed for ozone attainment. ³

Note: 1) Evaluation conducted by Hopps and Ono; 2) Evaluation conducted by Morris and Ono; 3) Evaluation conducted by Calungcagin and De Boer.

Step 4 - Other Districts' Current Rules and Regulations

Because the District is classified as extreme nonattainment for both the 1997 and 2008 ozone standards, and nonattainment for both the 1997 and 2006 PM_{2.5} standards, the District staff commits to search for innovative control technologies, make improvements, and update the District's rules and regulations as expeditiously as possible to effectively help the Basin reach the PM_{2.5} attainment in 2014-2019, and ozone attainment in 2024-2032. District staff's envisioned that the control technologies available and cost-effective to be implemented in other local areas in California, or any other areas in the nation, would be available and cost-effective for use in the Basin in a timely manner.

To catch all the improvements on innovative control technologies and identify the areas for improvements in its rules and regulations, the District staff re-evaluated all the District's source-specific rules and regulations, and compared the requirements in these rules with more than 100 rules recently adopted or amended by four local air districts in California from 2007 to 2012. The four air districts selected are San Joaquin Valley, Sacramento Metropolitan, Ventura, and San Francisco Bay Area. Staff selected these districts based on the severity of their nonattainment status and their near-term attainment dates as shown in Table VI-1 and Table VI-2.

The summary of this analysis is presented in Table VI-5. In this table, staff *only* listed the areas where the requirements in other local air district's rules are more stringent than those in the District's rules and regulations. The analysis in Table VI-5 shows that in general the District's current rules and regulations are equivalent to or more stringent than those developed by other air districts. However, where improvements are possible, District staff has developed several control measures to further study the situations.

Details of the control measures, emission reductions, cost effectiveness, prioritization and implementation schedule are discussed in Chapter 4 and Appendix IV. The modeling results discussed in Chapter 5 has shown that the attainment for PM_{2.5} can be achieved with a few episodic additional control measures. With regards to the ozone attainment, the District has identified several control measures with estimated early emission reductions. The control measures of which emission reductions cannot be quantified will not be considered RACMs since they cannot be used collectively to estimate the advancement of the attainment date.

Staff commits to fine-tune the emission inventory, emission reduction, and cost-effectiveness analysis, especially during the rule development process. In addition, staff commits to monitor the rule development in other air districts and conduct further analysis if necessary, and has developed a catch-all Control Measure MCS-01 – Application of All Feasible Measures Assessment to facilitate this activity.

Step 5 - Other Districts' Control Measures

In an effort to ensure that all feasible candidate control measures are considered, District staff evaluated more than 100 control measures adopted within the period of 2007-2012 by eight nonattainment air districts in the nation for both PM_{2.5} and 8-hour ozone listed on Table VI-1 and Table VI-2, specifically Ventura, San Francisco Bay Area, San Joaquin Valley, Sacramento Metro in California, Dallas-Fort Worth and Houston-Galveston-Brazoria in Texas, New York and New Jersey. A summary of this evaluation is provided below.

Ventura

Ventura is classified as serious nonattainment for the 2008 8-hour ozone standard. In the 2006-2008 Final Triennial Assessment and Plan Update,¹¹ the Ventura County Air Pollution Control District conducted an analysis of all feasible control measures, and identified 7 new control measures in addition to the 15 control measures in the Ventura's 2007 AQMP. In this list, there is only one new Ventura's control measure described below that is more stringent than the requirements in the existing District's rules:

Ventura adopted a control measure to eliminate the current vapor pressure limit (45 mmHg) of low VOC spray gun cleaning and establish a new limit of 25 g/L VOC content for cleaning solutions used in aerospace assembly and component manufacturing operations, adhesives and sealants, marine coating operations, and pleasure craft coatings and commercial boatyard operations. Currently, the cleaning solutions used in marine coating operations, pleasure craft coatings, and adhesives and sealants in the Basin are subject to District's Rule 1171 limit of 25 g/L, and there is no vapor pressure limit in Rule 1171. However, the limit for cleaning solutions and strippers in District's Rule 1124 – Aerospace Assembly and Component Manufacturing Operations are currently at 200 g/L (or 45 mmHg) and 300 g/L (or 9.5 mmHg), respectively, and there is a potential to reduce these limits. Further assessment will be

conducted through the District's Control Measure CTS-02 – Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants.

San Francisco Bay Area

San Francisco Bay Area is a nonattainment area for PM_{2.5} standard and a marginal nonattainment for 8-hour ozone standards. On September 15, 2010, the Bay Area adopted the final Bay Area 2010 Clean Air Plan (CAP) ¹² to provide an integrated, multi-pollutant strategy to address ozone, PM, air toxics and greenhouse gases. The plan established 55 feasible control measures to be implemented in the 2010-2012 timeframe in which there are 18 measures for stationary and area sources and 4 energy and climate measures. The following 6 Bay Area's control measures are currently above and beyond the requirements in the existing District's rules:

- Bay Area's Control Measure SSM1 – Metal Melting, and Control Measure SSM6 – PM Limitation proposed to reduce particulate emission limits and encourage the use of high efficiency filtration at foundry operations and metal melting facilities, and other facilities whenever appropriate. The Bay area has developed and proposed amended rule for SSM1 and scheduled for a Public Hearing in 2012. District staff will conduct further analysis study on this concept through the District's Control Measure MCS-01 – Application of All Feasible Measures Assessment.
- Bay Area's Control Measure SSM2 – Digital Printing proposed to control VOC emissions from digital printing. The Bay Area is currently collected emissions information from this fairly new category of printing, including solvent-based inkjet printing and laser printing. It is forecasted to have 21% market share by 2025, and thus there will be a potential to reduce VOC emissions from this category. District staff will conduct further study on this concept through the District's Control Measure MCS-01 – Application of All Feasible Measures Assessment.
- Bay Area's Control Measure SSM5 – Vacuum Trucks requires carbon or other control technology on vacuum trucks to reduce emissions of VOCs. District staff will conduct further study on this concept through the District's Control Measure FUG-01 – Further VOC Reductions from Vacuum Trucks.
- Bay Area's Control Measure SSM9 – Cement Kilns, SSM10 – Refinery Boilers and Heaters, SSM11 - Glass Furnaces proposed to further reduce NO_x from these source

category. District staff will conduct further study through the Control Measure CMB-01 – Further NO_x Reductions from RECLAIM.

- Bay Area’s Control Measure ECM1 – Energy Efficiency proposed 1) to promote education and training to increase awareness on energy efficiency; 2) to provide technical assistance to local governments and encourage them to adopt and enforce energy efficient building codes; and 3) to provide incentives for improving energy efficiency at schools. These concepts are similar to those described in the District’s Control Measure EDU-01 – Further Criteria Pollutant Reductions from Education, Outreach and Incentives.
- Bay Area’s Control Measure ECM2 - Renewable Energy proposed to promote distributed renewable energy generation (solar, micro wind turbines, cogeneration, etc.) on commercial and residential buildings, and at industrial facilities. These concepts are covered under the District’s Control Measure EDU-01 – Further Criteria Pollutant Reductions from Education, Outreach and Incentives.

The District already spearheaded in implementing other concepts in the Bay Area’s AQMP that called for reducing SO₂ emissions from coke calciner and cement kilns; further controlling VOC emissions from livestock waste and natural gas production facilities; and NO_x emissions from residential fan type furnaces, space heating, dryers, and ovens. The District also has an on-going program that promotes tree planting. Other Bay Area’s control measures addressing New Source Review, Air Toxics “Hot Spots” program, and greenhouse gases in permitting, are either administrative in nature or not related to criteria pollutants.

San Joaquin Valley

San Joaquin Valley is extreme nonattainment with respect to 2008 8-hour ozone standards and nonattainment with respect to PM_{2.5} standards. Up to date, the San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) has developed two separate plans to address the 8-hour ozone standards in 2007 and the 1997 PM_{2.5} standards in 2008. Recently, the SJVUAPCD developed a 2010 mid-course review for the ozone plan, and continued the feasibility study for several other measures such as refinery wastewater separators, refinery turnaround units, refinery vacuum devices and municipal water treatment plans. In addition, the SJVUAPCD is in the process of developing a plan to address the 2006 PM_{2.5} standards in cooperation with CARB and the District. District staff reviewed the list of control measures completed and listed in

the San Joaquin Valley's 2010 mid-course review in comparison with the 2012 control measures recommended by the District. Overall, the District has either already implemented or developed control measures with similar concepts proposed in the SJVUAPCD plans.¹³⁻¹⁵

Dallas-Fort Worth (DFW) Texas

The entire state of Texas is in attainment of the PM_{2.5} standards, but the state has two nonattainment areas with respect to the 8-hour ozone standards: the Dallas-Fort Worth and the Houston-Galveston-Brazoria. The DFW area was reclassified from a moderate to a serious nonattainment area for the 1997 8-hour ozone standard, and is moderate nonattainment with respect to the 2008 8-hour ozone. The area must attain the 1997 and 2008 8-hour ozone standards by June 2013 and December 2018, respectively. In their previous SIPs, the Texas Commission on Environmental Quality (TCQE) identified 8 new RACMs for area sources and point sources, and 6 of these measures were already implemented at the District. The remaining 2 measures, one for the cement kilns and one for the voluntary energy efficiency and renewable energy will be implemented through the District's Control Measure CMB-01 – Further NO_x Reductions from RECLAIM and Control Measure EDU-01 – Further Criteria Pollutant Reductions from Education, Outreach and Incentives.¹⁶

After being reclassified from a moderate to a serious nonattainment area, TCQE conducted additional RACM analysis in 2011 and made a determination not to adopt any additional measures since modeling demonstrated that the area would be able to meet the attainment date of 2013 for the 1997 ozone standard.

Houston-Galveston-Brazoria (HGB) Texas

The Houston-Galveston-Brazoria area was reclassified from moderate to a severe nonattainment area for the 1997 8-hour ozone standard, and classified as marginal for the 2008 8-hour ozone standard. The HGB area must attain the 1997 8-hour ozone standards by June 2019. The TCQE identified 11 RACMs for area sources and point sources. After being reclassified to severe nonattainment area, the TCQE conducted additional RACM analysis, analyzed additional 100 potential control measures, and determined that there is only one control measure that would help advance the attainment date for the HGB by one year.¹⁷

This specific control measure calls for a 25% additional reduction of the facility's highly reactive VOC (HRVOC) caps from the facilities which are located in the Harris County and regulated under the HRVOC Emissions Cap and Trade program. The HRVOC cap includes the emissions from cooling towers, process vents, and flares. The District does not have a VOC cap and trade program, nevertheless plans to further control emissions from flares and from process vents at specific facilities through the District's Control Measure CMB-02 – NO_x Reductions from Biogas Flares, FUG-01 – Further VOC Reductions from Vacuum Trucks, FUG-02 – Emission Reduction from LPG Transfer and Dispensing , and FUG-03 – Further VOC Reductions from Fugitive VOC Emissions. The District has no plan to further regulate the emissions from cooling towers at this stage.

New York Metropolitan

The New York Metropolitan Area is classified as nonattainment area or the 1997 annual PM_{2.5} standard of 15 µg/m³. All of the New York State is in compliance with the 1997 24-hour PM_{2.5} standard of 65 µg/m³. To satisfy the requirement of the CAA, the New York Department of Environmental Conservation (NYDEC) finalized the final annual PM_{2.5} SIP in July 2008.¹⁸ In this final PM_{2.5} SIP, it was determined that modeling will be used to demonstrate attainment in 2010 taking into effect the emission reduction programs already in place, the control measures already proposed, and the contingency measures, if needed. The three stationary source control measures that are more stringent than the District's existing rules are:¹⁹

- Portland Cement Plants. The NYDEC has revised its regulations for cement plants on June 11, 2010 to require case-by-case RACT analysis for cement kilns. The District selects to reduce cement kiln emissions through the District's Control Measure CMB-01 – Further Reductions from NO_x RECLAIM.
- Glass Furnaces. The NYDEC has revised its regulation for glass manufacturing facilities on June 11, 2010 to require case-by-case RACT analysis to potentially include control technologies such as oxy-fuel firing, low NO_x burners, SCR, SNCR. The District selects to reduce emissions from glass furnaces through Control Measure CMB-01 – Further Reductions from NO_x RECLAIM.
- Stationary Combustion Installations. The NYDEC has revised its regulation on June 8, 2010 to include stricter, case-by-case RACT determination for major stationary sources that contain natural gas and/or oil-fired Industrial/Commercial/Institutional

boilers, or combined cycle/cogeneration combustion turbines. The Districts will reduce emissions from this category of sources through the District's Control Measure CMB-01 – Further Reductions from NOx RECLAIM.

In addition, many counties in the New York state are nonattainment areas with respect to the 8-hour ozone standards. The NYDEC developed a comprehensive plan to address multi-pollutant attainment for criteria pollutants, greenhouse gases and toxics in June 2010.²⁰ In addition to the control measures for cement kilns, glass furnaces, boilers and turbines addressed above, the NYDEC includes several measures for VOC Clean Air Interstate Trading of NOx and SO₂. Some of the VOC measures are more stringent than the District's existing rules which will be further analyzed under District's Control Measure MCS-01 – Application of All Feasible Measures Assessment.

New Jersey and Sacramento Metro

District staff also reviewed the control measures developed by Sacramento Metro and New Jersey Department of Environmental Protection for their 8-hour ozone plans. There are no additional new measure concepts that the District has not yet considered for this Draft Final 2012 AQMP.²¹⁻²⁴

Step 6 - Additional Studies and Analyses

In addition to all of the above analyses, SCAG, CARB, and the District have completed the following analyses to meet the requirements of the CAA:

- RACM analyses and demonstration conducted by SCAG and CARB for transportation and mobile sources control measures are included in Appendix IV-C and in the Attachment of this Appendix.²⁵
- Costs and cost effectiveness analyses, planning and scheduling to implement for each District's stationary source and mobile source control measures, if available, are provided in Chapter IV, Appendix IV-A and B.

CONCLUSION

Following are the District staff's findings:

- As required by the CAA and the U.S. EPA's PM_{2.5} Implementation Rule, District staff evaluated and analyzed all feasible control measure concepts that were currently available for inclusion in the Draft Final 2012 AQMP. These concepts were either provided by the public and experts, or recommended by U.S. EPA, or implemented by other air districts. From these concepts, District staff selected and developed 8 short-term stationary source control measures to address the 24-hour PM_{2.5} attainment, 16 early-action stationary source control measures and 17 on-road and off-road control measures to address the 8-hour ozone attainment. District staff also developed a catch-all Control Measure MSC-01 – Application of All Feasible Measures Assessment to facilitate the inclusion of any incoming innovative air pollution control technologies or ideas that can help the Basin achieve the NAAQS as expeditiously as possible.
- Following the approach recommended by the U.S. EPA in the PM_{2.5} Implementation Rule, District staff conducted a study of more than 100 rules and regulations and 100 control measures recently developed in the 2007-2012 timeframe by other nonattainment air districts in the nation. In general, the District's existing rules and regulations are equivalent to, or more stringent than other districts' rules and regulations and their proposed control measures in their respective SIPs. In the few areas where the District's rules can be amended to promote cleaner technologies, add additional best management practices, and improve enforceability, District staff has developed one or more control measures to facilitate these activities.
- The control measures that do not have estimated emission reductions cannot be considered RACMs, and the District commits to further conduct analyses to refine the emission inventory, emission reductions, and cost-effectiveness for these measures. The District's ambient air quality data and modeling analysis in Chapter 3 and Chapter 5 demonstrates that the Basin would be able to meet the 24-hour PM_{2.5} attainment date by 2014 with the implementation of a few episodic control measures discussed in Chapter 4.
- With regards to the early actions to achieve ozone attainment, District staff has developed an effective menu of controls to meet the attainment dates as expeditiously as possible. The available control measures that District staff did not include would not collectively advance the attainment date or contribute to the RFP because of the uncertain non-quantifiable amount of emission reductions that they may potentially generate.

- In conclusion, the District has conducted the RACM/RACT analysis for identifying and selecting the control measures for the Draft Final 2012 AQMP is in compliance with the requirements of the CAA, the U.S. EPA's PM_{2.5} Implementation Rule, as well as the U.S. EPA's policy and guidelines.

TABLE VI-5

Evaluation of SCAQMD Rules and Regulations - NOx and SOx Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1109	NOx	Emissions of Oxides of Nitrogen from Boilers and Process Heaters – Petroleum Refineries (Amended 8/5/88)	<p>0.03 lbs/mmBTU of heat input (~25 ppmv). Subsumed by RECLAIM.</p> <p>RECLAIM (Amended 1/2005):</p> <ul style="list-style-type: none"> • 5 ppmv for >110 mmbtu/hr units • 25 ppmv for units 40-100 mmbtu/hr 	<p>San Joaquin Rule 4306 (Amended 10/18/08) has the following limits:</p> <p>NOx limits for refinery gas:</p> <ul style="list-style-type: none"> • 5 ppmv for units >110 mmbtu/hr; • 25 ppmv for units 65-110 mmbtu/hr; and • 30 ppmv for 5-65 mmbtu/hr units <p>San Joaquin Rule 4320 (Amended 9/5/08) has the following limits for refinery gas:</p> <ul style="list-style-type: none"> • 5 ppmv for >110 mmbtu/hr units • 5 - 6 ppmv for units between 20 - 110 mmbtu/hr <p>Compliance may be mitigated with annual emissions fee.</p>	<p>Further study the feasibility of lowering the NOx limits through:</p> <p>CMB-01 – Further NOx Reductions from RECLAIM</p>
1110.2	NOx, VOC, CO	Emissions from Gaseous and Liquid Fueled Engines (Amended 7/9/2010)	<p>Rule 1110.2 has NOx, VOC, CO limits for all stationary and portable engines over 50 brake horse power (bhp).</p> <p>In general, the limits applicable to 1) stationary, non-emergency engines by 7/1/2011, and 2) biogas (landfill and digester gas) engines by 7/1/2012 are:</p>	<p>San Joaquin Valley Rule 4702 (Amended 8/19/2011) has NOx, VOC, CO and SOx limits for engines rated over 25 bhp.</p> <p>For engines over 50 bhp:</p> <ul style="list-style-type: none"> - By 1/1/2017, the limits for spark-ignited engines are: <ul style="list-style-type: none"> • 11 ppmv NOx 	<p>Further study the feasibility of lowering the NOx limits through:</p> <p>CMB-01 – Further NOx Reductions from RECLAIM</p>

TABLE VI-5 (continued)

Evaluation of SCAQMD Rules and Regulations - NO_x and SO_x Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
			<ul style="list-style-type: none"> • 11 ppmv NO_x • 30 ppmv VOC • 250 ppmv CO <p>Limits for new non-emergency engines driving electrical generators are:</p> <ul style="list-style-type: none"> • 0.07 lbs NO_x per MW-hr • 0.20 lbs CO per MW-hr • 0.10 lbs VOC per MW-hr <p>NO_x limits for low usage biogas engines:</p> <ul style="list-style-type: none"> • 36 ppmv, engines ≥ 500 bhp 45 ppmv, engines < 500 bhp <p>VOC and CO limits for low usage biogas engines:</p> <ul style="list-style-type: none"> • 40 ppmv VOC, landfill gas • 250 ppmv VOC, digester gas • 2000 ppmv CO. <p>Portable and agricultural engines are not subject to the general limits listed above.</p> <p>Many of Rule 1110.2 engines are in RECLAIM, and RECLAIM will be amended to incorporate feasible BARCT.</p>	<ul style="list-style-type: none"> • 250 ppmv VOC (rich-burn) and 750 ppmv VOC (lean burn), and • 2000 ppmv CO <p>- Engines used in agricultural operations (AO), or fueled with waste gas, or limited used, or cyclic loaded and field gas fueled are subject to higher limits than the above</p> <p>- In general, all compression ignited engines must meet EPA Tier 4 standards.</p> <p>Engines between 25 bhp - 50 bhp, non agricultural operations (AO), must meet federal standards 40CFR Part 60 Subpart IIII and JJJJ.</p> <p>The SO_x limits are: 1) Natural gas, propane, butane, LPG, or combination, or 2) 5 grains/100 scf for gaseous fuel, or 3) 15 ppmv liquid fuel, or 4) CA reformulated gasoline for spark-ignited engines, or 5) CA reformulated diesel for compression ignited engines, or 6) 95% control.</p>	

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - NO_x and SO_x Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1111	NO _x	NO _x Emissions from Natural-Gas-Fired, Fan-Type Central Furnaces (Amended 11/6/09)	40 nanograms per joule heat output until 2014. A lower standard of 14 ng/J is required with staggering compliance dates from 2014-2018.		
1112	NO _x	Emissions of Oxides of Nitrogen from Cement Kilns (Amended 6/6/86)	Applicable to gray cement only. 11.6 lbs/ton clinker averaged over 24 hours and 6.4 lbs/ton clinker averaged over 30 days. Subsumed by RECLAIM. RECLAIM, amended 1/2005 version, had no recommendation for cement kiln BARCT. However, RECLAIM BARCT analysis is an on-going process and will be evaluated every three years.		Further study the feasibility of lowering the NO _x limits through: CMB-01 – Further NO _x Reductions from RECLAIM
1117	NO _x	Emissions of Oxides of Nitrogen from Glass Melting Furnaces (Amended 1/6/84)	4 lb/NO _x per ton of glass pulled. Flat glass and fiberglass melting furnaces are exempt. Many of these R1117 units are in RECLAIM. RECLAIM (Amended 1/2005 version) had no BARCT recommendation for this class. However, BARCT analysis is an on-going process and will be reevaluated every three years.	San Joaquin Rule 4354 – Glass Melting Furnaces (Amended 5/19/2011) have NO _x , CO, VOC, SO _x limits. There are several options for the NO _x limits: <ul style="list-style-type: none"> • Container Glass: 1.5 lbs/ton (rolling 30-day average) • Fiberglass: 1.3-3 lbs/ton (24-hour average) 	Further study the feasibility of lowering NO _x limit through: CMB-01 – Further NO _x Reductions from RECLAIM

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - NOx and SOx Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1117 (Cont.)				<ul style="list-style-type: none"> • Flat Glass: 2.9 lbs/ton (30-day average) – 3.7 lbs/ton (24-hour average) <p>The SOx limits are:</p> <ul style="list-style-type: none"> • Container Glass: 0.9-1.1lbs/ton (rolling 30-day average) • Fiberglass: 0.9 lbs/ton (rolling 24-hour average) • Flat Glass: 1.2 lbs/ton (30-day average) – 1.7 lbs/ton (24-hour average) <p>The VOC limits are:</p> <ul style="list-style-type: none"> • Container or Fiberglass: 0.25 lbs/ton or 20 ppmv • Flat Glass: 0.10 lbs/ton or 20 ppmv. 	
1121	NOx	Control of Nitrogen Oxides from Residential Type, Natural-Gas-Fired Water Heaters (Amended 9/3/2009)	15 ppmv at 3% O ₂ , dry input (or 10 ng/j output) for all stationary water heaters; and 55 ppmv at 3% O ₂ , dry input (40 ng/j output) for mobile water heaters.	Other Districts' plans propose to accelerate replacements of old water heaters with electric units or new highly-efficient lower-emitting water heaters with the use of incentives.	<p>Further study the possibility of using incentives to promote electric heaters through:</p> <p>INC-01 – Economic Incentive Programs to Adopt Zero and Near-Zero Technologies [NOx]</p> <p>In addition, further consider the feasibility of technology transfer through:</p> <p>CMB-03 – Reductions from Commercial Space Heating</p>

TABLE VI-5

Evaluation of SCAQMD Rules and Regulations - NO_x and SO_x Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1134	NO _x	Emissions of Oxides of Nitrogen from Stationary Gas Turbines (Amended 8/8/97)	<p>Standard = Reference Limit x (Unit Efficiency/25%), where reference limit depends on size of units, varying from 9 ppmv for units rating at equal to or larger than 10MW to 25 ppmv for units rating from 0.3 MW to less than 2.9 MW.</p> <p>RECLAIM, amended 1/2005 version, indicated that 5 ppmv was achieved in practice but not cost effective, therefore did not propose BARCT. This analysis may need to be revised based on new information. RECLAIM BARCT is an on-going process that is planned to be reviewed every 3 years.</p>	<p>Bay Area, Regulation 9, Rule 9 (Adopted 12/6/06) contains the following limits:</p> <ul style="list-style-type: none"> • 9 ppmv for units between 250-500 mmBTU/hr and • 5 ppmv for units more than 500 mmBTU/hr <p>San Joaquin Valley Rule 4703, (Amended 8/17/06) requires 3 ppmv for combined cycle >10 MW, and standards from 5 – 50 ppmv for other units.</p> <p>Sacramento Rule 413 (Amended 03/24/05) requires 9 – 25 ppmv depending on size of units, but are independent on equipment efficiency.</p> <p>Ventura Rule 74.9 (Amended 11/08/05) requires 25 – 125 ppmv depending on fuel type but are independent from equipment size and efficiency. Control efficiency 90% - 96%. In addition, all units have to meet 20 ppmv NH₃.</p>	<p>Further study the feasibility of lowering the NO_x standard and establish ammonia standard through:</p> <p>CMB-01 – Further NO_x Reductions from RECLAIM</p> <p>MCS-01 – Application of All Feasible Measures Assessment (for non-RECLAIM facilities)</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - NOx and SOx Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1135	NOx	Emissions of Oxides of Nitrogen From Electric Power Generating Systems (Amended 7/19/91)	<p>Mass emission limits and emission reduction goals for utility boilers. Only City of Glendale is subject to Rule 1135, which is allowed to meet 0.2 lb/MW-hr (or a daily mass limit of 390 lb NOx per day, or an annual limit of 35 tons per year).</p> <p>Other utility boilers are in RECLAIM subject to declining NOx allocations which were determined based on a level of 7 ppmv = 0.07 lb/MW-hr = 0.008 lb/mmbtu, assuming a heat rate of 8130 Btu/kw-hr. The utility boilers are operated at various BARCT levels from 5 - 30 ppmv. ^(Note)</p>	<p>Ventura Rule 59 (amended 7/15/97) requires:</p> <ul style="list-style-type: none"> • 0.1 lb NOx/MW-Hr for utility boilers and • 0.04 lb/MW-hr for auxiliary boilers. <p>San Joaquin Rule 4306 – Phase 3 (amended 3/17/2005) requires boilers more than 20 mmbtu/hr to comply with the following options:</p> <ul style="list-style-type: none"> • Standard option of 9 ppmv (or 0.011 lb/mmbtu) complied by 2005-2007, or • Enhanced option of 6 ppmv (or 0.007 lb/mmbtu) complied by 2006-2008. (Assuming a heat rate of 8130 Btu/kw-hr, 6 ppmv is about 0.06 lb/MW-hr.) 	<p>Further study the feasibility of lowering the emission targets through:</p> <p>CMB-01 – Further NOx Reductions from RECLAIM facilities</p> <p>MCS-01 – Application of All Feasible Measures Assessment</p>

Note: RECLAIM facilities have flexibility to operate their utility boilers provided that the total facility emissions must be at or below their allocations determined based on a level of 7 ppmv. Regarding BARCT levels, according to Marty Kay and John Yee, the utility boilers at Southern California Edison, Department of Water and Power, and City of Burbank are operated at a level from 5 – 7 ppmv (1-hr to 1-month average time) whereas City of Pasadena boilers are operated at a level of 30 ppmv. In addition, since heat rate (mmbtu per kw-hr) varies with each utility boiler, District staff used 8130 BTU/kw-hr to convert the ppmv to lb/MW-hr for the unit operated by City of Glendale.

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - NO_x and SO_x Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1146	NO _x	Emissions of Oxides of Nitrogen from Industrial, Institutional and Commercial Boilers, Steam Generators, and Process Heaters (Amended 9/5/2008)	<p>Applicable to units rating of more than 5 mmbtu/hr.</p> <p>Current NO_x limits:</p> <ul style="list-style-type: none"> • For digester gas: 15 ppmv • For landfill gas: 25 ppmv • For refinery gas: 30 ppmv (the 2008 amendment did not revise limits for refinery gas) • For other types of fuels: 5 ppmv for ≥75 mmbtu/hr, natural gas; 30 ppmv for ≥75 mmbtu/hr, other fuels; and 5 or 9 ppmv for 20–75 mmbtu/hr units <p>CO limit: 400ppmv</p> <p>Many Rule 1146 units are in RECLAIM. RECLAIM (Amended 1/2005 version) contains the following NO_x limits:</p> <ul style="list-style-type: none"> • For refinery gas: 5 ppmv for units > 110 mmbtu/hr; and 25 ppmv for units < 110 mmbtu/hr units • For other units: 9 ppmv for units > 20 mmbtu/hr; and 12 ppmv for units >2 mmBTU/hr 	<p>Sacramento Rule 411 (Amended 10/27/05) limits for gaseous fuel are 9 ppmv for units greater than 20 mmbtu/hr, and 15 ppmv for units from 5 to 20 mmbtu/hr.</p> <p>San Joaquin Rule 4306 (Amended 10/18/08) has the following limits:</p> <p>NO_x limits:</p> <ul style="list-style-type: none"> • 30 ppmv for 5-65 mmbtu/hr units using refinery gas. For units from 40 – 100 mmbtu/hr, refer to the comparison under Rule 1109. • For other types of fuels: 9 ppmv for >20 mmbtu/hr units; 15 ppmv for ≤20 mmbtu/hr units (6 – 9 ppmv for enhanced options) • Other units: 15 – 30 ppmv <p>CO limit: 400 ppmmv.</p> <p>San Joaquin Valley further reduces NO_x, CO, SO₂ and PM₁₀ emissions by adopting Rule 4320 on 10/16/08. The limits in Rule 4320 are:</p>	<p>Further explore the feasibility of lowering the NO_x standards for Rule 1146 (e.g. refinery fuels, digester and landfill gases) and RECLAIM through:</p> <p>CMB-01 – Further NO_x Reductions from RECLAIM</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - NO_x and SO_x Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1146 (Cont.)	NO _x			NO _x limits: <ul style="list-style-type: none"> • For refinery gas: 5 – 6 ppmv for units between 20-110 mmbtu/hr; 6 – 9 ppmv for units between 5 - 20 mmbtu/hr; and 9 ppmv for units firing of less than 50% by vol PUC quality gas. Refer to the comparison under Rule 1109 for 40 mmbtu/hr units and above using refinery gas. • For oil field generators: 5 - 7 ppmv for units greater than 20 mmbtu/hr; 6 – 9 ppmv for units larger than 5 but less than 20 mmtu/hr; and 9 ppmv for units firing of less than 50% by vol PUC quality gas • For low usage units: 9 ppmv • For units at a wastewater treatment facilities firing on less than 50% by vol PUC quality gas: 9 ppmv • For other units: 5 – 7 ppmv for units larger than 20 mmbtu/hr; and 6 – 9 ppmv for units between 5 mmbtu/hr and 20 mmbtu/hr Compliance may be mitigated with annual emission fees.

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1146.1	NO _x	Emissions of Oxides of Nitrogen from Small Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters (Amended 9/5/2008)	<p>Applicable to units rating from 2 mmbtu/hr to 5 mmbtu/hr.</p> <p>NO_x limits:</p> <ul style="list-style-type: none"> • Atmospheric Units: 12 ppmv • Digester gas: 15 ppmv • Landfill gas: 25 ppmv • All others: 9 ppmv <p>CO limit: 400 ppmv.</p> <p>Many Rule 1146.1 units are in RECLAIM, and RECLAIM (Amended 1/2005 version) BARCT analysis recommended 12 ppmv for less than 20 mmbtu/hr units based on ultra low NO_x technology that is achieved in practice.</p> <p>RECLAIM (Amended in 2005) has a limit of 12 ppmv NO_x for boilers in this size range.</p>	<p>Bay Area Rule 9-11 (Amended 5/17/00) has following limits for boilers using gaseous fuel 1) 10 ppmv for boilers with rated input greater than 1.75 mmbtu/hr, 2) 25 ppmv for boilers from 1.5-1.75 mmbtu/hr, 3) 30 ppmv for boilers less than 1.5 million btu/hr. Non-gaseous fuel combustion devices have higher limits than gaseous fuel devices.</p> <p>San Joaquin Rule 4307 (Amended 5/19/2011) has the following limits:</p> <p>NO_x limits:</p> <ul style="list-style-type: none"> - For New or Replacement Units: Atmospheric Units: 12 ppmv, and Non-Atmospheric Units: 9 ppmv - For Retrofit Units: 30 ppmv burning gaseous fuels; and 40 ppmv burning liquid fuels <p>Sulfur limits for SO₂:</p> <ul style="list-style-type: none"> - For natural gas, propane, butane, or LPG: 5 grains of total sulfur per 100 scf, or 9 ppmv SO₂, or 95% control - For liquid fuels: 15 ppmv sulfur 	<p>Further study the feasibility of promoting the use of cleaner units through incentives through one of the following:</p> <p>INC-01 – Economic Incentive Programs to Adopt Zero and Near-Zero Technologies [NO_x]</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - NO_x and SO_x Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1146.2	NO _x	Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers (Amended 5/5/06)	Applicable to units less than 2 mmbtu/hr. Current limits are: <ul style="list-style-type: none"> • 20 ppmv for units from 400,000 btu/hr – 2 mmbtu/hr • 55 ppmv for units rating less than 400,000 btu/hr 	San Joaquin Valley Rule 4308, (Amended 12/17/09) requires: <ul style="list-style-type: none"> • 20 ppmv for units used PUC gas from 75,000 btu/hr – 2 mmbtu/hr • 30 ppmv for units from 400,000 btu/hr - 2 mmbtu/hr used other types of fuels • 77 ppmv for units rating from 75,000 btu/hr – 400,000 btu/hr used other types of fuels 	Further study the feasibility of promoting the use of cleaner units through: INC-01 – Economic Incentive Programs to Adopt Zero and Near-Zero Technologies [NO _x]
2000 - 2015	NO _x , SO _x	RECLAIM (Amended 5/6/05)	Include facility allocations for NO _x and SO _x for RECLAIM facilities.	Since other Districts do not have RECLAIM, refer to comparison for individual rules such as Rule 1146, 1146.1, 1110.2 etc.	Further review BARCT through: CMB-01 – Further NO _x Reductions from RECLAIM . District has set most stringent BARCT for SO _x sources in the 2010 RECLAIM Amendments.

TABLE VI-5 (continued)
Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1106	VOC	Marine Coating Operations (Amended 1/13/95)	Coating-specific emission limits from 275 – 780 g/L. In lieu of complying with specific emission limits, operator can use air pollution control system with at least 85% efficiency. Solvent cleaning operations must comply with Rule 1171.	Ventura Rule 74.24 (Amended 11/11/03) generally has the same limits as South Coast Rule 1106, except the limit for special marking of items such as flight decks, ship numbers is 420 g/L (490 g/L in Rule 1106) Bay Area Rule 8-43 (Amended 10/16/02) generally has the same limits as South Coast Rule 1106, except it has lower limit for pretreatment wash primer at 420 g/L (780 g/L in Rule 1106)	Further study the potential of lowering the emission standards for this source category through: CTS-02 – Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants
1106.1	VOC	Pleasure Craft Coating Operations (Amended 2/12/99)	Coating-specific emission limits from 340 – 780 g/L. Solvent cleaning operations must comply with Rule 1171.	San Joaquin Valley's Rule 4603 (Amended 9/17/09) limit for teak primer, wood sealer, and clear wood varnish is 420 g/L, which is more stringent than the limits in Rule 1106.1 (i.e. 775 g/L for teak primer, 550 g/L for clear wood sealers, and 490 g/L for clear wood varnishes.)	Further study the potential of lowering the emission standards for this source category through: CTS-02 – Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants
1113	VOC	Architectural Coatings (Amended 6/3/2011)	Coating-specific emission limits from 50 g/L – 730 g/L. Allow averaging, scheduled to be phased out on January 1, 2015.		Further study the potential of lowering the emission standards for this source category through: CTS-01 – Further VOC Reductions from Architectural Coatings (R1113)

 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1107	VOC	Coating of Metal Parts and Products (Amended 1/6/06)	Coating-specific emission limits from 2.3 lbs/gal – 3.5 lbs/gal. In lieu of complying with specific emission limits, operator can use air pollution control system with at least 95% control efficiency (or 5 ppmv outlet) and 90% capture efficiency. Solvent cleaning operations must comply with Rule 1171.	Ventura Rule 74.12 (Amended 1/6/06) generally has the same coating-specific limits as South Coast Rule 1107, except in the following categories: <ul style="list-style-type: none"> • Limit for metallic coating is 3 lbs/gal (3.5 lbs/gal in Rule 1107); • Limit for camouflage is 3 lbs/gal (3.5 lbs/gal in Rule 1107); • Limit of pretreatment coatings is 2.3 lbs/gal (3.5 lbs/gal in Rule 1107) • Overall minimum control efficiency is 90%, higher than Rule 1107 requirement at 85% San Joaquin Valley Rule 4603 (Amended 9/17/09) have more stringent limits than Rule 1107 for baked camouflage and baked metallic coating at 360 g/L (420 g/L in Rule 1107)	Explore the feasibility of lowering the VOC limits considering the diversity of applications, and if feasible, implement through the following control measure: CTS-02 – Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents, and Lubricants, or MSC-01 – Application of All Feasible Measures Assessment

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1115	VOC	Motor Vehicle Assembly Line Coating Operations (Amended 5/12/95)	Limits from 1.2 lbs VOC/gal coating for electrophoretic primer to 15 lbs/gal of applied solids for primer, primer surfacer and topcoat. Cleaning operations must comply with Rule 1171.	San Joaquin Valley Rule 4602, (Amended 9/17/09) has more stringent limits for: 1) Primer at 0.7 lbs/gal and 2) Primer surface and topcoat at 12 lbs/gal	Further lowering the VOC limits
1118	All	Refinery Flares (Amended 11/4/05)	<ul style="list-style-type: none"> • Minimize flare emissions & require smokeless operations • Specify SO₂ gradually decreasing performance target to less than 0.5 tons per million barrels of crude by 2012. • If the performance target is exceeded, the operator must 1) pay mitigation fee; or 2) submit a Flare Mitigation Plan to reduce emissions. • Require Cause Analysis for event exceeding 100 lbs VOC, 500 lbs of SO₂, or 500,000 scfm of vent gas, excluding planned shutdown, startup and turnarounds • Require 160 ppmv H₂S, 3 hour average by 1/1/2009, and no limits for NO_x, VOC, PM and CO. 	<p>U.S. EPA suggested the District to further re-evaluate Rule 1118 (FR Vol 76 No 217, Nov 9, 2011, CBE comments).</p> <p>San Joaquin Valley Rule 4311 (Amended 6/18/09) has VOC/NO_x limits for ground-level enclosed flares; SO₂ Targets (1.50 tons/million barrels of crude by 2011, and 0.5 tons/million barrels by 2012); Flare Minimization Plan for refinery flares more than 5 mmbtu/hr; and operational requirements for all flares that have potential to emit more than 10 tons/yr VOC and more than 10 tons/yr of NO_x.</p> <p>Bay Area Rule 12-12 (Adopted 4/5/06) does not specify a declining SO₂ target and does not contain a mitigation fee option.</p>	<p>Explore the possibility of further minimizing flare related events, through:</p> <p>MSC-03 – Improved Start-Up, Shutdown and Turnaround Procedures</p> <p>In addition, further study the feasibility of reducing emissions of landfill flares through:</p> <p>CMB-02 – NO_x Reductions from Biogas Flares</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1122	VOC	Solvent Degreasers (Amended 5/1/09)	Contain various work practice and design requirements.		Further study to assess the feasibility of reducing emissions through: CTS-02 - Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants
1124	VOC	Aerospace Assembly and Component Manufacturing Operations (Amended 9/21/01)	Coating-specific emission limits from 160 – 1000 g/L. Specific high transfer coating applications (e.g. HVLP spray). In lieu of complying with specific emission limits, operator can use air pollution control system with at least 95% control efficiency (or 50 ppmv outlet) and 90% capture efficiency. Solvent cleaning operations must comply with Rule 1171.	San Joaquin Valley Rule 4605 (Amended 6/16/2011) has the following limits that are more stringent than those in Rule 1124: <ul style="list-style-type: none"> • Flight Test Coatings = 600 g/L (840 g/L in Rule 1124) • Fastener Sealant = 600 g/L (675 g/L in Rule 1124) Sacramento Rule 456 (Amended 10/23/08) has the following limits that are more stringent than those in Rule 1124: <ul style="list-style-type: none"> • Conformal Coating = 600 g/L (Rule 1124 limit is 750 g/L) 	Explore the feasibility of lowering the VOC limits through: CTS-02 - Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1124 (Cont.)				<ul style="list-style-type: none"> • Fire Resistant Coatings = 600 g/L. (Rule 1124 limits are 650 g/L for Commercial; 800 g/L for Military) • High-Temperature Coating = 420 g/L. (Rule 1124 limit is 850 g/L) • Mold Release Coatings = 762 g/L. (Rule 1124 limit is 780 g/L) • Radiation Effect = 600 g/L. (Rule 1124 limit is 800 g/L) • Rain Erosion Resistant Coating = 600 g/L in All Other Category. (Rule 1124 limit is 800 g/L) <p>Ventura 2006-2008 Triennial Assessment and Plan Update has a control measure to require 25 g/L VOC limit for cleaning solutions and remove the 45 mmHg vapor pressure allowance. (Rule 1124 limits for cleaning solutions and strippers are 200 g/L (or 45 mmHg vapor pressure) and 300 g/L (or 9.5 mmHg vapor pressure))</p>	

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1125	VOC	Metal Container, Closure, and Coil Coating Operations (Amended 3/7/2008)	Coating-specific emission limits from 0 g/L (for non food cans) – 660 g/L. Specific high transfer coating applications (e.g. HVLP spray). In lieu of complying with specific emission limits, operator can use air pollution control system with at least 95% control efficiency (or 50 ppmv outlet) and 90% capture efficiency, which is equivalent to an overall control efficiency of 85%. Solvent cleaning operations must comply with Rule 1171.	<p>The following limit in San Joaquin Rule 4604 (Amended 9/20/07) are more stringent than those in Rule 1125:</p> <ul style="list-style-type: none"> • Two-Piece Interior Body Spray = 420 g/L (440 g/L in Rule 1125) • Three-Piece Interior Body Spray = 360 g/L (510g/L in Rule 1125) <p>In addition, SJV Rule 4604 have many limits that are not listed in Rule 1125 such as 20 g/L for end seal compounds and 225 g/L for two-piece interior sheet base coating and over-vanish.</p> <p>Sacramento Rule 452 (Amended 9/25/2008) has the following more stringent limits than Rule 1125:</p> <ul style="list-style-type: none"> • Two-Piece Interior Body Spray = 420 g/L (440 g/L in Rule 1125) • Three-Piece Interior Body Spray = 360 g/L (510g/L in Rule 1125) 	<p>Explore the feasibility of lowering the VOC limits through:</p> <p>CTS-02 - Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants, or</p> <p>MSC-01 – Application of All Feasible Measures Assessment</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1130	VOC	Graphic Arts (Amended 10/8/99)	<p>VOC content limits: 80 g/l – 100 g/l for fountain solution, 150 g/l for adhesives, 225 g/l - 300 g/l for inks and coatings. In lieu of meeting specific emission limits, control device with overall control efficiency from 75% - 85% can be used to achieve equal or better emission reductions.</p> <p>VOC limits for cleaning solutions for printing presses are in Rule 1171 ranging from 25 g/l (0.21 lb/gal) for flexographic printing to 100 g/l (0.83 lb/gal) for lithographic printing (even though 500 g/l is allowed up to end of year 2007.)</p>	<p>The following limits in San Joaquin Valley Rule 4607 (Amended 12/18/08) are more stringent: 1) 95% control efficiency for heat-set web offset lithographic or letterpress printers that emit greater than 25 tons per year VOC; 2) 1.6% VOC content for fountain solution used in heat-set lithographic printers, 5% for fountain solution used in cold-set and sheet-fed lithographic printers, and 8% for fountain solution used in other presses.</p> <p>Sacramento Rule 450 is more stringent in the following: 1) overall control efficiency of 95% for heat-set web offset lithographic and letterpress printing and 80% for flexible package printing (Rule 1130 requires only 75% control efficiency) ; 2) VOC in fountain solution is lower, generally from 1.6% to 5%; 3) electronic circuit limit is 800 g/l (850 g/l in Rule 1130.1)</p>	<p>Further study to assess the feasibility of increasing the overall control efficiency and reducing the alcohol usage in fountain solution through the implementation of:</p> <p>MSC-01 – Application of All Feasible Measures Assessment</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1130 (Cont.)				<p>Bay Area, Regulation 8, Rule 20 (Amended 11/19/08) requires 8% VOC content in fountain solution. In addition, the rule requires recordkeeping for digital printing, cleaning and stripping of UV or electron beam-cured inks for further study potential emission reductions in a near future.</p> <p>Ventura Rule 74.19 (Amended 6/14/11) requires low VOC content in fountain solution used in lithographic presses.</p> <p>In addition, the U.S. EPA CTG for lithographic and letterpress, September 2006, recommends:</p> <ul style="list-style-type: none"> • Destruction efficiency of 90% to 95% depending on date of installation (or 20 ppmv outlet concentration) for heat-set web with potential to emit, prior to controls, of at least 25 tpy. • For operations emitting 15 lb/day, fountain solution must be 1) 1.6% alcohol or less, or 	

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1130 (Cont.)				2) 3% with refrigerated chiller or 3) 5% alcohol substitute for heat-set web presses; 4) 5% alcohol for sheet-fed presses; 5) 5% alcohol substitute and no alcohol in fountain solution for cold-set web presses. The EPA CTG for rotogravure and flexographic, adopted in September 2006, recommends control efficiency of 80% for presses installed after March 1995, and 65% - 75% for older presses.	
1130.1	VOC	Screen Printing Operations (Amended 12/13/96)	VOC content limits ranges from 400 g/l – 800 g/l for materials used in screen printing. In lieu of specific emission limits, control device can be used to achieve equal or better reductions, at least 95%.	Bay Area, Regulation 8, Rule 20 (Amended 11/19/08) has more stringent limit for adhesives at 150 g/L (400 g/L in Rule 1130.1). Sacramento Rule 450 (Amended 10/23/08) has more stringent limits than Rule 1130.1 in the following areas: 1) limit for electronic circuit ink is 800 g/L (850 g/L in Rule 1130.1); 2) limit for adhesives is 150 g/L (400 g/L in Rule 1130.1)	Further study to assess the feasibility of reducing the VOC limits for adhesives through: MSC-01 – Application of All Feasible Measures Assessment

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1132	VOC	Further Control of VOC from High Emitting Spray Booths (Amended 5/7/04)	Further reduce emissions by 65% from the baseline primarily through the installation of control devices, beyond and above the use of coatings that comply with existing coating rules.		
1136	VOC	Wood Products Coatings (Amended 6/14/96)	VOC content limits range from 2.3 – 6.3 lbs/gal VOC. Averaging provisions and add-on control are allowed. Transfer efficiency is at least 65%, or operator must use certain type of equipment (e.g. HVLP). Solvent cleaning operations must comply with Rule 1171.	Ventura Rule 74.30 (Amended 6/27/06) has more stringent limit for high-solid stains on new wood products at 2 lbs/gal (2.9 lbs/gal in Rule 1136). In lieu of coating specific limits, control equipment achieving 90% efficiency is required. No averaging provisions in Ventura. San Joaquin Valley Rule 4606 (Amended 10/16/08) is more stringent in the following areas: <ul style="list-style-type: none"> • Rule 1136 allows the use of a stripper with limits higher than 350 g/L if the stripper has low vapor pressure of 2 mmHg. SJV does not have this allowance; • SJV Rule 4606 requires a min overall control efficiency of 85% - 90% for flat wood paneling products, whereas Rule 1136 does not have control efficiency requirement. 	Explore the feasibility of lowering the VOC limits for wood products coatings through: CTS-02 - Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants, or MSC-01 – Application of All Feasible Measures Assessment

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1136 (Cont.)				Bay Area, Regulation 8, Rule 32, (Amended 8/5/09) has lower limits for surface preparation and cleanup, including stripping, at 0.21 lbs/gal.	
1144	VOC	Metalworking Fluids and Direct-contact Lubricants (Amended 7/9/2010)	Various limits from 50 g/L – 340 g/L. Add-on control at 90% capture efficiency, 95% control efficiency (or 5 ppmv outlet)		Further study the potential of lowering the VOC limits through: CTS-02 - Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants

TABLE VI-5 (continued)

Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1151	VOC	Motor Vehicle and Mobile Equipment Non-Assembly Line Coating Operations (Amended 12/2/05)	VOC content limits range from 250 – 840 grams VOC per liter. Averaging provisions are allowed. High transfer coating equipment (e.g. HVLP) is required. Solvent cleaning operations must comply with Rule 1171.	<p>San Joaquin Valley Rule 4602 (Amended 9/17/09) is more stringent in the following areas: 1) adhesive at 250 g/L (540 g/L in Rule 1151), 2) gasket/gasket sealing at 200 g/L (400 g/L in Rule 1151), and 3) truck bed liner coating at 200 g/L (310 g/L in Rule 1151)</p> <p>Sacramento Rule 459 (Amended 8/25/11) is more stringent in the following areas: 1) multi-color coating at 520 g/L for mobile equipment driven on rails (680 g/L in Rule 1151), 2) truck bed liner coating at 200 g/L (310 g/L in Rule 1151)</p> <p>Bay Area, Regulation 8, Rule 45 (Amended 12/3/08) is more stringent in the following areas: 1) VOC limit for surface preparation and cleanup, including stripping, of 0.2 lbs/gal or 2) a minimum 85% overall control efficiency.</p>	<p>Further study the feasibility of lowering the VOC limits for coatings through:</p> <p>CTS-02 - Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants, or</p> <p>MSC-01 – Application of All Feasible Measures Assessment</p>
1162	VOC	Polyester Resin Operations (Amended 7/8/05)	VOC limits (monomer content) from 10-48% by weight or alternatively 90% control efficiency for add-on control	Regulation 8, Rule 50 (Amended 12/2/09) is similar to Rule 1162, except the limit for corrosion resistant resin is more stringent at 40% - 46% (48% in Rule 1162). The rule allows some usage of acetone	<p>Further study the feasibility of lowering the VOC limits through:</p> <p>MSC-01 – Application of All Feasible Measures Assessment</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1168	VOC	Adhesive and Sealant Applications (Amended 1/7/05)	VOC limits for solvents range from 30 – 775 lbs VOC per gallon. Require the use of high transfer efficiency equipment (e.g. HVLP spray). In lieu of meeting the VOC limits, using add-on control with 80% control efficiency is allowed.	San Joaquin Valley Rule 4653 (Amended 9/16/2010) has more stringent limits in the following areas: <ul style="list-style-type: none"> • 100 g/L for Cellulosic Plastic Welding Adhesive, 100 g/L for Styrene Acrylonitrile Welding Adhesive, and 200 g/L for Reinforced Plastic Composite Adhesive (Rule 1168 limit is 250 g/L limits for all three categories) • Minimum overall control efficiency is 85% (80% in Rule 1168) 	Further study the feasibility of lowering the VOC limits through: CTS-02 - Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants

TABLE VI-5 (continued)

Evaluation of SCAQMD Rules and Regulations - VOC Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1171	VOC	Solvent Cleaning Operations (Amended 5/1/2009)	VOC limits for solvents are 25 g/l in general, and have a 100-800 g/l VOC for specific cleaning operations. In lieu of meeting the VOC limits, add-on control having 90% collection efficiency and 95% destruction efficiency or meeting 50 ppmv outlet concentration can be used. The rule however only requires $(70\%)(95\%) = 66.5\%$ overall control efficiency for graphic arts and screen printing applications	The U.S. EPA RACT published in September 2006 limit is 50 g/l or an overall control efficiency of 85%. The U.S. EPA is not recommending limits beyond 50 g/l; but also recommends states to adopt higher limits based on individual performance requirements of specific applications. Rule 1171 meets the U.S. EPA RACT.	Further study the feasibility of lowering the VOC limits and increasing the overall control efficiency requirement for control devices located at graphic arts facilities through: CTS-02 - Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants,
462	VOC	Organic Liquid Loading (Amended 5/14/99)	Limit in Rule 462 is 0.08 lbs per 1000 gallons of liquid loaded for Class A facility loading of 20,000 gallons or more. This limit is not applicable to small facilities (Class B and C).	Bay Area, Regulation 8, Rule 33 (Amended 4/15/09) has a limit of 0.04 lbs/1000 gallons of liquid loaded and requires stringent monitoring requirements	Further study to assess the feasibility of reducing the VOC limits through: MSC-01 – Application of All Feasible Measures Assessment

TABLE VI-5 (continued)

Evaluation of SCAQMD Rules and Regulations – VOC, PM Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1133, 1133.1, 1133.2	PM, VOC, NH ₃	Composting, Co-Composting, and Related Operations (Rule 1133, Adopted 1/10/2003; Rule 1133.1, Amended 7/8/2011; and Rule 1133.2, Adopted 1/10/2003)	Various performance standards. Air pollution control must have 80% control efficiency or greater. Existing operations must reduce up to 70% baseline VOC and ammonia emissions. Baseline emission factors are 1.78 lbs VOC/ton throughput and 2.93 lbs NH ₃ /ton throughput.	San Joaquin Rule 4565 – Biosolids, Animal Manure, and Poultry Litter Operations (Adopted 3/15/07) and Rule 4566 – Organic Material Composting Operations (Adopted 8/18/11) have various operational requirements for these operations as well as the operators who landfills, composts, or co-composts these materials. The applicability of Rules 4565/4566 is broader than the applicability of Rule 1133.3. In addition, Rules 4565/4566 include additional mitigation measures to control VOC from composting active piles (e.g. maintain minimum oxygen concentration of 5%, moisture content of 40%-70%, carbon to nitrogen ratio of 20-1). San Joaquin's rule does not address chipping & grinding as in Rule 1133.1.	Further study the feasibility of further control through: MCS-02 – Further Emission Reductions from Green Waste Processing
1133.3	VOC NH ₃	Emission Reductions from Greenwaste Composting Operations (Adopted 7/8/2011)	Include requirements for composting greenwaste, or greenwaste in combination of manure or foodwaste. Include various performance standards. Require air pollution control with efficiency of 80% or greater for operations greater than 5000 tons/year of foodwaste. For operations less than 5000 tons/year, require the composting piles to be covered, watered, and turned, or operated with measures that reduce at least 40% VOC emission and 20% NH ₃ emissions.		

TABLE VI-5 (continued)

Evaluation of SCAQMD Rules and Regulations - PM Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1138	PM	Control Of Emissions From Restaurant Operations (Amended 11/14/97)	Require catalytic oxidizer for chain-driven charbroilers. Exemption provided for under-fired charbroilers and units cooking less than 875 lbs/week, but does not contain any specific limits.	<p>San Joaquin Valley Rule 4962 (Amended 9/17/09) requires the emissions from the restaurant charbroilers be controlled by catalytic oxidizer with minimum control efficiencies of 86% for VOC and 83% for PM10.</p> <p>Bay Area Regulation 6, Rule 2 (Adopted 12/5/07) sets limit for both chain-driven charbroilers at 1.3 lbs PM10 and 0.32 lbs ROG per 1000 lbs beef cooked) and under-fired charbroilers at 1 lbs PM10 per 1000 lbs beef cooked)</p> <p>Ventura Rule 74.25 (Adopted 10/12/04) which has equivalent requirements as in Rule 1138.</p>	<p>Further study the feasibility of regulating under-fired charbroilers through:</p> <p>BCM-03 – Emission Reductions from Under-Fired Charbroilers</p> <p>Note that the District has currently funded UCR - CE-CERT to investigate on the control technologies for under-fired charbroilers.</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - PM Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
1155	PM	Particulate Matter Control Devices (Adopted 12/4/2009)	PM standards for PM control devices at 0.01 gr/dscf for existing large baghouses >7500 square feet. Good operational practices to reduce PM emissions	<p>Bay Area, Draft Regulation 12, Rule 13 is scheduled for a Public Hearing in summer of 2012. This rule is to implement Bay Area Control Measure SSM1 in the 2010 Clean Air Plan. The rule is applicable to facilities that melt or process metals (foundries, forges, heat treatment of metals, and metal recycling operations). The focus is to promote the use of high efficiency filters (e.g. Gore-Tex bags). Proposed limits are:</p> <ul style="list-style-type: none"> • 0.002 gr/dscf for flow rate of 25,000 dscf per min or higher; and • 0.004 gr/dscf for flow rates less than 25,000 dscf per min. 	<p>Further study the feasibility of lowering the PM limits through:</p> <p>MCS-01 – Application of All Feasible Measures Assessment</p>
444	All	Open Burning (Amended 11/7/2008)	Contains requirements and prohibitions for open burning to minimize emissions and smoke impacts to the public.	<p>San Joaquin Valley Rule 4103 (Amended 4/15/2010) contains additional best management practices compared to Rule 444 such as best management practices to control open burning of weeds.</p> <p>Bay Area, Reg 5, sets requirements for open burning, and was to forbid recreational burning during curtailment periods.</p>	<p>Further study to include additional good management practices and a possibility of restricting burning during episodic curtailment periods through:</p> <p>BCM-02 – Further Reductions from Open Burning</p>

TABLE VI-5 (continued)
 Evaluation of SCAQMD Rules and Regulations - PM Rules

RULE	TYPE	RULE TITLE	CURRENT RULE REQUIREMENTS	OTHER DISTRICTS' 2007-2012 RULES	EVALUATION
404, 468, and 469	PM	Rule 404 – Particulate Concentration (Amended 2/7/86) Rule 468 – Sulfur Recovery Units (Amended 10/8/76) Rule 469 – Sulfuric Acid Units (Amended 2/13/81)	PM limits vary from 0.01 gr/dscf to 0.19 gr/dscf in Rule 404 depending on exhaust flow rates. Sulfuric acid mist limit in Rule 469 is 0.3 lbs per ton of acid produced (approximately 0.1 gr/dscf) Rule 468 for sulfur recovery units does not contain any PM standard.	Bay Area, Regulation 6, Rule 1 (Adopted 12/5/07) contains the following limits: <ul style="list-style-type: none"> • Generally, PM limit is 0.15 gr/dscf • Sulfuric Acid Manufacturing Plants: limit sulfur trioxide or sulfuric acid mist, or both, expressed as 100% sulfuric acid, to 0.04 gr/dscf • Sulfur Recovery Units: limit sulfur trioxide or sulfuric acid mist, or both, expressed as 100% sulfuric acid, to 0.08 gr/dscf 	Further study the feasibility of reducing the emission limits through: MCS-01 – Application of All Feasible Measures Assessment
445	PM	Wood Burning Devices (Adopted 3/7/08)	Contains requirements for wood burning devices to minimize emissions and smoke impacts to the public.	San Joaquin Valley Rule 4901 (Amended 10/16/2008) contains additional best management practices compared to Rule 445.	Further study to include additional good management practices and the possibility of restricting burning during the episodic curtailment periods through: BCM-01 – Further Reductions from Residential Wood Burning Devices

ATTACHMENT

CALIFORNIA AIR RESOURCES BOARD

Mobile Source RACM Analysis for the South Coast 2012 Draft Final AQMP

Given the significant emission reductions needed for attainment in California, ARB has adopted some of the most stringent control measures nationwide for on-road and off-road mobile sources and the fuels that power them. These measures target both new and in-use equipment. And while California first focused on cleaning up cars – new car emissions have been reduced by 99 percent – the scope of California’s program is vast. The State has implemented regulations and programs to reduce emissions from freight transport equipment, including heavy-duty trucks, ocean going vessels, locomotives, harbor craft, and cargo handling equipment. In addition, the State has standards for lawn and garden equipment, recreational vehicles and boats, and other newly manufactured off-road equipment. California has also adopted many measures that focus on achieving reductions from in-use mobile sources that include accelerated replacement of older equipment with newer, less polluting equipment; more stringent inspection and maintenance requirements; and operational requirements such as truck and bus idling restrictions and speed reduction requirements for ocean going vessels.

California has unique authority under Clean Air Act section 209 to adopt and implement new emission standards for many categories of on-road vehicles and engines, and new and in-use off-road vehicles and engines. Use of this authority is subject to U.S. EPA waiving the applicable federal standard upon their finding that the standards adopted by California are, in the aggregate, at least as stringent as the comparable federal standard.

To support the attainment plans submitted to U.S. EPA in 2007 for 8-hour ozone and PM_{2.5}, ARB undertook an extensive public consultation process to identify potential SIP measures. New measures developed by ARB as part of this 2007 State Strategy focused on cleaning up the in-use fleet, and increasing the stringency of emissions standards for a number of engine categories, fuels, and consumer products. These measures build on ARB’s already comprehensive program that addresses emissions from all types of mobile sources.

In 2011, U.S. EPA approved the State mobile source control program as being RACM in the context of the 2007 and 2008 South Coast and San Joaquin Valley PM_{2.5} plans (76 FR 69928 at 69933). In its proposed approval of the 2007 South Coast PM_{2.5} Attainment Plan, U.S. EPA recognized that the “State of California has been a leader in the development of some of the most stringent control measures nationwide for on-road and off-road mobile sources and the fuels that power them” (76 FR 41562 at 41570). In the 2007 State Strategy, ARB identified and committed

to propose new defined measures for the sources under its jurisdiction. Of these new measures, U.S. EPA noted that “many, if not most, of these measures are being proposed for adoption for the first time anywhere in the nation” (76 FR 41562 at 41570).

California’s comprehensive mobile source program continues to be RACM as it expands and further reduces emissions. The 2012 PM_{2.5} SIPs rely on additional regulations adopted since the State’s last major SIP revision in 2007. In January 2012, ARB adopted the Advanced Clean Cars program, which combines the control of smog-causing pollutants and greenhouse gas emissions into a single coordinated package of requirements for model years 2017 through 2025. The program was developed in tandem with the federal government over several years, including a joint fact-finding process with shared engineering and technical studies. Benefits from this new program are reflected in emission inventories used in the 2012 PM_{2.5} attainment plans.

SECTION 1

INTRODUCTION

PURPOSE AND SCOPE

The purpose of the 2012 1-hour ozone SIP revision is to provide an attainment demonstration to respond to the U.S. EPA's published "SIP call" proposal on September 19, 2012, finding the existing approved 1-hour ozone SIP substantially inadequate to provide for attainment of the revoked 1-hour ozone standard by the applicable attainment date of November 15, 2010. EPA's proposed SIP call was in turn a response to the decision of the Ninth Circuit Court of Appeals in *Association of Irrigated Residents, et al. v. United States Environmental Protection Agency, et al.*, 686 F. 2d 668 (Amended January 12, 2012).

The only new information presented in this Appendix is the 1-hour ozone attainment demonstration described in Section 5. The other sections of this appendix are largely summaries or replications of information presented in the main volume or other appendices of the Draft Final 2012 AQMP. This information is repeated here to provide context and completeness in support of the 1-hour ozone attainment demonstration.

BACKGROUND

In 1979, EPA established a primary health-based national ambient air quality standard (NAAQS) for ozone at 0.12 parts per million (ppm) averaged over a 1-hour period. See 44 Fed. Reg. 8220 (February 9, 1979). The Clean Air Act, as amended in 1990, classified areas that had not yet attained that standard, based on the severity of their ozone problem, ranging from Marginal to Extreme. Extreme Areas were provided the most time to attain the standard, until November 15, 2010. On November 6, 1991, EPA classified the South Coast Air Basin as "Extreme" nonattainment. As required under the 1990 amendments to the CAA, in 1994 the District and CARB submitted a 1-hour ozone "state implementation plan" (SIP) revision. In 1997, EPA approved the 1-hour ozone SIP for the South Coast. 62 Fed. Reg. 1150 (January 8, 1997). In 1997 and 1999, CARB submitted revisions to the 1994 South Coast 1-hour ozone SIP, which EPA approved in 2000. 65 Fed. Reg. 18903 (April 10, 2000).

In 2004, CARB submitted the 2003 revisions to the 1-hour ozone SIP which included updated emissions inventories showing higher mobile source emissions than had previously been projected and a lower "carrying capacity" than previously predicted, along with new commitments to achieve specified amounts of VOC and NOx reductions needed to attain by the applicable date. 73 Fed. Reg. 63408, 63410, 63416 (October 24, 2008).

NEW OZONE STANDARD

In the meantime, in 1997 EPA promulgated a new 8-hour ozone standard of 0.08 ppm to replace the 1-hour standard. 62 Fed. Reg. 38856 (July 18, 1997). EPA

promulgated rules to implement that standard. The “Phase 1” rule, promulgated on April 30, 2004 (69 Fed. Reg. 23951) established anti-backsliding requirements that would continue to remain in effect even though the existing 1-hour standard was revoked effective June 2005. See 40 CFR §51.905(a)(1) and §51.900(f). An Extreme area was required to have a fully-approved attainment demonstration in effect. (Id.).

EPA ACTION ON 2003 1-HOUR OZONE SIP REVISION

In 2008, the California Air Resources Board (CARB) withdrew key components of its emission reduction commitments in the 2003 South Coast 1-hour ozone SIP. See 73 Fed. Reg. at 63410-12. In 2009, EPA approved certain elements of the 2003 South Coast 1-Hour Ozone SIP but disapproved the attainment demonstration, largely because CARB’s 2008 withdrawal of emission reduction commitments rendered the plan insufficient to demonstrate attainment. 74 Fed. Reg. 10176, 10181 (March 10, 2009). EPA also concluded that this disapproval did not trigger a sanctions clock or a FIP (federal implementation plan) because the approved SIP already contained an approved 1-hour attainment demonstration meeting CAA requirements, which was all that was necessary regarding the revoked 1-hour standard. 74 Fed. Reg. at 10177, 10181.

LITIGATION OVER EPA’S 2009 ACTION

Several environmental and community groups petitioned for review of EPA’s action in the Ninth Circuit Court of Appeals. On February 2, 2011, the Ninth Circuit ruled in favor of petitioners. As pertinent here, the Court held that EPA must promulgate a FIP or issue a SIP call where EPA disapproves a new attainment demonstration unless the Agency determines that the SIP as approved remains adequate to demonstrate attainment of the relevant NAAQS. On May 5, 2011, EPA petitioned for panel rehearing, and amicus briefs were filed in support of EPA by the District, CARB, and SCAG. On January 27, 2012, the Ninth Circuit denied the petition for rehearing but modified its opinion to delete references to sanctions. The court remanded the case to EPA, stating that “EPA should have ordered California to submit a revised attainment plan for the South Coast after it disapproved the 2003 Attainment Plan”. *Association of Irrigated Residents v. EPA*, 632 F. 3d. 668, 681 (9th Cir., reprinted as amended January 27, 2012, further amended February 13, 2012.) The Court also issued a ruling regarding transportation control measures for ozone under CAA §182(d)(1)(A), which is discussed in Appendix VIII of the Draft Final 2012 AQMP.

EPA PROPOSED SIP CALL

On September 19, 2012, EPA published a proposed SIP call under Section 110(k)(5) of the CAA, based on a determination that the applicable implementation plan (here, the 1997/99 plan approved April 10, 2000) “is substantially inadequate to attain or

maintain the relevant NAAQS...” The proposed SIP call is based on evidence submitted in the form of the 2003 South Coast 1-hour Ozone Plan that the 1997/1999 plan was substantially inadequate to provide for attainment. That plan noted that “this revision points to the urgent need for additional emission reductions (beyond those incorporated in the 1997-99 Plan) to offset increased emissions estimates from mobile sources...” (See 2003 Air Quality Management Plan, pages ES-1 and ES-2.) However, many of those additional emission reduction commitments were withdrawn by CARB in 2008. EPA also notes that on December 30, 2011, EPA determined that the South Coast Air Basin had failed to attain the 1-hour ozone standard by the applicable date of November 15, 2010, thus triggering a fee program or equivalent under CAA §185. 76 Fed. Reg. 82133 (December 30, 2011). This determination provides further support for the present SIP call because it establishes that the approved SIP did not in fact lead to attainment for the 1-hour ozone NAAQS by the applicable date.

As a result, the state must submit an attainment demonstration for the South Coast for the 1-hour ozone standard showing attainment as expeditiously as practicable but no later than five years from the effective date of the final SIP call, unless the State can demonstrate a need for a later date, not to exceed 10 years beyond the effective date of the SIP call, considering the severity of the remaining nonattainment problem and the availability and feasibility of pollution control measures. CAA §172(a)(2).

EPA’s proposed SIP call would give the State up to one year after the effective date of the SIP call to submit the revised attainment demonstration. The District intends to demonstrate that a period of the full 10 years allowed by law is needed to attain the 1-hour standard. The District plans to submit the updated 1-hour ozone attainment demonstration as part of the 2012 AQMP.

SECTION 2

OZONE AIR QUALITY IN THE BASIN

INTRODUCTION

The U.S EPA has designated the Basin as extreme nonattainment for the revoked federal 1-hour ozone standard of 0.12 ppm. The Basin had the highest number of days exceeding the federal 1-hour ozone standard of any urban area nationwide in 2011. The following information on 1-hour ozone air quality is taken from Chapter 2 and Appendix II of the Draft Final 2012 AQMP, and is repeated here for completeness. The 1-hour ozone air quality data is used to support the 1-hour ozone attainment demonstration.

OZONE HEALTH EFFECTS

The adverse effects of ozone air pollution exposure on health have been studied for many years, as is documented by a significant body of peer-reviewed scientific research, including studies conducted in southern California which shows that even relatively low concentrations of ozone can significantly reduce lung function in normal healthy people.

Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered the most susceptible sub-groups to ozone effects. Short-term exposures to ozone at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. Elevated ozone levels are associated with increased school absences and daily hospital admission rates. An increased risk for asthma has been found in children who participate in multiple sports and live in high ozone communities.

Ozone exposure under exercising conditions is known to increase the severity of the above-mentioned observed responses. Animal studies suggest that exposures to a combination of pollutants which include ozone may be more toxic than exposure to ozone alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.

OZONE EPISODES

While the 1-hour ozone episode levels and the related health warnings still exist, they have been largely superseded by the more protective health warnings associated with the current 8-hour ozone NAAQS. The 1-hour O₃ episode warning levels include the state Health Advisory (0.15 ppm), Stage 1 (0.20 ppm), Stage 2 (0.35 ppm) and Stage 3 (0.50 ppm). Only the lowest of these 1-hour episode thresholds, the state Health Advisory, was exceeded in 2011. The last 1-hour O₃ Stage 1 episode occurred in

2003. The last Stage 2 episode occurred in 1988, and the last Stage 3 episode occurred in 1974.

1-HOUR OZONE LEVELS IN THE SOUTH COAST AIR BASIN

In 2011, the District regularly monitored ozone concentrations at 29 locations in the Basin and the Coachella Valley portion of the SSAB. All areas monitored measured 1-hour average ozone levels well below the Stage 1 episode level, but the maximum concentrations measured in the Basin exceeded the health advisory level in San Bernardino County. The maximum ozone concentrations in the Los Angeles, Riverside and San Bernardino Counties all exceeded the former 1-hour federal standard in 2011; Orange County and the Coachella Valley did not exceed that standard. Maximum ozone concentrations in the SSAB areas monitored by the District were lower than in the Basin and were below the health advisory level. Table VII-2-1 shows maximum 1-hour ozone concentrations by air basin and county.

TABLE VII-2-1

2011 Maximum 1-Hour Average Ozone Concentrations by Basin and County

BASIN/COUNTY	MAXIMUM 1-HR AVERAGE (PPM)	PERCENT OF FEDERAL STANDARD (0.12 PPM)	AREA
South Coast Air Basin			
Los Angeles	0.144	115	Santa Clarita Valley
Orange	0.095	76	North Orange County
Riverside	0.133	106	Lake Elsinore
San Bernardino	0.160	128	Central San Bernardino Mountains
Salton Sea Air Basin			
Riverside	0.124	99	Coachella Valley

The number of days exceeding the former federal 1-hour ozone standard in the Basin varies widely by area (Figure VII-2-1). The former 1-hour federal standard was not exceeded in areas along or near the coast in the Counties of Los Angeles and Orange, due in large part to the prevailing sea breeze which transports emissions inland before high ozone concentrations are reached. The standard was exceeded most frequently in the Central San Bernardino Mountains. Ozone exceedances also extended through San Bernardino and Riverside County valleys in the eastern Basin, as well as the northeast and northwest portions of Los Angeles County in the foothill

and valley areas. The Central San Bernardino Mountains area recorded the greatest number of exceedances of the former 1-hour federal standard (8 days). The Coachella Valley did not exceed the former 1-hour ozone standard in 2011.

FIGURE VII-2-1

Number of Days in 2011 Exceeding the 1979 1-Hour Federal Ozone Standard
(1-hour average O₃ > 0.12 ppm)

AMBIENT AIR QUALITY STANDARDS

Federal Ozone Standards

The federal government has adopted ambient air quality standards, which define the concentration below which long-term or short-term exposure to a pollutant is not expected to cause adverse effects to public health and welfare. The current and revoked federal ozone ambient air quality standards and the effect of ozone on health are summarized in Table VII-2-2. As noted above, the federal 1-hour ozone standard was revoked in favor of the 8-hour ozone standard in 1997.

TABLE VII-2-2

Federal Ozone Ambient Air Quality Standards and Health Effects

Federal Standard (NAAQS)	Relevant Health and Welfare Effects[#]
Concentration, Averaging Time	
0.075 ppm, 8-Hour (2008) 0.08 ppm 8-Hour (1997) 0.12 ppm, 1-hour (1979, revoked in 1997)	(a) Pulmonary function decrements and localized lung edema in humans and animals; (b) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (c) Increased mortality risk; (d) Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (e) Vegetation damage; (f) Property damage

ppm – parts per million by volume

Federal standards follow the design value form of the NAAQS

[#] More detailed health effect information can be found in the 2012 AQMP Appendix I or the U.S. EPA NAAQS documentation at <http://www.epa.gov/ttn/naaqs/>

Design Values and NAAQS Attainment Status

In 2011, 1- hour ozone levels exceeded federal standard concentration levels at one or more of the routine monitoring stations in the Basin. As shown in Table VII-2-1, maximum 1-hour ozone concentrations of 0.160 ppm recorded in the Central San Bernardino Mountains area were 128 percent of the former 1-hour federal standard. However, an exceedance of the concentration level does not necessarily mean a violation of the NAAQS, given that the form of the standard must be considered. Air quality statistics can be presented in terms of maximum concentrations measured at monitoring stations or in air basins, as well as the number of days exceeding state or federal standards.

Attainment of the NAAQS is measured with three-year design values that take into account the form of the federal standards and multi-year averages. For 1-hour O₃, the form of the standard is the 4th highest measured 1-hour average concentration at each station over a three-year period. The overall design value for an air basin is the highest design value of all the stations in that basin. Figure VII-2-2 shows the trends in the 1-hour ozone design values and the annual Basin days exceeding the former 1-hour ozone NAAQS over the past two decades.

FIGURE VII-2-2

South Coast Air Basin Trends in Ozone Design Value and Annual Basin Days Exceeding the Former 1-hour NAAQS

Air Quality Compared to Other U.S. Metropolitan Areas

Despite significant improvement, the Basin still has some of the worst air quality in the nation in terms of the number of days per year exceeding the revoked federal 1-hour ozone standard. Figures VII-2-3 and VII-2-4 show maximum 1-hour ozone concentrations in 2011 for the Basin compared to other urban areas in the U.S. and California, respectively. It is important to note that maximum pollutant concentrations do not necessarily indicate potential NAAQS violations and subsequent nonattainment designations, as the design values that are used for attainment status are based on the form of the standard.

FIGURE VII-2-3

2011 South Coast Air Basin 1-hour Ozone Air Quality Compared to Other U.S. Metropolitan Areas (Maximum Pollutant Concentrations as Percentage of the Federal Standard)

FIGURE VII-2-4

2011 South Coast Air Basin 1-hour Ozone Air Quality Compared to Other California Metropolitan Areas (Maximum Pollutant Concentrations as Percentage of the Federal Standard)

SECTION 3

BASE YEAR AND FUTURE YEAR EMISSIONS

INTRODUCTION

The 1-hour ozone attainment demonstration is based on the latest emissions inventories for the base year (2008) and projected future years developed as part of the Draft Final 2012 AQMP. For specific details and descriptions of inventory development methodology, please refer to Chapter 3 and Appendix III of the Draft Final 2012 AQMP.

BASE YEAR AND FUTURE YEAR EMISSIONS

Summaries of the summer planning inventory (ozone precursors) emissions that occurred in the Basin in the 2008 base year and that are projected for the 2022 attainment year are provided in the Tables VII-3-1 and VII-3-2. Note that the 2008 Base year inventory is identical to that in the Draft Final 2012 AQMP (Chapter 3, Appendix III). Table VII-3-3 provides the complete 2022 summer planning emissions inventory by major source category in the South Coast Air Basin.

SECTION 4

1-HOUR OZONE SIP CONTROL STRATEGY

INTRODUCTION

This section sets forth the proposed control strategy and implementation schedule to demonstrate attainment with the former 1-hour ozone NAAQS by 2022. Given the approximate alignment of the attainment dates, the control strategy for the 1-hour ozone standard is identical to the control strategy for the 1997 federal 8-hour ozone standard. The control strategy for the 8-hour ozone standard is described in the 2007 AQMP with updates proposed in the current Draft Final 2012 AQMP. The following sections discuss the proposed control measures for attainment of the 1-hour ozone national ambient air quality standards (NAAQS) that include:

- 2007 8-hour ozone SIP control measures carried forward for the 1-hour ozone attainment demonstration; and
- Proposed 8-hour ozone control measures from the Draft Final 2012 AQMP (taken from Chapter 4 of the Draft Final 2012 AQMP and repeated in this Section for completeness.)

2007 SIP CONTROL MEASURES CARRIED FORWARD FOR THE 1-HOUR OZONE ATTAINMENT DEMONSTRATION

As provided in Table 1-3 of the Draft Final 2012 AQMP, the emission reduction commitments provided in the 2007 SIP have been met with the implementation of the majority of control measures identified in the 2007 SIP. For the 1-hour ozone attainment demonstration, the proposed control strategy is the continued implementation of the 2007 SIP control strategy for the 8-hour ozone attainment demonstration. As such, seven mobile source control measures (four on-road mobile source measures and three off-road measures) are proposed to be carried forward. The seven mobile source control measures are listed in Table VII-4-1 along with the specific reference pages from the 2007 SIP. The emission reductions associated with each measure are also provided in Table VII-4-1. These are not new measures and the emissions reductions commitments for these measures have already been approved in U.S. EPA's approval of the 2007 8-hour ozone SIP.

TABLE VII-4-1

List of 2007 SIP Mobile Source Control Measures Proposed to be Included in the 1-Hour Ozone Attainment Demonstration

2007 SIP Mobile Source Control Measures		
Title	2007 SIP Reference (released April 26, 2007)	Reduction (tpd) by 2022

Total		7.1 [VOC] 23.7 [NOx]

DRAFT FINAL 2012 AQMP PROPOSED 8-HOUR OZONE CONTROL MEASURES FOR THE 1-HOUR OZONE ATTAINMENT DEMONSTRATION

As stated above, the control strategy for attainment of the 1997 federal 8-hour ozone standard is identical to the control strategy being proposed for attainment of the former 1-hour ozone standard. The proposed 8-hour ozone control measures identified in the Draft Final 2012 AQMP are repeated below for completeness, and are taken directly from Chapter 4 of the Draft Final 2012 AQMP. A more detailed description of each control measure is provided in Appendices IV-A and IV-B.

The Draft Final 2012 AQMP is proposing a control strategy that includes emission reductions from both stationary and mobile sources. The proposed stationary source control measures in the Draft Final 2012 AQMP are based on implementation of all

feasible control measures through the application of available cleaner technologies, best management practices, incentive programs, as well as development and implementation of zero- and near-zero technologies and control methods. The stationary source control measures presented in the Plan are proposed to further reduce emissions from both point sources (permitted facilities) and area sources (generally small and non-permitted in addition to smaller permitted sources with emissions less than the reporting threshold in the District's Annual Emissions Reporting Program). The basic principles followed in developing the District's stationary source control measures call for initiating programs or rule making activities for VOC and further NO_x control strategies aiming at maximum reductions by the applicable timeframe to further implement the federal ozone standards.

The mobile source strategy includes actions seeking further emission reductions from both on-road and off-road mobile sources, such as accelerated penetration of zero- and near-zero emission vehicles and early retirement of older vehicles. In addition, the mobile source strategy includes research and development of advanced control technologies from various mobile sources. Some of the proposed actions need to be implemented by several agencies that currently have the statutory authority to implement such measures.

For each control measure, the District will seek to achieve the maximum reduction potential that is technically feasible and cost-effective. Significant challenges remain in meeting the federal ozone standards. Ozone reduction strategies and programs need to be continued and accelerated to ensure that the air basin will meet the 1-hour ozone standards by 2022. Proposed measures to reduce ozone include emission reductions from coatings, consumer products, and RECLAIM facilities as well as early transitions to cleaner technologies.

To ultimately achieve the ozone ambient air quality standards, significant additional emissions reductions will be necessary from a variety of sources, including those primarily under the jurisdiction of CARB (e.g., on-road motor vehicles, off-road equipment, and consumer products) and U.S. EPA (e.g., aircraft, ships, trains, and pre-empted off-road equipment). Without an adequate and fair-share level of reductions from all sources, the emission reduction burden would unfairly be shifted to sources that have already been doing their part for clean air. Moreover, the District will continue to use its available regulatory authority to further control mobile source emissions where federal or State actions do not meet regional needs.

Overall, the Draft Final 2012 AQMP includes 16 stationary and 17 mobile source measures for ozone. The following two sections discuss the control measures as outlined below:

- SCAG’s Regional Transportation Strategy and Transportation Control Measures (see Appendix IV-C for detailed descriptions of the regional transportation strategy and control measures)
- Proposed Ozone measures (see Appendix IV-A for detailed descriptions of the District’s stationary source control measures and Appendix IV-B for detailed descriptions of the District’s mobile source measures)

For District’s SIP emission reduction commitments, overall emission reductions and implementation, please refer to Chapter 4 of The Draft Final 2012 AQMP.

SCAG’s REGIONAL TRANSPORTATION STRATEGY AND TRANSPORTATION CONTROL MEASURES

The Southern California Association of Governments (SCAG), the Metropolitan Planning Organization (MPO) for Southern California, is mandated to comply with federal and state transportation and air quality regulations. Federal transportation law authorizes federal funding for highway, highway safety, transit, and other surface transportation programs. The federal CAA establishes air quality standards and planning requirements for various criteria air pollutants.

Transportation conformity is required under CAA Section 176(c) to ensure that federally supported highway and transit project activities “conform to” the purpose of the SIP. Conformity currently applies to areas that are designated non-attainment, and those re-designated to attainment after 1990 (“maintenance areas” with plans developed under CAA Section 175[A]) for the specific transportation-related criteria pollutants. Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. The transportation conformity regulation is found in 40 CFR Part 93.

Pursuant to California Health and Safety Code section 40460, SCAG has the responsibility of preparing and approving the portions of the AQMP relating to regional demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies. The District combines its portion of the Plan with those prepared by SCAG.

The transportation strategy and transportation control measures (TCMs), included as part of the Draft Final 2012 AQMP and SIP for the South Coast Air Basin, are based on SCAG’s adopted 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and 2011 Federal Transportation Improvement Program (FTIP). This was developed in consultation with federal, state and local transportation and air quality planning agencies and other stakeholders.

The Regional Transportation Strategy and Transportation Control Measures portion of the 2012 AQMP/SIP consists of the following three related sections.

Section I. Linking Regional Transportation Planning to Air Quality Planning

As required by federal and state laws, SCAG is responsible for ensuring that the regional transportation plan, program, and projects are supportive of the goals and objectives of AQMPs/SIPs. SCAG is also required to develop demographic projections and a regional transportation strategy and control measures for the AQMPs/SIPs.

The RTP/SCS, updated every four years, is a long-range regional transportation plan that provides a vision for transportation investments throughout the SCAG Region. The 2012-2035 RTP/SCS also integrates land use and transportation planning to achieve regional greenhouse gas (GHG) reduction targets set by ARB pursuant to SB375.

SCAG also develops the biennial FTIP. The FTIP is a multimodal program of capital improvement projects to be implemented over a six year period. The FTIP implements the programs and projects in the RTP/SCS.

Section II. Regional Transportation Strategy and Transportation Control Measures

The SCAG Region faces daunting mobility, air quality, and transportation funding challenges. Under the guidance of the goals and objectives adopted by SCAG's Regional Council, the 2012-2035 RTP/SCS was developed to provide a blueprint to integrate land use and transportation strategies to help achieve a coordinated and balanced regional transportation system. The 2012-2035 RTP/SCS represents the culmination of more than two years of work involving dozens of public agencies, 191 cities, hundreds of local, county, regional and state officials, the business community, environmental groups, as well as various nonprofit organizations. The 2012-2035 RTP/SCS was formally adopted by the SCAG Regional Council on April 4, 2012. The 2012-2035 RTP/SCS contains a host of improvements to every component of the regional multimodal transportation system including:

- Active transportation (non-motorized transportation, such as biking and walking)
- Transportation demand management (TDM)
- Transportation system management (TSM)
- Transit
- Passenger and high-speed rail
- Goods movement
- Aviation and airport ground access

- Highways
- Arterials
- Operations and maintenance

Included within these transportation system improvements are TCM projects that reduce vehicle use or change traffic flow or congestion conditions. TCMs include the following three main categories of transportation improvement projects and programs:

- High occupancy vehicle (HOV) measures,
- Transit and systems management measures, and
- Information-based transportation strategies.

New to this cycle of the RTP is the inclusion of the SCS as required by SB 375. The primary goal of the SCS is to provide a vision for future growth in Southern California that will decrease per capita GHG emissions from passenger vehicles. However, the strategies contained in the 2012-2035 RTP/SCS will produce benefits for the region far beyond simply reducing GHG emissions. The SCS integrates the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas on existing main streets, in downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. In addition, SCAG is a strategic partner in a regional effort to accelerate fleet conversion to near-zero and zero-emission transportation technologies, including planning for the expansion of alternative-fuel infrastructure to accommodate the anticipated increase in alternative fueled vehicles.

Section III. Reasonably Available Control Measure (RACM) Analysis for Transportation Control Measures

As required by the CAA, a RACM analysis must be included as part of the overall control strategy in the AQMP/SIP to ensure that all potential control measures are evaluated for implementation and that justification is provided for those measures that are not implemented. Appendix IV-C contains the RACM TCM component for the Draft Final 2012 AQMP control strategy. In accordance with U.S. EPA procedures, this analysis considers TCMs in the 2012-2035 RTP/SCS, measures identified by the CAA, and relevant measures adopted in other non-attainment areas of the country. Based on this comprehensive review, it is determined that the TCMs being implemented in the Basin are inclusive of all TCM RACM. None of the candidate measures reviewed and determined to be infeasible meets the criteria for RACM implementation.

The emission benefits associated with the RTP/SCS are reflected in the 2012 AQMP projected emissions. For a detailed discussion of the regional transportation strategy, refer to Appendix IV-C: Regional Transportation Strategy and Control Measures.

PROPOSED OZONE CONTROL MEASURES

The 2007 State Implementation Plan for the 8-hour ozone NAAQS contains commitments for emission reductions that rely on advancement of technologies, as authorized under Section 182(e)(5) of the federal Clean Air Act. These measures, which have come to be known as the “black box,” account for a substantial portion of the NO_x emission reductions needed to attain the federal ozone standards – over 200 tons/day. Attaining these standards will require substantial reductions in emissions of NO_x well beyond reductions resulting from current rules, programs, and commercially available technologies. The 8-hour ozone measures included in the Draft Final 2012 AQMP as an implementation update for the 8-hour ozone plan are also being submitted as the control strategy for the 1-hour ozone attainment demonstration.

Mobile sources emit over 80 percent of regional NO_x and therefore must be the largest part of the solution. On-road truck categories are projected to comprise the single largest contributor to regional NO_x. Other equipment involved in goods movement, such as marine vessels, locomotives and aircraft, are also substantial NO_x sources.

Since NO_x emissions from most significant sources are already controlled by over 90%, attainment of the ozone standards will require broad deployment of zero and near zero¹ emission technologies. On-land transportation sources such as trucks, locomotives and cargo handling equipment have technological potential to achieve zero- and near-zero emission levels. Current and potential technologies include hybrid-electric, hybrid with all electric range, battery-electric, and hydrogen fuel cell on-road vehicle technologies. New types of hybrids could also serve long-term needs while providing additional fuel diversity. These could include, for example, natural gas-electric hybrid technologies for on-road and other applications, particularly if coupled with improved after-treatment technologies. Equipment powered solely by alternative fuels such as natural gas may also play a long-term role in some applications, if those applications are found to pose technological barriers to

¹ The term “near zero emissions” refers to emissions approaching zero and will be delineated for individual source categories through the process of developing and implementing the Air Quality Management Plan/State Implementation Plan. Based on current analyses, on-land transportation sources will need to achieve zero emissions where possible, and otherwise will need to be substantially below adopted emission standards — including standards with future effective dates. Near zero emissions technologies can help meet this need, particularly if they support a path toward zero emissions (e.g. electric/fossil fuel hybrids with all- electric range).

achieving zero or near-zero emissions. Even in such applications, however, substantial additional emission reductions will be needed through development of new, advanced after-treatment technologies. In addition, alternative fuels will likely play a transitional near-term role. Alternative fuels such as natural gas have historically helped the region make progress toward attaining air quality standards, and -- while not achieving zero or near-zero NO_x emission levels -- they are generally cleaner than conventional fuels. Given the region's need to attain air quality standards in a few short years, alternative fueled engines will continue to play a role. Finally, we emphasize that air quality regulatory agencies have traditionally set policies and requirements that are performance based and technology and fuel neutral -- a policy that the District intends to continue. In short, all technologies and fuels should be able to compete on an equal footing to meet environmental needs.

While there has been much progress in developing and deploying transportation technologies with zero- and near-zero emissions (particularly for light-duty vehicles and passenger transit), additional technology development, demonstration and commercialization will be required prior to broad deployment in freight and other applications. This section describes a path to evaluate, develop, demonstrate, fund and deploy such technologies for land-based transportation sources. It also proposes near-term measures to accelerate fleet turnover to the lowest emission units, and require deployment of zero-emission technologies where most feasible.

The District staff believes that a combination of regulatory actions and public funding is the most effective means of achieving these emission reductions. Voluntary incentive programs such as the Carl Moyer Program can help to accelerate turnover to the cleanest commercially available equipment. A majority of the on-road and off-road measures proposed are based on existing funding programs implemented by the District or the California Air Resources Board. However, several of the existing funding programs will sunset in the 2014 – 2015 timeframe. Continued funding beyond 2015 will be needed to reduce the emissions associated with the black box. Developing, demonstrating and deploying new technologies will require public/private partnerships and, in some cases, regulatory actions.

The measures described in this section are a relatively small down payment on the total emission reductions needed to attain the 8-hour and 1-hour NAAQS for ozone. The measures proposed in this section and further discussed in Appendix IV-A and IV-B are feasible steps that must commence in the near-term to establish a path toward a broader transition to the technologies that will be needed to attain federal air quality standards. Between now and 2015, the additional measures needed to attain the ozone NAAQS will be fleshed out in greater detail as required under the federal Clean Air Act as part of the next AQMP revision. Given the magnitude of needed emission reductions, and the time remaining until attainment deadlines, it is

important that progress and momentum to identify, develop, and deploy needed technologies be sustained and accelerated.

The District staff recognizes these are very difficult policy choices the Basin is facing. Transitioning over the next 10 to 20 years to cleaner transportation technologies will involve major costs and effects on the economy. However, adopting sufficient plan measures to attain the ozone air quality standards by the applicable dates is required by federal law and therefore, failing to do so is not an acceptable public policy. Such failure would also risk adverse health consequences highlighted in recent health studies, not to mention the potential adverse economic impacts on the region due to potential federal sanctions. The following sections summarize the ozone measures. More detailed discussions are provided in Appendix IV-A and IV-B.

Clean Air Act Section 182(e)(5)

The District's 1-hour ozone SIP submittal relies in part on the ability to use advanced technology measures as authorized under Clean Air Act § 182(e)(5). EPA has already approved the reliance on § 182(e)(5) in the South Coast 8-hour ozone plan. 77 Fed. Reg. 12674, 12693 (Mar. 1, 2012). The present 1-hour ozone SIP submittal includes a number of ozone measures which reduce reliance on § 182(e)(5). Under the plain language of the Clean Air Act, the District may rely on § 182(e)(5) measures, as long as the reductions to be obtained from them are not needed for the first ten years after November 15, 1990. 42 U.S.C. § 7511a(e)(5)(B). The District's initial 1-hour ozone plan complied with this requirement, and EPA approved the § 182(e)(5) measures in 1995. 62 Fed. Reg. 1150, 1178 (Jan. 8, 1997), citing 60 Fed. Reg. 43379 (Aug. 21, 1995).

Since the present 1-hour SIP submission does not rely on § 182(e)(5) for emission reductions prior to November 15, 2000, it complies with § 182(e)(5). There is no textual or policy basis for concluding that § 182(e)(5) is not available. Because the present SIP submission addresses 1-hour ozone, there is no textual basis for deviation from the plain language of the Clean Air Act: Section 182(e)(5) is available for reductions needed after November 15, 2000. Nor is there any policy basis to do so. The Clean Air Act clearly authorizes EPA to grant up to 10 years to attain the standard. Therefore, under § 182(e)(5), contingency measures would need to be in place which attain the needed reductions by three years before the attainment deadline. This provides adequate assurance that the § 182(e)(5) measure, or the contingency measures, will be implemented in time to attain the 1-hour ozone standard.

The fact that EPA has interpreted § 182(e)(5) somewhat differently in the context of the 8-hour ozone standard is irrelevant here. EPA was required to deviate from the literal language of the Clean Air Act in the case of the 8-hour ozone standard because

it did not literally apply. However, the U.S. Supreme Court held that EPA may not simply ignore Subpart 2 (relative to 1-hour ozone) as to do so produced unreasonable results (e.g., Los Angeles needing to attain the more stringent 8-hour standard *at least as quickly as* it attained the less stringent 1-hour standard.) *Whitman v. American Trucking*. 531 U.S. 457, 486 (2001). As a result, EPA was required to “interpret” Subpart 2. In contrast, when considering the 1-hour ozone standard, the plain language of § 182(e)(5) applies, leaving no room for interpretation. Certainly nothing in § 179(d), dealing with plan submittals on failure to attain, remotely suggests that the plain language of § 182(e)(5) is no longer applicable. That being the case, EPA is not authorized to “interpret away” the provisions of § 182(e)(5). Even if the language were ambiguous, there is no policy reason to interpret it to prohibit reliance on § 182(e)(5).

As noted above, EPA has already approved the District’s reliance on § 182(e)(5) for the 8-hour standard. It would make no sense to prohibit reliance on § 182(e)(5) for a standard *that has been revoked*. The District has already established in the 2007 AQMP and the 2012 1-hour ozone submittal that it is impossible to attain the standards without § 182(e)(5) measures, and all reasonable or feasibly available measures have been identified and scheduled for adoption. To say the District must attain a *revoked* standard, which EPA repeatedly described as not necessary to protect public health, (69 Fed. Reg. 23951, 23971, 23976 (April 30, 2004)), without reliance on measures undisputedly available for the existing, *more* health protective 8-hour standard, produces absurd results. Any such conclusion must be rejected. See e.g., *Logan v. United States*, 522 U.S. 23, 26 (2007); *United States v. X-Citement Video, Inc.*, 513 U.S. 64, 69 (1994).

Finally, EPA must consider the fact that for 8 years, all parties believed an attainment demonstration for the 1-hour standard *was not required*.

EPA stated in revoking the standard: “attainment of the 1-hour NAAQS would no longer be a goal....” 69 Fed. Reg. 23951 23970 (Apr. 30, 2004). EPA explained that it is not appropriate to “mandate states to perform an attainment demonstration for a NAAQS that is not needed to protect public health.” 69 Fed. Reg. 23951, 23976. In disapproving the AQMD’s 2003 attainment demonstration because it relied on withdrawn CARB measures, EPA explained that states no longer needed to attain the 1-hour standard. Responding to a comment that EPA must assure a viable path to attainment, EPA said: “...EPA’s responsibility at the present time is to ensure that states adopt viable paths toward attainment of the 8-hour NAAQS, rather than the revoked 1-hour ozone NAAQS....” 74 Fed. Reg. 10176, 10179 (Mar. 10, 2009).

Only when the AIR case became final was this position rejected. (Jan. 27, 2012.) *Ass’n of Irrigated Residents v. EPA*, 686 F.3d 668 (9th Cir. 2012). That being the case, it would be unreasonable to say the District must now attain that standard without relying on future technology advancements, as authorized by § 182(e)(5).

Had it been clear when EPA revoked the standard that the District would still have to attain it, CARB may not have withdrawn the 2003 AQMP measures. The region may have been closer to attainment of the 1-hour standard by now. Absent the ability to rely on § 182(e)(5), District would have no choice but to seek to amend the Clean Air Act to eliminate such obligations relative to revoked standards.

Contingency Measures

CAA section 182(e)(5) authorizes EPA to “approve provisions of an implementation plan for an Extreme Area which anticipate development of new control techniques or improvement of existing control techniques, and an attainment demonstration based on such provisions,” if the State meets certain criteria. Such plan provisions may include enforceable commitments to submit, at a later date, contingency measures for failure to attain under CAA section 172(c)(9), in addition to the contingency measures to be implemented if the anticipated technologies approved under section 182(e)(5) do not achieve planned reductions. These contingency measures must be submitted no later than three years before proposed implementation of the plan provisions and approved or disapproved by EPA in accordance with CAA section 110.

CARB and the District have satisfied the criteria in section 182(e)(5) for reliance on the new technology provision as part of the attainment demonstration in the South Coast 8-Hour ozone SIP and in this 1-hour ozone SIP. Based on the State’s anticipated development of these new technologies, CARB has submitted an enforceable commitment to submit, no later than 2020, additional contingency measures under CAA section 182(e)(5) that meet the requirements for attainment contingency measures in CAA section 172(c)(9), in addition to contingency measures to be implemented if the anticipated long-term measures approved pursuant to section 182(e)(5) do not achieve planned reductions. CARB Resolution 11–22, July 2011 and see letter dated November 18, 2011 from James Goldstene, CARB, to Jared Blumenfeld, EPA. Similarly, when submitting this 1-hour ozone demonstration to EPA, CARB is expected to submit enforceable commitments no later than 2019 (no later than three years prior to the attainment year of 2022), additional contingency measures under CAA section 182(e)(5) that meet the requirements for attainment contingency measures in CAA section 172(c)(9), in addition to contingency measures to be implemented if the anticipated long-term measures approved pursuant to section 182(e)(5) do not achieve planned reductions need for attainment of the 1-hour ozone standard. **RACT/RACM**

The CAA, Section 172(c)(1), sets the overall framework for the Reasonably Available Control Measures (RACM) analysis. The CAA requires the nonattainment air districts to:

“provide for the implementation of all reasonably available control measures as expeditiously as practicable (including such reductions in emissions from existing sources in the area as may be obtained through the adoption, at a minimum, of reasonably available control technology (RACT)) and shall provide for attainment of the national primary ambient air quality standards.”

The U.S. EPA recommends that nonattainment air districts first identify the emission reduction programs that have already been implemented at the federal level, and by other states and local air districts. Next, the U.S. EPA recommends the air districts to examine additional RACM/RACTs adopted for other nonattainment areas to attain the ambient air quality standards as expeditiously as practicable. The RACT/RACM analysis for the 1-hour ozone attainment demonstration can be found in Attachment 2 of this Appendix.

Proposed Ozone Stationary Source Measures

The proposed stationary source implementation measures are designed to assist in the attainment of the 8-hour ozone standard. These measures will also assist in attaining the 1-hour standard. The measures target a number of source categories including Coatings and Solvents (CTS), Combustion Sources (CMB), Petroleum Operations and Fugitive VOC Emissions (FUG), Multiple Component Sources (MCS), Incentive Programs (INC) and Educational Programs (EDU). There are 16 stationary source measures with the majority anticipated to be adopted in the next 2 – 3 years and implemented after 2015. These measures include two incentive programs and one educational measure.

There are two measures that were continued from the 2007 AQMP. The remaining 14 control measures are new ideas or revised previous measures (e.g., further reductions from an existing rule).

Table VII-4-2 provides a list of the District’s ozone measures for stationary sources along with the anticipated adoption date, implementation date and emission reduction.

TABLE VII-4-2

List of the District's Adoption/Implementation Dates and Estimated Emission Reductions from Ozone Measures for Stationary Sources

NUMBER	TITLE	ADOPTION	IMPLEMENTATION PERIOD	REDUCTION (TPD)
CTS-01	Further VOC Reductions from Architectural Coatings (R1113) [VOC]	2015 - 2016	2018 – 2020	2-4
CTS-02	Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents and Lubricants [VOC]	2013 - 2016		1-2
CTS-03	Further VOC Reductions from Mold Release Products [VOC]	2014	2016	0.8 – 2
CTS-04	Further VOC Reductions from Consumer Products [VOC]	2013 - 2015	2018	N/A ^a
CMB-01	Further NOx Reductions from RECLAIM [NOx]	2015	2017 – 2020	3-5 ^b
CMB-02	NOx Reductions from Biogas Flares [NOx]	2015	Beginning 2017	Pending ^c
CMB-03	Reductions from Commercial Space Heating [NOx]	Phase I – 2014 (Tech Assessment) Phase II - 2016	Beginning 2018	0.18 by 2023 0.6 (total)
FUG-01	VOC Reductions from Vacuum Trucks [VOC]	2014	2016	1d
FUG-02	Emission Reduction from LPG Transfer and Dispensing [VOC] – Phase II	2015	2017	1-2
FUG-03	Further Reductions from Fugitive VOC Emissions [VOC]	2015 -2016	2017-2018	1-2
MCS-01	Application of All Feasible Measures Assessment [All Pollutants]	Ongoing	Ongoing	TBD ^e
MCS-02	Further Emission Reductions from Greenwaste Processing (Chipping and Grinding Operations not associated with composting) [VOC]	2015	2016	1 ^d
MCS-03 (formerly MCS-06)	Improved Start-up, Shutdown and Turnaround Procedures [All Pollutants]	Phase I – 2012 (Tech Assessment) Phase II - TBD	Phase I – 2013 (Tech Assessment) Phase II – TBD	TBD ^e

TABLE VII-4-2 (concluded)

List of the District’s Adoption/Implementation Dates and Estimated Emission Reductions from Ozone Measures for Stationary Sources

NUMBER	TITLE	ADOPTION	IMPLEMENTATION PERIOD	REDUCTION (TPD)
INC-01	Economic Incentive Programs to Adopt Zero and Near-Zero Technologies [NOx]	2014	Within 12 months after funding availability	TBD ^e
INC-02	Expedited Permitting and CEQA Preparation Facilitating the Manufacturing of Zero and Near-Zero Technologies [All Pollutants]	2014-2015	Beginning 2015	N/A ^a
EDU-01 (formerly MCS-02, MCS-03)	Further Criteria Pollutant Reductions from Education, Outreach and Incentives [All Pollutants]	Ongoing	Ongoing	N/A ^a

- a. N/A are reductions that cannot be quantified due to the nature of the measure (e.g., outreach, incentive programs) or if the measure is designed to ensure reductions that have been assumed to occur will in fact occur.
- b. CMB-01 will target a cumulative 3-5 TPD of NOx emission reductions, including any CMB-01 PM2.5 contingency measure emission reductions.
- c. Pending because emission reductions will be provided prior to the Final Draft.
- d. Reductions submitted in SIP once emission inventories are included in the SIP.
- e. TBD are reductions to be determined once the inventory and control approach are identified.

The following text provides a brief description of the proposed ozone stationary source control measures and is taken directly from Chapter 4 of the Draft Final 2012 AQMP.

Coatings and Solvents

The category of coatings and solvents is primarily targeted at reducing VOC emissions from these VOC-containing products. This category includes four proposed control measures that are based on additional emission reductions from architectural coatings; miscellaneous coatings, solvents, adhesives and lubricants; mold release products; and consumer products with low vapor pressure used by commercial and institutional facilities regulated by CARB.

CTS-01 – FURTHER VOC REDUCTIONS FROM ARCHITECTURAL COATINGS: The District adopted Rule 1113 – Architectural Coatings, in 1977 and it has since undergone numerous amendments. This proposed control measure seeks to reduce the VOC emissions from large volume coating categories such as flat, non-flat and primer, sealer, undercoaters (PSU) and from phasing out the currently exempt use of high-VOC architectural coatings sold in one liter containers or smaller. Additional emission reductions could be achieved from the application of

architectural coatings by use of application techniques with greater transfer efficiency. Such transfer efficiency improvements could be achieved through the use of a laser paint targeting system, which has been shown to improve transfer efficiency on average by 30% over equipment not using a targeting system, depending on the size, shape and configuration of the substrate. The proposal is anticipated to be accomplished with a multi-phase adoption and implementation schedule.

CTS-02 – FURTHER VOC REDUCTIONS FROM MISCELLANEOUS COATINGS, ADHESIVES, SOLVENTS, AND LUBRICANTS: This control measure seeks VOC emission reductions by focusing on select coating, adhesive, solvent and lubricant categories by further limiting the allowable VOC content in formulations. Examples of the categories to be considered include but are not limited to, coatings used in certain aerospace applications; adhesives used in a variety of sealing applications; solvents for graffiti abatement activities; and lubricants used as metalworking fluids to reduce heat and friction to prolong life of the tool, improve product quality and carry away debris. Reductions would be achieved by lowering the VOC content of the coatings, adhesives and lubricants. For solvents, reductions could be achieved with the use of alternative low-VOC products or non-VOC product/equipment at industrial facilities. The proposal is anticipated to be accomplished with a multi-phase adoption and implementation schedule.

CTS-03 – FURTHER VOC REDUCTION FROM MOLD RELEASE PRODUCTS: Metal, fiberglass, composite and plastic products are often manufactured using molds which form the product into a particular configuration. Mold release agents are used to ensure that the parts, as they are made, can be released easily and quickly from the molds. These agents often contain VOC solvent carriers and may also contain toxic components like toluene and xylene. Mold release products are also used for concrete stamping operations to keep the mold from adhering to the fresh concrete. Residential and commercial concrete stamping is a rapidly growing industry, and overall VOC emissions are estimated to be significant. This control measure seeks to reduce emissions from mold release products on metal, fiberglass, composite and plastic products, as well as concrete stamping operations, by requiring the use of low-VOC mold release products.

CTS-04 - FURTHER VOC REDUCTION FROM CONSUMER PRODUCTS: This measure seeks to revise the exemption for low vapor pressure solvents in CARB's consumer products regulation, which exempts low vapor pressure volatile organic compounds (LVP-VOC) from counting towards the compliance obligation for consumer product VOC limits. Recent testing conducted by the District on institutional cleaners found that traditionally formulated consumer products may contain significant amounts of LVP-VOC solvents. In some cases, such as certain multipurpose solvents, the products were 100 percent LVP-VOC solvents. Further

testing indicated that many of the LVP-VOC solvents evaporate nearly as quickly as the traditional solvents they were meant to replace and have Maximum Incremental Reactivity (MIR) values well above the threshold considered to be non-reactive, currently based on ethane. Therefore, an evaluation of the continued need for use of LVP-VOC solvents in certain categories is warranted.

Combustion Sources

This category includes three proposed measures for stationary combustion equipment. There is one control measure that further reduces NO_x emissions from RECLAIM facilities. A second proposed measure seeks a reduction from biogas flares, and a third proposed control measure seeks to reduce NO_x emissions from commercial space heaters.

CMB-01 – FURTHER NO_x REDUCTIONS FROM RECLAIM: This proposed control measure will seek cumulative reductions of 3-5 tpd of NO_x allocations by the year 2020, via implementation of periodic BARCT evaluation as required under the state law. If triggered, the PM_{2.5} contingency measure provision of CMB-01 would achieve 2-3 tpd of NO_x allocation reductions in 2015, with the remaining 1-2 tpd implemented in the 2017-2020 timeframe. If the contingency measure is not triggered, then the entire 3-5 tpd of NO_x reductions will be implemented in 2017-2020 timeframe. The control measure has the ability to produce co-benefits in the reduction of PM_{2.5} and ozone.

CMB-02 – NO_x REDUCTIONS FROM BIOGAS FLARES: There are no source-specific rules regulating NO_x emissions from biogas flares. Flare NO_x emissions are regulated through new source review and BACT. This control measure proposes that, consistent with the all feasible measures measure, older biogas flares be gradually replaced with flares that meet current BACT. Strategies that minimize flaring and associated emissions can also be considered as alternative control options.

CMB-03 – REDUCTIONS FROM COMMERCIAL SPACE HEATING: This control measure applies to natural gas-fired commercial space heaters used for comfort heating. District Rule 1111 - NO_x Emissions from Natural Gas-Fired Fan Type Central Furnaces, regulates space heaters with input rates less than 175,000 Btu/hr. This measure proposes to establish a NO_x emission limit for new space heaters for commercial applications, which can be achieved through the use of low-NO_x burners or other technologies.

Petroleum Operations and Fugitive VOC Emissions

This category pertains primarily to operations and materials associated with the petroleum, chemical, and other industries. Within this category, there is one proposed control measure targeting fugitive VOC emissions with improved leak

detection and repair. Other proposed measures include reductions from vacuum truck venting, and propane transfer and dispensing.

FUG-01 – VOC REDUCTIONS FROM VACUUM TRUCKS: This control measure seeks to reduce emissions from the venting of vacuum trucks. Emissions from such operations can be further reduced through the utilization of control technologies, including but not limited to, carbon adsorption systems, internal combustion engines, thermal oxidizers, refrigerated condensers and liquid scrubbers. Additionally, implementation of a leak detection and repair (LDAR) program may further reduce fugitive emissions.

FUG-02 - EMISSION REDUCTION FROM LPG TRANSFER AND DISPENSING: The District recently adopted Rule 1177 - Liquefied Petroleum Gas (LPG) Transfer and Dispensing (June 2012). The rule requires use of low-emission fixed liquid level gauges or equivalent alternatives during filling of LPG-containing tanks and cylinders, use of low-emission connectors, routine leak checks and repairs of LPG transfer and dispensing equipment. The purpose of this control measure is to reduce fugitive VOC emissions associated with the transfer and dispensing of LPG by expanding rule applicability to include LPG transfer and dispensing at currently exempted facilities such as refineries, marine terminals, natural gas processing plants and pipeline transfer stations, as well as facilities that conduct fill-by-weight techniques.

FUG-03 – FURTHER REDUCTIONS FROM FUGITIVE VOC EMISSIONS: This control measure seeks to broaden the applicability of improved leak detection and repair (LDAR) programs to remove additional fugitive VOC emissions. Areas for further study may include, but are not limited to, Rule 1142 - Marine Vessel Tank Operations, and wastewater separators. This control measure would explore the opportunity of incorporating a recently developed advanced optical gas imaging technology to detect leaks (Smart LDAR) to more easily identify and repair leaks in a manner that is less time consuming and labor intensive. Additionally, vapor recovery systems are currently required to be 95% control efficient. In an effort to further reduce emissions from these operations, this control measure would explore opportunities and the feasibility of further improving the collection/control efficiency of existing control systems resulting in additional VOC reductions.

Multiple Component Sources

There are a total of three stationary source measures proposed in this category. The first measure seeks reductions of all feasible measures after such an assessment is made. Another measure seeks further emission reductions from greenwaste processing, which is chipping and grinding not associated with composting. The third measure seeks to minimize emissions during equipment startup and shutdown

and to reduce emissions by applying the state requirement of all feasible control measures.

MCS-01 – APPLICATION OF ALL FEASIBLE MEASURES ASSESSMENT:

This control measure is to address the state law requirement for all feasible measures for ozone. Existing rules and regulations for pollutants such as VOC, NO_x, SO_x and PM reflect current best available retrofit control technology (BARCT). However, BARCT continually evolves as new technology becomes available that is feasible and cost-effective. Through this proposed control measure, the District would commit to the adoption and implementation of the new retrofit control technology standards. Finally, staff will review actions taken by other air districts for applicability in our region.

MCS-02 - FURTHER EMISSION REDUCTIONS FROM GREENWASTE PROCESSING (CHIPPING AND GRINDING NOT ASSOCIATED WITH COMPOSTING):

Chipped or ground greenwaste and/or wood waste has a potential to emit VOCs when being stockpiled or land-applied for various purposes. Chipping and grinding is a process to mechanically reduce the size of greenwaste and wood waste. The District rules currently establish best management practices (BMPs) for greenwaste composting and related operations under Rule 1133.1 – Chipping and Grinding Activities, and Rule 1133.3 – Greenwaste Composting Operations. During rule development, stakeholders raised the need to develop a holistic approach to identifying and accounting for emissions from all greenwaste streams and reducing potential emissions from greenwaste material handling operations at chipping and grinding facilities and other related facilities, and not just the ones associated with composting operations. This control measure would seek to establish additional Best Management Practices (BMPs) for handling processed or unprocessed greenwaste material by greenwaste processors, haulers, and operators who inappropriately stockpile material or directly apply the material to land. The implementation of the control measure would be in two phases. First, the existing database would be reviewed to refine the greenwaste material inventory, and second, staff would potentially develop a rule to incorporate technically feasible and cost-effective BMPs or controls.

MCS-03 - IMPROVED START-UP, SHUTDOWN AND TURNAROUND PROCEDURES:

This proposed control measure seeks to reduce emissions during equipment startup, shutdown, and turnaround. Opportunities for further reducing emissions from start-up, shut-down and turnaround activities potentially may exist at refineries as well as other industries. Examples of possible areas for improvement may include best management practices, better engineering and equipment design, diverting or eliminating process streams that are vented to flares, and installation of redundant equipment to increase operational reliability. This measure will be

implemented through a two-phase effort to first collect/refine emissions and related data and then, based on the data collected, assess viable controls, if appropriate.

Incentive Programs

There are two proposed incentive programs within this category. The first program seeks to provide incentives for new and existing facilities to install and operate clean, more-efficient combustion equipment beyond what is currently required. The second program provides expedited permitting processing and development of applicable CEQA documentation if a company manufactures zero or near-zero emission technology.

INC-01: ECONOMIC INCENTIVE PROGRAMS TO ADOPT ZERO AND NEAR-ZERO TECHNOLOGIES: The primary objective of this measure is to develop programs that promote and encourage adoption and installation of cleaner, more-efficient combustion equipment with a focus on zero and near-zero technologies, such as boilers, water heaters and commercial space heating, through economic incentive programs, subject to the availability of public funding. Incentives may include grants for new purchases of equipment as well as loan programs in areas where long-term cost savings from increased efficiency are achieved.

INC-02: EXPEDITED PERMITTING AND CEQA PREPARATION FACILITATING THE MANUFACTURING OF ZERO AND NEAR-ZERO TECHNOLOGIES: This proposed measure is aimed at providing incentives for companies to manufacture zero and near-zero emission technologies locally, thus populating the market, potentially lowering the purchase cost, and increasing demand. With availability and usage of such technologies, air quality benefits will be achieved. This proposed measure focuses on two elements: 1) process the required air permit(s) in an expedited procedure; and 2) prioritize the preparation, circulation and certification of the applicable CEQA document. A stakeholder process will be initiated to design the program and collaborate with other existing District or local programs.

Educational Programs

There is one proposed educational program within this category.

EDU-01: FURTHER CRITERIA POLLUTANT REDUCTIONS FROM EDUCATION, OUTREACH AND INCENTIVES: This proposed control measure seeks to provide educational outreach and incentives for consumers to contribute to clean air efforts. Examples include the usage of energy efficient products, new lighting technology, “super compliant” coatings, tree planting, and the use of lighter colored roofing and paving materials which reduce energy usage by lowering the

ambient temperature. In addition, this proposed measure intends to increase the effectiveness of energy conservation programs through public education and awareness as to the environmental effects and benefits from conservation. Finally, educational and incentive tools to be used include comparison of energy usage and efficiency, social media, public/private partnerships.

Proposed Ozone Mobile Source Measures

Depending on the mobile source sector and the proposed control approach, District staff analyzed the need to accelerate the penetration of cleaner engine technologies. The proposed ozone measures are based upon a variety of control technologies that are commercially available and/or technologically feasible to implement in the next several years. The focus of these measures includes accelerated retrofits or replacement of existing vehicles or equipment, acceleration of vehicle turnover through voluntary vehicle retirement programs, and greater use of cleaner fuels in the near-term. In the longer-term, in order to attain the federal ozone ambient air quality standard, there is a need to increase the penetration and deployment of near-zero and zero-emission vehicles such as plug-in hybrids, battery-electric, and fuel cells, even further use of cleaner fuels (either alternative fuels or new formulations of gasoline and diesel fuels), and additional emission reductions from locomotive and aircraft engines.

Ten measures are proposed as actions to reduce mobile source emissions and seven additional measures are proposed to accelerate the development and deployment of near-zero and zero-emission technologies for goods movement related sources and off-road equipment. The measures call for greater emission reductions through accelerated turnover of older vehicles to the cleanest vehicles currently available and increased penetration of commercially-available near-zero and zero-emission technologies through existing incentives programs.

Drawing upon the recent draft “Vision for Clean Air: A Framework for Air Quality and Climate Planning” (or Vision), a document produced jointly between the District staff, the California Air Resources Board, and the San Joaquin Valley Air Pollution Control District, seven measures are proposed to further the development of zero- and near-zero emission technologies for on-road and off-road mobile sources. The draft Vision document discusses the need to accelerate deployment of the cleanest combustion technologies and zero- and near-zero emission technologies earlier to meet federal ambient air quality standards and long-term climate goals. The document provides actions for several key transportation sectors and off-road equipment.

Partial-zero and zero-emission technologies are rapidly being introduced into the on-road light- and medium-duty vehicle categories in large part due to the CARB Low Emission Vehicle (LEV) and the Zero-Emission Vehicle (ZEV) Regulations. In

addition, next-generation electric hybrid trucks are being commercialized for light-heavy and medium-heavy heavy-duty on-road vehicles. However, additional research and demonstration are needed to commercialize zero- and near-zero emission technologies for the heavier heavy-duty vehicles (with gross vehicle weight ratings greater than 26,000 lbs.).

For many of the off-road mobile sources such as locomotives, cargo handling equipment, commercial harbor craft, and off-road equipment, some form of “all zero-emission range” is feasible to demonstrate and implement beginning in the latter part of this decade. For other sectors such as marine vessels and aircraft, the development of cleaner combustion technologies beyond existing emission standards will be needed. The Vision document provides a broad discussion of the potential zero- and near-zero technologies or cleaner combustion technologies that could be demonstrated in the near-term. The potential technologies are discussed further in each of the “ADV” measures. A summary of the 17 measures is provided in Table VII-4-4.

TABLE VII-4-4

- a. Emission reductions will be determined after projects are identified and implemented.
- b. Reductions achieved locally in Mira Loma region.
- c. Emission reductions provided are updated from the 2007 SIP values reflecting a revised future year base emission levels. The reductions are not included in the 2012 AQMP SIP submittal
- d. Submitted into the SIP once technically feasible and cost effective options are confirmed.
- e. Emission reduction will be quantified after projects are demonstrated.

On-Road Mobile Source Measures

Five on-road mobile source control measures are proposed. The first two measures focus on on-road light- and medium-duty vehicles operating in the South Coast Air

Basin. By 2023, it is estimated that about 12 million vehicles will be operating in the Basin. The first measure would implement programs to accelerate the penetration and deployment of partial zero-emission and zero-emission vehicles in the light- and medium-duty vehicles categories. The second control measure would seek to accelerate retirement of older gasoline and diesel powered vehicles up to 8,500 gross vehicle weight (GVW). These vehicles include passenger cars, sports utility vehicles, vans, and light duty pick-up trucks.

The remaining three measures focus on heavy-duty vehicles. The first of these measures seeks additional emission reductions from the early deployment of partial zero-emission and zero-emission light- and medium-heavy-duty vehicles with gross vehicle weights between 8,501 pounds to 26,000 pounds. The second control measure for heavy-duty vehicles seeks additional emissions reductions from older, pre-2010 heavy-duty vehicles beyond the emission reductions targeted in CARB's Truck and Bus Regulation. Additional emission reductions could be achieved if an additional percentage of the oldest, pre-2010 heavy duty vehicles not subject to the Truck and Bus Regulation are targeted. The fifth on-road measure seeks emission reductions at near-dock railyards through the deployment of zero-emission heavy-duty vehicles. District staff is recommending a minimum funding level of \$85 million per year for incentives to implement on-road mobile source measures.

Off-Road Mobile Source Measures

Five control measures that seek further emission reductions from off-road mobile sources and industrial equipment are proposed. Transportation sources such as aircraft, locomotives, and marine vessels are associated with anticipated economic growth not only in the Basin, but also nationwide. These sources are principally regulated by federal and state agencies. In addition, certain local actions can result in emission reductions beyond the emissions standard setting authority of the state and U.S. EPA. The first measure calls for the continuation of the Surplus Off-Road Opt-In for NO_x (SOON) provision of the statewide In-Use Off-Road Diesel Fleet Regulation beyond 2014. The SOON provision implemented to-date has realized additional NO_x reductions beyond the statewide regulation. The second and third measures call for additional emission reductions from freight and passenger locomotives. The fourth measure seeks additional emission reductions from ocean-going vessels while at berth. The fifth measure recognizes the efforts that the Ports of Los Angeles and Long Beach are implementing to incentivize Tier 2 and Tier 3 ocean-going vessels to call at the ports. District staff is recommending a minimum funding level of \$30 million per year for incentives to implement off-road mobile source measures.

Actions to Deploy Advanced Control Technologies

Seven additional measures are proposed to deploy the cleanest control technologies as early as possible and to foster the development and deployment of near-zero and zero-emission technologies. Many of these actions have already begun. However, additional research and development will be needed that will lead to commercial deployment of control technologies that achieve emission levels below current adopted emission standards. Other near-zero and zero-emission technologies that are commercially available will require infrastructure development to facilitate their deployment.

The term “near-zero” technology is not defined in these actions. The term’s specific meaning could depend on the source category and feasible technologies. The actions needed to deploy zero-emission technologies, “near-zero” emission technologies, and the next generation of cleaner combustion engines will be discussed in the development of the proposed measures and future AQMPs. To initiate the development of cleaner engines (either through in-cylinder or after-treatment controls or in combination with hybrid systems that lead to further criteria pollutant emission reductions), District staff is proposing that optional NO_x standards be adopted. Having such optional standards will facilitate the early development of cleaner technologies and assist to deploy these technologies as soon as possible. They would be set by the level of emission reductions commercially achievable in the near-term. Several of the technologies to achieve emission levels lower than current standards, or zero-emission levels, are currently available and are potentially transferrable to various vehicle vocations and in-use applications. However, further research and demonstration are needed for many of these technologies to evaluate their performance prior to commercialization. Each measure contains a timeline for actions to bring about the zero-emission or cleaner technologies.

The District staff, U.S. Department of Energy, U.S. Environmental Protection Agency, Federal Aviation Administration, California Air Resources Board, California Energy Commission, engine manufacturers, advanced engine control developers, and electric hybrid systems developers have been discussing potential technologies to further reduce engine exhaust emissions or eliminate exhaust emissions entirely. Public forums such as technology symposiums will be used to solicit public input on technology development as part of the proposed actions.

The following text provides a brief description of the District staff’s proposed mobile source measures:

ONRD-01 – ACCELERATED PENETRATION OF PARTIAL ZERO-EMISSION AND ZERO EMISSION VEHICLES: This measure proposes to continue incentives for the purchase of zero-emission vehicles and hybrid vehicles with a portion of their operation in an “all electric range” mode. The state Clean

Vehicle Rebate Pilot (CVRP) program is proposed to continue from 2015 to 2023 with a proposed funding for up to \$5,000 per vehicle. The proposed measure seeks to provide funding assistance for up to 1,000 zero-emission or partial-zero emission vehicles per year.

ONRD-02 – ACCELERATED RETIREMENT OF OLDER LIGHT- AND MEDIUM-DUTY VEHICLES: This proposed measure calls for promoting the permanent retirement of older eligible vehicles through financial incentives currently offered through local funding incentive programs and the AB 118 Enhanced Fleet Modernization Program (EFMP). The proposed measure seeks to retire up to 2,000 older light- and medium-duty vehicles (up to 8,500 lbs gross vehicle weight) per year. Funding incentives of up to \$2,500 per vehicle are proposed for the scrapping of the vehicle, which may include a replacement voucher for a newer or new vehicle.

ONRD-03 – ACCELERATED PENETRATION OF PARTIAL ZERO-EMISSION AND ZERO-EMISSION LIGHT-HEAVY- AND MEDIUM-HEAVY-DUTY VEHICLES: The objective of the proposed action is to accelerate the introduction of advanced hybrid and zero-emission technologies for Class 4 through 6 heavy-duty vehicles. The state is currently implementing a Hybrid Vehicle Incentives Project (HVIP) program to promote zero-emission and hybrid heavy-duty vehicles. The proposed measure seeks to continue the program from 2015 to 2023 to deploy up to 1,000 zero- and partial-zero emission vehicles per year with up to \$25,000 funding assistance per vehicle. Zero-emission vehicles and hybrid vehicles with a portion of their operation in an “all electric range” mode would be given the highest priority.

ONRD-04 – ACCELERATED RETIREMENT OF OLDER ON-ROAD HEAVY-DUTY VEHICLES: This proposed measure seeks to replace up to 1,000 heavy-duty vehicles per year with newer or new vehicles that at a minimum, meet the 2010 on-road heavy-duty NO_x exhaust emissions standard of 0.2 g/bhp-hr. Given that exceedances of the 24-hour PM_{2.5} air quality standard occur in the Mira Loma region, priority will be placed on replacing older diesel trucks that operate primarily at the warehouse and distribution centers located in the Mira Loma area. Funding assistance of up to \$35,000 per vehicle is proposed and the level of funding will depend upon the NO_x emissions certification level of the replacement vehicle. In addition, a provision similar to the Surplus Off-Road Option for NO_x (SOON) provision of the statewide In-Use Off-Road Fleet Vehicle Regulation will be sought to ensure that additional NO_x emission reduction benefits are achieved.

ONRD-05 – FURTHER EMISSION REDUCTIONS FROM HEAVY-DUTY VEHICLES SERVING NEAR-DOCK RAILYARDS: This proposed control measure calls for a requirement that any cargo container moved between the Ports of Los Angeles and Long Beach to the nearby railyards (the Intermodal Container Transfer Facility and the proposed Southern California International Gateway) be

with zero-emission technologies. The measure would be fully implemented by 2020 through the deployment of zero-emission trucks or any alternative zero-emission container movement system such as a fixed guideway system. The measure calls for CARB to either adopt a new regulation or amend an existing regulation to require such deployment by 2020. To the extent the measure can feasibly be extended beyond near-dock railyards, this would be considered for adoption by CARB.

OFFRD-01 – EXTENSION OF THE SOON PROVISION FOR CONSTRUCTION/INDUSTRIAL EQUIPMENT: This measure seeks to continue the Surplus Off-Road Option for NO_x (SOON) provision of the statewide In-Use Off-Road Fleet Vehicle Regulation beyond 2014 through the 2023 timeframe. In order to implement the SOON program in this timeframe, funding of up to \$30 million per year would be sought to help fund the repower or replacement of older Tier 0 and Tier 1 equipment, with reductions that are considered surplus to the statewide regulation with Tier 4 or cleaner engines.

OFFRD-02 – FURTHER EMISSION REDUCTIONS FROM FREIGHT LOCOMOTIVES: The proposed control measure is to meet the commitment in the 2007 SIP for the accelerated use of Tier 4 locomotives in the South Coast Air Basin. The measure calls for CARB to seek further emission reductions from freight locomotives through enforceable mechanisms within its authority to achieve 95 percent or greater introduction of Tier 4 locomotives by 2023.

OFFRD-03 – FURTHER EMISSION REDUCTIONS FROM PASSENGER LOCOMOTIVES: This measure recognizes the recent actions by the Southern California Regional Rail Authority (SCRRA or Metrolink) to consider replacement of their existing Tier 0 passenger locomotives with Tier 4 locomotives. The SCRRA adopted a plan that contains a schedule to replace their older existing passenger locomotives with Tier 4 locomotives by 2017. More recently, SCRRA released a Request for Quotes on the cost of new or newly manufactured passenger locomotives with locomotive engines that meet Tier 4 emission levels.

OFFRD-04 – FURTHER EMISSION REDUCTIONS FROM OCEAN-GOING MARINE VESSELS WHILE AT BERTH: This measure seeks additional emission reductions from ocean-going marine vessels while at berth. The actions would affect ocean-going vessels that are not subject to the statewide Shorepower Regulation or vessel calls that are considered surplus to the statewide regulation. The measure seeks at a minimum to have an additional 25 percent of vessel calls beyond the statewide regulation to deploy shorepower technologies or alternative forms of emissions reduction as early as possible. Such actions could be implemented through additional incentives programs or through the San Pedro Bay Ports as part of the implementation of the Ports Clean Air Action Plan.

OFFRD-05 – EMISSION REDUCTIONS FROM OCEAN-GOING MARINE VESSELS: This measure recognizes the recent actions at the Ports of Los Angeles and Long Beach to initiate an incentives program for cleaner ocean-going vessels to call at the ports. The program has been initiated as part of the San Pedro Bay Ports Clean Air Action Plan. The program will provide financial incentives for cleaner Tier 2 and Tier 3 ocean-going vessels to call at the ports. This measure also recognizes the need to monitor progress under such programs and augment them as necessary to ensure sufficient results. The program will be monitored on annual basis and, if necessary, any adjustments to the program will be made.

ADV-01 –ACTIONS FOR THE DEPLOYMENT OF ZERO- AND NEAR-ZERO EMISSION ON-ROAD HEAVY-DUTY VEHICLES: This measure would continue the efforts underway to develop zero-emission and near-zero emission technologies for on-road heavy-duty vehicle applications. Such technologies include, but not limited to, fuel cell, battery-electric, hybrid-electric with all electric range, and overhead catenary systems. Hybrid-electric systems incorporate an engine powered by conventional fuels or alternative fuels such as natural gas. The actions provided in the proposed measure are based on the SCAG 2012 Regional Transportation Plan.

ADV-02 –ACTIONS FOR THE DEPLOYMENT OF ZERO- AND NEAR-ZERO EMISSION LOCOMOTIVES: This measure calls for the development and deployment of zero-emission and near-zero emission technologies for locomotives. Such technologies include overhead catenary systems, hybrid locomotives that have some portion of their operation in an “all electric range” mode, and alternative forms of external power such as a battery tender car. The actions provided in the proposed measure are based on the SCAG 2012 Regional Transportation Plan. The zero-emission technologies could apply to freight and passenger locomotives.

ADV-03 –ACTIONS FOR THE DEPLOYMENT OF ZERO- AND NEAR-ZERO EMISSION CARGO HANDLING EQUIPMENT: This measure recognizes the actions underway to develop and deploy zero- and near-zero emission technologies for various cargo handling equipment. The San Pedro Bay Ports are currently demonstrating battery-electric yard tractors. In addition, battery-electric, fuel cell, and hybridized systems could be deployed on smaller cargo handling equipment. In addition, the use of alternative fuels for conventional combustion engines could potentially result in greater emissions benefits.

ADV-04 –ACTIONS FOR THE DEPLOYMENT OF CLEANER EMISSION COMMERCIAL HARBORCRAFT: Several commercial harbor craft operators have begun deployment of hybrid systems in their harbor craft to further reduce criteria pollutant emissions and improve fuel efficiency. Other cleaner technologies include the use of alternative fuels, retrofit of existing older marine engines with selective catalytic converters, and diesel particulate filters. This measure recognizes

several efforts between the District and the Ports of Los Angeles and Long Beach to further demonstrate control technologies that could be deployed on commercial harbor craft that could go beyond the statewide Harbor Craft Regulation.

ADV-05 –ACTIONS FOR THE DEPLOYMENT OF CLEANER OCEAN-GOING MARINE VESSELS: The Ports of Los Angeles and Long Beach, CARB, and the District have sponsored research and demonstration of various control technologies to further reduce emissions from ocean-going vessels. In addition, the San Pedro Bay Ports Clean Air Action Plan contains a measure to further demonstrate such technologies on ocean-going vessels. This measure recognizes many of these efforts and the need to further demonstrate retrofit technologies on existing ocean-going vessels.

ADV-06 –ACTIONS FOR THE DEPLOYMENT OF CLEANER OFF-ROAD EQUIPMENT: The District, Mobile Source Air Pollution Reduction Review Committee (MSRC), and CARB have been conducting an off-road “showcase” program for retrofit technologies to further reduce emissions from older off-road equipment. In addition, several major off-road engine manufacturers are investigating the potential use of hybrid systems to further reduce criteria pollutant and greenhouse gas emissions. Potential advanced technologies include hybrid systems that utilize batteries, fuel cells, or plug-in capabilities, which could result in lower emissions compared to Tier 4 emission levels when combined with future Tier 4 compliant engines. The measure is implemented by the District, CARB and U.S. EPA.

ADV-07 –ACTIONS FOR THE DEPLOYMENT OF CLEANER AIRCRAFT ENGINES: This measure recognizes the efforts of the Federal Aviation Administration’s Continuous Lower Energy, Emissions and Noise (CLEEN) Program. The goal of the CLEEN Program is the development of new aircraft engines that potentially can be up to 60 percent cleaner in NO_x emissions than current aircraft engines. The actions under this measure are to continue the development of cleaner aircraft engines and work with the airlines and local airport authorities to develop mechanisms to route the cleanest aircraft to serve the South Coast Air Basin.

OVERALL EMISSION REDUCTIONS

A summary of emission reductions for the proposed 1-hour ozone control measures for the year 2022, based on the summer planning inventory for VOC and NO_x, is provided in Table VII-4-5. These reductions reflect the emission reductions associated with implementation of control measures under local, State, and federal jurisdiction. Emission reductions represent the difference between the projected baseline and the remaining emissions. Note the inclusion in Table VII-4-5 of long term (“black box”) measures under CAA Section 182(e)(5) provisions.

TABLE VII-4-5
Emission Reductions for 2022 Based on
Summer Planning Inventory (Tons per Day)

SOURCES	VOC	NO_x
Year 2022 Baseline ¹	440	335
Emission Reductions:		
Stationary Sources (2012 Proposed Measures)	6	3
Mobile Sources (2012 Proposed Measures)	---	8
Mobile Sources (2007 SIP Carried Forward) ²	7	24
Long Term Measures ³	17	150
Total 1-hour Ozone SIP Reductions	30	185
2022 Remaining Emissions	410	150

¹ Emission assumptions from SCAG's 2012 regional transportation plan are already reflected in the AQMP baseline, including TCMs.

² Emissions reductions already committed in the 2007 8-hour ozone SIP

³ CAA Section 182(e)(5) long-term emission reduction measures. Note that the U.S. EPA approved 2007 8-hour ozone SIP included 40 tpd VOC and 241 tpd NO_x emissions reductions (based on the emissions inventories from the 2007 SIP) as long term measures under CAA Section 182(e)(5). See 77 Fed. Reg. 12674 (March 1, 2012). Thus, the 1-hour ozone long term emissions reductions are not new emissions reductions as they are a subset of the previous 2007 SIP emissions reductions from long-term measures.

SECTION 5

1-hour Ozone Attainment Demonstration

INTRODUCTION

On September 19, 2012, in response to a California Ninth Circuit Court of Appeals remand, U.S. EPA published a proposed rule to require California to provide a new 1-hour ozone attainment demonstration for the South Coast Air Basin and the San Joaquin Valley non-attainment areas. The proposed rule made a finding of substantial inadequacy of the State Implementation Plan for the two areas. The proposed rule is anticipated to be approved early in 2013 and will allow five years, with a total of up to ten years for attainment of the now revoked 1-hour standard, if the state shows that ten years are needed. That will require a demonstration of attainment of the 0.12 ppm standard by 2023, with emissions reductions in place by the end of 2022. Background discussion on the reasoning for the required revision to the 1-hour ozone SIP as well as a description of the control strategy approach is provided in earlier sections of this Appendix. This section provides the details of the 2012 1-hour ozone modeling attainment demonstration.

BACKGROUND

For a full background discussion regarding the 1-hour ozone attainment demonstration, see the Introduction to this Appendix. The most recently approved SIP for the 1-hour ozone standard is the 1997/99 Plan, approved by EPA in April 2000. There have been changes to the motor vehicle emissions inventories and model since that time. EPA disapproved the attainment demonstration in the 2003 SIP revision because it relied in large part on control measures that had been withdrawn by CARB following revocation of the 1-hour standard. This disapproval led to the litigation which resulted in the SIP call proposed by EPA on September 19, 2012. In that proposal EPA calls for a revised and updated 1-hour ozone attainment demonstration.

Modeling platforms, meteorological models and chemistry packages have also undergone significant enhancements since the 1997 AQMP attainment demonstration when the Urban Airshed Model (UAM) with CB-IV chemistry was the primary tool for projecting air quality. During the development of the 2003 AQMP, the District convened a panel of seven experts to independently review the regional air quality modeling for ozone. The consensus of the panel was for the District to move to more current state-of-the-art dispersion platforms and chemistry modules. At that time, the model selected for the 2007 AQMP ozone attainment demonstrations was the Comprehensive Air Quality Model with Extensions (CAMx) [Environ, 2002], using SAPRC99 chemistry. The Draft Final 2012 AQMP has continued to move forward to incorporate current state-of-the-art modeling platforms to conduct regional modeling analyses. The Draft Final 2012 AQMP PM_{2.5} attainment demonstration and ozone implementation update has been developed using the U.S. EPA supported Community Multiscale Air Quality (CMAQ) (version 4.7) air quality modeling

platform with SAPRC99 chemistry, and the Weather Research and Forecasting Model (WRF) (version 3.3) meteorological fields. Appendix V of the 2012 Draft Final AQMP provides an expanded discussion of the current modeling platform.

ATTAINMENT DEMONSTRATION STRUCTURE: DETERMINISTIC VS. TIERED RELATIVE RESPONSE FACTOR (RRF)

The 1997 AQMP and 2003 AQMP 1-hour ozone attainment demonstrations relied on direct output from model simulations to project future year air quality and design values. This “deterministic” approach was based on the premise that future year projected baseline inventories were accurate and the impacts of implementing the control program were well simulated. In addition, the form of the 1-hour ozone standard was directed at the fourth highest concentration in a three year period for a given air monitoring station. In essence, the analysis looked at the 2nd highest concentration in a given year, typically occurring during the worst-case meteorological scenario. The 2007 AQMP and 2012 AQMP have relied on the use of relative response factors (RRF) determined from the ratio of future to base year simulation projections to estimate attainment. Since shifting to the 8-hour ozone standard, the RRF estimated from multiple meteorological episodes has been the primary methodology to project future year station specific design values calculated as the three year averages of the 4th highest 8-hour concentration. Both approaches, (deterministic or RRF), have their limitations: the deterministic method relies on accurate modeling and the proper selection of a meteorological episode while the RRF approach tends to place less reliance on individual day model performance since the factor is based on an average of several events having similar meteorological profiles. However, basing the RRF on multiple days may mask the meteorological profile characteristics of an extreme event such as an annual second maximum concentration. Table VII-5-1 summarizes a comparison of the two approaches to demonstrate attainment of the standard.

No specific modeling guidance applies to this current analysis since the 1-hour standard has been revoked. As discussed above, the previous 1-hour ozone attainment demonstrations utilized the deterministic approach to demonstrate attainment of the standard. As modeling platforms (both dispersion and meteorological) and emissions inventories have greatly improved over the past two decades, ozone simulations have demonstrated an increasingly higher level of accuracy in recreating observed base year concentrations. The improved simulation performance has mitigated several of the concerns regarding using the deterministic approach to directly predict future year concentrations. As a result of the improved base year performance, this Basin 1-hour ozone attainment demonstration will be based on the deterministic modeling approach. As part of the weight of evidence discussion, the RRF approach will be applied using a stratified or tiered approach to develop station specific projections of 2022 1-hr ozone concentrations.

TABLE VII-5-1

Comparison of Attainment Demonstration Methodologies

RRF	Deterministic
Targets 98th percentile – multiple year average standard	Targets annual 2nd maximum concentration
Designed to compensate for base year performance	Requires performance within established criteria thresholds
Projects future design values based on the base year design value applied to ratio of future to base year simulated ozone	Assumes accurate future year emissions inventory and directly predicts expected concentrations
Station specific evaluation	Day specific analysis requiring candidate episode meeting the “worst case” profile
Requires concentration threshold for inclusion in analysis and minimum number of valid simulation days	

MODELING PROTOCOL

Table VII-5-2 provides the Draft Final 2012 AQMP 1-hour ozone modeling protocol. As previously discussed, the CMAQ/WRF/SAPRC99 modeling structure used for the 8-hour ozone update in the Draft Final 2012 AQMP was used for the 1-hour ozone attainment demonstration. A comprehensive discussion of the 8-hour ozone modeling analysis is provided in Appendix V of the Draft Final 2012 AQMP.

MODELING EMISSIONS INVENTORY

Table VII-5-3 provides the baseline and controlled modeling emissions inventories used in the attainment demonstration. The CMAQ simulations were based on the summer planning inventory, with adjustments made for weekly and daily temperature variations. A brief characterization of the emissions used for the modeling analysis is presented in Section 3 of this Appendix and Chapter 3 of the Draft Final 2012 AQMP. An extensive discussion of the overall emissions inventory is provided in the Draft Final 2012 AQMP Appendix III.

TABLE VII-5-3
Summer Planning Emissions Inventory (tons/day)

Year	VOC	NOX	CO
(a) Baseline			
2008	593	754	2880
2022	440	335	1540
(b) Controlled			
2022	410	150	1540

EPISODE SELECTION AND DESIGN VALUES

Past ozone attainment demonstrations evaluated a set of days characterized by restrictive meteorology or episodes occurring during concurrent intensive field monitoring programs. Of great importance, these episode periods needed to be rated in terms of how representative they were relative to the ozone standard being evaluated. For the now revoked 1-hour ozone standard, the attainment demonstration focused on a limited number of days closely matching the annual design value. Typically, the analysis addressed fewer than 5 days of simulations. The 2003 1-hour ozone episode focused on the August 4-7, 1997 ozone meteorological episode that occurred during the Southern California Ozone Study and was the subject of an extensive field monitoring campaign.

This update to the future year ozone projection focuses on 92 days of ozone air quality observed during June through August of the base year 2008. Overall, the 92 day period provides a robust description of the 2008 ozone meteorological season. Table VII-5-4 lists the number of days each Basin station exceeded the revoked 1-hour ozone standard during the June through August 2008 period. Also listed in Table VII-5-4 are the 2008, 5-year weighted design values (also used in the RRF future year ozone projections). Figure VII-5-1 depicts the time series of the daily Basin maximum and the Crestline (the Basin design station) daily maximum 1-hour ozone concentrations during the three month period in 2008. During this period,

seven well defined multi-day ozone episodes occurred in the Basin with 30 total days having daily Basin-wide 1-hour maximum ozone concentrations of 120 ppb or higher. More importantly, when assessed for a normalized meteorological ozone episode potential using a regression based weighting covering 30-years of data (1998-2010), the June 18 - 22, 2008 period was ranked in the 99th percentile. This episode contained the top four daily Basin ozone maximum concentrations for 2008 and has been selected as the focus of the attainment demonstration.

Table VII-5-5 summarizes the June 18 - 22 ozone meteorological episode. Three monitoring stations shared the distinction as having the daily maximum concentration including Crestline, Glendora and on the final day, Glendora and Santa Clarita. As indicated in Table VII-5-4, Crestline is the design site for the Basin with a 1-hour average design value of 158 ppb. Several locations in the San Bernardino and Riverside Valleys exhibit similar daily transport patterns as Crestline. Glendora, which exhibited the second highest design value (151 ppb) is located approximately 30 km downwind of Central Los Angeles along the same wind transport route. The peak Basin 2008 1-hour average ozone concentration observed at Santa Clarita was on August 2nd with a value of 150 ppb along a distinctly different transport route. As illustrated in Table VII-5-5, the observed Basin maximum ozone concentration for the episode closely matches the station design value for the station observing the maximum concentration. The exceptions occur on June 20th where the observed 1-hr maximum ozone concentration reached 176 PPB at Crestline, approximately 111 percent of the Crestline (and Basin) design value. Similarly, on Sunday June 22nd the observed maximum concentration was approximately 82 and 87 percent of the Glendora and Santa Clarita design values, respectively.

FIGURE VII-5-1

Observed Basin and Crestline Daily Maximum 1-Hr Ozone Concentrations: June 1 through August 31, 2008. (Shaded areas indicate multiple day regional ozone episodes).

TABLE VII-5-4

2008 Basin Weighted Design Values and Number of Days Daily 1-Hour Ozone Maximum Concentrations Exceeded 120 ppb*

Station	2008 5-Year Weighted Design (ppb)	Number of Days in 2008 with Observed 1-Hr Maximum Ozone > 120 ppb

22-Jun-08	Sun	123	151	Glendora
			141	Santa Clarita

BASE-YEAR OZONE MODEL PERFORMANCE EVALUATION

For the CMAQ performance evaluation, the modeling domain is separated into nine sub-regions or zones. Figure VII-5-2 depicts the sub-regional zones used for base-year simulation performance. The different zones present unique air quality profiles. In previous ozone modeling attainment demonstrations using a smaller modeling domain, the number and size of the zones were different. Seven zones represented the Basin and portions of Ventura County, the Mojave Desert and the Coachella Valley.

For the current analysis the Basin is represented by three of the zones: Zone 3 – the San Fernando Valley, Zone 4 – the Eastern San Gabriel, Riverside and San Bernardino Valleys, and Zone 5 – the Los Angeles and Orange County emissions source areas. Of the three areas, Zone 4 represents the Basin maximum ozone concentrations and the primary downwind impact zone. As such, the priority in evaluating model performance is focused on Zone 4.

The statistics used to evaluate 1-hour average CMAQ ozone performance do not change from previous AQMPs and include the following:

Statistic for O ₃	Criteria (%)	Comparison Basis
Normalized Gross Bias	≤ ±15	Paired in space and time
Normalized Gross Error	≤ 35	Paired in space (+2 grid cells) and time
Peak Prediction Accuracy	≤ ± 20	Unpaired in space and time

FIGURE VII-5-2
Performance Evaluation Zones

The base year average regional model performance for the June 2008 episode for Zones 3, 4, and 5 is presented in Table VII-5-6. Performance statistics are presented for observed concentrations of 60 ppb or greater.

The CMAQ ozone simulations generally meet the 1-hour average unpaired peak on four of the five episode days in Zones 3 and 5 and on three of the days in Zone 4. The 2008 highest observed 1-hour ozone concentrations occurred on June 18th and June 20th in Zone 4. The ozone simulations were only able to recreate 76 and 73 percent of the observed concentrations on each of those days. Normalized bias tended to be negative in Zones 3 and 4. Zone-5 showed a tendency for over prediction on June 19th and 22nd. The normalized model error performance goal was consistently met in the three zones on June 19-21.

Figures VII-5-3 through VII-5-12 present the diurnal profiles of observed and CMAQ simulated 1-hour ozone and spatial plots of daily 1-hour maximum predicted ozone for the June 2008 episode. The diurnal trends depict station profiles grouped

by evaluation zone with Zone 3 presented at the left side of the chart. The CMAQ predicted trend is highlighted by a dashed red line. The trend diagrams support the statistical analysis with June 19th and 21st depicting a close match with observations, particularly in Zone 4. The trend of predicted and observed diurnal ozone is also closely matched in Zones 3 and 5 for all days except June 22nd when the daily peak ozone concentrations were over predicted.

The corresponding spatial plots of daily ozone maximum demonstrate the extent and concentration ranges of CMAQ predicted ozone. The peak predicted concentrations occur in Zone 4 on June 21st followed by June 19th, with both days meeting the unpaired prediction criteria. On June 22nd, the same pattern persists but with an extension of higher predicted ozone concentrations occurring in Zone 5 as well. While June 18th and 20th are under predicted (unpaired peak ratio of 0.76 and 0.73), the location of the projected daily 1-hour ozone maximum concentrations is correctly depicted in the spatial presentation.

Additional statistical characterizations of model performance and individual station diurnal trends of observed and predicted 1-hour ozone concentrations are presented as Attachments 1 and 2 to this Appendix.

TABLE VII-5-6

June 18-22, 2008 Base Year 1-Hour Average Ozone Performance
(Bold type indicates meeting statistical performance criteria).

ATTAINMENT DEMONSTRATION

Table VII-5-7 provides the summary of the 1-hour ozone attainment demonstration using the CMAQ modeling platform and the 2022 controlled emissions inventory (410 TPD VOC, 150 TPD NO_x). The Controlled Emissions Projection Algorithm (CEPA) summary is provided as Attachment 3 to this document. The maximum predicted 1-hour ozone concentration on 125.6 ppb occurs on June 19th at Pasadena. All other predicted concentrations during the five day episode are projected to be below the attainment demonstration concentration threshold of 124.4 ppb. (Note: both June 18th and June 20th failed to meet all of the model acceptance criteria, more specifically the unpaired peak analysis. As a result, the attainment demonstration is focusing on the June 19th and 21st, days with observed peak concentrations that closely matched the design values).

The final two columns in Table VII-5-7 provide the maximum of the 2022 predicted daily maximum 1-hour ozone concentrations for all 92 days simulated with the controlled emissions as well as the number of occurrences the daily maximum was predicted to exceed 124.4 ppb. The analysis demonstrated that throughout the June through August smog season, only Pasadena on June 19th has a 2022 predicted 1-hour daily maximum ozone concentrations that would exceed the attainment threshold. All other predicted maximum 1-hour average concentrations during the 92 day summer ozone season are projected to be at least 10 percent below the attainment threshold. This is illustrated by the time series of predicted daily maximum 1-hour ozone concentrations in Figure VII-5-13. Regional temperatures during the June episode were extremely warm, giving rise to extensive evaporative and biogenic emissions. Midday temperatures in the San Gabriel Valley exceeded 100 degrees Fahrenheit on each day during the episode. Table VII-5-8 lists a summary of 4 model simulations for June 19th which include the 2022 predicted maximum 1-hour ozone for that day, the maximum predicted 1-hour ozone over all 92 simulated days, and the number of days the standard was projected to be violated at each station. The simulations included 2022 baseline emissions, and model analyses with remaining emissions of 410 TPD VOC and 180, 160 and 150 TPD NO_x.

The analysis shows that when NO_x emissions are reduced from the 2022 baseline values to 180 TPD, only 4 sites have one day exceeding the standard throughout the season. Three violations are projected to occur on June 19th while the violation at Upland is projected to occur on June 20th. When simulated with 160 TPD NO_x, only Burbank and Pasadena are projected to exceed the standard on June 19th, and with 150 TPD NO_x, only Pasadena is projected to exceed the standard on one day. The high biogenic emissions during this episode may have contributed to an increasing VOC/NO_x ratio in this area which is directly downwind of the metropolitan Los Angeles emissions sources. As biogenic emissions remain constant, NO_x emissions are lowered leading to the increased reactivity and ozone forming potential. By the

150 TPD NO_x emissions level, the impact appears to be isolated only to Pasadena which remained above the 124.4 ppb level. It is important to note that variations in the local wind field and deeper atmospheric mixing responding to the surface heating on June 18th and June 20th may have ameliorated the impact to the San Gabriel Valley on those days.

The form of the 1-hour standard allows for a single exceedance at a station annually. Given the form of the standard, the 410 TPD VOC and 150 TPD NO_x emissions carrying capacity satisfies the Basin 1-hour ozone attainment demonstration. The 410 TPD VOC and 150 TPD NO_x level emissions carrying capacity translates to a 30 TPD (7 percent) reduction in VOC emissions beyond the 2022 baseline and a 185 TPD (55 percent) reduction in NO_x emissions beyond 2022 baseline. The 150 TPD NO_x level represents a conservative estimate of the carrying capacity. Since the form of the standard allows for one exceedance per station per year, it may be possible to meet the standard at NO_x levels as high as 180 TPD as demonstrated in Table VII-5-8.

Figures VII-5-14 through VII-5-23 provide the gridded daily 1-hour maximum ozone simulated for the 2022 baseline (440 TPD VOC and 335 TPD NO_x) and controlled emissions (410 TPD VOC and 150 TPD NO_x).

WEIGHT OF EVIDENCE

The U.S. EPA recommends that a weight of evidence discussion be incorporated with air quality attainment demonstrations, particularly if the future year simulated ozone concentrations are within a certain percent of the standard in question. For 8-hour ozone, U.S. EPA requires a weight of evidence discussion to provide aggregate supplemental analyses to support the modeled attainment test if the future projected concentration falls within 3 percent of the acceptance threshold. Applying this criterion for the 1-hour standard would require a weight of evidence discussion if the projected maximum concentration fell within 4 ppb of the 124.4 threshold. As such, the weight of evidence discussion presented in this section addresses two lines of reasoning why the proposed control strategy and associated emissions reductions will achieve attainment of the 1-hour ozone standard. The first analysis examines the trends of observed ozone and precursor emissions and then projecting those trends forward in time to determine when an empirically projected attainment date would take place and if the emissions trends continued. As previously stated, the second analysis employs a tiered RRF approach to determine if the emissions reductions using the simulation ratio and design value methodology provides further support for the demonstration of attainment.

Figures VII-5-24 and VII-5-25 present the trends of observed annual 1-hour maximum ozone concentrations and the projections of the trend through 2023. Figure VII-5-24(a) depicts the long term trend beginning with 1976 and including all years through 2011. The linear regression best fit line indicates that if the trend is projected forward in time, the Basin would be expected to meet the one hour standard as early as 2013. However, a close examination of the long term trend shows an inflection that occurred post 1996 California Phase II Reformulation creating a “hockey stick” appearance. Reexamining the blade of the hockey stick in Figure VII-5-24(b) from 2000 through 2011, the best fit projection suggests attainment would take until 2023 which is consistent with the attainment demonstration. Similarly, by 2022 the trends of Basin VOC and NO_x emissions with full implementation of the 2007 AQMP will be very consistent with the targeted carrying capacity (410 TPD VOC and 150 TPD NO_x).

FIGURE VII-5-24

Trends of Annual Basin 1-Hour Maximum Ozone Concentrations with Projections to 2023: (a) 1976 – 2011, (b) Post Phase II Fuel Reformulation: 2000 – 2011. (The dashed red line depicts the attainment threshold 124 PPB).

FIGURE VII-5-25

Trends of Annual Basin 1-Hour Maximum Ozone Concentrations with Projections to 2023: (a) 1976 – 2011, (b) Post Phase II Fuel Reformulation: 2000 – 2011. (The dashed red line depicts the attainment threshold 124 PPB).

The second element of the weight of evidence discussion utilizes the tiered RRF approach to determine station specific future year design concentrations based on base year 2008 emissions and 2022 controlled emissions. The proposed methodology tiers the concentration threshold for accepting a simulation station day based on three criteria for evaluation: (1) the base year daily maximum concentration absolute prediction error (calculated for a station per episode day) must be 20 percent or less; (2) the observed station concentration must be within 25 percent of the design value; and (3) a minimum of four station specific days simulated must meet the error at the set concentration threshold for the RRF to be calculated. The 20 percent error criteria is the same level used in the 8-hour ozone analysis and the four day minimum was iteratively determined to provide a measure of robustness to the RRF calculation. Basically, the four day criteria represented a balance between an analyses based on a higher error criteria with potentially more days included at a higher concentration threshold vs. a limited set of better simulated station days with lower prediction error. Table VII-5-9 lists the impacted stations and the threshold concentration used for the RRF calculation. Also listed in Table VII-5-9 are the base year average percentage prediction bias and error for those days included in the future year projection. Overall, the base year tendency is towards under prediction.

It is important to note that the analysis included both weekdays and weekend days. For example, the RRF calculation for the design site, Crestline, included 4 days with

observed concentrations above 140 ppb including one Thursday, two Fridays and one Saturday. In contrast, the RRF for Fontana met the four day criteria at the 120 ppb threshold with one Thursday, two Saturdays and two Sunday episodes respectively. For both Azusa and Glendora, one of the four days included in the analysis was a weekday.

Pasadena	5	100	5	-5.9	7.1

Tables VII-5-10 and VII-5-11 provide the summaries of the RRF analyses for the June through August period for 2022 baseline (440 TPD VOC and 335 TPD NOx) and 2022 controlled emissions (410 TPD VOC and 150 TPD NOx). The analyses provide future year projected 1-hour ozone design values for two scenarios: with and without the June 19th simulation day included. The difference between the projected future year design values assessed from the 17 and 18 day analyses provides an assessment of the impact a single day can have on the RRF attainment calculation.

The 2022 baseline analysis (Table VII-5-10) indicates that roughly half of the stations with 2008 weighted design values exceeding 120 ppb will not meet the attainment threshold of 124.4 ppb. Future year design values for the eastern portion of the Basin are projected to approach the standard at several sites. However, Crestline and Upland will remain upwards of 11 ppb over the attainment level. The San Gabriel Valley stations of Azusa, Pasadena and Glendora are all projected to be at least 15 ppb above the standard in the baseline scenario. Removing June 19th from the baseline analysis only impacts Pasadena, whereby the projected future design value is lowered by more than 8 ppb. All other future year design values remain \pm 1 ppb of the 18 station estimate.

When the controlled scenario is implemented in 2022 (Table VII-5-11), the predicted future year design values for the eastern portion of the Basin meet the attainment threshold. Only the San Gabriel Valley has projected design values exceeding the threshold. Removing June 19th from the analysis brings Pasadena into compliance and lowers the future design value at Azusa to within 3 ppb of the attainment goal. The removal of June 19th does not impact Glendora because that day was not included in the base year analysis. Of note, the removal of June 19th causes the Upland future year design value to nominally increase by 2 ppb. The RRF analysis demonstrates that the emissions reductions targeted through the implementation of the control program will cause future year air quality to meet the 1-hour standard at the majority of the areas in the Basin. Accounting for a particularly restrictive meteorological episode day, and excluding an episode such as June 19th, narrowed the gap between a projection of attainment and non-attainment. Overall, the 2022 17-day Tiered RRF analysis based on the controlled emissions closely mirrored the deterministic attainment demonstration.

While the tiered RRF analysis attainment projection can provide an approximation of the form of the 1-hour standard, the analysis does not provide an exact comparison. Day selection, the number of days included in the calculation, and the simulation performance for that day, all have critical impacts on the outcome of the future year projections.

The weight of evidence discussion provided in this section shows that the ongoing trends in air quality due to the implementation of the 2007 and 2012 control program and the control strategies already in place is expected to lower the future year 1-hour ozone design value such that the Basin will meet the standard by 2022. This is consistent with the Basin's projected attainment of the 8-hour ozone standard in 2023. Furthermore, while the tiered RRF analysis did not replicate the deterministic attainment projection, the analysis lends support to the level of emissions reduction need for attainment and the areas of the Basin expected to experience most air quality improvements from implementation of the control program.

TABLE VII-5-10Summary of 2022 Tiered RRF Analysis for Baseline Emissions (440 TPD VOC and 335 TPD NO_x)

SUMMARY AND CONCLUSIONS

CMAQ regional air quality simulations, conducted for the severe June 18 - 22, 2008 meteorological episode, demonstrate that the Basin will be in attainment of the revoked 1-hour ozone standard with controlled emissions of 410 TPD VOC and 150 TPD NO_x in 2022. The form of the 1-hour standard allows for one day at each station to exceed the threshold of 120 ppb (124.4 for the modeling attainment threshold). When the deterministic modeling was expanded to include 92 days of simulations from June 1 through August 31, the projected number of violations of the standard totaled one station day at Pasadena. The attainment demonstration is supported by the air quality trend analysis and a companion attainment analysis based on a tiered RRF methodology.

The 1997 SIP's 1-hour ozone attainment demonstration defined a 2010 VOC and NO_x emissions carrying capacity 413 and 530 TPD, respectively. The 2003 AQMP's updated attainment demonstration revised the projection to 313 TPD VOC and 541 TPD NO_x. The contribution of the long term emissions reductions measures to the attainment demonstration were 46 percent in 1997 and 76 percent in 2003. The 2007 federally approved 8-hour ozone attainment demonstration defined a 2023 carrying capacity of 420 TPD VOC and 114 TPD NO_x. As presented above, the 1-hour ozone attainment demonstration defines a 2022 carrying capacity of 410 TPD VOC and 150 TPD NO_x. For both the current 8-hour and revoked 1-hour ozone standards, require a control strategy that significantly reduces NO_x emissions and thus a continued reliance on long term measures (CAA Section 182(e)(5) "black box" measures). For the 1-hour ozone attainment demonstration, the "black box" control measures account for 43 percent of the total emissions reductions from the 2022 baseline needed for attainment.

This current 1-hour ozone attainment demonstration requires 7 percent VOC and 55 percent NO_x emissions reductions from 2022 baseline emissions. The targeted emissions reductions to achieve 1-hour ozone attainment are consistent in both the amount of emissions reduction and timing of those reductions with the approved 2007 8-hour ozone SIP inventory. Table VII-5-12 summarizes the emissions reductions required for attainment of the 1-hour ozone standard.

TABLE-VII-5-12

1-hour Ozone Attainment Demonstration Emissions Summary

Scenario	VOC (TPD)	NO _x (TPD)	CO (TPD)
2022 Baseline	440	335	1540
2022 Attainment	410	150	1540
Total Reduction	30	185	0
Percentage Reduction From Baseline	7	55	0

SECTION 6

Environmental and Socioeconomic Impacts

California Environmental Quality Act (CEQA)

In anticipation that U.S. EPA would likely request that the District prepare a one-hour ozone SIP, the Program Environmental Impact Report (EIR) for the 2012 AQMP included a total of 11 project objectives² including the following:

- Continue making expeditious progress towards attaining the federal eight-hour ozone standard and demonstrate attainment of the federal one-hour ozone standard (revoked) by 2022 – 2023;
- Reduce population exposure to ozone through continued progress towards attaining the federal one-hour (revoked) and eight-hour ozone standards by 2022 – 2023;

The 2012 AQMP reflects a multi-agency effort to identify 2012 AQMP control measures that specifically address the District’s efforts to attain the federal 24-hour PM_{2.5} standard and the federal one-hour (revoked) and eight-hour ozone standards by 2022 – 2023, respectively. Consistent with CEQA requirements to analyze the whole of the actions from a project, the Program EIR prepared for the 2012 AQMP includes an environmental analysis of all PM_{2.5} control measures, as well as, all of the ozone-related control measures in the 2012 AQMP.

On September 19, 2012, U.S. EPA published in the Federal Register a proposed “SIP call” which, if finalized, would require the District to prepare a demonstration of attainment of the one-hour ozone standard, with attainment required by ten years from the date the SIP call is finalized. The same day, U.S. EPA published in the Federal Register a proposal to withdraw its approval of, and then to disapprove, the transportation control measure (TCM) demonstrations, also referred to as VMT emissions offset demonstrations, in the 2003 one-hour ozone plan and the 2007 eight-hour ozone plan. As explained by U.S. EPA, both of these actions were taken in response to a decision of the Ninth Circuit Court of Appeals in *Association of Irrigated Residents v EPA*, January 27, 2012.

In response to U.S. EPA’s “SIP call” and in anticipation that it will be finalized, District staff has prepared this *1-hour Ozone Attainment Demonstration*, which demonstrates attainment of the federal one-hour (revoked) ozone standard by the year 2022. The federal one-hour ozone attainment demonstration in this document contains all of the same ozone control measures that are included in the 2012 AQMP,

² CEQA Guidelines §15124(b)

as well as the seven remaining mobile source control measures from the 2007 AQMP. No new measures are proposed beyond those in the 2012 AQMP.

Similarly, in connection with the proposed disapproval of the TCM demonstrations for the South Coast Air Basin, U.S. EPA prepared a guidance document³ for Severe and Extreme ozone nonattainment areas on how to address Clean Air Act (CAA) §182(d)(1)(A) (VMT emissions offset demonstrations). District staff conducted a VMT emissions offset analysis pursuant to U.S. EPA guidance and concluded that actual emissions with controls and VMT growth were substantially less than emissions assuming no new measures and no VMT growth ("ceiling"). Based on this conclusion, no new TCMs are required for the one-hour ozone SIP. District staff has prepared the *VMT Offset Requirement Demonstration* (2012 AQMP Appendix VIII) to provide the results of the VMT emissions offset analysis to the public.

With regard to the seven mobile source control measures from the 2007 AQMP, potential environmental impacts from these control measures along with all other 2007 AQMP ozone and PM_{2.5} control measures were evaluated in the Final Program EIR for the 2007 AQMP (Sch. #2006111064), certified by the District Governing Board on June 1, 2007. These remaining measures would be implemented even without the 2012 AQMP. For this reason, the seven mobile source control measures, as well as four other remaining control measures from the 2007 AQMP, were also evaluated as Alternative 1, the No Project Alternative, in the 2012 AQMP Program EIR, which concluded that implementation of the remaining 2007 AQMP control measures would not generate any significant adverse environmental impacts. The inclusion of existing 2007 AQMP control measures in this *1-hour Ozone Attainment Demonstration* does not require additional environmental review where no changes are being proposed to the 2007 measures.

Based on the above information, no additional control measures or TCMs to address progress in attaining the federal one-hour (revoked) and eight-hour ozone standards by 2022 – 2023 have been identified beyond those listed in the 2012 AQMP. This means that this *1-hour Ozone Attainment Demonstration* includes all of the same ozone-related control measures that are currently in the 2012 AQMP. Further, the timing or implementation dates of the ozone control measures in this *1-hour Ozone Attainment Demonstration* compared to timing and implementation dates in the 2012 AQMP would not change to meet the one-hour standard. Therefore, by analyzing the 2012 AQMP ozone-related control measures in the Program EIR, the Program

³ U.S. EPA. Office of Transportation and Air Quality. 2012. *Implementing Clean Air Act Section 182(d)(1)(A): Transportation Control Measures and Transportation Control Strategies to Offset Growth in Emissions Due to Growth in Vehicle Miles Travelled*. EPA-420-B-12-053. August. <http://www.epa.gov/otaq/stateresources/policy/general/420b12053.pdf>.

EIR also serves as the CEQA document for this *1-hour Ozone Attainment Demonstration* and the *VMT Offset Requirement Demonstration* (2012 AQMP Appendix VIII). Finally, potential impacts from the seven remaining mobile source ozone control measures from the 2007 AQMP have been disclosed to the public in the 2007 AQMP and as part of the alternatives analysis in the Program EIR for the 2012 AQMP. Since no changes are being proposed to those existing measures, no additional environmental analysis of the 2007 AQMP control measures is required.

Socioeconomic Analysis

The *1-hour ozone attainment demonstration* provided in this Appendix does not include any new measures beyond those proposed for the 8-hour ozone plan in the Draft Final 2012 AQMP. The socioeconomic impacts of the included new measures are fully analyzed in the Socioeconomic Report for the Draft Final 2012 AQMP. The impacts of the 2007 AQMP ozone attainment strategy and the benefits of ozone attainment were discussed in the Socioeconomic Report associated with the 2007 AQMP. Therefore, no additional socioeconomic impact analysis is necessary.

District staff assesses the socioeconomic impacts of proposed rule amendments or proposed rules pursuant to the Board resolutions and state legislative requirements. As additional information on control requirements becomes more well-defined during the rulemaking process, a detailed assessment of their socioeconomic and environmental impacts will be conducted.

Attachment 1 – Post-1990 California Motor Vehicle Control Program

Attachment 2 – Transportation Control Measures Implemented Since 1990

PREFACE

This appendix is prepared as part of the 2012 Air Quality Management Plan to demonstrate that sufficient transportation control strategies and transportation control measures have been identified to offset growth in emissions due to growth in vehicle miles traveled under Section 182(d)(1)(A) of the federal Clean Air Act. Section 182(d)(1)(a) applies to areas classified as severe or extreme nonattainment of the national ambient air quality standard for ozone. As such, the analysis provided in this Appendix applies to air quality management plans and state implementation plans for both the 8-hour ozone (2007 SIP for the South Coast Air Basin) and the previous 1-hour ozone ambient air quality standards (Draft Final 2012 AQMP, Appendix VII).

SECTION 1

INTRODUCTION

INTRODUCTION

The purpose of the vehicle miles travelled (VMT) emissions offset demonstration for the 1-hour and 8-hour ozone standards is to respond to U.S. EPA's proposed action entitled "Disapproval of Implementation Plan Revisions; State of California; South Coast VMT Emissions Offset Demonstrations" published on September 19, 2012 (77 Fed. Reg. 58067). In that proposal, EPA would withdraw its approval of, and then disapprove, the VMT emissions offset demonstrations in the 2003 1-hour ozone State Implementation Plan (SIP or plan) and the 2007 8-hour ozone plan. In turn, EPA's proposed action is in response to a decision of the Ninth Circuit Court of Appeals in *Association of Irrigated Residents v EPA*, (9th Cir., reprinted as amended on January 27, 2012, 686 F. 3d 668).

BACKGROUND

In 1979, EPA established a primary health-based national ambient air quality standard (NAAQS) for ozone at 0.12 parts per million (ppm) averaged over a 1-hour period. See 44 Fed. Reg. 8220 (February 9, 1979). The Clean Air Act (CAA), as amended in 1990, classified areas that had not yet attained that standard, based on the severity of their ozone problem, ranging from Marginal to Extreme. Extreme areas were provided the most time to attain, until November 15, 2010, but were also subject to the most stringent requirements. In particular, Severe and Extreme areas were subject to CAA Section 182(d)(1)(A), which requires state implementation plans to adopt "specific enforceable transportation control strategies and transportation control measures to offset any growth in vehicle miles traveled or numbers of vehicle trips in such area..." EPA designated the South Coast Air Basin as "Extreme" on November 6, 1991 (56 Fed. Reg. 56694). Thus the South Coast Air Basin was subject to this requirement. EPA has historically interpreted this provision of the CAA (now called "VMT emissions offset requirement") to allow areas to meet the requirement by demonstrating that emissions from motor vehicles decline each year through the attainment year. See, e.g., 57 Fed. Reg. 13498, at 13521-13523 (April 16, 1992).

NEW OZONE STANDARD

In 1997, EPA replaced the 1-hour ozone standard with an 8-hour standard of 0.08 ppm [62 Fed. Reg. 38856 (July 18, 1997)]. EPA promulgated rules implementing the new standard. The "Phase 1" rule was issued on April 30, 2004 (69 Fed. Reg. 23951). That rule includes anti-backsliding requirements that meant that many requirements remained applicable even after the revocation of the 1-hour standard, which was effective June 2005. See 40 CFR §51.905(a)(1) and §51.900(f). In particular, an area that was classified as Extreme for the 1-hour standard would remain subject to the VMT emissions offset requirement even if it would not otherwise have been subject to that requirement based on its classification under the new 8-hour ozone standard [40 CFR

§51.900(f)(11)]. EPA's Phase 2 rule, issued on November 29, 2005 (70 Fed. Reg. 71612) required that areas classified as Severe or Extreme under the new 8-hour standard would also be subject to the VMT offset requirement.

SOUTH COAST SIP SUBMISSIONS FOR VMT OFFSET REQUIREMENT

In 1994, the District, SCAG, and CARB submitted the South Coast 1-hour ozone plan, as required by the 1990 Amendments to the Clean Air Act. The plan included transportation control measures (TCMs). In 1997, EPA approved this plan [62 Fed. Reg. 1150 (January 8, 1997)]. In 1997 and 1999, the District, SCAG, and CARB submitted revisions to the plan, which were approved as amended in 2000 [65 Fed. Reg. 18903 (April 10, 2000)]. In 2004, the state agencies submitted the 2003 South Coast 1-hour ozone SIP. In 2008, the District submitted a VMT offset demonstration to comply with the VMT offset requirement by showing that there would be no increase in motor vehicle emissions between the area's base year for the attainment demonstration and the area's attainment year. EPA approved the VMT offset demonstration [74 Fed. Reg. 10176 (March 10, 2009)]. At the same time, EPA disapproved the overall attainment demonstration which had relied on CARB measures that were subsequently withdrawn. (See 1-hour ozone attainment demonstration Appendix).

EPA initially designated the South Coast Air Basin as Severe-17 for the 8-hour ozone standard, but later granted the State's request to reclassify the area as "Extreme" [69 Fed. Reg. 23858 (April 30, 2004)] and [75 Fed. Reg. 24409 (May 5, 2010)]. In 2007, the state submitted a SIP revision to address the 8-hour ozone requirements, including a VMT offset demonstration in accordance with EPA's prior guidance. In March 2012, EPA approved the 2007 South Coast 8-hour ozone SIP, including the VMT emission offset demonstration [77 Fed. Reg. 12674 (March 1, 2012)].

LITIGATION OVER VMT OFFSET REQUIREMENT

In approving the 2003 VMT offset demonstration, EPA used its longstanding interpretation that no additional TCMs are necessary if aggregate motor vehicle emissions are projected to decline each year from the base year of the plan to the attainment year [74 Fed. Reg. 10176, 10179-80 (March 10, 2009)]. Several environmental and community groups challenged this approval. In February 2011, the Ninth Circuit Court of Appeals ruled against EPA, holding that additional transportation control strategies and transportation control measures are required whenever vehicle emissions are projected to be higher than they would have been had vehicle miles traveled not increased, even where aggregate vehicle emissions are actually decreasing

[*Association of Irrigated Residents v EPA*, 632 F. 3d 584, at 596-597, 686 F. 3d. 668 (reprinted as amended on January 27, 2012, and further amended February 13, 2012)]. EPA had filed a petition for panel rehearing in May 2011, which was denied on January 27, 2012.

In the meantime, as of December 15, 2011, when EPA signed its final approval of the 2007 South Coast 8-hour ozone SIP, the Court had not yet ruled on EPA's petition for rehearing. Thus EPA took final action and approved the VMT offset requirement demonstration based on its long-standing interpretation. The final approval was ultimately published on March 1, 2012 (77 Fed. Reg. 12674). Several environmental and community groups filed a lawsuit challenging that approval (*Communities for a Better Environment, et al. v. EPA*, Ninth Circuit No. 12-71340).

EPA'S PROPOSED WITHDRAWAL OF APPROVAL AND DISAPPROVAL OF 2003 AND 2007 VMT OFFSET REQUIREMENT DEMONSTRATIONS

In response to the decision in *Association of Irrigated Residents*, EPA has now proposed to withdraw its approval of and to disapprove the VMT offset requirement demonstrations in the 2003 and 2007 South Coast 1-hour and 8-hour ozone SIPs. As EPA explains, the demonstrations "are not consistent with the court's ruling ...because they fail to identify, compared to a baseline assuming no VMT growth, the level of increased emissions resulting solely from VMT growth and to show how such increased emissions have been offset through adoption and implementation of transportation control strategies and transportation control measures."

If EPA finalizes the proposed disapprovals, the offset sanction in CAA Section 179(b)(2) would apply in the South Coast Air Basin 18 months after the effective date of the final disapproval, and highway funding sanctions six months after that, unless EPA has taken final approval action on a SIP submission that corrects the deficiency. A federal implementation plan (FIP) would also be triggered 24 months after the final disapproval unless the deficiency has been corrected.

EPA GUIDANCE ON VMT OFFSET REQUIREMENT

In August 2012, EPA issued guidance entitled "Implementing Clean Air Act Section 182(d)(1)(A): Transportation Control Measures and Transportation Control Strategies to Offset Growth in Emissions Due to Growth in Vehicle Miles Travelled".

Among other things, EPA's guidance points out that the Court in *Association of Irrigated Residents* omitted any reference to "transportation control strategies" which are not

defined in the CAA or EPA regulation, but which are eligible to offset growth in emissions due to growth in VMT. EPA's new guidance indicates that technology improvements such as vehicle technology improvements, motor vehicle fuels, and other control strategies that are transportation-related could be used to offset increases in emissions due to VMT. EPA's revised guidance sets forth a method of calculating what is the actual growth in emissions due to growth in VMT. Essentially, the state would compare projected attainment year emissions assuming no new control measures and no VMT growth with projected actual attainment year emissions (including new control measures and VMT growth). If the latter number is smaller than the former, no additional transportation control measures or strategies would be required. If additional transportation control measures and transportation control strategies are required, they should be clearly identified and distinguished from the measures included in the initial calculations for the base year and the three scenarios identified for the attainment year.

In addition, the guidance recommends that the base year to be used in the demonstration be the base year used in the attainment demonstration for the ozone ambient air quality standard. For the 1-hour ozone attainment demonstration as provided in the Clean Air Act, 1990 was used as the base year. For the 8-hour ozone attainment demonstration, 2002 was used as the base year as provided in the 2007 SIP. The District believes, however, that in all cases the proper "base year" is 1990 since Section 182(d)(1)(A) was part of the 1990 Amendments and clearly contemplated the use of 1990 as a base year.

This Appendix includes a VMT offset demonstration in accordance with EPA's new guidance for both the 8-hour and 1-hour ozone requirements. To address U.S. EPA's guidance on the base year, two analyses are provided, one using 1990 and a second alternative for 8-hour ozone only, an analysis using 2002 as the base year.

TRANSPORTATION CONTROL STRATEGIES AND TRANSPORTATION CONTROL MEASURES

By listing them separately, the Clean Air Act [CAA §182(d)(1)(A)] differentiates between transportation control strategies (TCS) and transportation control measures (TCM), and thus provides for a wide range of strategies and measures as options to offset growth in emissions from vehicle miles traveled (VMT) growth. In addition, the example TCMs listed in Section 108(f)(1)(A) of the CAA include measures that reduce emissions by reducing VMT, reducing tailpipe emissions, and removing dirtier vehicles from the fleet. California's motor vehicle control program includes a variety of strategies and measures including new engine standards and in-use programs (e.g., smog

check, vehicle scrap, fleet rules, idling restrictions). TCMs developed by SCAG provide additional reductions. In addition, SCAG prepares a report every two years that reports on the status of implementation of TCMs.

Based on the provisions in Section 182(d)(1)(A) and the clarifications provided in the U.S. EPA guidance, any combination of transportation control strategies and TCMs may be used to meet the requirement to offset growth in emissions resulting from VMT growth. Since 1990 when this requirement was established, California has adopted more than sufficient enforceable transportation strategies and measures to meet the requirement to offset the growth in emissions from VMT growth. For this demonstration, 1990 level controls serve as the base case since the mandate is to adopt any necessary new strategies and controls needed post-1990.

A list of the state's mobile source control program adopted since 1990 is provided in Attachment 1. In addition, a list of TCMs implemented in the South Coast Air Basin is provided in Attachment 2.

EMISSIONS DUE TO VMT GROWTH

There is no specific guidance in the Clean Air Act, Court Opinion, or the EPA guidance on how to select the base year for determining the increase in emissions from VMT. Since the Clean Air Act was amended in 1990, the 1990 calendar year is assumed as the base year. As discussed above, the EPA guidance does provide a recommended calculation methodology that could be done to determine if sufficient transportation control strategies and TCMs have been adopted and implemented to offset the growth in emissions due solely to growth in VMT. As such, any increase in emissions solely from VMT increases in the future attainment year from calendar year 1990 (assuming that there are no further motor vehicle control programs implemented after 1990) would need to be offset. In addition, a calculation is needed to show the emissions levels if VMT had remained constant from 1990 to the future attainment year. As discussed earlier, a comparison of the projected attainment year emissions assuming no new control measures and no VMT growth with projected actual attainment year emissions (including new control measures and VMT growth) would be made. If the latter number is smaller than the former, no additional transportation control measures or strategies would be required.

METHODOLOGY

The following calculations are based on the U.S. EPA guidance recommended calculation methodology. As discussed above, two sets of calculations are provided. The first set uses 1990 as the base year. An alternative analysis is presented using 2002 as the base year. As part of the 1-hour ozone national ambient air quality standard demonstration provided in Appendix VIII, 1990 serves as the base year and 2022 is the projected attainment year. As provided in the 2007 SIP, 2002 is the base year used for the attainment demonstration and 2023 is the attainment year. However, as mentioned above the District believes that for the Section 182(d)(1)(A) demonstration, 1990 serves as the base year for both ozone air quality standards. The analysis using 2002 as the base year is provided as alternative analysis in conjunction with the 8-hour ozone attainment demonstration provided in the 2007 SIP.

Since VMT is projected to increase from the base year to the attainment year and projected VMT for 2023 is higher than the projected VMT for 2022, an analysis using 2022 as the attainment year is not provided and 2023 serves as a more stringent test. Additional discussion is provided in the “Summary Section” below.

Analysis Using 1990 as the Base Year

Step 1. Provide the emissions levels for the base year.

As mentioned above, the base year assumed for the demonstration is 1990. The following table shows the VOC and NO_x emissions for calendar year 1990 from the EMFAC2011 model.

Description	VMT (miles/day)	VOC (tons/day)	NO _x (tons/day)
1990 Vehicle Miles Travelled and On-Road Emissions	257,490,000	933	854

Step 2. Calculate three emissions levels in the attainment year.

For the attainment year,

- (1) calculate emissions levels with the motor vehicle control program frozen at 1990 levels and with projected VMT in the attainment year. This represents what the emissions in the attainment year would have been if transportation control strategies and TCMs had not been implemented after 1990;

- (2) calculate emission levels with the motor vehicle control program frozen at 1990 levels and assuming VMT do not increase from 1990 levels; and
- (3) calculate an emissions level that represents emissions with full implementation of all transportation control strategies and TCMs since 1990, which represents the projected future year baseline emissions inventory in the attainment year.

Calculation 1. Calculate the emissions in the attainment year assuming no new measures since the base year with growth in VMT

To perform this calculation, the California Air Resources Board (CARB) staff identified the on-road motor vehicle control programs adopted since 1990 and adjusted the EMFAC2011 to reflect the VOC and NO_x emissions levels in 2023 without the benefits of the post-1990 control programs. As mentioned earlier, a list of the control programs adopted by CARB since 1990 and TCMs implemented since 1990 are provided in Attachments 1 and 2 to this Appendix. The projected VOC and NO_x emissions are 546 and 910 tons/day, respectively.

Calculation 2. Calculate the emissions with no growth in VMT

EMFAC2011 allows the user to input different vehicle miles travelled. As such, for this calculation, the EMFAC 2011 was run for calendar year 2023 with the 1990 VMT level of 257,490,000 miles per day. The VOC and NO_x emissions associated with the 1990 VMT level are 484 and 572 tons/day, respectively.

Calculation 3. Calculate emission reductions with full implementation of Transportation Control Strategies & TCMs

The VOC and NO_x emission levels for 2023 assuming the benefits of the post-1990 motor vehicle control program and the projected VMT levels in 2023 are calculated using EMFAC2011. The output of the EMFAC2011 model for 2023 is provided in Appendix III of the Draft Final 2012 AQMP. The projected VOC and NO_x emissions levels are 70 and 117 tons/day, respectively.

VOC and NO_x emissions for the three sets of calculations described above are provided in the following tables.

	Description	VMT* (miles/day)	VOC (tons/day)	NOx (tons/day)
(1)	Emissions with Motor Vehicle Control Program Frozen at 1990 Levels (VMT at 2023 Projected Levels)	395,750,000	546	910
(2)	Emissions with Motor Vehicle Control Program Frozen at 1990 Levels (VMT at 1990 Levels)	257,490,000	484	572
(3)	Emissions with Full Motor Vehicle Control Program in Place (VMT at 2023 Projected Levels)	395,750,000	70	117

* VMT Based on 2012 SCAG Regional Transportation Plan (see 2012 AQMP Appendix III)

As provided in the U.S. EPA guidance, to determine compliance with the provisions of Section 182(d)(1)(A) of the federal Clean Air Act, the emissions levels calculated in Calculation 3 should be less than the emissions levels in Calculation 2:

VOC: 70 < 484 tons/day

NOx: 117 < 572 tons/day

Analysis Using 2002 as the Base Year

As mentioned above, this alternative analysis is for the federal 8-hour ozone ambient air quality standard and the attainment year is 2023.

Step 1. Provide the emissions levels for the base year.

The following table shows the VOC and NOx emissions for calendar year 2002 from the EMFAC2011 model.

Description	VMT (miles/day)	VOC (tons/day)	NOx (tons/day)
2002 Vehicle Miles Travelled and On-Road Emissions	330,267,528	310	602

Step 2. Calculate three emissions levels in the attainment year.

For the attainment year,

- (1) calculate emissions levels with the motor vehicle control program frozen at 2002 levels and with projected VMT in the attainment year. This represents what the emissions in the attainment year would have been if transportation control strategies and TCMs had not been implemented after 2002;
- (2) calculate emission levels with the motor vehicle control program frozen at 2002 levels and assuming VMT do not increase from 2002 levels; and
- (3) calculate an emissions level that represents emissions with full implementation of all transportation control strategies and TCMs since 2002, which represents the projected future year baseline emissions inventory in the attainment year.

Calculation 1. Calculate the emissions in the attainment year assuming no new measures since the base year with growth in VMT

To perform this calculation, the California Air Resources Board (CARB) staff identified the on-road motor vehicle control programs adopted since 2002 and adjusted the EMFAC2011 to reflect the VOC and NO_x emissions levels in 2023 without the benefits of the post-2002 control programs. The projected VOC and NO_x emissions are 132 and 483 tons/day, respectively.

Calculation 2. Calculate the emissions with no growth in VMT

EMFAC2011 allows the user to input different vehicle miles travelled. As such, for this calculation, the EMFAC 2011 was run for calendar year 2023 with the 2002 VMT level of 330,267,528 miles per day. The VOC and NO_x emissions associated with the 2002 VMT level are 124 and 391 tons/day, respectively.

Calculation 3. Calculate emission reductions with full implementation of Transportation Control Strategies & TCMs

The VOC and NO_x emission levels for 2023 assuming the benefits of the post-2002 motor vehicle control program and the projected VMT levels in 2023 are calculated using EMFAC2011. The output of the EMFAC2011 model for 2023 is provided in Appendix III of the Draft 2012 AQMP. The projected VOC and NO_x emissions levels are 70 and 117 tons/day, respectively.

VOC and NO_x emissions for the three sets of calculations described above are provided in the following tables.

	Description	VMT* (miles/day)	VOC (tons/day)	NO _x (tons/day)
(1)	Emissions with Motor Vehicle Control Program Frozen at 2002 Levels (VMT at 2023 Projected Levels)	395,750,000	132	483
(2)	Emissions with Motor Vehicle Control Program Frozen at 2002 Levels (VMT at 1990 Levels)	<u>330,267,528</u>	124	391
(3)	Emissions with Full Motor Vehicle Control Program in Place (VMT at 2023 Projected Levels)	395,750,000	70	117

* VMT Based on 2012 SCAG Regional Transportation Plan (see 2012 AQMP Appendix III)

As provided in the U.S. EPA guidance, to determine compliance with the provisions of Section 182(d)(1)(A) of the federal Clean Air Act, the emissions levels calculated in Calculation 3 should be less than the emissions levels in Calculation 2:

VOC: 70 < 124 tons/day

NO_x: 117 < 391 tons/day

SUMMARY

The previous sections provide an analysis to demonstrate complies with the provisions of Section 182(d)(1)(A) of the federal Clean Air Act. To further illustrate the demonstration, Figures 1 and 2 below show graphically the emissions benefits of the motor vehicle control programs in offsetting VOC and NO_x emissions due to VMT increases in the South Coast Air Basin. The left bar (in purple) shows the emissions in the 1990 base year. The three sets of bars on the right in each figure show the emissions levels in 2023 if there were no further motor vehicle controls after 1990 and with projected VMT increases (red bar); the green bar show the emissions if VMT does not increase from 1990 levels and there are no transportation control strategies or TCMs after 1990; and the blue bar shows the emission levels with the post-1990 motor vehicle control program in place. Based on the U.S. EPA guidance, if the blue bar is lower than the green bar, then the identified transportation control strategies and TCMs are sufficient to offset the growth in emissions.

Figure 1. VOC Emissions from On-Road Mobile Sources in the South Coast Air Basin (1990 Base Year)

Figure 2. NOx Emissions from On-Road Mobile Sources in the South Coast Air Basin (1990 Base Year)

As discussed above, a similar set of calculations are made using 2002 as the base year. Figures 3 and 4 illustrate the results of the calculation for VOC and NOx, respectively. As with the first analysis, the blue bar is lower than the green bar, the identified transportation control strategies and TCMs are sufficient to offset the growth in emissions.

Figure 3. VOC Emissions from On-Road Mobile Sources in the South Coast Air Basin with 2002 as an Alternative Base Year

Figure 4. NOx Emissions from On-Road Mobile Sources in the South Coast Air Basin with 2002 as an Alternative Base Year

At this time, based on the 2007 SIP for the 8-hour ozone attainment demonstration, it is projected that the 8-hour ozone ambient air quality standard will be achieved by 2023. It is projected that the previous 1-hour ozone ambient air quality standard will be achieved by 2022. (See 1-hour ozone attainment demonstration Appendix VII.) As provided in Appendix VII Table VII-3-2, the projected VOC and NOx emissions from on-road vehicles is 73 tons/day and

135 tons/day, respectively and are slightly higher than the on-road VOC and NO_x emissions for 2023 (70 and 117 tons/day, respectively). The VMT for 2022 is slightly lower compared to 2023. The demonstration presented for 2023 will be similar for 2022. As such, the above demonstration applies to both the 1-hour ozone and 8-hour ozone national ambient air quality standards. In addition, the District believes that 1990 is the appropriate base year for the demonstration. Regardless, an alternative analysis using 2002 is provided. In both analyses, there are sufficient transportation control strategies and TCMs to offset the emissions increase due to growth in VMT.

ATTACHMENT 2

**TRANSPORTATION CONTROL MEASURES
IMPLEMENTED SINCE 1990**

INTRODUCTION

This Attachment contains a list of transportation control measures implemented in the SCAG region, which includes the South Coast Air Basin, since 1990. The tables are taken from the Federal Transportation Improvement Program [FTIP, formerly Regional Transportation Improvement Program (RTIP)] reports approved by SCAG. Section III of the Technical Appendix to each of the FTIP/RTIP reports contains a list of implemented TCMs. The following section provides a reference list of the FTIP/RTIP reports. The full reports since 2002 can be found on SCAG's website: www.scag.ca.gov/ftip. The specific list of TCMs from each of the referenced reports is provided in the following sections.

2006 RTIP Committed Transportation Control Measures (TCMs)

Project Listing Report

Timely Implementation Report, 2006 RTIP:
Transportation Control Measure (TCM) Project Implementation Status- By County

Los Angeles County**TCMs Reported on in a Previous RTIP**

Lead Agency	Project ID	Description	2004 RTP/RTIP ⁷ Completion Date	2006 RTIP Completion Date	Project Status
ACCESS SERVICES, INC.	LA900520	PURCHASE OF ADDITIONAL 386 VEHICLES FROM FY06 TO FY09. 100 VEHICLES IN FY06, 114 VEHICLES IN FY07; 110 IN FY08 AND 62 IN FY09.	2005	2009	First Delivery Vehicle. This is a multi-year project, with the final purchasing phase to be completed by 2009. As of 2006, the First Vehicle/Equipment has been delivered; the following vehicles will be delivered in phases in 2006, 2007, 2008 with final delivery in 2009.
ALAMEDA TRANSPORTATION CORRIDOR AGENCY	LA0D45	ALAMEDA CORRIDOR TRUCK EXPRESSWAY . ELEVATED 4-LANE EXPRESSWAY BETWEEN COMMODORE HELM BRIDGE AND ALAMEDA STREET (SR-47).	2003/2005	2011	Project is in the Environmental Document/Pre-Design Phase. Project delay was due to required re-evaluation and incorporation as part of the multi-year, multi-phased Alameda Transportation Corridor Project from LA/LB harbors to San Bernardino via Los Angeles County. The Project is scheduled to be completed by 2011.
ARCADIA	LA990712	NEW & EXPANDED SHUTTLE SERVICE THRU DOWNTOWN ARCADIA CONNECTING HOTELS & BUSINESSES TO SANTA ANITA RACE TRAK & FASHION MALL (HUNTINGTON ST) & PROPOSED TRANSIT STATION	2003/2005	2010	No Project Activity. The project has been incorporated as part of the City of Arcadia transportation circulation element incorporating the proposed Metro Gold Line Foothill Extension multi-modal transportation hub. The project will be implemented in phases with the first phase scheduled in 2008 and the second phase by 2010.
BELLFLOWER	LA996275	WEST BRANCH GREENWAY MULTI-MODAL TRANS. CORRIDOR DESIGN AND CONSTRUCT 2.5 MILE CLASS I BIKE PATH ALONG MTA-OWNED SANTA ANA BRANCH ROW INCL. PEDESTRIAN AND LANDSCAPING (3145)	2006	2007	Project In Engineering (PS&E) Phase. Problems in reconciling ROW guidelines arose due to the Orange Line potentially intersecting with this project. Plans had to be reconfigured. Estimated completion date is May 2007.

⁷ The dates reflected are the 2004 RTP and RTIP completion dates. If the completion date was identical in both documents only one date is listed.

Los Angeles County

CULVER CITY MUNI BUS LINES	LA0B400	PROCUREMENT OF FIVE (5) 40' CNG EXPANSION BUSES/420K PER BUS	2004	2008	Project Implementation Phase. The project will support the Sepulveda Rapid Bus project. The project delay is due to on-going coordination with various funding agencies needed to ensure that all components are delivered on time. The project will be completed as part of the Metro Rapid Program by 2008.
CULVER CITY MUNI BUS LINES	LA0C8382	SEPULVEDA BLVD BUS STOP IMPROVEMENT PROGRAM. BUS STOP AMENITIES INC LIGHTING SIGNAGE, LANDSCAPING, SHELTERS, SEATING, LANDINGS AND TRASH RECEPTACLES.	2008/2010	2010	Multi-component Project Underway. Project in Environmental Documents/Pre-design phase. Anticipated completion by end of 2009.
FOOTHILL TRANSIT ZONE	LA0B311	PARK AND RIDE FACILITY TRANSIT ORIENTED NEIGHBORHOOD PROGRAM	2003/2005	2010	Project In Environmental Documents/Pre-design Phase. This is a multi-phased program among Foothill's 21 city service area. Foothill has identified 3 specific sites which are being reviewed by the cities. The reason for delay is that there the coordination/permitting/ROW approvals with the individual cities has taken longer than expected as they each have differing requirements. Once approved, construction is expected to take approximately 6 months. The project is expected to be completed by 2010.
FOOTHILL TRANSIT ZONE	LA0C8362	EL MONTE STATION IMPROVEMENT PROJECT AND TRANSIT STORE EQUIPMENT	2005	2007	Project In Construction/Implementation Phase. The reason for the delay has been some change orders to the original scope of work as various operators are using this facility. Each operator has to agree to the standards and some operators have requested some changes. Operators are working to reach agreement by next six months. Project is expected to be completed by 2008.

FOOTHILL TRANSIT ZONE	LA963526	BUS STOP ENHANCEMENT AND SCHEDULE CAROUSELS	2005	2008	Initial Phase. This is a Multi-year program to identify high ridership/low transit amenity bus stops to provide park/ride type improvements including pedestrian and transit amenities to promote ridership. The reason for delay has been the ongoing coordination with the 21 cities and their specific requirements relating to site access and street ROW needs. There are over 3,000 bus stops in the service area with more than 60 identified that qualify for the program. The first phase included 12 sites with transit amenity improvements. The project's budget has been approved and will be completed in 2008.
FOOTHILL TRANSIT ZONE	LA963762	MONROVIA TIMED TRANSFER CENTER	2004	2006	Project in Construction/Implementation phase. The reason for delay was the LA County permitting took longer than anticipated. The land has been purchased and all permits have been approved. Project will be completed by June 2007.
FOOTHILL TRANSIT ZONE	LA9811007	AVL SYSTEM, ARRIVAL SIGNS, FUEL MGMT. SYSTEM (SMART BUS PROJECT)	2005	2007	Project In Construction/Implementation Phase. Project would integrate audio-visual and ADA requirements, interface with the Universal Fare Card, and rider counters. The contract has been signed and the first phases of buses will be online in the next 6-9 months. The project will be completed by end of 2007.
LAC MTA	927333	RIDESHARE ACTIVITIES	2005	2006	Project construction and implementation has commenced.

LAC MTA	LA29202W	MID -CITY TRANSIT CORRIDOR: WILSHIRE BLVD. FROM VERMONT TO SANTA MONICA DOWNTOWN-MID-CITY WILSHIRE BRT INCL. DIV. 10 EXPANSION	2009/2010	2012	Project under environmental document review and pre-design phase. The reason for delay is due to the community concerns over parking loss and other environmental concerns. In addition, the TCRP funding component was removed due to the state deficit, which required Metro to re-prioritize the project in phases to be completed in 2012. The first phase including procurement of 60' articulated buses has been delivered.
LAC MTA	LA962214	PACIFIC COAST HIGHWAY TRAFFIC MANAGEMENT SYSTEM FROM MCCLURE TUNNEL TO TRANCAS CANYON RD TRAFFIC MAN. & BUS SPEED IMPROVEMNT(TEA21-#707). LACDPW LEAD AGENCY INSTEAD CALTRANS.	2003/2005	2007	Project under construction and implementation. The reason for the delay was that LA County Public Works took over as lead agency instead of Caltrans. The project has experienced greater than anticipated increases in materials, security and ROW costs, and a lower than expected number of bidders, requiring re-programming the project further out than initially budgeted to accommodate these increases. The project is under construction and will complete by June 2007.
LAC MTA	LA963542	ACQUISTION REVENUE VEHICLES - 2,513 CLEAN FUEL BUSES: LEASED VEH, FY02 (370) FY03 (30 HC) + FY04 (70 HC) + (200 ARTICS); FY05-FY10 TOTAL OF 1000 BUSES.	2005	2012	The project is in the Implementation Phase. The first part of the project is completed. This is part of the multi-phased, multi-year implementation of Metro's bus fleet expansion program. This includes an additional procurement of 200 60' articulated buses, which were part of a new design that Metro was the lead agency. The vehicles were required to undergo tests and pass the FTA tests. The first delivery of 40' and 60' buses has been received and the additional vehicles will be delivered in phased in 2007, 2008 and 2009.
LAC MTA	LA974083	CHANDLER/BURBANK BIKE PATH-WHITEOAK TO PIERCE COLLEGE A 3.2 MILE CLASS I BIKEWAY ON MTA'S CHANDLER/BURBANK RAIL RIGHT-OF-WAY WILL IMPROVE NON-MOTORIZED ACCESS (COMBINED W/LA974078)	2003/2007	2008	Project is Construction/Implementation Phase. The project is integrated with a busway project, which was delayed due to the discovery of contaminated soil.

2002 REGIONAL TRANSPORTATION IMPROVEMENT PROGRAM (RTIP) (FY2002/2003-2007/2008) – TCM PROJECTS

Update of TCM projects in 2001 RTIP TCM Implementation Status report:
(Same basic report format as 2001 RTIP)

LOS ANGELES COUNTY - TCMS

PROJECT ID:	LA974170
PROJECT DESCRIPTION:	AGOURA HILLS P&R LOT INCREASE CAPACITY IN AGOURA HILLS AREA FROM 93 TO 193 SPACES LOCATED ON THE 101 FWY
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.

PROJECT ID:	16113
PROJECT DESCRIPTION:	ON CATALINA ISLAND FROM AVALON TO NORTH END OF ISLAND - 2 MILE BIKEWAY WITH SCENIC OVERLOOK
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.

PROJECT ID:	LA000777
PROJECT DESCRIPTION:	FROM ROUTE 10 TO ROUTE 101 TO EXISTING 8-10 LANE FWY ADD TWO HOV LANES (SB:4+0; 5+0 TO 5+1 HOV)
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.

PROJECT ID:	LA973005
PROJECT DESCRIPTION:	BUS EXPANSION: ALTERNATIVE FUEL (TROLLEY BUS)
FUNDING YEARS:	1997/98
IMPLEMENTATION STATUS:	Project was completed.

PROJECT ID:	LA962315
PROJECT DESCRIPTION:	POMONA VALLEY TRAFFIC SIGNAL FORUM IMPROVEMENT PROJECT REGIONALLY SIGNIFICANT IMPROVEMENT SIGNAL COORDIN./MONITOR.
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.

PROJECT ID:	4U004
PROJECT DESCRIPTION:	IN LOS ANGELES FROM PICO STATION LOS ANGELES CONVENTION CENTER - SIDEWALKS AND PEDESTRIAN CONNECTIONS
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.

PROJECT ID:	LA79203
PROJECT DESCRIPTION:	LA STANDARD LIGHT RAIL CAR PROCUREMENT FOR GREEN AND BLUE LINES (52) POSSIBLE DEFENSE CONVERSION FUNDS
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.

PROJECT ID:	LA962356
PROJECT DESCRIPTION:	SOUTH BAY JPA SYNCHRONIZATION & BUS SPEED IMPROVEMENTS (TRANSIT PRIORITY SYSTEM)
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.

PROJECT ID:	LA9703001
PROJECT DESCRIPTION:	RIDESHARE EMPLOYER SERVICE INCLUDING RIDEGUIDE/SURVEY REGISTRATION, TDM ASSISTANCE, SPECIAL MARKETING & MONITORING
FUNDING YEARS:	1997/98
IMPLEMENTATION STATUS:	Project was completed.

LOS ANGELES COUNTY - TCMS

PROJECT ID:	LA974006
PROJECT DESCRIPTION:	UNION STA. GATEWAY BIKE STA. (BIKE RACKS/LOCKERS, BICYCLE REPAIR/ ACCESSORY SALES, SHOWERS/CHANGING FACILITIES, LIMITED FOOD SVC.)
FUNDING YEARS:	1997/98
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	4U005
PROJECT DESCRIPTION:	METROLINK VAN NUYS STATION BETWEEN WILLIS AVENUE AND RAYNER STREET - PEDESTRIAN OVERCROSSING
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	LA962098
PROJECT DESCRIPTION:	BOYLE HEIGHTS ATSAC PROJECT COMPUTER BASED REAL TIME TRAFFIC SIGNAL MONITORING SYSTEM
FUNDING YEARS:	1997/98
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	LA962102
PROJECT DESCRIPTION:	MID-CITIES BUS SPEED IMPROVEMENTS (PEAK-HOUR ONLY)
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	LA962107
PROJECT DESCRIPTION:	SMART CORRIDOR OPERATION ENHANCEMENT
FUNDING YEARS:	1997/98
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	LA962113
PROJECT DESCRIPTION:	CENTRAL/EAST LA BUS SPEED IMPROVEMENT PROJECT (INCREASES SPEED FOR FIXED-ROUTE TRANSIT BY SIGNAL PRIORITY)
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	LA962121
PROJECT DESCRIPTION:	VICTORY/VANOWEN BUS PRIORITY TREATMENTS (SIGNAL COORDIN.)
FUNDING YEARS:	1997/98
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	LA55201
PROJECT DESCRIPTION:	CONTINUING PROJECT - BUS STOP IMPROVEMENTS (AMENITIES, SHELTERS)
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	LA55206
PROJECT DESCRIPTION:	DAR REPLACEMENT VANS; ONE NEW VAN AND ONE REPLACEMENT VAN
FUNDING YEARS:	1997/98
IMPLEMENTATION STATUS:	Project was completed.
PROJECT ID:	LA973506
PROJECT DESCRIPTION:	ROLLING STOCK ACQUISITION UP TO 5 LOCOMOTIVES & 30 CARS
FUNDING YEARS:	1997/98
IMPLEMENTATION STATUS:	Project was completed.

LOS ANGELES COUNTY - TCMS

PROJECT ID:	LA974096
PROJECT DESCRIPTION:	SANTA CLARITA COMMUTE CONNECT OPERATION - PROPANE-FUELED EXP. BUSES TO LINK EMPLOYMENT CTRS W/ SANTA CLARITA METROLINK STA.
FUNDING YEARS:	1998/99
IMPLEMENTATION STATUS:	Project complete
PROJECT ID:	LA974419
PROJECT DESCRIPTION:	BLUE LINE MISSION STREET STATION PARK-AND-RIDE LOT WILL CONSIST OF 130 SPACES AND 300 SQUARE FEET FOR BICYCLES
FUNDING YEARS:	1999/2000
IMPLEMENTATION STATUS:	Project is now LA996090

TCMs project status using new reporting format for 2002 RTIP:

LOS ANGELES COUNTY - TCMS – LOCAL HIGHWAYS (Reporting on TCM projects identified in first two years of 2001 RTIP, i.e., FY00/01 & FY01/02)

ANALYSIS OF IMPLEMENTATION

The implementation status of applicable TCMs (organized by county):

Los Angeles County Metropolitan Transportation Authority

PROJECT ID: LA974170
PROJECT DESCRIPTION: AGOURA HILLS PARK&RIDE LOT INCREASE CAPACITY IN AGOURA HILLS AREA FROM 93 TO 193 SPACES LOCATED ON THE CONGESTED 101 FWY
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: Ongoing.

PROJECT ID: LA974065
PROJECT DESCRIPTION: AVTA BIKE RACK ON BUS PROGRAM ANTELOPE VALLEY TRANSIT AUTH. PROCURE AND INSTALL 25 SPORTWORKS BICYCLE ON AVTA BUS
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: Completed.

PROJECT ID: 16113
PROJECT DESCRIPTION: ON CATALINA ISLAND FROM AVALON TO NORTH END OF ISLAND - 2 MILE BIKEWAY WITH SCENIC OVERLOOK
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA8STIP13
PROJECT DESCRIPTION: BURBANK LOCAL TRANSIT PURCHASE OF TWO ELETRIC BUSES
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA000548 **ROUTE: 10**
PROJECT DESCRIPTION: FROM PUENTE TO CITRUS- HOV LANES FROM 8 TO 10 LANES (C-ISTEA 77720) (98 RTP)
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA01347 **ROUTE: 14**
PROJECT DESCRIPTION: RTE 14 FROM PEARBLOSSOM HWY TO AVE P-8 - HOV LANES
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA01348 **ROUTE: 14**
PROJECT DESCRIPTION: RTE 14 FROM ESCONDIDO CYN RD. TO PEARBLOSSOM HWY - HOV LANES
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA963724 **ROUTE: 30**
PROJECT DESCRIPTION: IN LA VERNE AND CLAREMONT FROM FOOTHILL BLVD. TO SAN BERNARDINO COUNTY LINE - NEW 8 LANE FWY INCLUDING 2 HOV LANES
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 126310 **ROUTE:** 30
PROJECT DESCRIPTION: IN CLAREMONT FROM PADUA AVENUE TO SAN BERNARDINO COUNTY LINE
 - NEW 8 LANE FREEWAY INCLUDING 2 HOV LANES AND INTERCHANGE
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 12640 **ROUTE:** 30
PROJECT DESCRIPTION: IN CLAREMONT FROM TOWNE AVE TO PADUA AVE - NEW 8 LANE FREEWAY
 INCLUDING 2 HOV LANES
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 17210 **ROUTE:** 30
PROJECT DESCRIPTION: IN CLAREMONT FROM FOOTHILL BLVD. TO SAN BERNARDINO COUNTY LINE
 - NEW 8 LANE FREEWAY INCLUDING 2 HOV LANES
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 12570 **ROUTE:** 60
PROJECT DESCRIPTION: IN AND NEAR INDUSTRY FROM 0.5 MILE WEST OF OLD BREA CANYON RD TO
 0.5 MI. E. OF GRAND AVE. - HOV DIRECT CONNECTORS & COLLECTOR ROAD
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 11985 **ROUTE:** 405
PROJECT DESCRIPTION: NEAR HAWTHORNE AND CULVER CITY FROM ROUTE 105 TO ROUTE 90 - 6
 LANE FREEWAY ADD 2 HOV LANES
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 1178A **ROUTE:** 405
PROJECT DESCRIPTION: IN LA & CULVER CITY FROM RTE 90 to RTE 10 - HOV LANES (SB 5+0 TO 5+1;
 NB5+0 TO 5+1 HOV) 98CTIP \$ FUND NB LN, ALSO PAYS FOR PART OS SB \$
 DELETED FROM 96STIP
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA000777 **ROUTE:** 405
PROJECT DESCRIPTION: FROM ROUTE 10 TO ROUTE 101 TO EXISTING 8-10 LANE FWY ADD TWO HOV
 LANES (SB:4+0; 5+0 TO 5+1 HOV)
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974042
PROJECT DESCRIPTION: HARBOR TRANSITWAY SHUTTLE WEEKDAYS & SAT. SVC BTW HARBOR
 TRANSIT STAS @ CARSON & REGION. DESTINATIONS & EMPLOYMENT CTRS
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT DESCRIPTION: BOYLE HEIGHTS ATSAC PROJECT COMPUTER BASED REAL TIME TRAFFIC SIGNAL MONITORING SYSTEM
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962102
PROJECT DESCRIPTION: MID-CITIES BUS SPEED IMPROVEMENTS (PEAK-HOUR ONLY)
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962104
PROJECT DESCRIPTION: WESTSIDE BUS SPEED IMPROVEMENT PROJECT
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962106
PROJECT DESCRIPTION: ADARIVE TRAFFIC CONTROL SYSTEM COMPUTER BASED REAL TIME TRAFFIC SIGNAL MONITORING SYSTEM
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA962107
PROJECT DESCRIPTION: SMART CORRIDOR OPERATION ENHANCEMENT
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962113
PROJECT DESCRIPTION: CENTRAL/EAST LOS ANGELES BUS SPEED IMPROVEMENT PROJECT (INCREASES SPEED FOR FIXED-ROUTE TRANSIT BY SIGNAL PRIORITY)
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962121
PROJECT DESCRIPTION: VICTORY/VANOWEN BUS PRIORITY TREATMENTS (SIGNAL COORDIN.)
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962127
PROJECT DESCRIPTION: SYLMAR/SAN FERNANDO BUS TERMINAL AND TIMED TRANSFER CONNECTION CENTER
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962148
PROJECT DESCRIPTION: WESTLAKE COMMUNITY BASED INTERCEPT INTERMODAL FACILITY (96 CALL, CAT 2)
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA962158
PROJECT DESCRIPTION: W. VALLEY SMART SHUTTLE DEMONSTRATION PROJECT (NO SHUTTLE #)
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA962167
PROJECT DESCRIPTION: BIKE RACK AND PARKING PROGRAM
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA962173
PROJECT DESCRIPTION: WESTLAKE/MACARTHUR PARK - SMART SHUTTLE DEMONSTRATION PROJECT (NO SHUTTLE NUMBER)
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA970901
PROJECT DESCRIPTION: AT&B PRIORITY INFRASTRUCTURE 138 SIGNALIZED INTERSECTIONS INSTALLATION
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA970902
PROJECT DESCRIPTION: AT&B PRIORITY INFRASTRUCTURE 42 SIGNALIZED INTERSECTIONS INSTALLATION
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA970903
PROJECT DESCRIPTION: AT&B PRIORITY INFRASTRUCTURE 109 SIGNALIZED INTERSECTIONS INSTALLATION
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974040
PROJECT DESCRIPTION: METRO GREEN LINE SHUTTLE, AVIATION STATION TO CITY BUS CENTER OPERATE TWO WEEKDAY, PEAK HOUR SHUTTLE SERVICE
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974044
PROJECT DESCRIPTION: BICYCLE RACK ON BUSES-HARBOR AREA ADD BIKE RACKS ON THE LADOT LINES WHICH EXCLUSIVELY SERVE THE HARBOR AREA
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974054
PROJECT DESCRIPTION: KOREATOWN - METRO DASH LINK CONNECT RESID. & BUSINESS AREAS W/ 3 RED LINE STAS ALONG WILSHIRE (ALLOWS FOR SOME RTE. DEVIATION)
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974058
PROJECT DESCRIPTION: EXPOSITION PARK COMPLEX -- INSTALL APPROX. 80 BICYCLE SPACES AT 10 HIGHLY VISIBLE ENTRY LOCATIONS AT MAJOR INSTITUTIONS
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974072
PROJECT DESCRIPTION: CHATSWORTH TRANSIT STATIONS BIKE STATION INCLUDE CHANGING ROOMS, BIKE REPAIR, SALES, RENTAL SHOP, AND BIKE LOCKERS
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962148
PROJECT DESCRIPTION: METRO RAIL RED LINE AT WESTLAKE COMMUNITY INTERMODAL INTERCEPT FACILITY - PARKING STRUCTURE (PHASE I AND II)
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA962314
PROJECT DESCRIPTION: EAST SAN GABRIEL VALLEY SOM PILOT PROJECT - TRAFFIC SIGNALS INTERCONNECT PROJECT
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA55012
PROJECT DESCRIPTION: REPLACE BUSES - 1997 40' BUSES, 1998 5 40' BUSES, 2000 5 40' BUSES
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA55201
PROJECT DESCRIPTION: CONTINUING PROJECT - BUS STOP IMPROVEMENTS (AMENITIES,SHELTERS)
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA55206
PROJECT DESCRIPTION: DAR REPLACEMENT VANS; ONE NEW VAN AND ONE REPLACEMENT VAN
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974020
PROJECT DESCRIPTION: MONTEREY PK DOWNTOWN PKG COMPLEMENT to CURRENT EFFORTS FOR IMPLEMENTATION OF A PEDEST. PLAZA W/IN THE PROJECT AREA.
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA022191
PROJECT DESCRIPTION: PASADENA - REGIONAL SIGNAL SYNCH & SMART CORRIDOR
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA974409
PROJECT DESCRIPTION: POMONA TELEBUSINESS WORKCENTER: BRIDGING THE GAP ADD TELECONFERENCING CAPABILITIES AND INCREASE MARKETING OF CTR
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA973506
PROJECT DESCRIPTION: ROLLING STOCK ACQUISITION UP TO 5 LOCOMOTIVES & 30 CARS
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974096
PROJECT DESCRIPTION: SANTA CLARITA COMMUTE CONNECT OPERATION - PROPANE-FUELED EXP. BUSES TO LINK EMPLOYMENT CTRS W/ SANTA CLARITA METROLINK STA.
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA003255
PROJECT DESCRIPTION: SANTA CLARA RIVER REGIONAL COMMUTER BIKEWAY (93/94 CFP, CAT. 8, 255) CLASS 1 14.5 MILES PH.II
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA974062
PROJECT DESCRIPTION: SANTA CLARITA BICYCLE STA. METROLINK STA. INCLUDE SECURE SPACES FOR 50 BIKES, CHANGING & REST ROOMS, BIKE REPAIR, SALES, & RENTALS
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974204
PROJECT DESCRIPTION: NORWALK/SANTA FE SPRINGS TRANSPORTATION CTR EXPANSION, PARK-&-RIDE FOR 67 VEHICLES, KISS-AND-RIDE PASSENGER DROP OFF AREA
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA974405
PROJECT DESCRIPTION: ARTESIA STA PED. WAY TO PROVIDE SAFE DIRECT ACCESS TO EASTBOUND PEDESTRIANS AT BLUE LINE STA. (INCLUDE SIGNALIZED PED CROSSING)
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA974032
PROJECT DESCRIPTION: SANTA FE SPRINGS METROEXPRESS EXPAND ON THE CITY'S FIXED ROUTE CIRCULATOR TO PROVIDE FEEDER SERVICE TO THE NORWALK/SANTA FE SPRINGS METROLINK STATION
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA002047
PROJECT DESCRIPTION: SANTA MONICA SMART CORRIDOR EXTENSION
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: LA57110
PROJECT DESCRIPTION: BUS REPLACEMENT: FY 1997: 25 BUSES; FY1998: 31 BUSES; FY2000: 15 BUSES; FY2001: 12 BUSES; FY2002: 10 BUSES
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 927331
PROJECT DESCRIPTION: RIDESHARE ACTIVITIES
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: Completed.

PROJECT ID: LA974419
PROJECT DESCRIPTION: BLUE LINE MISSION STREET STATION PARK-AND-RIDE LOT WILL CONSIST OF 130 SPACES AND 300 SQUARE FEET FOR BICYCLES
FUNDING YEARS: 1997/98
IMPLEMENTATION STATUS: Replaced by Project ID LA996090

PROJECT ID: LA974059
PROJECT DESCRIPTION: WEST HOLLYWOOD COMMUTER CENTER TO BE LOCATED IN A HIGHLY VISIBLE STOREFRONT ALONG SANTA MONICA BLVD.
FUNDING YEARS: 1998/99
IMPLEMENTATION STATUS: On-going.

Orange County Transportation Authority

PROJECT ID: ORA1870
PROJECT DESCRIPTION: PURCHASE STANDARD REPLACEMENT BUSES
FUNDING YEAR: 1998/99
IMPLEMENTATION STATUS: Project Initiated/Ongoing.

PROJECT ID: ORA35
PROJECT DESCRIPTION: TRAFFIC OPERATIONS CONTROL CENTER
FUNDING YEAR: 1998/99
IMPLEMENTATION STATUS: Project Completed.

PROJECT ID: ORA55001
PROJECT DESCRIPTION: SANTA ANA: PURCHASE AND INSTALLATION OF BICYCLE LOCKERS CITYWIDE.

PROJECT DESCRIPTION: TRANSFER POINT FACILITY WITH BUS BAYS LAND ACQUISITION AND CONSTRUCTION IN DOWNTOWN SAN BERNARDINO
FUNDING YEAR: 1997/98
IMPLEMENTATION STATUS: Complete.

PROJECT ID: SBD59203
PROJECT DESCRIPTION: PEDESTRIAN FACILITY IMPROVEMENTS AT RIALTO METROLINK STA. BTW ORANGE & RIVERSIDE Ave. (IN ALLEY BTW METROLINK & DOWNTOWN)
FUNDING YEAR: 2002/03
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: SBD59254
PROJECT DESCRIPTION: METROLINK - LOCOMOTIVE RETROFIT FOR NATURAL GAS
FUNDING YEAR: 1997/98
IMPLEMENTATION STATUS: Complete.

PROJECT ID: SBD88357
PROJECT DESCRIPTION: LA CADENA VALLEY BOULEVARD TO MOUNT VERNON SIGNAL INTERCONNECT
FUNDING YEAR: 1997/98
IMPLEMENTATION STATUS: Complete.

PROJECT ID: SBD94163
PROJECT DESCRIPTION: FUNDING FOR COMMUTER COMPUTER
FUNDING YEAR: 1997/98
IMPLEMENTATION STATUS: Rollover project, on-going.

PROJECT ID: SBD41245 **ROUTE: 10**
PROJECT DESCRIPTION: PARK AND RIDE FACILITY N/O I-10 AT SPERRY AND FAIRWAY DEVELOPMENT OF 70 PARKING SPACES FOR COMMUTER VEHICLE PARKING
FUNDING YEAR: 1998/99
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 44370 **ROUTE: 30**
PROJECT DESCRIPTION: NEAR FONTANA FROM 0.2 MI E OF SIERRA AVE TO LINDEN AVE CONSTRUCT 6-LANE FWY & 2 HOV LANES
FUNDING YEAR: 1997/98
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 44380 **ROUTE: 30**
PROJECT DESCRIPTION: IN RIALTO, 0.16 KM E/O LINDEN TO 0.16 KM W/O WILLOW AVE. CONSTRUCT 6 LANE FREEWAY & 2 HOV LANES (SEGMENT 9)
FUNDING YEAR: 1997/98
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 59101 **ROUTE:** 30
PROJECT DESCRIPTION: IN RIALTO & SBD, 0.16KM W/O WILLOW AVE. TO 0.16KM W/O MACY ST.
 CONSTRUCT 6-LANE FREEWAY & 2 HOV LANES (SEGMENT 10)
FUNDING YEAR: 1997/98
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 711 **ROUTE:** 215
PROJECT DESCRIPTION: NEAR COLTON AND SAN BERNARDINO FROM ROUTE 10 TO ROUTE 66 AT
 VARIOUS LOCATIONS – NORTHBOUND AND SOUTHBOUND AUXILIARY LANES
 WITH RIGHT OF WAY FOR FUTURE HOV LANES.
FUNDING YEAR: 1997/98
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 713 **ROUTE:** 215
PROJECT DESCRIPTION: SAN BERNARDINO, RTE 10 TO RTE 30 ADD 2 HOV LANES, MODIFY
 OVERCROSSING PE ONLY (INITIATED)
FUNDING YEAR: 1998/1999
IMPLEMENTATION STATUS: Initiated.

ADDED PROJECTS:

PROJECT ID: SBD990305
PROJECT DESCRIPTION: METROLINK/SAN BERNARDINO LINE CONSTRUCT A SECOND PLATFORM,
 PASSENGER SHELTERS AND INFORMATION KIOSKS.
FUNDING YEAR: 1999/00
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: SBD59209
PROJECT DESCRIPTION: METROLINK STA., PHASE 2 SW CORNER OF MILLIKEN & AT & SF RAILROAD –
 EXPAND PARKING LOT FROM 330-1,000 SPACES, EXTEND SOUTH PLATFORM,
 ADD SHADE STRUCTURES
FUNDING YEAR: 1999/00
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: SBD981118
PROJECT DESCRIPTION: BUS SYSTEM - PASSENGER FACILITIES: DESIGN AND BUILDING OF ONTARIO
 TRANSCENTER
FUNDING YEAR: 2001/02
IMPLEMENTATION STATUS: To be implemented.

PROJECT ID: 9908001
PROJECT DESCRIPTION: Running Springs – Village Trail
FUNDING YEAR: 1998/99
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 990602
PROJECT DESCRIPTION: METROLINK CAPITAL MAINTENANCE
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: ON-GOING.

PROJECT ID: 200037
PROJECT DESCRIPTION: 4 MILE ROUTE WITHIN THE CITY OF REDLANDS – LOCAL TRANSPORTATION
 SERVICE UTILIZING CNG POWERED, RUBBER WHEEL TROLLEYS
FUNDING YEAR: 1999/00
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: SBD90105
PROJECT DESCRIPTION: Bus system - Bus Replacements ALT. FUEL, 01-21, 02-16, 03-19, 04-13
FUNDING YEAR: 1999/00
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 716 **ROUTE:** 215
PROJECT DESCRIPTION: SAN BERNARDINO, 0.2 MI S/O 9TH ST TO 0.4 MI N/O 16TH ST WIDEN FWY, MODIFY INTERCHANGES CONSTRUCT COLLECTOR-DISTRIBUTOR ROAD
FUNDING YEAR: 1999/00
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 20620 **ROUTE:** 30
PROJECT DESCRIPTION: UPLAND TO SAN BERNARDINO FROM LOS ANGELES COUNTY LINE TO ROUTE 215 - 8 LANE FREEWAY INCLUDING 2 HOV LANES (R.O.W. ONLY)
FUNDING YEAR: 1996/97
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 44301 **ROUTE:** 30
PROJECT DESCRIPTION: IN UPLAND, LA/SBD CO LINE TO MOUNTAIN AVE. CONSTRUCT 6 LANE FREEWAY & 2 HOV LANES (SEGMENT 1)
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: Under construction.

PROJECT ID: 44311 **ROUTE:** 30
PROJECT DESCRIPTION: IN UPLAND, MOUTAIN AVE. TO 0.1 MILE W/O CUCAMONGA CANYON WASH CONSTRUCT 6 LANE FWY & 2 HOV LANES & CAMPUS AVE. UC (SEGMENT 2)
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: Under construction.

PROJECT ID: 44321 **ROUTE:** 30
PROJECT DESCRIPTION: IN RANCHO CUCAMONGA, 0.1 MILE W/O CUCAMONGA CANYON WASH TO HERMOSA AV CONSTRUCT 6 LANE FREEWAY & 2 HOV LANES (SEGMENT 3)
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: Under construction.

PROJECT ID: 44331 **ROUTE:** 30
PROJECT DESCRIPTION: IN RANCHO CUCAMONGA, HERMOSA AVE TO 0.6 KM E/O MILLIKEN AVE. CONSTRUCT 6 LANE FREEWAY & 2 HOV LANES (SEGMENT4)
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: Under construction.

PROJECT ID: 44400 **ROUTE:** 30
PROJECT DESCRIPTION: RTE 30 - 0.1 MILE W/O MACY ST TO 'H' ST. RTE 215 - 0.1 MILE S/O MUSCUIABE DR. TO UNIVERSITY PKWY (SEGMENT 11/PHASE 1)
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 200056
PROJECT DESCRIPTION: GREEN VALLEY LAKE - AREA IMPROVEMENTS ROADWAY SHOULDER FOR PAVED WALKWAY, STRUCTURAL REHAB., DIRT TRAIL IMPROVEMENTS
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: To be implemented.

PROJECT ID: 980901 **ROUTE:** 30
PROJECT DESCRIPTION: ON SR 30 FROM LA CO. LINE TO .5 MILES EAST OF ETTWANDA AVE.
 CONSTRUCT 12 OVERCROSSINGS & UNDERCROSSINGS FOR SEGS. 1-5
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 200068
PROJECT DESCRIPTION: UPGRADE AND SYNCHRONIZE TRAFFIC SIGNALS ON PARALLEL/
 INTERSECTING ARTERIALS ALONG I-10 AND SR-60 FREEWAY CORRIDORS
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: Initiated.

PROJECT ID: 200062
PROJECT DESCRIPTION: 40TH ST FROM KENDALL DR TO SEPULVEDA AV - SIGNAL INTERCONNECT A
 TOTAL OF 6 TRAFFIC SIGNALS
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: To be implemented.

PROJECT ID: 200077
PROJECT DESCRIPTION: BUS SYSTEM - PURCHASE EXPANSION ALT FUEL BUSES (01-13), (02-14)
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: On-going.

PROJECT ID: 200072
PROJECT DESCRIPTION: GRAND AVE., PEYTON DRIVE, CHINO AVENUE AND CHINO HILLS PARKWAY -
 TRAFFIC SIGNAL SYNCHRONIZATION AND TRAFFIC OPERATION CENTER
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: To be implemented.

PROJECT ID: 200073
PROJECT DESCRIPTION: ANDERSON ST./TIPPECANOE FROM UNIVERSITY COURT TO HOSPITALITY
 LANE - PROVIDE TRAFFIC SIGNAL COORDINATION AND TIMING
 INTERCONNECT 7 TRAFFIC SIGNALS, INSTALL EMERG. PRE-EMPTION
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: To be implemented.

PROJECT ID: 200074
PROJECT DESCRIPTION: LUMP SUM - TRANSPORTATION ENHANCEMENT ACTIVITIES PROJECTS FOR
 SAN BERNARDINO COUNTY-BIKE/PED PROJECTS
FUNDING YEAR: 2000/01
IMPLEMENTATION STATUS: To be implemented.

PROJECT ID: SBD41065
PROJECT DESCRIPTION: PARATRANSIT-VEHICLES: REPLACEMENT ALT. FUEL, 99-1, 00-4, 02-1
FUNDING YEAR: 2001/02
IMPLEMENTATION STATUS: On-going.

1998 RTIP Committed Transportation Control Measures (TCMs)

Project Listing Report

ANALYSIS OF IMPLEMENTATION

Implementation status of applicable TCMs are organized by county.

Los Angeles County Metropolitan Transportation Authority

Project ID: 7051
 Project Description: METROLINK - VENTURA LINE
 NORTHRIDGE STATION - CONSTRUCTION
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT COMPLETED**

Project ID: 10501 Route: 30
 Project Description: IN LA VERNE AND CLAREMONT, FROM FOOTHILL BOULEVARD
 TO SAN BERNARDINO COUNTY LINE - CONSTRUCT EIGHT
 LANE FREEWAY INCLUDING TWO HIGH OCCUPANCY VEHICLE
 LANES
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: 11267 Route: 110
 Project Description: CONSTRUCT TWO TRANSIT STATIONS
 HARBOR TRANSITWAY STATIONS
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT COMPLETED**

Project ID: 11768
 Project Description: AT VARIOUS LOCATIONS
 SIGNAL SYNCHRONIZATION
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT IMPLEMENTED**

Project ID: 12560 Route: 14
 Project Description: NEAR SANTA CLARITA, FROM SAND CANYON ROAD TO
 ESCONDIDO CANYON ROAD - FOUR LANE FREEWAY ADD TWO
 HIGH OCCUPANCY VEHICLE LANES WITH TRUCK CLIMBING
 LANES (6+0 TO 6+2)
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: 12640 Route: 30
 Project Description: IN CLAREMONT, FROM TOWNE AVENEUE TO PADUA AVENUE -
 CONSTRUCT EIGHT LANE FREEWAY INCLUDING TWO HIGH
 OCCUPANCY VEHICLE (HOV) LANES

Funding Years: FY 1997/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA000274 Route: 2
 Project Description: FROM SEPULVEDA TO MORENO EXISTING 3 LANES; PROPOSED
 4 + HOV (4+2)

Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA000357 Route: 5
 Project Description: FROM ROUTE 170 TO ROUTE 118 HOV LANES (10 TO 12 LANES)

Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA000358 Route: 5
 Project Description: FROM ROUTE 134 TO ROUTE 170 HOV LANES (8 TO 10 LANES)

Funding Years: FY 1996/97
 Implementation Status: **PROJECT IMPLEMENTED.**

Project ID: LA000362 Route: 60
 Project Description: FROM ROUTE 605 TO BREA CYN ROAD HOV LANE (FROM 8-10
 TO 10-12 LANES)

Funding Years: FY 1996/97
 Implementation Status: **PROJECT IMPLEMENTED.**

Project ID: LA000544 Route: 60
 Project Description: IN AND NEAR POMONA FROM ROUTE 57 TO SAN BERNARDINO
 COUNTY LINE -- HOV LANES (8 LANES PLUS 2 HOV)

Funding Years: FY 1997/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA000546 Route: 57
 Project Description: HOV CONNECTORS RTE. 57/60 FROM 8 TO 10 LANES HOV

Funding Years: FY 1997/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA000777 Route: 405
 Project Description: FROM ROUTE 10 TO ROUTE 101 TO EXISTING 8-10 LANE
 FREEWAY ADD TWO HOV LANES
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA002047
 Project Description: SANTA MONICA SMART CORRIDOR EXTENSION
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA002506
 Project Description: DASH SHERMAN OAKS SHUTTLE PROGRAM (93/99 TDM)
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT COMPLETED.**

Project ID: LA002556
 Project Description: BLUE LINE WILLOW STATION PARKING STRUCTURE
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA002633
 Project Description: THOMPSON CREEK BICYCLE TRAIL (93/97 CFP; BIKE
 PROGRAM) CLASS I (2 MILES)
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT COMPLETED.**

Project ID: LA003626
 Project Description: DOMINGUEZ CHANNEL BICYCLE TRAIL PHASE. I (93/94 CFP,
 CAT. 8, 626) CLASS I
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA01344 Route: 5
 Project Description: RT 5 FROM RT 118 TO RT 14 FROM 10 TO 12 LANES HOV LANES
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA01347 Route: 14
 Project Description: RT 14 FROM PEARBLOSSOM HWY TO AVE P-8
 HOV LANES (4 TO 6 LANES)
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA01348 Route: 14
 Project Description: RT 14 FROM ESCONDIDO CYN RD. TO PEARBLOSSOM HWY -
 HOV LANES (4 TO 6 LANES)
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA022140
 Project Description: EXPOSITION RIGHT-OF-WAY REGIONAL BIKEWAY
 CLASS I (8.8 MILES)
 CLASS II (2.6 MILES)
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA022191
 Project Description: PASADENA REG SIGNAL SYNCH & SMART CORRIDOR
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA02556A
 Project Description: TRAFFIC OPERATION SYSTEM #4
 RT.2 RT.5/RT.210
 RT.14 RT.5/RT.48
 RT.30 RT.210/RT.66
 RT.42 RT.210/RT.WILLOW
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT COMPLETED.**

Project ID: LA29202
 Project Description: METRO RED LINE MOS-3: HOLLYWOOD/VINE TO
 LANKERSHIM/CHANDLER (1) & WILSHIRE/WESTERN TO
 PICO/SAN VICENTE (2) EASTSIDE (3)
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA29211
Project Description: PASADENA TRANSPORTATION CENTER
Funding Years: FY 1996/97
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA29212
Project Description: METRO RAIL BLUE LINE - PASADENA EXT (SIERRA MADRE VILLA) TO LA
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA29225
Project Description: LA-RIVERSIDE (VIA UP) COMMUTER RAIL (LAUPT - RIVERSIDE STATION) COMPLETION OF TRACK UPGRADE
Funding Years: FY 1996/97
Implementation Status: **PROJECT COMPLETED.**

Project ID: LA51602
Project Description: BUS REPLACEMENT OF 5 BUSES
Funding Years: FY 1997/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA52605
Project Description: PURCHASE 10 ENGINES AND 10 TRANSMISSION PACKAGES
Funding Years: FY 1996/97
Implementation Status: **PROJECT COMPLETED.**

Project ID: LA52606
Project Description: REPLACE 19 TRANSIT BUSES
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT COMPLETED.**

Project ID: LA53903
Project Description: PURCHASE 3 REPLACEMENT VANS, 2 WITH LIFTS
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA55012
Project Description: REPLACE 7 BUSES
Funding Years: FY 1996/97
Implementation Status: **PROJECT COMPLETED.**

Project ID: LA55201
Project Description: ON GOING BUS STOP MAINTENANCE; REPLACEMENT OF ITEMS
DUE TO DAMAGE AND NORMAL WEAR AND TEAR
Funding Years: FY 1996/97
Implementation Status: **PROJECT COMPLETED.**

Project ID: LA57110
Project Description: BUS REPLACEMENT
FY 1997: 25
FY 1998: 16 BUSES
FY 1999: 15 BUSES
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA5B214
Project Description: CITY OF INGLEWOOD/METRO RIDE, INC. SHUTTLE BUS
OPERATION
Funding Years: FY 1996/97
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA5B218
Project Description: TRANSPORTATION CONCEPTS DOWNEY - SHUTTLE BUS
OPERATION ALSO KNOWN AS THE LAKEWOOD SHUTTLE #631
Funding Years: FY 1996/97
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA65406
Project Description: REPLACE BUSES FY'97 18 BUSES
Funding Years: FY 1996/97
Implementation Status: **PROJECT COMPLETED.**

Project ID: LA65408
Project Description: MAJOR BUS COMPONENTS (2 ENGINES & 2 TRANSMISSIONS)
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA66100
 Project Description: REPLACEMENT OF 40' TRANSIT COACHES WITH ALTERNATIVE
 FUELED COACHES 30 BUSES
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA66101
 Project Description: REPLACEMENT OF FOUR 30' COACHES WITH ALTERNATIVE
 FUEL (ELECTRIC, CNG)
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA66102
 Project Description: REPLACE TRANSIT COACHES WITH ALTERNATIVELY FUELED
 40' COACHES 4 BUSES
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA7031
 Project Description: IN LA COUNTY AT VARIOUS LOCATIONS SYNCHRONIZE
 SIGNALS PILOT AREA PROJECT
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA71702
 Project Description: REPLACE THREE FIXED ROUTE BUSES
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA75054
 Project Description: REPLACE 4 FIX RTE. BUSES
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA79203
 Project Description: LA STANDARD LIGHT RAIL CAR PROCUREMENT FOR GREEN
 AND BLUE LINES __ (74) P'SBLE FED DEFENSE CONVERSION
 FUNDS AND ADD'L OUTYEAR PC40
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA85010
 Project Description: GLOBAL POSITIONING SYSTEM (GPS) TRACKING SYSTEM
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT COMPLETED.**

Project ID: LA85055
 Project Description: REPLACE 4 FIX RTE. BUSES
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA96001
 Project Description: BUS-ROLLING STOCK - 67 BUSES
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT COMPLETED.**

Project ID: LA960139
 Project Description: OCEAN AVE, BROADWAY, OCEAN PARK BLVD, MAIN STREET
 UPDATE EXISTING OUTDATED SIGNALS, CONTROLLERS,
 SYNCHRONIZED SIGNALS
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA960181
 Project Description: RAIL MODE AND RENOVATION PROGRAM
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA962206
 Project Description: FROM RT 90 TO RT 10_HOV LANES PROJECT
 (FROM 8+0 TO 8+2 HOV) Route: 405
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: LA9703Z
 Project Description: LOCOMOTIVE EMISSIONS REDUCTION PROGRAM STUDY
 STATE FUNDS ARE PVEA
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Orange County Transportation Authority

Project ID: 1240 Route: 91
 Project Description: IN BUENA PARK & BREA FROM L.A. COUNTY LINE TO RTE 57
 SEGMENT 2 EXIST 8-LN FWY ADD 2 HOV LANES AND
 AUXILIARY LANES
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: 1250 Route: 91
 Project Description: IN ANAHEIM AT RTE 57/91 CONSTRUCT 57/91 INTERCHANGE
 WITH HOV DIRECT CONNECTORS - TRANSITWAY
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: 1260 Route: 5
 Project Description: IN ANAHEIM RECONSTR GENE AUTRY WAY INTERCHNG FROM
 I-5 HOV FACILITY TO BETMOR LN INCLUDED AS PART OF I-5
 WIDENING SEE #2850 & #2850A (93 RME)
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: 9530
 Project Description: LOS ANGELES/SAN DIEGO CORRIDOR MISSION VIEJO/LAGUNA
 NIGUEL STATION - RIGHT OF WAY ACQUISTION, PLATFORMS,
 AND PARKING FACILITY
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: 01260EE Route: 5
 Project ID:
 Project Description: IN SANTA ANA AND ANAHEIM FROM RTE 22 TO RTE 91 ON
 EXISTING 6-LANE FWY ADD 2 MIXED FLOW LANES, TWO HIGH
 OCCUPANCY VEHICLE LANES, & RECONSTRUCT
 INTERCHANGES
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: ORA157
 Project Description: PURCHASE 170 REPLACEMENT VANS
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: ORA175
 Project Description: RTE 405/55 TRANSITWAY MIT ND (11/93)
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: ORA187
 Project Description: DEBT SERVICE FOR 1993 COP FUNDING MISCELLANEOUS
 CAPITAL PROJECTS
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: ORA1870
 Project Description: PURCHASE 259 REPLACEMENT BUSES STANDARD 40FT BUSES
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: ORA37136
 Project Description: ORANGE COMMUTER RAIL STATION IMPROVEMENTS
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT COMPLETED.**

Riverside County Transportation Commission

Project ID: 41062
 Project Description: UNIVERSITY AVENUE FROM CHICAGO AVENUE TO ROUTE 60 -
 PEDESTRIAN LIGHTING, LANDSCAPING, BENCHES, AND
 HANDICAPPED ACCESSIBILITY
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT COMPLETED.**

Project ID: 46322 Route: 60
 Project Description: NEAR RIVERSIDE, FROM VALLEY WAY TO UNIVERSITY - FOUR
 AND SIX LANE FRWY ADD 2 HOV LANES (STAGE 2)
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: 46360 Route: 60
Project Description: IN RIVERSIDE AND MORRENO VALLEY, FROM ROUTE 215 TO REDLANDS BOULEVARD - FOUR LANE FREEWAY ADD TWO HIGH OCCUPANCY VEHICLE (HOV) LANES
Funding Years: FY 1996/97
Implementation Status: **SEE APPENDIX - LETTER DATED MAY 19, 1998.**

Project ID: 46720 Route: 215
Project Description: IN CITY OF RIVERSIDE FROM WEST JCT RTE 60 TO SAN BERNARDINO COUNTY LINE EXISTING 6-LN FWY ADD 2 HOV LANES
Funding Years: FY 1996/97
Implementation Status: **SEE APPENDIX - LETTER DATED MAY 19, 1998.**

Project ID: RIV32086
Project Description: COMMUTER TRANSPORTATION SERVICES RIDESHARE SERVICES
Funding Years: FY 1996/97
Implementation Status: **PROJECT COMPLETED.**

Project ID: RIV32120
Project Description: IN RIVERSIDE COUNTY CITY OF BANNING PURCHASE ONE REPLACEMENT 12-PASSENGER VAN W/LIFT & TIEDOWNS
Funding Years: FY 1996/97
Implementation Status: **PROJECT COMPLETED.**

Project ID: RIV32145
Project Description: IN RIVERSIDE CITY OF CORONA - PURCHASE FIVE REPLACEMENT VANS W/LIFTS & TIEDOWNS, RADIOS
Funding Years: FY 1997/98
Implementation Status: **PROJECT ON SCHEDULE FOR FY97/98.**

Project ID: RIV32162
 Project Description: IN RIVERSIDE CITY OF RIVERSIDE SPECIAL SERVICES
 PURCHASE OF FOUR REPLACEMENT VANS W/LIFTS AND
 TIEDOWNS
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT COMPLETED.**

Project ID: RIV32164
 Project Description: IN RIVERSIDE CITY OF RIVERSIDE SPECIAL SERVICES
 PURCHASE ONE REPLACEMENT VAN W/LIFTS AND TIEDOWNS
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT ON SCHEDULE FOR FY97/98.**

Project ID: RIV32172
 Project Description: IN RIVERSIDE COUNTY PALO VERDE VALLEY TRANSIT
 AGENCY PURCHASE ONE REPLACEMENT MID-SIZE BUS W/
 LIFT RADIO, FAREBOX & TIEDOWNS
 Funding Years: FY 1996/97
 Implementation Status: **PURCHASED MINI-BUS INSTEAD OF MID-SIZE BUS.**

Project ID: RIV32174
 Project Description: IN RIVERSIDE COUNTY PALO VERDE VALLEY TRANSIT
 AGENCY PURCHASE ONE REPLACEMENT VAN W/ LIFT &
 TIEDOWNS
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT ON SCHEDULE FOR FY97/98.**

Project ID: RIV32228
 Project Description: IN WESTERN RIVERSIDE COUNTY PURCHASE 3 REPLACEMENT
 TRANSIT COACHES, RADIOS & FAREBOXES
 Funding Years: FY 1997/98
 Implementation Status: **PROJECT ON SCHEDULE FOR FY97/98.**

Project ID: RIV32359
 Project Description: IN MORENO VALLEY ON SR60/MORENO BEACH CONSTRUCT
 200 SPACE PARK N RIDE LOT.
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV32392
Project Description: IN WESTERN RIVERSIDE COUNTY DEBT SERVICE PAYMENT FOR TEN EXPANSION COACHES (COPS)
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV32397
Project Description: IN WESTERN RIVERSIDE COUNTY PURCHASE 11 REPLACEMENT DIAL-A-RIDE VANS
Funding Years: FY 1997/98
Implementation Status: **PROJECT DELETED, DUPLICATE OF PROJECT RIV32400.**

Project ID: RIV32412
Project Description: IN COACHELLA VALLEY AREA LEASE/PURCHASE MOTOR COACHES FY 1996/97 - 98/99
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV32420
Project Description: IN COACHELLA VALLEY AREA 2 REPLACE. PARATRANSIT VEH.
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52015
Project Description: IN CATHEDRAL CITY ON DATE PALM FROM 30TH AVE TO PEREZ RD - INTERCONNECT OF 12 TRAFFIC SIGNALS, IN-HOUSE CONTROL PC SYSTEM
Funding Years: FY 1996/97
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52018
Project Description: IN CATHEDRAL CITY ON RAMON ROAD FROM LANDAU BL TO DATE PALM DR - INTERCONNECT OF 5 TRAFFIC SIGNALS
Funding Years: FY 1996/97
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52019
Project Description: IN CATHEDRAL CITY ON PALM CANYON FROM GOLF CLUB DR TO CATHEDRAL CANYON DR - INTERCONNECT OF 4 TRAFFIC SIGNALS
Funding Years: FY 1996/97
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52020
 Project Description: IN MURRIETA INSTALL INTELLIGENT TRAFFIC SURVEILLANCE SYSTEM
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52021 Route: 91
 Project Description: IN CORONA HOV ON RAMP AT 3 LOCATIONS ON SR91 (SERFAS CLUB WB, LINCOLN WB, AND MCKINLEY WB, ADD ONE HOV BYPASS LANE ON EXISTING RAMP AT SERFAS)
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52022
 Project Description: IN PALM SPRINGS CITYWIDE SIGNAL INTERCONNECT ON INDIAN CANYON DRIVE AND ON TAHQUITZ CANYON WAY
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52024
 Project Description: IN MORENO VALLEY CITYWIDE SIGNAL INTERCONNECT ON PERRIS BLVD AND ON ALESSANDRO BLVD
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52025
 Project Description: IN RIVERSIDE COUNTY ON SR 79 NORTH FROM MARGARITA ROAD TO MURRIETA HOT SPRINGS ROAD - INTERCONNECT OF 3 TRAFFIC SIGNALS
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52026
 Project Description: IN RIVERSIDE COUNTY ON SR 79 SOUTH FROM I15 TO BUTTERFIELD STAGE RD - INTERCONNECT OF 6 TRAFFIC SIGNALS
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT DELAYED PENDING COMPLETION OF SR79 WIDENING (SEE LETTER IN APPENDIX)**

Project ID: RIV52027
 Project Description: IN RIVERSIDE COUNTY SIGNAL INTERCONNECT ON MISSION BLVD FROM SR60 TO PYRITE AND VAN BUREN FROM BELLEGRAVE TO RUTILE
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52028
 Project Description: IN MURRIETA AT LOS ALAMOS - SIGNAL INTERCONNECT (PHASE 2 - HEACOCK & GATEWAY PLAZA ENTRANCE) WEST OF WHITEWOOD RD.
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: RIV52106
 Project Description: VALLEY RESOURCE CENTER ONE EXPANSION VAN WITH MOBILE RADIO
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT COMPLETED.**

Project ID: RIV52107
 Project Description: MEDITRANS SERVICES INC. ONE REPLACEMENT VEHICLE
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT COMPLETED.**

San Bernardino Associated Governments

Project ID: 711 Route: 215
 Project Description: NEAR COLTON AND SAN BERNARDINO, FROM ROUTE 10 TO ROUTE 66 AT VARIOUS LOCATIONS - NORTHBOUND AND SOUTHBOUND AUXILIARY LANES WITH RIGHT OF WAY FOR FUTURE HOV LANES
 Funding Years: FY 1996/97, 97/98
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: 20621 Route: 30
 Project Description: IN SAN BERNARDINO COUNTY FROM LOS ANGELES COUNTY LINE TO MOUNTAIN AVE CONSTRUCT 8-LN FWY WITH 2 HOV LANES
 Funding Years: FY 1996/97
 Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: SBD0129 Route: 10
Project Description: IN MONTCLAIR & UPLAND FROM LOS ANGELES COUNTY LINE
TO GROVE AVE. ADD 2 HOV LNS. AUX LNS./SOUNDWALLS
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: SBD031171
Project Description: CITRUS AVENUE AT BASELINE AVENUE TRAFFIC SIGNAL
MODIFICATION AND INTERSECTION IMPROVEMTS (TURN LNS)
Funding Years: FY 1996/97
Implementation Status: **PROJECT COMPLETED.**

Project ID: SBD031506
Project Description: RIDESHARING CONTRIBUTIONS FOR RIDESHARE ACTIVITIES
IN COOP WITH CTS
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING**

Project ID: SBD31088
Project Description: BUS FLEET EXPANSION PURCHASE 16 40' EXPANSION
COACHES & AUXILLARY EQUIPMENT, CNG
Funding Years: FY 1996/97, 97/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: SBD31093
Project Description: BUS FLEET EXPANSION PURCHASE 8 40' EXPANSION COACHES
& AUXILLARY EQUIPMENT, CNG
Funding Years: FY 1997/98
Implementation Status: **PROJECT DELETED, ADDED TO PROJECT SBD31088.**

Project ID: SBD31828
Project Description: CAMINO DEL CIELO/PINION AT STATE ROUTE 62 - CONSTRUCT
PARK AND RIDE FACILITY
Funding Years: FY 1996/97
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: SBD31853
Project Description: BARTON ROAD - 22430 BARTON ROAD (WEST OF I-215) CONST.
48 VEHICLE PARK & RIDE LOT
Funding Years: FY 1996/97
Implementation Status: **PROJECT DELETED, DUPLICATE OF PROJECT SBD31854.**

Project ID: SBD31854
Project Description: BARTON ROAD AT LA CROSSE AVENUE CONST. 60 VEHICLE
PARK & RIDE LOT
Funding Years: FY 1996/97
Implementation Status: **PROJECT DELAYED UNTIL FY98/99.**

Project ID: SBD31860
Project Description: MAIN STREET MT. VERNON AVENUE TO W. CITY LIMITS
PROVIDE BICYCLE LANES
Funding Years: FY 1997/98
Implementation Status: **PROJECT ON SCHEDULE FOR FY97/98.**

Project ID: SBD41202
Project Description: ARROW RTE. MILLIKEN AVE TO EAST ST. WIDEN PORTIONS
FROM 2-4 LANES (APPROX. 12,000 FT.)_ SPOT WIDEN PLUS
MARKED BIKE LANES (CLASS 3)
Funding Years: FY 1997/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: SBD41287
Project Description: GRAND TERRACE MULTIMODAL TRANSFER PT FACILITY
REHAB. OF A VACANT 12,000 FT. COMMERCIAL BUILDING AND
PARK-N-RIDE WITH 57 SPACES
Funding Years: FY 1997/98
Implementation Status: **PROJECT DELAYED UNTIL FY98/99.**

Project ID: SBD41322
Project Description: 9TH ST./H TO SIERRA WAY - MODIFY EXISTING TRAFFIC SIGNAL
TO ADD PEDESTRIAN SIGNALS AND LOOPS ON THE SIDE
STREETS
Funding Years: FY 1997/98
Implementation Status: **PROJECT INITIATED/ONGOING.**

Project ID: SBD41436 Route: 83
Project Description: EUCLID AVE., SPRR R/W A" ST ,MEMORIAL PARK CAMPUS AVE.
16TH ST" AND FOOTHILL BLVD. - CONSTRUCTION OF
SELECTED BICYCLE ROUTES
Funding Years: FY 1997/98
Implementation Status: **PROJECT ON SCHEDULE FOR FY97/98.**

Project ID: SBD41437
Project Description: CITY OF UPLAND - UPLAND TOWN CENTER ACCESS
IMPROVEMENTS TO TOWN CENTER INCLUDING PEDESTRIAN
AND BICYCLE AMENDMENTS. UPGRADE PEDESTRIAN ALLEY
WAYS.
Funding Years: FY 1996/97
Implementation Status: **PROJECT INITIATED/ONGOING.**

PREFACE

The 2012 Air Quality Management Plan (AQMP) response to comments is prepared as part of the 2012 AQMP proceedings to ensure all questions raised and comments received during the development process of the 2012 AQMP are adequately considered and addressed. Based on the comments received and additional analysis, changes have been made to the Plan which is reflected in the Draft Final 2012 AQMP and the Draft Socioeconomic Report for the 2012 AQMP. Numerous recurring comment letters were received, and for ease of identification requested by several commentors, each individual letter is responded to separately, although repetitive. There is one exception. Staff received about 38 letters, all addressing VOC reduction strategies, almost identical in content. These letters are grouped together with one letter as the boiler plate, and the remaining letters referencing the answers in the boiler plate letter. The Letter SS from the Consumer Specialty Products Association (CSPA) is the boiler plate for this group and the 37 letters following after are the similar cases.

AQMP Response to Comments

A. Association of CA Cities Orange County (ACCOC), July 25, 2012

RE: ACC-OC Comments to the Draft Air Quality Management Plan

Dear Dr. Wallerstein,

Thank you for the opportunity to comment on the South Coast Air Quality Management District's (AQMD) 2012 Draft Air Quality Management Plan (AQMP). As the largest municipal education and advocacy organization in Orange County, the Association of California Cities – Orange County (ACC-OC) is proud of its efforts to protect and restore local control on behalf of all 34 cities. Thus, we are grateful for the opportunity to review this important regional policy document to ensure local governments are able to continue to represent their taxpayers to most effective way possible.

The ACC-OC appreciates the mission of AQMD to protect the health and well-being of Southern California residents. Clean air is a vital part of Orange County's quality of life and we respect the importance as well as the complexities of your efforts.

However, the ACC-OC has several questions and concerns regarding the draft AQMP and its control measures as it concerns to potential impacts to local governments. Therefore, I have included the following chart outlining the specific Control Measures and the ACC-OC's suggested revisions or actions AQMD should take in order to balance the overall objectives of the AQMP and fiscal health of local governments.

As AQMD continues its AQMP process, we would appreciate responses to these issues and requests included below.

Measure #	Description	ACC-OC Concern & Recommendation
BCM-01	Emission reduction from under-fired charbroilers ; seeks to require that restaurants install new devices to reduce emissions from their charbroilers.	Restaurants are an important part of the Orange County economy and provide significant sales tax revenue to local cities. This mandate would discourage the development of new restaurants in the region, thereby reducing potential revenue sources for cities. Moreover, this measure is

A-1

		<p>untested and AQMD's own report states that "Emissions reductions specific to this control measure are unknown at this time."</p> <p><i>AQMD should have an economic impact analysis and a clearer picture of what this measure would improve air quality prior to its adoption.</i></p>	
CMB-03	This control measure seeks emission reductions from unregulated commercial fan-type central furnaces used for space heating.	<p>Local governments operate large facilities across Orange County, many of which are heated by the commercial units targeted by this measure. These units are not currently regulated by AQMD and this measure threatens to require cities replace costly units in order to meet this expansion of regulation.</p> <p><i>AQMD should conduct an economic impact analysis on how this measure would affect cities and other stakeholders prior to its expansion of regulatory authority.</i></p>	A-2
FUG-01	This control measure seeks reductions from vacuum trucks through the use of control devices and technologies, including carbon adsorption systems, positive displacement pumps, internal combustion engines, thermal oxidizers, refrigerated condensers and liquid scrubbers.	<p>Cities, especially those with their own utilities, own, operate and maintain between one and three vacuum trucks. Annual maintenance costs average approximately \$15,000 per truck. These trucks are essential elements to secure and sanitary public works. Expanded regulation of these trucks would be financially damaging to both cities and special districts. FUG-01 would significantly increase this burden, yet yield minimal (if any) benefits towards AQMD's overall goals.</p> <p><i>In its proposed regulations, AQMD does not identify municipalities as impacted parties to FUG-01. The ACC-OC requests that AQMD exempt local governments, including cities, special districts, county governments, and others from this measure due to their limited contributions to fugitive emissions and the disproportionate financial impact that would result from FUG-01.</i></p>	A-3
ICE 01-02 and EDU-01	These measures outline incentive programs and education and outreach efforts to facilitate the implementation of all control measures.	<p>Too often, the implementation of incentive and education programs falls to cities. These cost valuable time and monetary resources that are not currently available at the city level. It appears as if cities will have a level of responsibility for implementation based on the Measure EDU-01, which states that "The implementing agency will</p>	A-4

		<p>be the District, in cooperation with other local governments, agencies, technology manufacturers and distributors, and utility service providers.”</p>
		<p><i>AQMD, in its final AQMP, should state how it expects local governments to assist in the implementation of these programs as well as the resources provided and costs expected to be borne by cities.</i></p>

Cities and local governments are a leading source of innovation with regards to emissions reductions. Broadly, numerous municipalities have gone to fleet management services, drastically reducing the amount of vehicles miles traveled. In addition, many have are transitioning from gas-thirsty trucks to hybrid or natural gas vehicles and implementing forward-thinking air quality measures, like anti-idling policies and diesel particulate filters. These proactive, voluntary measures should be rewarded rather than discouraged through the expansion of regulations that would unintentionally harm local governments.

A-5

Again, we appreciate the opportunity to review and comment on this early draft. We look forward to your response on these requests, **especially Control Measure FUG-01**, as it will have the most immediate impact on local governments.

Please do not hesitate to reach me at (714) 953-1300 or lkelly@accoc.org should you need further clarification.

Sincerely,

Lacy Kelly
 Chief Executive Officer
 Association of California Cities – Orange County

 Supervisor Shawn Nelson, 4th District
 Mayor Miguel Pulido, City of Santa Ana
 ACC-OC Board of Directors

Responses to Comment Letter A
ACCOC

Response to Comment A-1:

AQMD staff will consider any concerns regarding the economic impact associated with implementing emission controls at restaurants, particularly existing small businesses. However, under-fired charbroiling is still one of a few, large unregulated sources of air pollution. Prior rule development efforts have been put on hold due to affordability issues (capital, installation, and annual operating), which is why the AQMD is conducting testing at UCR-CCERT. The goal of the testing is to identify technologically feasible, cost-effective, and affordable emission controls. It is worth noting that the Bay Area AQMD already has a rule in place that establishes requirements for under-fired charbroilers and the AQMD is one of many air pollution control agencies currently looking at control programs for this source category. If technologically feasible and affordable emission controls have been identified, and additional emissions reductions are needed for attainment of ambient standards, then rule development process will begin, which will include a full environmental and socioeconomic analyses.

Response to Comment A-2:

A socioeconomic analysis has been conducted as part of this AQMP. Broad in scope, the analysis encompasses the economic impact of all proposed control measures. As required by state law, AQMD staff will also prepare a socioeconomic assessment and a cost-effectiveness analysis as part of this measure's rulemaking process. This proposed measure will not require local governments to replace their forced air-heating units. Instead, the proposed measure will require manufacturers to produce a lower emission product at some date in the future and will require sales outlets to sell only compliant units to customers after that date. After that date, at the time of replacement, local governments can purchase low emission compliant furnaces. In addition, this proposed measure is not an expansion of AQMD authority. The AQMD currently has the authority to regulate these units just as it currently regulates smaller residential units and larger units with heat input of 2 million Btu/hour or greater.

Response to Comment A-3:

Although FUG-01 does not exempt local governments, including cities, special districts, county governments, and others from this measure, the District does not expect the control measure to have a significant financial impact on them. This control measure is based on Bay Area AQMD Regulation 8, Rule 53: Vacuum Trucks Operations, which is limited to emissions of organic compounds from the use of vacuum trucks to move materials that are typically handled at petroleum refineries, bulk plants, bulk terminals, marine terminals, and organic liquid pipeline facilities. Because

local governments, cities, special districts, county governments primarily use vacuum trucks to remove trash from parking lots, clean out sewers and water mains for maintenance work, and remove waste from septic tanks and portable toilets, the AQMD will carefully consider whether to include them in the rule's scope. The Bay Area AQMD regulation does provide an exemption for emergencies that would be applicable to both private and public agencies under defined circumstances (e.g., a petroleum product spill) where the delay in acquiring and using equipment to comply with the rule would result in a risk of significant harm to facility equipment, personnel, the public, or the environment. District staff expects to include similar provisions in any rulemaking efforts. Any other use of vacuum trucks that would otherwise be subject to the proposed control measure would be assessed during the rulemaking process with appropriate stakeholder input, along with an evaluation of cost impacts and effectiveness to determine the form of the control requirements. Finally, the rule would be subject to socioeconomic impact analysis if it results in a significant impact on air quality or emissions limitations.

Response to Comment A-4:

The ICE-01, ICE-02 and EDU-01 measures do not propose to require cities to participate in incentive program funding. Incentive programs are generally voluntary and implemented by the District. However, AQMD hopes to partner with local governments where appropriate to enhance and outreach and education efforts.

Response to Comment A-5:

AQMD staff agrees that cities and local governments can be a leading source of transportation innovation that has reduced vehicle miles travelled through ridesharing and other fleet management services. Local governments have implemented fleets with alternative technology vehicles and clean fuels that help with air pollution and fuel costs. There are no proposed measures that would discourage such activities or add additional regulatory requirements on local governments. The AQMD will continue to be a significant supporter of these transportation changes in local government fleets and operations through incentive programs, grant funding, and providing technical assistance.

B. U.S. EPA, August 30, 2012

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

AUG 30 2012

Elaine Chang, Dr.PH
Deputy Executive Officer
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765

Dear Dr. Chang,

The U.S. Environmental Protection Agency (EPA) appreciates the opportunity to review the draft 2012 South Coast Air Quality Management District's (District's) Air Quality Management Plan (draft 2012 AQMP), which addresses the planning requirements for the 2006 fine particulate (PM_{2.5}) National Ambient Air Quality Standards (NAAQS). Thank you for continuing to work with EPA, the California Air Resources Board (ARB), the Southern California Association of Governments (SCAG) and all stakeholders to ensure that the Plan provides for expeditious attainment of the 35 µg/m³ 24-hour PM_{2.5} standard in the South Coast. The draft 2012 AQMP reflects an extensive effort from you and your staff, and we understand that additional work at the District and ARB is underway. Here are our preliminary comments on the plan.

Emission Inventories

Documentation of the Baseline Emissions Inventory

Baseline emissions inventories are the projected future inventories that incorporate reductions from baseline control measures; that is, measures adopted prior to a plan's development that continue to provide additional reductions between the base year and the attainment year.

Preliminary results of the air quality modeling as presented in Chapter 5 and Appendix V of the draft 2012 AQMP show that baseline measures are expected to provide for attainment of the 35 µg/m³ standard by 2014 in most of the South Coast air basin. Given the importance of an accurate understanding of these baseline measures for attainment planning purposes, we recommend that the plan identify the specific measures that are providing the baseline reductions and the emissions reductions associated with each measure. The AQMP should highlight the baseline measures with compliance dates during the period that the Plan covers. We note that while the draft AQMP already describes the measures that have been adopted to regulate sources in the South Coast, the final AQMP should also identify the measures for which emissions reductions are included in the baseline inventories.

B-1

Rule Effectiveness

EPA recommends that states consider “rule effectiveness” as part of the calculation of emissions estimates for stationary point and non-point (or “area”) sources when developing base year and projection year emissions inventories.¹ Adjustments for rule effectiveness (RE) are appropriate for emissions estimates that involve the use of a control device or control technique (*i.e.*, where the estimates are contingent on the effectiveness of controls), but not where emissions can be calculated by means of a direct determination (*e.g.*, direct emission measurements or explicit records of types and amounts of solvents used) or for uncontrolled emission sources.² Accordingly, we recommend that the District develop its base year and projection year emission inventories using appropriate RE adjustments for the stationary and area source emissions estimates that are contingent on the effectiveness of controls. We also recommend that the District include, in its SIP emission inventory submissions, specific documentation of any RE adjustments applied to the emissions calculations, and the basis for the identified adjustments, consistent with EPA guidance. Use of the highest RE range (86 to 100%) in developing emissions estimates may be appropriate where the SIP contains adequate documentation of high compliance rates in the regulated industry and rigorous enforcement/compliance programs, such as source-specific monitoring, submittal of monitoring records, inspections, and compliance assistance programs.³

B-2

Requirements for Reasonably Available Control Measures Demonstration

The Draft 2012 AQMP should provide for implementation of all reasonably available control measures (RACM) for existing sources as required by Clean Air Act (CAA) section 172(c)(1). RACM are those economically and technologically feasible measures that are necessary to provide for attainment as expeditiously as practicable or to demonstrate reasonable further progress. See 40 CFR section 51.1010; see also 70 FR 71612 at 71661 (November 29, 2005). As part of the RACM demonstration, the AQMP should include a list of the potential measures considered by the State, District, and SCAG and analysis sufficient to show that all RACM, including reasonably available control technologies (RACT), have been adopted and are being implemented expeditiously. See 40 CFR section 51.1010(a). Potential measures that are reasonably available considering economic and technological feasibility must be adopted as RACM if, considered individually or collectively, they would advance attainment in the area by one year or more. See 40 CFR section 51.1010(b). Please work with ARB and SCAG to identify any potential RACM that are not adopted and to quantify potential emission reductions from

B-3

¹ “Rule effectiveness” is a term that describes a method to account for the reality that not all facilities covered by a rule are in compliance with the rule 100% of the time. See “Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter National Ambient Air Quality Standards (NAAQS) and Regional Haze Regulations,” EPA-454/R-05-001, August 2005 (Appendix B), at B-3.

² “Rule Effectiveness Guidance: Integration of Inventory, Compliance, and Assessment Applications,” EPA 452/R-94-001, January 1994.

³ See “Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter National Ambient Air Quality Standards (NAAQS) and Regional Haze Regulations,” EPA-454/R-05-001, August 2005 (Appendix B).

these measures. As part of this analysis, the plan should estimate the additional emission reductions needed to advance attainment by one year.

B-3

Documentation of Interpollutant Trading Ratios

If the final AQMP will include provisions that rely on trading between PM_{2.5} and its precursors to meet CAA requirements (e.g., a trading mechanism for transportation conformity), the AQMP should document the methods used to derive equivalency ratios. This documentation should include rationales explaining why the methods are reasonable for the specific requirement. The methods should be based on the photochemical modeling used in the attainment demonstration and should account for the variability of pollutant and precursor relationships across the air basin. Note that under the transportation conformity rule, interpollutant trading for PM_{2.5} and its precursors is allowed only upon EPA approval of a specific trading hierarchy and ratio(s) as part of the PM_{2.5} attainment plan for the area.⁴

B-4

Contingency Measures

Section 172(c)(9) of the CAA requires that SIPs for PM_{2.5} nonattainment areas provide for the implementation of specific contingency measures to be implemented if the area fails to make reasonable further progress or to attain the NAAQS by the applicable attainment date. Under long-standing EPA policy, these contingency measures should, at minimum, ensure that an appropriate level of *emissions reduction progress* continues to be made if attainment or RFP are not achieved and additional planning by the State is needed.⁵ Accordingly, the PM_{2.5} plan should identify the specific amounts of emission reductions (generally expressed in tonnages) associated with each adopted contingency measure, together with the District's rationale for how these adopted measures ensure an appropriate level of emissions reduction progress if attainment or RFP are not achieved.

B-5

Update on Implementation of the 2007 AQMP for 8-Hour Ozone

We fully support the District's inclusion in the 2012 AQMP of updates on the implementation of control measures and emission reduction commitments relied upon in the South Coast 2007 AQMP to demonstrate expeditious attainment of the 1997 8-hour ozone NAAQS. We urge the District to continue working closely with EPA staff to identify the specific near-term and long-term control measures that will fulfill the NO_x and VOC emission reduction commitments contained in the SIP-approved South Coast 2007 8-hour ozone plan, and to develop appropriate methodologies for calculating the emission reductions attributed to each such measure.

B-6

⁴ See 40 CFR 93.124(b).

⁵ See "State Implementation Plans; General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990," 57 FR 13498, 13511; see also "Clean Air Fine Particle Implementation Rule," 72 FR 20586, 20643 (April 25, 2007) (contingency measures should represent a portion of the actual *emissions reductions* necessary to bring about attainment in the area) and Memorandum dated March 2, 2012 from Stephen D. Page, Director, Office of Air Quality Planning and Standards, to EPA Regional Air Directors, "Implementation Guidance for the 2006 24-Hour Fine Particle (PM_{2.5}) National Ambient Air Quality Standards (NAAQS)" (plan may show that the cumulative effect of the *emission reductions* to be achieved by adopted contingency measures would result in specified reductions in ambient pollutant levels).

Comments on Specific Measures and Rules

BCM-01 Further Reductions from Residential Wood Burning Devices

Page 4-10 of the draft 2012 AQMP describes a new basin-wide curtailment provision that would apply "...whenever a PM_{2.5} level of greater than 30 µg/m³ is forecasted at any monitoring station at which the design value has exceeded the current PM_{2.5} 24-hour standard of 35 µg/m³ for either of the two previous periods."

We support the District's efforts to address upwind/basin-wide PM_{2.5} emissions. In the draft AQMP, it is unclear how the criteria will be applied. The PM_{2.5} design value is the 3-year average of annual 98th percentile of 24-hour average values. Please clarify how the new curtailment criteria will be calculated, for example:

- "...whenever a PM_{2.5} level of greater than 30 µg/m³ is forecast at any monitoring station that exceeded the current PM_{2.5} 24-hour standard of 35 µg/m³ at least once during the previous 2 years."
- "...whenever a PM_{2.5} level of greater than 30 µg/m³ is forecast at any monitoring station that recorded violations of the current PM_{2.5} 24-hour standard of 35 µg/m³ at least once during the previous 2 design value periods."

Also, please clarify whether the curtailment criteria will apply for the entire curtailment season.

The San Joaquin Valley Air Pollution Control District (SJVAPCD) is considering lowering the residential wood burning curtailment threshold to below 30 µg/m³ (SJV PM_{2.5} Plan, Appendix D, June 27, 2012 draft). We recommend the District consider whether a lower threshold is appropriate in the South Coast air basin given model forecast ability and/or PM_{2.5} reduction needs.

Additionally, the District should consider adding a provision to require removal of non-certified wood stoves upon property resale. This is a common provision in nonattainment areas around the country (e.g., Washoe County Rule 040-151, Section D-3, Placer County APCD Rule 225, Section 303, San Joaquin Valley APCD Rule 4901, Section 5.2, Great Basin Unified APCD Rule 431, Section E, and Oregon Department of Environmental Quality Division 262 (340-262-0700).

BCM-02 Further Reductions from Open Burning

Page 4-10 proposes to ban agricultural burning on days when residential wood burning is banned basin-wide. We recommend the District also consider banning agricultural burning by sub-region on sub-regional curtailment days to more fully align the two programs. Additionally, we recommend the District consider whether a ban on burning specific agricultural crops, which have economically and technologically feasible alternatives to burning, is reasonable, as is done in SJVAPCD Rule 4103.

B-7

B-8

BCM-03 Emission Reductions from Under-Fired Charbroilers

We support the District's work to establish cost-effective controls in this area and recommend continued collaboration with EPA and the Bay Area and San Joaquin Valley air districts during this process. If there are areas where EPA can be of help, please contact Rynda Kay at (415) 947-4118 or kay.rynda@epa.gov.

Thank you for the opportunity to review and comment on the South Coast Draft 2012 AQMP. We look forward to working with you as the plan is finalized. If you have any questions or concerns, please call me at 415-972-3183.

B-9

Sincerely,

Elizabeth J. Adams
Deputy Director, Air Division

Responses to Comment Letter B
U.S. EPA

Response to Comment B-1:

Appendix III to the 2012 AQMP provides the base year and future years emission inventory that considers the effects of growth and of adopted regulations that have later implementation years. Thus, the reductions from past rules with later compliance dates are included in the baseline emissions inventory. However, in order to be more specific as per the comment, a new Table III 2-2B has been added to list the emissions reductions (for both 2014 and 2023) by District rules with Post-2008 compliance dates.

Response to Comment B-2:

As discussed in Chapter 3, the emission inventories are based on activity information, and emission factors from either EPA or facilities' annual emissions report, and rule requirements or source test. As noted in Appendix IV-A, the District followed the EPA's guidance on rule effectiveness. As such, the quantification of emission reductions in the baseline inventory reflects future reductions considering rule compliance rates and control effectiveness. For example, reductions in VOC emissions from the required reformulation of architectural coatings are a direct determination, and thus the District used 100 percent effectiveness. Other rules require control devices or compliance rates (e.g, Rules 461) that can achieve a certain percent reduction. This percent reduction achieved was considered in generating the emission inventory. Documentation in establishing the emission inventory can be found in Appendix III.

Response to Comment B-3:

The Draft 2012 AQMP provides for the implementation of all RACMs as expeditiously as practicable. The comprehensive six-step approach for RACM (including RACT for stationary sources) demonstration in this AQMP is essentially identical to that in the 2007 AQMP, and the current list of control measures is built upon those stated in the 2007 AQMP. It should be noted that the RACM demonstrations and the PM_{2.5} control measures in the 2007 AQMP were approved by EPA on November 9, 2011 (76 FR 69928). The robust demonstrations conducted by the District, CARB and SCAG for RACMs (Appendix VI and its attachment and Appendix IV-C) show that the three agencies have diligently analyzed all possible control measures available at this time, specifically considered the most stringent rules and regulations nationwide for opportunities for further emissions control. With many of the most stringent regulations in the nation already implemented in the District, opportunities for implementing further control are limited. The modeling analysis in Chapter 5 suggests that the region can meet the 24-hour PM_{2.5} standard by 2014 (within 5 years of the designation date) by implementing the short-term episodic PM_{2.5} measures listed in Table 4-2. As such, the District will not request an extension beyond 2014. The District has not identified any additional measures that could individually or

collectively be implemented to achieve the PM_{2.5} standards earlier than 2014. The District is always open to suggestions and recommends that the commenter as well as the public provide detailed information on any potential measures that may individually or collectively advance the attainment date.

Response to Comment B-4:

The Draft Final 2012 AQMP provides a detailed description of the methodology used to determine the proposed Basin trading ratios (Appendix V, Attachment 8). The use of the trading ratios represents the impacts of regional precursor emissions reductions on the attainment of the NAAQS. Briefly, the ratios have been developed from the 24-hr PM_{2.5} attainment demonstration. Projected reductions in the four basic components of particulates and their relative contributions to ambient 24-hour PM_{2.5} levels were determined from CMAQ regional modeling. The procedure related SO_x and NO_x emissions reductions to corresponding reductions in ammonium sulfate and ammonium nitrate including the contribution of bonded water. Reductions of VOC emissions and directly emitted PM_{2.5} were used to determine the ratios for organic carbon and the primary particulate component categories including EC. This methodology has been presented in the 2007 AQMP where trading ratios were specifically developed for the annual PM_{2.5} attainment demonstration. The methodology was incorporated in the 2007 AQMP and was approved by U.S. EPA as part of that plan. The District requests EPA to approve the interpollutant trading ratios for use in transportation conformity and SIP emission reduction commitments. Staff has previously worked with U.S. EPA to help refine potential policy on emissions trading and the establishment of regionally determined trading ratios.

Response to Comment B-5:

The contingency measure discussion in Chapter 6 was expanded to include specific emissions reductions for each control measure relied on for contingency purposes. Table 6-2 in the Revised Draft shows the emissions reductions from each measure and the corresponding NO_x equivalent reductions.

Response to Comment B-6:

The District appreciates the support from US EPA for the inclusion of control measures and emission reduction commitments relied upon in the 2007 AQMP to demonstrate expeditious progress towards attainment of the 1997 8-hour ozone NAAQS.

Response to Comment B-7:

The design value is the 3-year average of the annual 98th percentile of the 24-hour average values of monitored data ambient PM_{2.5} data. The suggested alternative language implies a curtailment would be called if a violation of the standard occurs “at least once during the previous two years”; however, that one violation may be excluded

under the 98th percentile. Staff has clarified in the control measure that a curtailment would apply Basin-wide whenever a PM_{2.5} level of greater than 30 µg/m³ is forecast at any monitoring station at which the design value for either of the two previous 3-year periods exceed the current PM_{2.5} 24-hour standard of 35 µg/m³.

The referenced San Joaquin Valley APCD proposed control measure includes consideration of lowering the curtailment threshold to 20 µg/m³ in the event the area fails to attain the current PM_{2.5} 24-hour standard of 35 µg/m³. The AQMD's control measure already proposes lowering the curtailment to 30 µg/m³ to address forecast uncertainties. Note that lowering the threshold does not lead to additional daily emissions reductions, other than potential carryover from previous days. The San Joaquin Valley has significantly more carryover of PM_{2.5} from day to day than the South Coast Basin. However, staff is considering longer term forecasts and curtailment periods that last multiple days to address any potential carryover influences. The expansion of the wintertime curtailment period to include October and/or March is also being considered.

As to the removal or replacement of a non-certified wood stove during property sale or transfer, this was considered during the development of Rule 445. Staff will revisit the issue as part of current incentive programs, but as the 2014 attainment date is fast approaching and given the rate of property transfers, adding the requirement to the rule would not have an appreciable effect by 2014.

Response to Comment B-8:

AQMD staff concurs that additional emissions reductions can be achieved with the alignment of the Rule 444 – Open Burning and Rule 445 – Wood-Burning Devices control programs. With respect to sub regional forecasts, Rule 444 currently includes a definition for source/receptor areas, which correspond to the same forecast areas under Rule 445. Under the provisions of existing Rule 444, the Executive Officer is authorized to restrict all burning activities by source/receptor areas if the air quality is forecasted to be unhealthy for sensitive persons (AQI 100). This corresponds with the existing Rule 445 curtailment threshold of 35 µg/m³. AQMD staff concurs and proposes to match the Basin-wide and regional curtailment criteria in Rules 444 and 445 to the extent possible while still being consistent with State law.

Regarding the suggestion to prohibit the burning of specific agricultural crops where there are alternatives that are technically and economically feasible, staff intends to require economically and technologically feasible alternatives to burning where possible.

Response to Comment B-9:

Staff appreciates the support and has been in contact with all the noted agencies as the District continues its efforts to seek affordable and technologically feasible controls for under-fired charbroilers. Control device testing at University of California Riverside, College of Engineering-Center for Environmental Research and Technology (CE-CERT) is ongoing with the participation of the agencies listed and U.S. EPA.

C. Southern California Business Coalition, May 15, 2012

May 15, 2012

Dr. William A. Burke, Chairman
Members of the SCAQMD Governing Board
South Coast Air Quality Management District
21865 Copley Dr.
Diamond Bar, CA 91765

Dear Chairman Burke and Governing Board Members:

As AQMD staff continues development of the 2012 Air Quality Management Plan, our coalition made up of the leaders of some of California's largest regional business entities and associations, wants to convey to you our recognition of the challenges and difficulties inherent in this process, and express our continued support for a well-balanced strategy that addresses federal requirements as well as economically feasible compliance approaches.

Through the AQMP Advisory Group, many of us have seen SCAQMD staff presentations on issues related to emissions inventories and modeling, but little discussion or information has been presented to date related to specific control measures or socioeconomic impacts under consideration for this AQMP. Since this last issue is one that the Board has weighed in on

C-1

numerous times on other rules and policies, we feel compelled to offer our assistance to help direct the drafting of the AQMP so that it complies with the Board's stated preferences regarding independent economic analyses of proposed policies, regulations and rules.

Through direction from the SCAQMD Governing Board, state legislation and recommendations of the Little Hoover Commission, common practice now calls for the development of an economic impact analysis prior to implementation of new regulations and the review of the economic impacts of certain current regulations.

While we would not presume to dictate one solution that would work for every political opinion, we do have recommendations based on our combined business sense and practical experience. In particular, there are two key areas in which we have broad agreement.

First, given the persistent economic recession in which we all find ourselves, we urge the SCAQMD Governing Board to exercise reasonable moderation when fashioning the AQMP. Specifically, now – more than ever – is the time to rely only on economical and proven technologies and strategies in this current AQMP and allow subsequent plans to focus on future, as-yet-developed technologies to provide substantial air quality improvements once our economy recovers.

Second, we support the principles of the Little Hoover Commission that call for using a standard set of economic analytic tools, "calibrated to the scope of the proposed regulation – to determine which alternative both meets the stated goal of the regulation and produces the desired social benefits, while avoiding unnecessary costs to regulated parties and society."¹

As part of the socioeconomic impacts, we strongly urge SCAQMD to contract with a truly independent party to analyze certain factors related to the proposed AQMP. Please consider drawing upon the considerable expertise from within the entities represented in this letter to help develop the statement of work for that independent party. Following are the factors that should be analyzed:

1. Cost Effectiveness Analysis (CEA)

This process offers a framework for identifying the most cost-effective and financially efficient policy choice. CEA examines various policy options for obtaining a desired result, and creates a ratio of cost to an effectiveness measure (e.g., tons of emissions eliminated). The CEA should also be done for each control measure, as well as the overall AQMP.

We recognize that the District always estimates cost-effectiveness for new or amended rules, and attempts - whenever possible - to do so for proposed AQMP control measures. Our concerns, however, are with the facts that ever increasing, higher values for cost-effectiveness are routinely deemed acceptable, and that the actual values for cost-effectiveness continue to be calculated in a manner that underestimates the true costs.

We note that, in extreme contrast to the \$10,000 per ton cost-effectiveness upper bound set by President Clinton in 1994, or to historical benchmarks established by the District at \$13,000 per ton, values as high as \$65,000 per ton of emissions reduced have been referenced by SCAQMD senior staff as "acceptable" when discussing recent rules.

C-1

C-2

C-3

C-4

¹ Cover letter to the Governor and Legislature, Little Hoover Commission, "Better Regulation: Improving California's Rulemaking Process", 10-25-11

There has been no discussion in the AQMP stakeholder meetings to suggest that these spiraling values will be contained. Thus, there is the perception within the business community, which we represent, that the District lacks sufficient concern about the very real, and very significant, cost impacts of its regulatory programs.

Compounding the problem of ever-increasing levels of cost-effectiveness that are considered acceptable by the Board is that fact that the District's method of calculating cost-effectiveness produces "low-ball" values that do not reflect the true cost-effectiveness. Specifically, the District uses a Discounted Cash Flow (DCF) method, whereas virtually all other regulatory agencies (e.g., US EPA, all of the Cal/EPA agencies, the BAAQMD, etc.) use the Levelized Cash Flow (LCF) method. Although the District is required, per the Health and Safety Code, to estimate the true cost-effectiveness of its proposed rules for both decision makers and stakeholders, the DCF method underestimates the values for cost-effectiveness. This has the effect of making proposed rules seem more "attractive" than they really are. Further, the District's use of the DCF methodology means that the cost-effectiveness of its rules cannot be compared to those of other agencies' rules, and vice versa.

The District has, in the past, been made aware of the inadequacies of the DCF method. Although the problem - and the concerns of the regulated community - had apparently been given some consideration, as a practical matter the problem continues. In addition to establishing a clear and definitive policy regarding an upper bound on cost-effectiveness, the actual values for cost-effectiveness need to be calculated in a manner (i.e., LCF) that accurately reflects the true costs.

2. Cost Benefit PLUS Opportunity Costs Analysis

This tool attempts to examine the costs and benefits of policies and identifies the alternative that yields the largest net benefits for society.

3. Comprehensive Analysis of Higher Cost Regulation

The economic impact of the AQMP and its associated control measures is also relevant to the residents of this region in terms of their overall quality of life and jobs. The region's continued economic recovery must be a key component of policy makers' decision-making in the AQMP, as should the affordability of proposed regulations.

The AQMP should not be so focused on any one result without taking into consideration the broader context, or unintended consequences, of the solution it seeks. Undervaluing the fragile nature of our economy will place the region at a competitive disadvantage and potentially impact the affordable production and delivery of goods and services.

Finally, in order to produce a document that can be supported by both the regulated and non-regulated communities, the process must be fair, transparent and accountable. With that in mind, SCAQMD staff should also provide clarity and transparency with regard to benchmarking for future considerations.

We can't stress enough the need for credible independent evaluation of the data. In fact, this is the same direction given by the Board in relation to Rule 1110.2, Rule 1147, and the Energy Policy adopted by the Board last year.

We are not requesting *less* regulation when it comes to the AQMP, but rather *better* regulation. On a larger scale, even the state's economy will benefit from better, more effective regulation and reduced uncertainty.

C-4

C-5

C-6

C-7

The regulated community appreciates the public process thus far, and believes that as the development of the AQMP moves forward, increased collaboration is needed between the SCAQMD and relevant stakeholders to create a better consensus on how to reduce the region's emissions as required under existing law, while simultaneously improving the region's economy. To this end, and in keeping with your February 3, 2012 comments on the importance of outreach to stakeholders, we respectfully request a meeting with you, and the Executive Officer, to discuss how our recommendations might be incorporated into the current development and outreach schedule for the 2012 AQMP.

C-8

To follow up on this request, Tracy Rafter, CEO of BizFed (tracy.rafter@bizfed.org) or Kate Klimow, Vice President of Government Affairs for Orange County Business Council (kklimow@ocbc.org) will contact your office to schedule a meeting.

Sincerely,

Southern California Business Coalition - AQMP Stakeholders Working Group

Responses to Comment Letter C
SCBC

Response to Comment C-1:

Staff has released cost and cost-effectiveness data for the AQMP control measures (http://www.aqmd.gov/gb_comit/aqmpadvgrp/2012AQMP/meetings/2012/july26/CostSummary.pdf)

http://www.aqmd.gov/gb_comit/aqmpadvgrp/2012AQMP/meetings/2012/july26/DetailCost.xls). The full socioeconomic analysis was released in late September which can be found at: <http://www.aqmd.gov/aqmp/2012aqmp/DraftSocioeconomicReport.pdf>.

The analysis includes discussions on the distribution of costs and benefits to 21 sub-regions within the AQMD and presents the resulting regional employment and competitiveness impacts.

Response to Comment C-2:

The standard set of tools called for in the Little Hoover Commission report (October 2011) has not been developed to date. The District's socioeconomic analysis of the Draft 2012 AQMP includes detailed costs of individual control measures and benefits of meeting the federal PM2.5 standard (health, visibility, material, and congestion relief). The benefits analysis is based on peer-reviewed research. Additionally, Regional Economic Models, Inc. (REMI), that has been used by consultants, public agencies and academicians, is used to assess the ripple effects of costs and benefits of clean air on the local economy. The District's analysis, in many instances, has exceeded the scope and depth of similar analyses performed by other entities.

Response to Comment C-3:

Experts hired and invited to assist in the AQMP socioeconomic analysis are well established professionally in their respective fields. The list of experts include: Dr. Leland Deck, Ph.D. of Stratus Consulting Inc., Professor J. R. DeShazo of UCLA, Professor Gloria Gonzalez-Rivera of UC Riverside, Professor Lisa Grobar of California State University, Long Beach, Professor Emeritus Jane Hall of California State University, Fullerton, Stephen Levy of CCSCE, Professor Paul Ong of UCLA, Professor Karen Polenske of MIT, Dr. Gang Shao, Ph.D. of MarcoSys, LLC, and Dr. Fred Treyz, CEO of REMI. Additionally, the AQMD's Scientific, Technical and Modeling Peer Review Advisory Group (STMPRAG) is composed of leading experts in the socioeconomic and air quality modeling fields, representatives from the regulated community, and participants from public interest groups. The list of STMPRAG members can be found at:

http://www.aqmd.gov/gb_comit/stmpradvgrp/2012stmpradvgrpmembership.html.

The District carefully considers the comments of the advisory groups and incorporates them when appropriate.

Response to Comment C-4:

Cost-effectiveness analysis, whether LCF and DCF, provides a relative ranking of regulatory alternatives. The DCF method, because it relies on the present value of all costs associated with a given proposal, allows for the analysis of complex cash flow patterns that cannot be analyzed with the LCF method. As such, under the same assumptions (e.g., interest rate and project life), LCF and DCF are mathematically equivalent. They merely show two different approaches to presenting a stream of costs occurring over a period of time.

Response to Comment C-5:

The clean air benefit analysis is based on the opportunity cost concept where the price of a non-market commodity is deduced from goods and services sold in a market system. The socioeconomic analysis of the 2012 AQMP uses these deduced non-market values (i.e., opportunity costs) to estimate the regional economic impacts of health, visibility, material, and congestion. This is a standard approach in the economics profession. Please see response to Comment C-1 regarding cost analysis performed under this concept.

Response to Comment C-6:

The socioeconomic analysis of the all measures proposed in the Draft AQMP was released in late September. Costs associated with individual measures have been released (see response to Comment C-1). A more detailed and comprehensive analysis of the socioeconomic impacts of each measure occurs during the rule making process.

Response to Comment C-7:

Please refer to Comment C-1.

Response to Comment C-8:

Please contact Dr. Phil Fine at 909-396-2239 to arrange a meeting with staff.

D. American Coatings Association (ACA), June 13, 2012

June 13, 2012

Dr. Philip Fine and Joe Cassmassi
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

RE: SCAQMD 2012 Air Quality Management Plan (AQMP) Advisory Group Meeting #9 – Control Measure Concepts; ACA Comments

Dear Dr. Fine and Mr. Cassmassi:

The American Coatings Association (ACA) submits the following initial comments on CTS-01 *Further Emission Reduction from Architectural Coatings (Rule 1113)* that were presented at the May 17, 2012 Air Quality Management Plan (AQMP) Advisory Group Meeting.

Architectural and Industrial Maintenance (AIM) Coatings Inventory

ACA wants to assure that appropriate inventory credit is given for the significant reductions already achieved in mass and reactivity of VOC emissions from architectural coatings, and additional reductions to come from requirements for colorants, VOC limit reductions and thinning/cleaning solvents.

SCAQMD should fully explain any discrepancies or changes to the architectural and industrial maintenance (AIM) coatings inventory. At the May AQMP meeting, staff released a preliminary draft AIM inventory of 26.16 tpd for 2008, 22.87 tpd for 2014, and 24.72 tpd for 2023. Recent revised information suggests the inventory for 2008 is now 21.9 tpd (16.1 tpd for AIM coatings; 2.8 tpd for thinning/ cleaning/additives; and 3.1 tpd for colorants). ACA requests additional information on what the 2.8 tpd for thinning, cleaning and additives includes. ACA has also requested additional information on the 2014 inventory. ACA suggests the estimated 2014 inventory is too high, considering the 2011 Rule 1113 Staff Report where the District estimated the 2009 inventory to be as low as 11.6 tpd. Assuming the 2009 and 2014 inventories are similar (11.6 tpd), the original 2014 estimate of 22.87 tpd may be as much as two times too large. Instead of accounting for 22% of the AIM inventory, the proposed CTS-01 would instead account for nearly 43% of the AIM inventory.

ACA suggests the District develop an AQMP strategy that relates development/implementation of CTS-01 to future AIM emissions. If for example the District is able to document (via Rule 314) that the AIM emissions in 2012 are less than say 12 tpd (hypothetical number), then the District would not need to develop/implement CTS-01, since the District could take credit for the reductions in Rule 314. If on the other hand, the AIM emissions in 2012 are more than 12 tpd, then the District would develop and implement CTS-01 to reduce the industry emissions to

D-1

below 12 tpd. Another benefit of this option is that it resolves District concern that the recent inventory reductions are economy related (i.e. the emissions will increase once the economy improves).

D-1

AIM VOC Reduction Estimate

ACA assumes that the 4-5 tons per day in CTS-01 will come from reductions from the recent Rule 1143 (9.75 tpd) and Rule 1113 amendments (4.4 tpd) since the estimated a 4-5 tpd reduction from CTS-01 is too large based on the associated CTS-01 synopsis. In comparison, the 2011 Rule 1113 amendments resulted in estimated reductions of 4.4 tpd, which included VOC limit reductions for 11 categories (0.4 tpd), changes/phase-out of the averaging provision (1.2 tpd) and limits on colorants (2.8 tpd). ACA requests further details on the estimated CTS-01 reductions, since ACA is concerned that the reductions detailed in the synopsis will not result in 4-5 tpd of reductions, therefore the District will be forced to lower VOC limits for other coatings categories.

D-2

Further, similar to our comments on the 2007 AQMP (letter dated December 7, 2006), ACA is concerned that if these extreme and unproven reductions are approved, the industry will be forced to achieve the VOC targets regardless of whether the CTS-01 control measures are technologically feasible. As ACA commented in the past, we are concerned that once these reduction estimates are approved in the AQMP and the State Implementation Plan, the District may sidestep the technical concerns claiming that it has no choice since the reductions are "locked" into the Plan/SIP. Given this significant concern, the Plan should clearly state that any specific numeric goals or targets are subject to the District's statutory authority to regulate non-mobile sources and may be adjusted in the future based on technological feasibility analyses.

CTS-01 Control Measure Technological Concerns

ACA is currently reviewing the potential control measure concepts in CTS-01, however ACA offers the following initial comments:

D-3

1. Reduce VOC Emissions from Flat, Nonflat and Primer, Sealer, Undercoaters (PSU)

ACA is concerned that limits lower than 50 g/l (flat and nonflat) and 100 g/l (PSU's) may be difficult given the current problems associated with VOC test methods. In addition, ACA suggests the District complete a technology assessment to be sure that it is technologically feasible to lower the VOC limits, especially since certain products need to be kept at the current limits. See attached ACA comments dated 2/4/2011.

2. Small Container Exemption

ACA is concerned that eliminating the small container exemption, or eliminating the exemption for certain categories is problematic since the small container exemption is critical given the fact that the SCAQMD Rule 1113 limits are the most stringent in the US. This exemption provides a "safety valve" or a last resort option that allows for traditional products in problem situations when the limits in categories become more stringent or a category is eliminated. There are also a

D-4

host of niche coatings that manufacturers can now sell in small containers that would need to be categorized if the small container exemption is modified or removed. See attached ACA comments dated 2/4/2011.

3. Application Techniques with Greater Transfer Efficiency

ACA is concerned the District is imposing transfer efficiency requirements on equipment used to apply AIM coatings. With regards to the laser paint targeting system, ACA is concerned that the system is sold exclusively by Iowa University and has not been widely distributed throughout the US. While this technology may be useful for training contractors to properly apply coatings in an automotive refinish shop under controlled conditions, this technology may not be applicable to field applied coatings. As such, ACA is concerned that it may be difficult for the District to document and receive SIP credit for increased efficiency from the use of this technology. Further, this equipment is expensive – approximately \$100 per unit (not including replacement of the lithium battery that has a tested average life of only 20 hours). Also, ACA is concerned that this technology was designed for auto refinish coatings shops, and it may not work on AIM spray equipment that is used in the field (large areas, use of wands, rough texture substrates, sunny locations). Finally, it's unclear whether these units can be properly cleaned.

D-5

ACA is also concerned that if the laser paint targeting system control measure is abandoned for some reason the District will be forced to impose the 65% efficiency requirements for all AIM spray equipment, which is problematic.

Lack of Technological or Economic Assessment

ACA is also generally concerned with the absence of the following in the AQMP:

- (1) No assessment of technological or economic feasibility of the proposals, which may amount to pointless bans on useful products.
- (2) No assessment of potentially significant unintended adverse environmental impacts from either (a) substitution of inadequate alternatives, or (b) lack of adequate protective maintenance painting.
- (3) No demonstration that further reductions in VOC emissions from architectural coatings would be necessary or helpful in achieving ozone attainment under the increasingly NOx-limited conditions of the South Coast Air Basin.

D-6

Thank you for the opportunity to comment. If you have any questions or need any further information on the issues discussed here, please feel free to contact me at (202) 462-6272.

Sincerely,

/s/

David Darling, P.E.
Director, Environmental Affairs

Responses to Comment Letter D
ACA

Response to Comment D-1:

District staff recognizes the significant, cost-effective, and technologically-feasible VOC emission reductions that have been achieved from architectural coatings over the past 15 years, primarily with the success in reformulation and commercialization of low-VOC products by coating manufacturers. For CTS-01, District staff has revised the total baseline 2008 VOC inventory from architectural coatings to 21.9 tons per day (tpd), which includes: a) 16.1 tpd of VOC emissions as reported under Rule 314 reporting requirements for CY 2008. b) 2.8 tpd from thinning / cleaning / additives based on the California Air Resources Board (CARB) 2005 Architectural Coating Survey Final Report Appendix B - New Thinning and Cleanup Methodology and Rule 1143 rule development. c) 3.0 tpd from Colorants as detailed in the July 2011 amendments to Rule 1113. Further, emission reductions of 2.66 tpd from thinning / cleaning / additives, 2.8 tpd from colorants, and 1.6 tpd from Rule 1113 are also reflected in future year emissions summarized in revised CTS-01. The Draft 2012 AQMP utilizes the baseline emissions from CY 2008, and subsequent growth projections are estimated from the 2008 baseline for all measures. An analysis of data submitted pursuant to Rule 314 shows a decrease in sales volume and emissions, 15% and 30%, respectively, for CY 2009. However, the data does show a positive trend in terms of volume and a flattening of emissions for CY 2010 and 2011. This is consistent with the economic recovery and market-driven trends. There are no emission reduction commitments associated with Rule 314, which is strictly designed for the District to recover its program costs, and therefore this rule is not part of the State Implementation Plan (SIP). Hence, the District is unable to take credit for future emission reductions that may be associated with this fee rule. Nonetheless, total emissions from architectural coatings continues to reflect daily VOC emissions of more than 12 tpd, which is one of the largest sources of VOC emissions under the District's regulatory program. The District has not yet attained compliance with national air quality standards, and has a continued need to evaluate all technically-feasible and cost-effective reductions for criteria pollutants, including VOCs. Therefore, staff believes it would not be appropriate to implement CTS-01 only if emissions in 2012 are more than 12 tpd.

Response to Comment D-2:

Staff originally estimated that draft CTS-01 may potentially achieve VOC reductions of 4.4 tpd. The estimated emission reductions that were already achieved from past rule amendments are not part of the reduction estimates, but are reflected in the future year baseline emissions from architectural coatings. Nonetheless, based on the concern and subsequent discussions with the industry, CTS-01 has been revised to reflect potential emission reductions ranging from 2-4 tpd, with 2 tpd to be included in the SIP. As

clearly demonstrated in previous rule amendments to Rule 1113, District staff will evaluate technical feasibility during the rule development process, working closely with the manufacturers on any specific rule proposals.

Response to Comment D-3:

Staff agrees that an improved VOC test method is needed in order to fully document the achievement of further VOC reductions. Draft CTS-01 includes a proposal to lower VOC limits in conjunction with the adoption of a gas chromatographic test method for more accurately measuring of VOC content, and a change of the metric from VOC of coating to VOC of material. In addition, staff plans to perform a technology assessment, in conjunction with the industry, as part of the rule amendment process.

Response to Comment D-4:

Draft CTS-01 has been revised to reflect an evaluation of the potential for complete phase out of the Small Container Exemption. Staff does not agree that the small container exemption is a necessary safety valve for the VOC limits in Rule 1113. However, as part of any rule development activities, staff will evaluate the need for any niche categories with higher VOC limits that may be necessary for certain small volume uses. Based on a review of data submitted by manufacturers, there are ample products available in the market place that meet the VOC limits in Rule 1113. The District has not yet attained compliance with national air quality standards, and has a continued need to evaluate all technically-feasible and cost-effective reductions for criteria pollutants, including VOCs. With consideration of more stringent ozone standards in the near future including the required 2015 AQMP, it is vital to fully evaluate the need for any and all exemptions from VOC rules, including Rule 1113.

Response to Comment D-5:

Draft CTS-01 inclusion of transfer efficiency requirements does not focus solely on the laser paint targeting tool, but relies on any retrofit technology that increases the transfer efficiency or reduces the amount of overspray that occurs as a result of current spray application. The laser paint targeting system is one such useful device that assists painters to utilize the proper distance relative to the pressure to maximize transfer efficiency, with data supporting an increase in transfer efficiency by more than 30%. The use of the laser provides immediate feedback to the applicator with two dots which merge to one when the applicator maintains the optimal distance to the object being sprayed. The dot also provides a visual reference for conducting subsequent passes over previously painted areas so the applicator can maintain a 50% overlap. The use of the laser paint technology has been demonstrated to increase transfer efficiency by more than 30% (please see the following link <http://www.iwrc.org/index.cfm/products/laserpaint/product-info/>). Staff used a conservative estimate of an increase in transfer efficiency of 5% for this control measure. To date, this technology has been mainly implemented in the automotive

refinishing and aerospace uses, but it can easily be used to enhance the transfer efficiency from other spray applications, including architectural coatings.

The draft measure also includes the use of HVLP or other spray technology capable of achieving a minimum of 65% transfer efficiency, which is included in all other coatings rules. HVLP and other spray technology that meet the 65% transfer efficiency are readily available for most architectural coatings. While the retrofit and new spray gun technology does have an upfront cost, the transfer efficiency gains, ranging from a conservative estimate of 2% to 10%, can potentially result in significant reductions in volume of coating usage, estimated to be between 150,000 to 685,000 gallons annually. The savings from the reduced paint usage will more than offset the cost of retrofit or new spray units. Staff plans to conduct a thorough technical analysis, including evaluating cleaning and maintenance, during the rule development period.

Response to Comment D-6:

(1) The District has released socioeconomic and environmental analysis of the Draft 2012 AQMP. Further technology assessments and socioeconomic impact analysis will be conducted as part of the rule development process. (2) A comprehensive environmental assessment will be conducted as part of the rule development process. (3) The District has not yet attained compliance with national air quality standards, and has a continued need to evaluate all technically-feasible and cost-effective reductions for criteria pollutants, including VOCs.

E. David Darling, February 4, 2011

February 4, 2011

Ms. Heather Farr
Office of Planning, Rule Development, and Area Sources
South Coast Air Quality Management District (SCAQMD)
21865 Copley Drive
Diamond Bar, CA 91765

RE: January 20, 2011, SCAQMD Public Workshop on Proposed Amended Rule 1113: Architectural Coatings; ACA January 28, 2011 Comment Amendments

Dear Ms. Farr:

The American Coatings Association (ACA)¹ appreciates the recent changes that staff has made to the proposed rule amendments, and submits the following comments on the Draft January 12, 2011, Proposed Amended Rule 1113.

1. Given the unexpected massive reduction in VOC emissions from architectural coatings, drastic amendments to Rule 1113 are not needed at this time

ACA believes that given the reported Rule 314 emissions data for 2008 and 2009, SCAQMD has already met – and exceeded by half – its AQMP goal, so there is no reason or it is not necessary to enact stringent amendments to Rule 1113 at this time. If the District wants to amend Rule 1113, ACA suggests partnering with industry to amend the rule for the purposes of general cleanup, improving clarity and consistency, and harmonizing Rule 1113 with the ARB 2007 SCM in the manner we proposed at the working group meeting, and even possibly set reasonable limits for colorants. We see no necessity, however, for amending the rule at this time to impose lower limits on VOC content or restrict flexibility provisions, especially since the latest Rule 314 data indicate that emissions from this category are less than half the amount projected in the District's emissions inventory for this timeframe.

This trend is partly due to recessionary impacts on sales, but also due to market-driven low VOC technology transfer beyond what is required. Further, the trend in average material VOC content indicates that even if sales volumes increase, emissions will not return to former levels (2004

¹ The American Coatings Association (ACA) is a voluntary, nonprofit trade association working to advance the needs of the paint and coatings industry and the professionals who work in it. The organization represents paint and coatings manufacturers, raw materials suppliers, distributors, and technical professionals. ACA serves as an advocate and ally for members on legislative, regulatory and judicial issues, and provides forums for the advancement and promotion of the industry through educational and professional development services.

E-1

average MVOC: 97 g/L; 2008: 34 g/L; 2009: 30 g/L). Bottom line, the District has met its planning goals and industry should be given credit via less aggressive amendments to Rule 1113.

If, over ACA's objection, the District proceeds forward with the severe proposed amendments to Rule 1113, we respectfully submit the following comments for your consideration.

E-1

2. Small Container Exemption

The small container exemption is critical given the fact that the SCAQMD Rule 1113 limits are the most stringent in the US. This exemption provides a "safety valve" or a last resort option that allows for traditional product in problem situations when the limits in categories become more stringent or a category goes away. It is important to note that district staff consistently mentioned that if companies cannot meet lower limits they can always use the small container exemption – this is not the case anymore – as limits get lower and lower end users need a "relief valve".

There are also a host of niche coatings that manufacturers can now sell in small containers that would need to be categorized if the small container exemption is modified or removed. These include:

- Tile touchup
- Porcelain tub/sink touchup
- Magnetic coatings (turns wall into magnet)
- Chalkboard coatings (turns wall into chalkboard)
- White board coatings (turns wall into a white board)]
- Camouflage coatings
- Projection TV. coatings (turns wall into projection TV. screen)
- Wood stains and wood stain markers
- Appliance touch-up
- Samples
- Touch-up for wood products (allow proper repairs following installation of kitchen cabinets, bathroom vanities, doors and millwork).
- Coatings that are not manufactured as architectural coatings but may become subject to Rule 1113 by virtue of being applied to stationary structures or their appurtenances; e.g., hobby paints, artist colors, marine varnish, and various kinds of touch-up paints.

E-2

An example is that many Original Equipment Manufacturing (OEM) product manufacturers will send small container "touch-up" product so that products can be touched-up in the field – this is very common since the shop applied product may be oil based and Rule 1113-compliant product is water based, so the coatings are not equivalent from a performance, application, and appearance perspective. This will result in a patchy appearance and increased corrosion of the

touched up areas. This could also result in a negative impact on the overall emissions due to an earlier repainting to address these performance and appearance problems.

Given the excess emission reductions, and the need for this "safety valve" ACA recommends the District not amend the small container exemption beyond adding "anti-bundling" language. ACA partnered with the District by providing suggested language, and we request the District partner with Industry and retain the small container exemption. If over ACA's objection the District does amend the small container exemption, ACA requests the following needed changes to the proposed rule:

- Given the niche products above it is likely that additional categories will be needed, ACA suggests flat coatings and stains be added exempted as well.
- Bundling language is problematic: "or" should be "and" in (f)(1)(B).
- ACA suggests the following edit:

"The provisions of the Table of Standards and paragraph (c)(1) of this rule shall not apply to any architectural coatings in containers having capacities of one quart liter or less, excluding clear wood finishes and pigmented lacquers, until December 31, 2012, provided that the following conditions in Sections A and B below are met." and Waterproofing Concrete/Masonry Sealers, provided that the following conditions in Sections A and B below are met."

- ACA requests the anti-bundling language allow small containers be sold in shipping boxes.
- For categories that may be excluded from small container exemption, a three-year sell through is needed so that products in the pipeline and on shelves can be sold and not disposed of as hazardous waste.
- If the amended rule were to require labeling of small containers, a minimum three-year transition period is needed.
- ACA suggests the rule be consistent with 2007 SCM – "one liter (1.057 quart) or less".
- If the District does not add Conversion Varnish and Conjugated Oil Varnish categories to Rule 1113, ACA requests that these be included in the small container exemption.

3. Markets for Sale - this terminology is confusing. The definition of "market" is covered by current rule (to supply, sell, offer for sale). Since this could pull in Ebay, Craigslist, Amazon, where they notified of the change and implications? ACA is also concerned about national, state and regional TV, print and radio ad campaigns that could be problematic from a "markets for sale" perspective.

E-2

E-3

- 4. District deleted “for use” – the assumption that products sold in District are used in the District is problematic as a basis for enforcement – ACA believes that the District is overreaching and does not have authority to do so. We are especially concerned about warehouse materials/products being shipping through the District, these must be exempted. This deletion also pulls in homeowners into the rule – ACA does not believe that homeowners understand this implication. A full CEQA analysis should be performed to determine the fiscal impact and compliance cost for homeowners.

 E-4
- 5. Worksite Definition and “stores at worksite” - ACA suggests deleting “vehicle” from definition so this does not apply to contractor vehicles. Further, “regular maintenance” occurs at almost every building, and it does not seem logical that the District intended to pull in every building. Further, the definition should not apply to manufacturing sites and job shops (for example OEM surface coating operations).

 E-5
- 6. “Manufacturer” definition should exclude repackaging and relabeling at stores.

 E-6
- 7. Quick-Dry Enamel and Quick Dry Primer – needs to be transitioned like other CA Air Districts have done – ACA suggests the following:

“Effective January 1, 2013, the Quick-Dry Primer, Sealer, and Undercoater category and Quick Dry Enamel category are eliminated and coatings meeting either definition will be subject to the VOC limit for the applicable category in the Table of Standards, except in [most restrictive and sell through provisions].”

 E-7
- 8. Nonflat High Gloss Coatings – similar to the Quick-Dry Enamel and Quick-Dry Primer categories – ACA suggests the following transition language:

“Effective July 1, 2011, the Nonflat High Gloss Coatings category is eliminated and coatings meeting this definition will be subject to the VOC limit for the Nonflat coatings category, except in [most restrictive and sell through provisions].”

 E-8
- 9. Default Limit – this should be set at 50 g/L to eliminate the potential for arbitrary and capricious categorization of “default” products. Also ACA suggests dropping the language “and less any colorant added to tint bases until January 1, 2014, at which time the limit drops to 100 grams of VOC per liter of coating (0.83 pounds per gallon).”

 E-9
- 10. Section (c)(2) – ACA suggests deleting the language “except anti-graffiti coatings”

 E-10
- 11. Colorants – ACA suggests listing the limit for Solvent Borne Industrial Maintenance Coatings (600 g/L) first, then the limit for All Other Architectural Coatings (50 g/L) next. In

 E-11

addition, ACA suggests that the rule needs to be clarified that colorant limits apply only to colorants added at the point of sale.

ACA once again requests a higher colorant limits for IR Heat Reflective Pigment Colorant Dispersions, since heat reflective wall coating technology is based upon the use of Complex Inorganic Color Pigment Technology (CICP). The colorants that contain these unique pigments are only available from a few specialized colorant suppliers. The CICP pigments are very high in density and formulation of commercially viable machine dispensable colorants is very challenging. The CICP colorants have been found to be more prone to settling, caking, clogging, and canister collaring than conventional colorants when used in automated colorant dispensing equipment. This is the case even at conventional VOC levels of 450-550 grams per liter. Lowering the VOC level of these special colorants to below 50 grams per liter VOC will be very problematic. Because of the added environmental benefits of heat reflective coating (described below) and the fact that this a specialized niche, it is proposed that a limit of 400 grams per liter VOC be considered for this important class of colorants.

It is important to note that the performance of CICP pigment containing heat reflective wall coatings have been validated by the U.S. Department of Energy. The many benefits of this technology are becoming more widely known and accepted. By reducing the heat uptake of buildings, the cooling energy demands are reduced. This means less electricity needs to be generated by power plants for this purpose resulting in reduced power plant emissions. Also important is that this reduction occurs during the peak demand daylight hours. Because the CICP IR pigments are incredibly durable, these coatings do not need to be repainted due to color fading for many years longer than ordinary paint. This translates into eliminating the VOC emissions that would have occurred due to the skipped painting cycle requirements.

12. **Faux-Finishing/Japan** - ACA suggests setting the limit for the clear topcoat at 200 g/l then lowering this to 150 g/l since these clear coats are not "typical" they are required to provide long term color and gloss stability and protection for the color coats, also adequate open time is needed to create the faux finish appearances. In addition, there is a typo in Definition (17) Clear Topcoats - needs to be finished.

13. **Stone Consolidants (450 g/l)** - consistent with the 2007 SCM, this category and limits should be added to Rule 1113 since they are needed for preservation of historic buildings in the SCAQMD. The landmark Wilshire Boulevard Temple in downtown Los Angeles is a prime example of a historic structure in need of this technology. The exterior is literally falling apart one grain at a time. The California Office of Historic preservation has stated its opinion that they must be consulted as part of the Rule 1113 CEQA review due to the potential for substantial adverse change to historical resources under their jurisdiction. ACA will be submitting CEQA comments in this regard.

E-11

E-12

E-13

14. Reactive Penetrating Sealers (350 g/l) – The Reactive Penetrating Sealer niche category was created in the CARB 2007 SCM and needs to be added to Rule 1113 for infrastructure protection. ACA is aware that Caltrans has completed a report in April 2010 entitled “Report on Non-Film Concrete/Masonry Waterproofing Products”. This report indicates that Caltrans recently determined that Rule 1113 compliant alternatives lack the performance necessary for infrastructure protection and are requesting this category be adopted. ACA will be submitting CEQA comments in this regard since effective salt screening products are needed near the ocean in SCAQMD especially considering the use of pretensioned concrete structural components, in which it is vital to protect the reinforcement cables from corrosion. Since the Rule 1113 revision is a project with regional significance and has the potential to impact transportation infrastructure, we believe that the District is obligated to formally consult with Caltrans as well as the California Office of Historic preservation as part of its CEQA analysis.

E-14

15. Conversion Varnish(725 g/l)/Conjugated Oil Varnish (450 g/l) – These are very specialized small “niche” high-end coatings with unique properties that are needed in specific applications, and are generally applied only by professional contractors. ACA requests SCAQMD include these in Rule 1113. If can’t include in Rule 1113, ACA requests the District add these to small container exemption.

E-15

16. Tub and Tile Refinishing (420 g/l) – ACA suggests adding this category and limit consistent with the 2007 SCM, however please note that a manufacturer of these products is working on 150 g/l product. Staff has stated that these products fall under IM, however IM are prohibited from interior use.

E-16

17. Primers, Sealers & Undercoaters (PSU)

ACA is concerned that SCAQMD is considering whether to lower the VOC limit for the Primer, Sealer & Undercoater category, since products in this category are extremely important functional coatings that must perform well in adhering to substrates, and are often a last resort in solving difficult application issues. Also, these products are designed for a wide range of substrates and exposure conditions. While coatings manufacturers may be able to meet the 50 g/L limit for Flats and Non-Flats, they must have good PSU coatings to do so. Of course, when a primer fails, not only the primer must be replaced – new topcoats are necessary, too. This causes increased emissions and excess consumption of energy and material resources. ACA will be submitting CEQA comments with regards to this issue.

E-17

The District mentioned that when they lowered to PSU category limits to 100 g/l that they acknowledged the fact that lower VOC PSUs needed greater surface preparation, have less tolerance, and painters need to follow instructions that’s why they included a long

implementation timeframe. With 50 g/L topcoats, lowering the PSU limit further is very problematic.

While primers at lower VOC contents may be available for all substrates, their performance limitations make them inadequate as substitutes for higher VOC, better performing products. Consequently, such substitutions lead to higher rates of coating system failure or reduced longevity, or necessitate multiple primer coats that would otherwise be unnecessary. To the extent that better performing, lower VOC primers might be formulated with new technologies just becoming available, the lab work and field tests would require a period of time much longer than a year and a half.

Also, this category represents the 3rd largest category, and a limit of 50 g/l would eliminate 60% of available products on the market – nearly 550 products – in roughly a year and a half. This amount of time is insufficient to reformulate and test this number of products. District data also suggests that with every step lower in VOC content, performance attributes suffer accordingly. There is a tradeoff and we must expect a performance drop with lower VOC contents, but this is not acceptable with PSU coatings. It is clear from the bimodal data (or inverse bell curve) results indicate the need for higher VOC PSUs for specific applications including wood, metal, masonry and concrete tilt-up. Most PSUs at or below 50 g/L are applied to interior drywall. Critical substrates that need the 100 g/l limit include: non-bituminous roof primers, exterior wood (especially wood with high tannin extractives e.g., redwood and cedar); stucco; exterior concrete and masonry (especially with high alkalinity, efflorescence, or heavy surface chalking); and interior substrates that are smoke-, fire-, or water-damaged. Also, certain types of primers perform significantly better at higher VOC levels, including thin-film elastomeric primers, and the higher performing multi-purpose primers that can be used on various substrates including metal.

In addition, a review of the District selected products that meet the proposed 50 g/L limit (see Attachment A) there are several problematic issues with the 50 g/L products:

- several products are meant for interior use only
- several products require two coats are recommended for metals and wood with tannins;
- several products do not mention use on metal or wood
- several mention use on primed and previously painted metal
- several are two component epoxies which are problematic for consumer use (ease of use, pot life issues)
- several are elastomeric coatings
- several mention use of higher VOC block fillers for masonry, metal primers, and sealers for wood
- none are intended for use in a roofing or waterproofing environment

E-17

18. **Non-bituminous Roof Primer (100 g/l)** – If over ACA’s objection the District lowers the limit for the PSU category to 50 g/l, ACA supports the 3M comments and recommends the District include a new category for Non-bituminous Roof Primers since the 50 g/l PSU identified do not include any non-bituminous roof primers.

As noted above, several of the identified primers are intended for interior applications. As such, they are subjected to conditions that are significantly less harsh than those experienced outdoors. Of the products that are listed for exterior use, none are intended for use in a roofing or waterproofing environment. There are non-bituminous roof primers on the market for use on low-slope (*i.e.*, approximately horizontal, or “flat”) roofs, such as those on commercial and industrial buildings. These coatings are used to maintain and restore existing roof membranes. They extend the life of the existing roof for 10-20 years, thus delaying the cost and disposal issues associated with replacing a roof.

On low-slope roofs, ponding water occurs. Ponding water, combined with the thermal cycling that roofs undergo, can lead to coating and/or primer adhesion failure if the primer is not durable. The coating blisters and delaminates, and water can leak into the building at these failure points. In order for the primer/coating system to be effective, the primer must adequately adhere to the overcoat as well as to the existing roof membranes, the conditions of which are highly variable due to weathering effects. Because of the highly variable substrate conditions, achieving and maintaining the desired adhesion is very challenging and requires sufficient VOCs.

ACA requests the District create a product category of (non-bituminous) roof coating primers, with a VOC limit of 100 g/L. Overall, the volume of primers I question is relatively small but is important in order to ensure the successful performance of the low-VOC roof coating (and the delivering of the attendant cost and environmental benefits).

19. **Specialty Primers** – CARB is the process of completing a technology assessment to analyze any technical issues between new waterbased and traditional oil based products. This work is to be completed later this summer, ACA suggests adding a statement in the Board Resolution that staff address any CARB findings and recommendations.

As with the Primer Sealer category, specialty primers are critical to blocking stains. In addition, a review of the District selected products that meet the proposed 50 g/L limit (see Attachment A) there are several problematic issues with the 50 g/L products:

- several products do not mention use on metal or wood
- several products are meant for interior use only
- several mention use of higher VOC block fillers for masonry, metal primers, stain killer, and sealers for wood
- not for masonry, galvanized or zinc coated surfaces or use only on painted metal

E-18

E-19

20. **Sell Through Provision** – this provision should apply not only to changes in VOC limits, but also changes to definitions and labeling requirements. ACA suggest the following edit:
- “Any coating that is manufactured prior to the effective date of **a new rule provision** the applicable limit specified in the Table of Standards, and that was compliant at the date of **manufacture** has a VOC content above that limit (but not above the limit in effect on the date of **manufacture**), may be sold, supplied, offered for sale, or applied for up to three years after the specified effective date.....”
21. **Metallic Pigmented** - a review of the District selected products that meet the proposed 150 g/l limit (see Attachment A) there are several problematic issues with the 150 g/l products:
- One product is a high-solids mastic – 90% solids
 - One product is not a metal pigmented coating but a primer and the product says it’s less than 180 g/l.
 - Another is not a metallic pigmented coating it is a 2 part polyurethane
22. **Sanding Sealers** – ACA suggests the following transitional language:
- “SANDING SEALERS are clear wood coatings formulated for or applied to bare wood for sanding and to seal the wood for subsequent application of coatings. Until January 1, 2013, to be considered a sanding sealer a coating must be clearly labeled as such.”
23. **Retail Outlet Definition** – it is unclear what this term “supplied” means – we need additional clarification.
24. **Sale or Use of Stains and Lacquers in Areas above 4,000 feet** – ACA requests the District provide a list of zip codes where these products may be sold and used.
25. **Waterproofing Concrete/Masonry Sealers** – ACA suggests including “excluding stains” as follows:
- “WATERPROOFING CONCRETE/MASONRY SEALERS are clear or pigmented sealers, including concrete lacquers that are formulated for sealing concrete and masonry to provide resistance against water, alkalis, acids, ultraviolet light, and staining, or enhancing appearance **excluding stains.**”
26. **VOC Definition** - clarify that reporting is not for coatings manufacturers but for TBAC manufacturers.

- 27. **Economic burden** – district needs to consider cost per ton for categories in which less than 1 lb/day emission reductions would be achieved. Denominator very small – costs very high. Manufacturers have same reformulation costs for minor incremental changes as they do for major reformulations. E-27
- 28. **Addition of “fields and lawns”** is problematic – raises more issues than resolves and impact other AIM rules. E-28
- 29. **Enforcement** – what is the impact of adding the words “each gallon of” to the fine matrix E-29
- 30. **Concrete Lacquers** – this term should be defined E-30
- 31. **Swimming Pool Coatings** – the current limit is missing from Table 1 E-31
- 32. **Averaging** – the timing of when the various coatings can be averaged does not make sense, also the District should add Zinc Rich Primers since these are sold by the job. E-32
- 33. **Gonioapparent Characteristics for Coatings** – Method E284 only defines this term, it does not state how to determine it. E-33
- 34. **Exemption of TBAC and DMC**

ACA once again requests exemption of TBAC and DMC for AIM coatings. With regards to TBAC, the survey indicated that 50% of manufacturers that are using TBAC in IM formulations; Those currently not using TBAC – 25% are conducting research; 54% are conducting research on using TBAC for other categories of coatings.

If TBAC and DMC cannot be exempted for all AIM coatings at this time, ACA requests an initial limited exemption in those product categories such as exterior applications (Concrete Curing Compounds, Concrete Surface Retarders, Driveway Sealers, Form Release, Fire Proofing Exterior, Roof coatings and primers, swimming pool coatings, traffic coatings, waterproofing concrete/masonry) and in indoor application where vapors are vented outside the house and coatings are applied by licensed contractors wearing respiratory protection (such as the tub & tile refinishing category as well as others).

DMC should be exempted for Industrial Maintenance coatings since these coatings are applied outside by professional contractors. TBAC/DMC should be exempted for Anti-Graffiti coatings since this category was pulled from the Industrial Maintenance category were TBAC was already exempted. E-34

It is important to note that many other CA Air Districts have exempted TBAC and DMC and others have exempted these compounds with requirements for permits and necessary information to perform a health risk assessment.

E-34

If SCAQMD has done any recent risk assessment analysis for Tbac or DMC for use in AIM coatings – ACA requests information on assumptions used in these assessments.

35. Reactivity

ACA suggests SCAQMD work with the coatings industry to develop a Reactivity-based Alternative Compliance Option (RACO) that would allow a company to achieve compliance with Rule 1113 VOC limits by means of a District-approved RACO program. A manufacturer's RACO program would apply reactivity criteria to the VOC content of covered products and ensure equivalent or lower ozone formation potential compared to products complying on a mass VOC basis. ACA suggests this discussion topic be added to a future working group meeting.

E-35

36. Atmospheric Availability Credit

ACA again requests that the District account for the fact that certain coatings components remain in the substrate or coating structure and therefore are not "available" for ozone formation. While the ACA PACES work continues and a draft report is expected soon, ACA would like to discuss how the atmospheric availability issues can be addressed in Rule 1113. Hopefully, either the VOC calculation or the VOC inventory can be adjusted accordingly.

E-36

Thank you for the opportunity to comment. If you have any questions or need any further information on the issues discussed here, please feel free to contact me at (202) 462-6272.

Sincerely,

David Darling, P.E.
Senior Director, Environmental Affairs

Attachment A

Review of Product Data Sheets

A. Specialty Primer and Undercoat

1. Benjamin Moore – Fresh Start – exterior use on previously coated ferrous metal surfaces, not recommended for sealing knots or over pine sap. In cases of severe bleeding, a solvent based primer should be used to prevent stains from reappearing. If surfaces to be painted exhibit severe tannin or smoke staining, an alkyd based Benjamin Moore primer may be your best choice for conquering these severe conditions. Recommends for masonry – Moorcraft Latex Block Filler, Unpainted metal - Ironclad metal and wood enamels.
2. Richards Product Number 7-44
 - a. VOC content – “not to exceed 50 g/l”
3. Richards Product Number 705
 - a. VOC content – “not to exceed 50 g/l”
 - b. Limitations – “not for masonry, galvanized or zinc coated surfaces”
4. Kilz – maybe used on “painted metal”
5. ICI Dulux Trade
 - a. Suitable for use on interior walls and ceilings
 - b. Has EU VOC content and has a range of between 0.3% and 7.99%
6. Smart Hide – Concrete block filler is recommended, and unpainted metal must be primed with metal primer. This product may be used on previously painted metal only.
7. Zinsser Bulls Eye – Spot primer knots and sap streaks with Zinsser BIN Primer-Sealer.
8. Valspar – does not mention recommended use on metal
9. UGL – Ecolock – does not mention use on exterior metal
10. Rust Oleum Smart Prime - Spot primer knots and sap streaks with Zinsser BIN Primer-Sealer.
11. Duron Terminator Stain Killer – Use Terminator oil based stain killer over water sensitive stains.
12. Insl-X Aqua Lock Plus – galvanized metal and aluminum – ferrous metal not mentioned.

B. Metal Pigmented

1. Carboline Carbomastic 15 – high-solids mastic – 90% solids
2. Modern Masters Acid Blocking Primer – not metal pigmented but a primer. Metallic paints are considered under faux finish and are less than 180 g/l.
3. Deft 36 Series Acrylic Polyurethane – not a metallic paint – 2 part polyurethane.

C. Primer, Sealer, Undercoat

1. Frazee Paint 172 Grip-N-Seal – two coats are recommended for metals and wood with tannins
2. Frazee Paint 168 Prime+Plus – 2 coats for metal and wood with tannins
3. Frazee Paint 066 Envirokote – Interior only - Not for wood prone to tannin bleeding. Metal not mentioned.
4. Frazee Aqua Seal – Interior only – metal not mentioned.
5. Benjamin Moore Latex Block Filler 160 – Block Filler not primer, sealer, undercoater
6. Benjamin Moore Latex Block Filler 285 – Block Filler not primer, sealer, undercoater
7. Frazee 262 Acrylic Block Filler - Block Filler not primer, sealer, undercoater
8. Sherwin Williams PrepRite Block Filler - Block Filler not primer, sealer, undercoater
9. Vista Paint 018 Acrylic Block Filler - Block Filler not primer, sealer, undercoater
10. Davlin – Butylseal 572 – elastomeric coating
11. Frazee 063 PVA Wall Sealer – Interior only, no metal or wood.
12. Westcoat EC-11 Water-based epoxy – two component epoxy – IM
13. Westcoat EC-12 Epoxy primer - two component epoxy – IM
14. Benjamin Moore Auro Color Foundation – primed and previously painted metal, for bleeding use FreshStart, rough or pitted masonry use Moorcraft Block Filler, Unpainted metal use metal and wood enamel
15. Benjamin Moore Moorcraft Super Hide 284 - rough or pitted masonry use Moorcraft Block Filler
16. Frazee Paint - 266 Exterior Epoxy - two component epoxy
17. Frazee Paint - 061 Aqua Seal – Interior Wall Sealer
18. Glidden – Stain Blocker – does not mention ferrous metal
19. ICI Prep and Prime Stain Jammer – mentions use of block filler and metal primer

Responses to Comment Letter E
David Darling

NOTE: The following were prepared in 2011 in response to the original letter dated February 4, 2011.

Response to Comment E-1:

Staff concurs that the coatings industry has made great strides in lowering the VOC emissions from architectural coatings. Staff agrees that this can in part be attributed to market demands as well as the financial incentives in Rule 314. Table 1 of the Staff Report summarizes sales and emissions data for 2008 and 2009, and clearly shows that in addition to the reduction in the VOC content, the coatings industry has experienced several years of depressed sales due to the economic recession. Even with these reduced emissions, the coatings industry is one of the largest sources of VOC emissions under the AQMD's purview. The colorants alone, which are currently not included in the emission inventory for architectural coatings, account for 3 tons per day of VOC emissions. Due to the extreme non-attainment status for the AQMD, staff is under a directive to achieve all feasible emission reductions, as included in the 2007 Air Quality Management Plan (AQMP), specifically Control Measure CM# 2007 MCS-07 – Application of All Feasible Measures. This control measure explicitly lists coatings and solvents rules to achieve additional VOC reductions. During the rule development process, staff has conducted considerable outreach and research to determine reductions that are feasible and achievable. Through this process, staff received extensive and well supported comments that resulted in extended implementation dates and the elimination of several coating categories from the proposed VOC limit reductions. The current proposal is reasonable, achievable, and cost-effective and it reflects full implementation of currently available technology.

Response to Comment E-2:

Staff spent considerable time and effort in studying and evaluating the small container exemption (SCE), and recognizes the benefits of the SCE for manufacturers and end users for niche products, as well as repair, touch-up and maintenance. Based on comments received, staff has revised the rule language and is not proposing to further limit the categories that can use this exemption or to phase out the exemption at this time. This change addresses the concerns pertaining to additional categories, as well as the touch-up and issues represented by original equipment manufacturers. Staff does not agree that this exemption is a necessary safety valve for the VOC limits in Rule 1113. Aside from a few niche categories or new categories that may be developed, there are ample products available in the market place that meet the VOC limits in Rule 1113. Staff will continue monitoring the sales of products in small containers, and plans to revisit either limiting or phasing out the exemption in the future. Over the years, enforcement staff has encountered considerable rule circumvention due to this exemption, resulting in removal of the clear wood finish category from the SCE in

2006. Based on comments received, staff has revised the initial proposal which would have limited the eligible categories, and is proposing to clarify that while coatings in small containers do not need to comply with the VOC limit requirements, they do need to comply with other rule requirements, such as the labeling requirements. Further the proposal prohibits bundling of containers practiced by some manufacturers to sell multiple small containers in one package. The current proposal further incorporates additional clarifications to address comments from industry.

Response to Comment E-3:

Staff has included a definition for the term ‘market’ that limits the term to third-party vendors who solely bring together buyers and sellers, including but not limited to catalogs, and e-commerce businesses (e.g., EBay, Amazon). The definition also explicitly indicates that for the purpose of Rule 1113, ‘market’ does not include promoting or advertising coatings. Staff has contacted potential affected parties (Grainger, EBay, Craigslist, McMaster-Carr, & Amazon) and forwarded PAR 1113 for their information.

Response to Comment E-4:

Staff feels that it is indeed reasonable to assume that a coating sold in retail outlets within the District will be used in the District. However, that assumption is rebuttable for situations where a local manufacturer or distribution warehouse makes or stores a coating, staff has further clarified that when evidence shows coatings supplied, sold, offered for sale, marketed for sale, manufactured, blended, repackaged or stored in the District are for shipment outside of the District, they would be exempt. This exemption fully covers the coatings industry’s concern regarding coatings stored in the AQMD. In regard to the comment on the implication of the rule change on homeowners, Rule 1113 has always applied to any person who specifies or uses architectural coatings, including homeowners. Based on limited enforcement resources, which are more efficiently utilized where a large amount of coatings are sold, stored or may be used, inspectors generally do not make compliance stops at private residences; however, enforcement staff would investigate if there were public nuisance complaints regarding odors from the use of architectural coatings at a private residence, and based on the findings from the investigation, may issue notices to homeowners. As a result, staff does not anticipate any environmental impacts resulting from this rule change due to any fiscal impacts on homeowners.

Response to Comment E-5:

An exemption for non-compliant coatings stored in work trucks would create a loophole in the proposed rule language. Worksites frequently store their coatings in trailers which could be interpreted as a work truck. Worksites could simply store all coatings in a truck or trailer to circumvent the rule language. Staff is not proposing to exempt work trucks but did include clarification in the staff report regarding who would

be responsible for non-compliant coatings stored in work trucks. Further, the definition of worksite has been revised to indicate any location where architectural coatings are stored and applied, based on comments from the public. Staff is not proposing to exempt manufacturing sites or job shops considering that coatings operations for maintenance purposes are performed at those facilities. The building that houses a manufacturing operation where non-Rule 1113 coating operations occur would still need to be painted and maintained. The provision would apply to the architectural coatings that are used to paint the building e.g. floors, wall, doors, etc. Non-compliant products that are not for use at the facility but are stored for sale or shipment outside the AQMD, would be exempt under paragraph (f)(2)(A):

Response to Comment E-6:

Staff addressed industry's concern with the definition of manufacturer by exempting retail outlets where labels or stickers may be affixed to containers or where colorant is added at the point of sale. Staff does not feel that a further exemption for repackaging or re-labeling is necessary. It is a common practice for manufacturers to repackage or re-label (add their own label) coatings that were produced by another manufacturer (e.g., toll manufactured coatings). In those instances, whomever's name is on the label is considered the manufacturer. When a non-compliant coating is found in the field, it is the manufacturer whose name is on the label that is ultimately responsible for that coating. For this reason, staff does not intend to exempt repackaging or relabeling in the definition of a manufacturer.

Response to Comment E-7:

Staff addressed the concern regarding Quick Dry Enamels and Quick Dry PSUs by including an effective date of July 1, 2011. While the change is proposed to take place shortly after rule adoption, it will not result in a change in the VOC limit or the labeling of the products. Coatings can still be labeled as quick dry enamels, but for the purpose of Rule 1113, those coatings will be considered non-flat coatings effective July 1, 2011. Since there are no impacts of this change, a longer implementation period is not included.

Response to Comment E-8:

The comment includes a request for a phase-in period of July 1, 2011 for the elimination of the non-flat high gloss category. Since there is no VOC or labeling implication for the removal of the non-flat high gloss category, staff is not proposing any phase out period. Coatings can still be labeled as non-flat high gloss coatings, but for the purposes of Rule 1113, those coatings will be considered non-flat coatings. The proposed change is for rule simplification since there are currently no differences in the VOC limits or labeling requirements between non-flat coatings and non-flat high gloss coatings.

Response to Comment E-9:

Staff agrees with industry's proposal to lower the VOC limit for the default category to 50 g/L and has revised the proposed rule language accordingly.

Response to Comment E-10:

For rule clean up purposes, the requirement which was included in paragraph (c)(2) has been moved to paragraph (c)(7). This requirement states that industrial maintenance coatings, except non-sacrificial anti-graffiti coatings, shall not be applied or solicited for residential use unless they would be exposed to the extreme environmental conditions described in the definition of an industrial maintenance coating. The comment is to remove the clause "except non-sacrificial anti-graffiti coatings" since a separate category has been established for those coatings. Since the Non-Sacrificial Anti-Graffiti Coating category is included as a subcategory for Industrial Maintenance Coatings, staff feels this language is still necessary to be included.

Response to Comment E-11:

Based on the comment regarding the Table of Standards 2, revised PAR 1113 includes proposed VOC limits for architectural coatings, excluding IM, Waterborne IM Coatings and Solvent-Based IM coatings. In addition, staff has added language to clearly state that the VOC limits for colorants only apply to colorant added at the point of sale. Staff contacted several manufacturers of heat reflective or complex inorganic color pigment (CICP) technology who stated that these colorants can be formulated and are available with a VOC content of less than 50 g/L. Furthermore, based on a discussion and subsequent emails with the manufacturer that expressed concern about the VOC content of colorants with CICPs, they do not add these colorants at a point of sale, so PAR 1113 would not apply to their specific use. Lastly, staff agrees with the energy savings benefits of heat reflective coatings.

Response to Comment E-12:

Based on feedback from industry, staff has proposed to increase the proposed VOC limit for clear topcoats used in Faux Coatings System from 50 g/L to 100 g/L. Staff has received feedback that this limit is feasible. In addition, the omission in the definition has been addressed. The missing language was for the labeling requirements for clear topcoats.

Response to Comment E-13:

PAR 1113 includes a definition for Stone Consolidants that limits the use of these products only when used for restoration and/or preservation projects on registered historical buildings that are under the purview of a restoration architect. This category also includes a proposed VOC limit of 450 g/L, as requested. Staff intends to monitor this category through the Rule 314 Annual Quantity and Emissions Reports to ensure

that sales do not exceed the estimated usage, and may consider sales caps for this category if actual sales are well above the estimated usage.

Response to Comment E-14:

PAR 1113 includes a definition for Reactive Penetrating Sealers that limit the use of these products only when used for restoration and/or preservation projects on registered historical buildings that are under the purview of a restoration architect or for use on reinforced concrete bridge structures for transportation projects located within 5 miles of the coast or above 4,000 feet elevation. Staff shared the proposed definition with the interested parties and did not receive any negative feedback. This category also includes a proposed VOC limit of 350 g/L. Staff intends to monitor this category through the Rule 314 Annual Quantity and Emissions Reports to ensure that sales do not exceed the estimated usage, and may consider sales caps for this category if actual sales are well above the estimated usage.

Response to Comment E-15:

Staff has conducted research on the need for an additional coating category with a higher VOC limit for specific types of Clear Wood Finishes referred to as Conversion Varnishes. There has been extensive research on this coating category, including a technology assessment conducted in 2004 and 2005. The results of that assessment supported the 275g/L VOC limit, which was implemented on July 1, 2006. Details of that study can be found on the AQMD website at:

<http://www.aqmd.gov/hb/2006/February/060236a.html>. In addition, staff has received feedback from manufacturers that there are compliant waterborne clear wood finishes that perform as well if not better than the high-VOC counterparts. One reason for this request is that Clear Wood Finishes are not allowed under the Small Container Exemption. They were excluded from this exemption due to rule circumvention that resulted in significant excess emissions. Since conversion varnishes were one of the major coating types utilized for coating hardwood floors in the past, allowing this type of clear wood finish to again be sold in the AQMD would, eliminate the emission reductions achieved by removing these coatings from the small container exemption. In addition, the application of conversion varnishes releases formaldehyde, and therefore has some health and safety issues that would be created compared to the waterborne products in use today. For these reasons, staff is not proposing to add a high-VOC category for conversion varnishes. Staff also considered the need for an additional category for conjugated oil varnishes. These are solvent-based, high-VOC Clear Wood Finishes that cannot be reformulated to a lower-VOC limit due to the nature of the oils of which they are composed. Based on research conducted, including reviewing variance requests seeking relief, staff did not find sufficient evidence that a high-VOC Clear Wood Finish is needed at this time since there are sufficient compliant waterborne technologies available. This is demonstrated by the fact that there have not

been any variance requests for Clear Wood Finishes with a VOC content higher than the Rule 1113 limit.

Response to Comment E-16:

Staff has researched the tub and tile category and has not found sufficient evidence of the need for a separate category. These coatings currently fall under the IM category with a VOC limit of 100 g/L. Previous staff analysis clearly shows a preponderance of acrylic, epoxy, and urethane-based coatings that can be used for tub and tile refinishing. In addition, these coatings are typically sold in small containers, since most tub and tile coverage area is limited to no more than 100 square feet. Coatings sold in small containers are exempt from the VOC limits in Rule 1113, thus providing additional flexibility for manufacturers of these coatings. The rule language that prohibits the application of IM coatings for residential use only applies to coatings that do not meet the extreme environmental conditions described in the definition of IM coatings. Since tub and tile coatings do meet the definition of IM coatings, especially under the abrasion resistance requirements, they are permitted for use in residential settings. If the small container exemption is eliminated in future rule development, staff will consider whether there is a need for additional niche categories with higher VOC limits.

Response to Comment E-17:

Based on comments received pertaining to the originally-proposed VOC limit of 50 g/L for PSUs, staff has reconsidered the proposal and is not proposing any additional VOC reductions limit for PSUs at this time.

Response to Comment E-18:

See response to E-1 through E-17.

Response to Comment E-19:

Based on comments received pertaining to the originally-proposed VOC limit of 50 g/L for specialty primers (SP), staff has reconsidered the proposal and is not proposing any additional VOC reductions limit for SPs at this time.

Response to Comment E-20:

Based on feedback received during working group meetings, staff extended effective dates for rule changes sufficiently such that an additional sell through period is not necessary. In regard to the labeling requirements, manufacturers requested a three year period to implement the change so they could use their current labels. If the rule included an additional three years to sell through of old labels, the rule change would not be effective for six years. Staff feels that the proposed three years to implement the change is sufficient without an additional sell through period. A similar change is the

labeling change for sanding sealers. This change will re-categorize coatings from the PSU category to the Clear Wood Finish category. Since 2006, Clear Wood Finishes are no longer included in the small container exemption. Staff proposed an effective date of July 1, 2013 for this change to allow a two year transition, which should be sufficient to sell through products that are currently on retail shelves.

Response to Comment E-21:

The list of coatings provided for review only encompass a selection of the coatings currently available at the proposed VOC limit and should not be considered all-inclusive. As presented in the numerous working group meetings, there are 18 manufacturers that have reported the sales of 63 products that are categorized as metallic pigmented coatings. Staff can provide the comprehensive list of these products upon request. As for the 3 products mentioned, the coating that is referred to as a mastic in the product data sheet does not meet the Rule 1113 definition of a mastic. The coating is applied at a maximum of 7 – 10 mils in one or two coats. The Rule 1113 definition specifies that the coating is applied at least 10 mils dry in a single coat. That coating would fall under the metallic pigmented coating (MPC) category. The primer is not a metallic pigmented coating, but an acid blocking primer specified for certain metallic pigmented coatings, that page was inadvertently included with the other coatings. The last product mentioned is a high performance, zero VOC acrylic polyurethane which can include metallic pigments resulting in a coating that meets the definition of a metallic pigmented coating. Those coatings have been in use at local theme park to create metallic effects. Staff has reevaluated the last coating included in the list and interprets that coating to be an IM coating. Even though this coating could meet the definition of a MPC based on the metallic content, the coating is a polyurethane which could be tinted to several colors, including a clear or a metallic, the specified usage is for IM applications. The product data sheet states that the intended application is for theme parks, industrial maintenance and heavy equipment applications. Many of the products used at theme parks are IM coatings due to the extreme conditions created by the number of daily visitors, typically requiring coatings that withstand “repeated heavy abrasion, including mechanical wear and repeated scrubbing with industrial solvents, cleaners, or scouring agents” as well as “exterior exposure of metal structures”.

Response to Comment E-22:

PAR 1113 includes language to address the necessary transition time for the proposed change to the definition of sanding sealers. This change will re-categorize some PSUs to sanding sealers; therefore, they will no longer fall under the small container exemption. The extended transition time will allow ample time for those select coatings to be phased out.

Response to Comment E-23:

Staff agrees with the comment and has removed the word ‘supplied.’

Response to Comment E-24:

The following list includes the cities and communities within the AQMD that may qualify for the exemption in paragraph (f)(2)(D):

Lancaster, 93536
Castaic, 91384
Angelus Oaks, 92305
Valyermo, 93563
Mentone, 92359
Idyllwild, 92549
Cabazon, 92230
Banning, 92220
Lebec, 93243
Big Bear City, 92314
San Bernardino, 92407
Lytle Creek, 92358
Cedarpines Park, 92322
Sylmar, 91342
Yucaipa, 92399
Crestline, 92325
Palmdale, 93550
Mt Baldy, 91759
Lake Hughes, 93532
Forest Falls, 92339
Acton, 93510
Running Springs, 92382
Wrightwood, 92397
San Bernardino, 92404
Santa Clarita, 91390
Newhall, 91321
Tujunga, 91042
La Canada Flintridge, 91011
Morongo Valley, 92256
White Water, 92282
Mountain Center, 92561
Palm Springs, 92264
Palm Springs, 92262

Note: Most of the zip codes listed are not completely above 4,000 feet, therefore, a more precise indication of the areas above 4,000 feet can be found by referencing the

map included as Appendix B. An interactive map will also be included on the website www.aqmd.gov

Response to Comment E-25:

Staff concurs with the comments and has revised the definition for waterproofing concrete/masonry sealer.

Response to Comment E-26:

Staff has provided clarification in the staff report (Definitions section, page 9) regarding the implications of the change in the VOC definition pertaining to reporting of TBAC.

Response to Comment E-27:

Based on comments pertaining to possible costs of lower-VOC limits, as well as the associated environmental benefits, staff has revised PAR 1113 to include only those categories that are cost-effective. The 2007 AQMP, Control Measure MCS-07, indicates that cost-effectiveness cannot be determined because “all feasible” measure are not known. Nonetheless, MCS-07 commits that the District will continue to analyze the potential cost impact associated with implementing the control measure, conduct research on the newest control technologies, and provide cost effectiveness information. A thorough cost-effectiveness of the proposed amendments was conducted and a summary of overall cost-effectiveness is included in the Staff Report. More detailed data is included in the Socioeconomic Impact Analysis Report.

Response to Comment E-28:

Staff included the phrase ‘including but not limited to’ in regard to the inclusion of fields and lawns. This addition is for rule clarification, as this is a frequently asked question of staff, and is not expected to have any implications on other architectural coatings rules.

Response to Comment E-29:

The change in Appendix A subdivision (J) is to clarify that the penalties for violating the provisions of the averaging compliance option (ACO) apply to every gallon of each product line sold above the VOC limit and not just for each product line sold above the limit. This proposed revision is for clarification, since based on discussions during the development of the ACO Guidance document, staff always intended the violation to apply to each and every gallon of coating sold above the VOC limit if a manufacturer violates any provisions of the ACO.

Response to Comment E-30:

Based on the comment, staff has removed the phrase ‘concrete lacquer’ from the proposed amended definition of waterproofing concrete/masonry sealers.

Response to Comment E-31:

Staff has addressed the omission in the proposed amended rule language.

Response to Comment E-32:

Staff has addressed the inconsistency in the proposed phase out dates in the ACO. Staff is not proposing to include zinc rich primers to the list of categories that can be averaged since no manufacturer has, or is currently listing zinc rich primers in their averaging plan. Manufacturers must submit the coatings they are proposing to average at the beginning of an ACO period. New coatings must be submitted for review and approval prior to averaging them, and would be considered a modification to the previously approved plan. The ACO provision does not work well when a manufacturer adds coatings on a job-by-job basis and the ACO needs to be well planned to ensure that the actual emissions at the end of the compliance period are below the allowable emissions.

Response to Comment E-33:

Staff is still proposing to keep the method which defines the term gonioapparent; the ASTM method provides a technical definition of gonioapparent which can be measured in a laboratory. The definition states that gonioapparent material change in appearance with change in illumination angle or viewing angle. This can be demonstrated in a laboratory by using multi-angle color measurements.

Response to Comment E-34:

Current Rule 1113 – Architectural Coatings considers tertiary butyl acetate (tBAC) as an exempt VOC when used to formulate industrial maintenance coatings only, considering that these coatings are typically applied by professional painting contractors that use personal protective equipment (PPE), including appropriate respirators. At this time, staff does not believe that it is necessary to expand the categories that can use tBAC as an exempt VOC. Staff is not confident that contractors applying the suggested broad range of coatings are trained in the use of PPE, and would use the appropriate respirators. Further, in regards to Dimethyl Carbonate (DMC), staff is not proposing any exemptions since, in September 2009, the AQMD’s Governing Board rejected delisting DMC due to potential health concerns expressed by the public. Additionally, AQMD staff is working with the California Air Resources Board staff on a consumer/worker exposure health assessment for DMC, which is still in the draft stage. If and when this final health assessment recommends the exemption of DMC as a VOC, the AQMD will consider a proposal to exempt DMC. In regard to the comment

that permits could be required prior to allowing the use of DMC for architectural coatings operations, currently, the use and application of architectural coatings does not require any AQMD permits, thus this approach would not be feasible.

Response to Comment E-35:

Over the past 15 years, AQMD staff has been, and continues to participate in discussions at the federal and state level, to discuss alternative ozone control strategies, including the use of a reactivity-based approach. However, as discussed over the past two years, uncertainty in some Maximum Incremental Reactivity (MIR) values, enforcement, toxics, and formation of fine particulate less than 2.5 micrometers in diameter (PM_{2.5}) continue to be areas that need additional assessment. Staff is studying the viability of a reactivity-based ozone control strategy by actively participating in research projects pertaining to establishing maximum incremental reactivity (MIR) values for different VOCs. For example, staff is actively participating in the North American Research Strategy for Tropospheric Ozone (NARSTO) work related to reactivity. Staff also continues to participate in the following committees: Applications Benefits, Near Term Science, Toxics, Atmospheric Chemistry and PM. Further, staff recognizes the low MIR values associated with the compounds that are considered exempt under the traditional VOC mass-based regulatory scheme as well as the potential flexibility of an alternate ozone control strategy. In concept, staff is not opposed to a reactivity-based approach to control ozone, but based on the state of the science and other comments received, there are several concerns. For example, one of the main concerns is that there may be toxicity associated with some VOC-containing compounds that have a relatively low MIR value. Other issues that need to be considered include the potential for secondary organic aerosol formation, specific consensus methodology, and enforceability. Further, CARB staff has indicated that, effective and efficient enforcement of the aerosol coatings rule, which is a reactivity-based control approach, has been an issue over the past few years, especially with regard to formulation data and analytical limitations. The EPA is also in the process of developing a “toolkit” that will address SIP equivalency and will include additional enforceability guidelines for a reactivity-based approach. Thus, staff plans to continue working closely with CARB, U.S. EPA, the American Chemistry Council, other industry members and the public to address and resolve these issues prior to proposing a reactivity-based ozone control strategy.

Response to Comment E-36:

The AQMD appreciates the opportunity to continue working with industry on the Paint and Coatings Exposure Study (PACES), and closely monitors the progress. As these studies fully evaluate the fate and availability of solvents used in architectural coatings, and are finalized, the AQMD staff is open to discussions as to how the results may be incorporated into future planning activities and/or regulations.

pfine@aqmd.gov

Mr. Joe Cassmassi
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
jcassmassi@aqmd.gov

RE: 2012 Air Quality Management Plan – Santa Monica Airport

Dear Dr. Fine and Mr. Cassmassi,

I am writing on behalf of Concerned Residents Against Airport Pollution (“Concerned Residents”) regarding Santa Monica Municipal Airport (“SMO”) located at 3223 Donald Douglas Loop South, Santa Monica, California 90405. Concerned Residents is composed primarily of residents who live and/or work near SMO. We request that South Coast Air Quality Management District (“SCAQMD”) review, propose, approve, and submit to California Air Resources Board (“CARB”) an Indirect Source Review Rule regulating air pollution emissions originating from activities at SMO.

F-1

SMO has a disproportionate environmental health impact on local residents. SMO is unique in having dense residential development less than 300 feet from the east and west ends of the runway. Unlike other Southern California airports, SMO has almost no buffer zone between the runway ends and the surrounding community. Adrian Castro, et al, Santa Monica Airport Health Impact Assessment (2010). A UCLA study noted that “[s]mall airports in heavily populated areas do not necessarily have ... buffers ... so residents may be more directly exposed to aircraft emissions.” Shishan Hu, et al *Aircraft Emissions Impacts in a Neighborhood Adjacent to a General Aviation Airport in*

F-2

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
March 28, 2012

Southern California, 43 Environ. Sci. Technol. 8039, 8039 (2009). The UCLA study went on to conclude that the residential neighborhoods surrounding SMO have “markedly high concentrations of air pollutants ... suggesting ... [that the] buffer areas around ... [SMO] may be insufficient.” The proximity between the airport and the surrounding community creates a dangerous health risk for local residents.

Local residents living in proximity with the airport face an elevated risk of cancer. According to a study sponsored by the Los Angeles Unified School District, cancer risk arising from maximum exposure to air pollution generated by activities at SMO for local residents ran thirteen to twenty-six in one million. Bill Piazza, Santa Monica Municipal Airport: A Report on the Generation and Downwind Extent of Emissions Generated From Aircraft and Ground Support Operations 2 (1999). Cancer risks to local residents from SMO significantly exceed the guideline lifetime cancer risk of one in a million individuals for cancer risk from maximum exposure to a source of air pollutants under the Federal Clean Air Act. 42 U.S.C. § 7412.

I. South Coast Air Quality Management District is Legally Obligated to Implement an Indirect Source Review Rule Regulating Emissions from Santa Monica Airport.

SCAQMD is legally required to implement an Indirect Source Review rule controlling emissions from Santa Monica Airport. The California Clean Air Act requires that SCAQMD “provide for indirect source controls in those areas of the south coast district in which there are high-level, localized concentrations of pollutants” Cal. Health & Safety Code § 40440(b)(3).

Multiple studies have demonstrated that there are elevated levels of air pollutants such as lead, black carbon, and ultrafine particulate matter on Santa Monica Airport property as well as in neighboring residential areas. *Infra*.

Modeling studies have shown that concentration of ambient lead levels near, at and exceeding the National Ambient Air Quality Standard (“NAAQS”) at Santa Monica Airport as well

F-2

F-3

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
March 28, 2012

as at nearby residential neighborhoods. Studies conducted by the U.S. Environmental Protection Agency (“USEPA”) and SCAQMD found areas on Santa Monica Airport’s runway with lead levels violating the current lead NAAQS. U.S. Environmental Protection Agency, Development and Evaluation of an Air Quality Modeling Approach for Lead Emissions from Piston-Engine Aircraft Operating on Leaded Aviation Gasoline 72 (2010); South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study 20–21 (2010). In addition, both studies found elevated ambient lead levels that often exceeded, but averaged near the NAAQS in surrounding residential neighborhoods. *Id.*

F-3

Lead can have irreversible brain and nerve damage, severe developmental impacts on children as well as adverse impacts on adults. Lead has been found to have neurological impacts on children, leading to behavioral problems, learning problems, and lowered IQ. Adults, when exposed to lead, can suffer cardiovascular problems such as high blood pressure, and heart disease. Finally, lead exposure has also been found to have negative impacts on the nervous system, kidney function, immune systems, and reproductive ability. U.S. Environmental Protection Agency, Lead in Air: Health (2011), <http://www.epa.gov/airquality/lead/health.html> (last visited Nov. 11, 2011).

Elevated levels of Black Carbon have also been found to have been generated by activities at SMO. Jet takeoffs at SMO have been found to result in large spikes in concentrations of Black Carbon in and around the airport. Hu, 43 Environ. Sci. Technol. at 8039 (2009); South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study: Follow-up Monitoring Campaign at the Santa Monica Airport 3 (2011).

F-4

Black carbon, as a component of particulate matter, has been linked to increased risk of cardiovascular disease, respiratory disease, cancer, and premature death. United Nations

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
March 28, 2012

Environmental Program, World Meteorological Organization Integrated Assessment of Black Carbon and Tropospheric Ozone (2011) 113–15.

F-4

Very high levels of ultrafine particulate matter have also been found at SMO. Studies conducted by the University of California, University of Southern California, CARB, and SCAQMD found elevated ultrafine particle concentrations in the downwind residential areas directly attributable to SMO aircraft operations. South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study (2010); South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study: Follow-up Monitoring Campaign at the Santa Monica Airport (2011); Shishan Hu et al, Aircraft Emissions Impacts in a Neighborhood Adjacent to a General Aviation Airport in Southern California, 43 Environ. Sci. Technol. 8039 (2009).

F-5

Ultrafine particles have been linked to premature death from respiratory and cardiovascular disease. University of California Los Angeles Community Health and Advocacy Training PGY-2 Pediatric Residents, Santa Monica Airport Health Impact Assessment 10 (2010). Ultrafine particulate matter may pose a greater health risk than other, larger forms of particulate matter due to their tendency to penetrate deeper into the body. Ning Li et al, Ultrafine Particulate Pollutants Induce Oxidative Stress and Mitochondrial Damage 111 *Envt'l Health Perspectives* 455, 455 (2003).

Airports are a significant source of emissions of Volatile Organic Compounds (VOCs) as well as Nitrogen Oxides (NOx), both of which are ozone-forming pollutants. Colleen Callahan, The Plane Truth: Air Quality Impacts of Airport Operations and Strategies for Sustainability: A Case Study of the Los Angeles World Airports 7–10 (2010); U.S. EPA, Documentation for Aircraft Component of the National Emissions Inventory Methodology (2011).

F-6

Ozone has been shown to cause decreased lung function, chest pain, as well as aggravate existing respiratory illnesses such as asthma, pneumonia, and bronchitis. U.S. EPA, Ground Level

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
March 28, 2012

Ozone: Health, <http://www.epa.gov/air/ozonepollution/health.html> (accessed on March 25, 2012).

SMO is located in Northwest Coastal LA County, which exceeded both the State and Federal Ozone standards in 2010 and 2009. South Coast Air Quality Management District, 2010 Air Quality (2011); South Coast Air Quality Management District, 2009 Air Quality (2010).

F-6

The California Clean Air Act requires SCAQMD to promulgate Indirect Source controls to regulate pollution from SMO. SCAQMD is required to impose Indirect Source controls in areas where there are “high level, localized concentrations of pollutants.” A study concluded that there are “high concentrations of air pollutants in the residential neighborhoods downwind of SM[O] due to aircraft activities” Hu at 8039. SCAQMD should act to regulate emissions from Santa Monica Airport.

F-7

II. South Coast Air Quality Management District has the Authority under the Federal Clean Air Act to Impose Indirect Source Controls on Santa Monica Airport.

Arguably, SCAQMD is federally preempted from imposing Indirect Source controls on SMO. Both the Federal Aviation Agency and the USEPA have exclusive federal authority over aircraft operations, design, and manufacture. However, SCAQMD has the authority to regulate pollution from SMO with the approval of CARB with its delegated authority under the Federal Clean Air Act. Federal courts have found that states may regulate *emissions* from aircraft engines under the Federal Clean Air Act as long as it does not directly regulate aircraft operations, design, or manufacturing. *California v. Navy*, 431 F.Supp. 1271 (1977). SCAQMD and CARB have federally delegated authority to impose Indirect Source controls on facilities such as airports. 42 U.S.C. § 7410(a)(5).

F-8

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
March 28, 2012

III. Santa Monica Airport Could Implement Reasonably Available Control Measures to Reduce its Environmental Health Impact on Local Residents.

SMO could implement control measures to abate its impact on the surrounding community and comply with an Indirect Source Rule. Possible control measures could include reduced idling and holding times for jet aircraft as well as re-directing the exhaust from pre-flight run up tests.

F-8

IV. South Coast Air Quality Management District Should Impose Indirect Source Controls on Air Pollutant Emissions from Santa Monica Airport.

SCAQMD should impose an Indirect Source Review Rule on SMO. In light of SCAQMD's legal obligations, the significant public health risks and the feasibility of control measures that could be adopted, SCAQMD should act to abate SMO's impact on its surrounding communities.

F-9

Thank you for considering these comments. Please put the undersigned on the mailing list for the 2012 AQMP. Should you have any questions or need more information, please contact Mitchell Tsai at (714) 881-4876 or tsai.mitchell@gmail.com.

Sincerely,

Mitchell M. Tsai, Esq.

Martin Rubin
Concerned Residents Against Airport Pollution

Responses to Comment Letter F
Mitchell M. Tsai

Response to Comment F-1:

AQMD staff and counsel met with the commenter and the Concerned Residents representative to discuss potential Indirect Source rules regulating activities at Santa Monica Airport. AQMD has not observed elevated levels of PM_{2.5} in neighborhoods near the airport so this plan does not include a measure specific to the airport. AQMD will continue to explore possible ways of reducing emissions at the airport.

Response to Comment F-2:

Thank you for the references. The health effects of air pollutants are addressed in Appendix I. Regarding cancer risk, the AQMD's MATES III study estimates lifetime risk for air toxics near the Santa Monica Airport at about 930 per million which is less than the regional average of 1194 in a million.

Response to Comment F-3:

The commenter asserts that AQMD must implement an indirect source rule regulating Santa Monica Airport based on H&S §40440(b)(3) calling for indirect source controls “in those areas of the south coast district in which there are high-level, localized concentrations of pollutants. The comment cites levels of lead, black carbon, and ultrafine particulate matter. AQMD monitoring studies have not detected exceedances of lead standards either on the runway area or in neighboring residential areas. US EPA modeling studies did not project exceedances in neighboring residential areas but did project exceedances at the blast fence. This was not confirmed by AQMD studies. The statement that both studies found levels often exceeding the NAAQS but averaging at the NAAQS is misleading because the NAAQS itself is in the form of a three month average. The NAAQS itself was not exceeded. AQMD has not observed elevated levels of PM_{2.5} near the airport. There is currently no NAAQS or SAAQS for ultrafines. So, it is not feasible to determine a level to which emissions should be reduced. Therefore, the cited statute does not require regulation.

Response to Comment F-4:

Thank you for the references. We note that one of the citations is a AQMD report. Additional discussion of health effects of particulate matter are in Appendix I.

Response to Comment F-5:

Thank you for the references. We note that two of the citations are AQMD reports. Additional discussion of health effects of particulate matter are in Appendix I, and additional discussion of ultrafine particulate matter health effects and sources is contained in Chapter 9.

Response to Comment F-6:

Thank you for the references. Additional discussion of the health effects of ozone and nitrogen dioxide are in Appendix I.

Response to Comment F-7:

The commenter states that AQMD must adopt an indirect source rule for the airport because state law calls for indirect source rules in areas where there are “high-level, localized concentrations of pollutants” and a study by Hu concluded that there were “high concentrations of air pollutants in the residential neighborhoods “ downwind of the airport. However, this study referred to levels of black carbon and ultrafine particles, which are not criteria pollutants for which a NAAQS has been established. Neither EPA nor CARB has yet developed any ambient standards for these particular pollutants. Therefore, it is uncertain what levels of such pollutants would be considered unacceptably “high.” The 2012 AQMP contains a chapter discussing the emerging science relating to ultrafine particles and AQMD staff will continue to monitor the situation.

Response to Comment F-8:

The AQMD staff agrees that it has the authority under state and federal law to adopt indirect source controls. Such authority is not preempted by the Clean Air Act, as held in *National Association of Home Builders vs. San Joaquin Valley APCD*, 627 F. 3d 730 (9th Cir. 2010). Whether any other federal statute would have preemptive effect would likely depend on the particulars of any proposed indirect source rule.

Response to Comment F-9:

For the reasons stated earlier, AQMD staff does not believe that this request for an indirect source rule for SMO should be addressed as part of the 2012 AQMP, but will continue to consider whether such an approach would be necessary or viable to reduce emissions in the future.

Subject: Part 1 of Comments 2012 AQMD Plan & Public Review Draft Vision for Clean Air 6/27/2012
From Harvey Eder PSPC Solar Conversion Plan 7/17/12

Howdy SCAQMD/Steve Smith,

July 17,2012

This is the first /Part 1 of several submittals commenting on the Notice Of Preparation Of A Draft Program Environmental Impact Report Project Title 2012 Air Quality Management Plan (AQMP) as well as comments on the June 27,2012 Public Review Draft Vision for Clean Air: A Framework for Air Quality and Climate Planning & Appendix Actions for Development, Demonstration, and Deployment of Needed Advanced Technologies from Harvey Eder, & from PSPC, the Public Solar Power Coalition as part of a Draft Immediate Total Solar Conversion Plan for the South Coast District and California. This is in addition to comments made in Santa Monica last Friday July 13, 2012 at the City of Santa Monica Main Library from 2-5 PM etc.

This part 1 of several contains information and linke from a fracking call heald Thursday July 12, 2012 and incorporates all of the information and links into the record herein, including the recording of the call and papers by Howarth et al on ghg of methane natural gas fracking from 2010, 2011, and February 25, 2012 which have been shared with SCDistrict Staff in the pastas well as the information submitted to staff and the board with the December 2009 cover article of Scientific American and the follow up articles in Energy Policy on a 20 year solar conversion plan / proposal by Drs. Jacobson and Delucci of Stanford and UC Davis etc. The time for action is now.

H-1

Thanks ,take care

Fracking Climate Change Impacts:
Methane and the greenhouse-gas footprint of natural gas from shale formations:
<http://www.sustainablefuture.cornell.edu/news/attachments/Howarth-EtAl-2011.pdf>

"The take-home message of our study is that if you do an integration of 20 years following the development of the gas, shale gas is worse than conventional gas and is, in fact, worse than coal and worse than oil," Howarth said. "We are not advocating for more coal or oil, but rather to move to a truly green, renewable future as quickly as possible. We need to look at the true environmental consequences of shale gas."

The study is the first peer-reviewed paper exploring the greenhouse gas footprints of conventional gas drilling. Most studies have used EPA emission estimates from 1996, which were updated in November 2010 when it was determined that greenhouse gas emissions of various fuels are higher than previously believed.

Feb. 2012 background paper on methane and the natural gas industry for the National Climate Assessment:
<http://www.eeb.cornell.edu/howarth/Howarth%20et%20al%20-%20National%20Climate%20Assessment.pdf>

Scope:

- 830,000 operating oil and gas wells in U.S.
- 34 oil and gas producing states
- In 2012, 2,000 wells drilled every month, 90% of well are fracked
- Already fracking: AK, CO, WY, NM, CA (does not track production from fracking), MT, TX (news regs coming next year), OK, LA, AR, AL, MI, OH and PA (among worst regs)
- Prevention states: NY, MD, NC

Successful Strategies:

- Community Rights/ Home Rule
- Zoning Laws
- Property Rights – has provided an opportunity to work with a new constituency
- Documentary on this issue: Split Estate (this film is streaming and available on Netflix)
- People's Assembly and People's Resolution - OH

Protective Regulations and Harm Reduction Strategies:

- Production set-back from homes/structures
- Liners and covers for waste pits
- End Goal: Federal Regulations – fracking is exempted from 7 environmental laws, creating an inadequate patchwork of state-based regulations

Other resources:

1) Enforcement of existing laws is woefully lax. Earthworks is releasing a series of reports on enforcement in 6 states: the first two on Colorado and New Mexico, are here: http://www.earthworksaction.org/library/detail/enforcement_report_cogcc and http://www.earthworksaction.org/library/detail/nm_enforcement_report. Upcoming reports will focus on Texas, Ohio, Pennsylvania and New York.

2) Earthworks' report *Flowback, the Dark Side of the Boom* outlines some of the health impacts in the Barnett Shale in Texas. http://www.earthworksaction.org/library/detail/natural_gas_flowback

3) The federal loopholes in 7 environmental laws enjoyed by the oil and gas industry are outlined here: http://www.earthworksaction.org/library/detail/loopholes_for_polluters. This fact sheet is incredibly handy if you find yourself explaining to folks why fracking is such a boom right now.

4) NY: <http://www.grassrootsinfo.org/fracking.html>
<http://amillionfrackingletters.com/>

Upcoming Events:

Stop the Frack Attack – Washington, D.C. July 25- 28
Learn more: <http://www.stopthefrackattack.org/>
Get the word out and join the discussion: Follow on Twitter (twitter.com/stopfrackattack) and like us on Facebook (www.facebook.com/stopthefrackattack) for even more information about the rally!

Stop Fracking with California – Join us in Sacramento July 25

Your voice is urgently needed at an upcoming demonstration and fracking workshop run by the Department of Conservation to solicit input on potential regulations. Please join us in demanding a ban that will protect our environment from this industry, which is associated with more than 1,000 documented cases of water contamination across the country.

What: Demonstration & Workshop on fracking regulations held by the California Department of Conservation
When: Wednesday, July 25 Demonstration at 5:30 p.m., Workshop at 7 p.m.
Where: California Environmental Protection Agency Headquarters, Byron Sher Auditorium
1001 I Street, Sacramento, CA 95814

More to follow before the 5pm submittal deadline tomorrow 7/18/12

Subject: FW: Part 2 Comments Draft 2012 AQMP Plan & Draft Vision for Clean Air/Harvey Eder & PSPC
7/17/12 ITSCP Immediate Total Solar Conversion Plan SCD & CALIFORNIA

Howdy Steve Smith etc,

July 17, 2012

This is Part 2 of Comments for the Draft 2012 Air Quality Management Plan and Public Review Draft June 27, 2012 Vision for Clean Air: A Framework for Air Quality and Climate Planning and Appendix: Actions for Development, Demonstration and Development of Needed Advanced Technologies / Immediate Total Solar Conversion Plan for the South Coast Air Quality Management District and the State of California etc, by Harvey Eder & PSPC the Public Solar Power Coalition July 17, 2012 before the 5pm deadline July 18, 2012. Stream of consciousness style sorry, hope to mark comments on the Final more organized." The Quantum Inigma: Physics

H-2

Encounters Consciousness"

1) The costs of solar cells has gone down 1/3 in the past 3-5 years PhotoVoltaics note moores law and computer chips etc.

Concentrated PV is more efficient and hybrids pv heat also more cost effective

2) Interests rates are the lowest it's ever been since the great depression of the 1930's

In contrast to 30 years ago (when I first came to the SCD with information that there was no cost for solar as best available control technology bact apx. 1985 when interest was 10-20% and the price of fossil fuels was as high as it is today with preset value of \$80-120 per barrel of oil without cap and trade values or nox reclaime etc.

3/Solar is BACT Best Available Control Technology and BARACT Best Available Control Technology (solar should be cited by SCD as such and proven so it can be used in other air quality management districts in CA and the US using LCA life cycle analysis it pays for itself plus saves without counting externalities, social costs and direct medials costs , security no war in middle east etc, etc.

4) 20 years ago H Eder and PSCP went to the district and presented this and it was included in the AQMPPlan that solar thermal hot water systems were bact etc. for swimming pools and residential and process hot water etc.

5) Federal Solar Tax Credits on solar are 30% until the end of 2016 and ACRA accelerated cost recovery system are worth about another 30% for depression making no down solar leasing /PPAs power purchase agreements/less expensive than fossil fuels , even if there is a cost to society through the federal debt and deficit etc. has to be studed further vs ghg climate change costs and global warming see page 7 of this past weekends Financial Times section 1

Scientists accept global warming 20 times to 60 times probality of this weather in the east and mid country and weather in England than in the 1960s , Rutgers University Prof artic sea ice is 40-50% less than the 1990 etc. etc. etc (theKing and I)

6) Solar thermal is 2 to 5 times more efficent than PV like the Israeli Luz plants 354 MW less than 100 miles from SCD Dimond Bar headquarters (the largest solar project in the world) built in 1 14, and several 30, and 80 MW systems now operating for over 20 and close to 340 years right here in river city !

The Sun Makes the Wind Blow, the Water Flow , and the Plants Grow or it can be used directly. It's the Engine of Our Ecosystem, It's The Way The World Works !

7) This same solar technology can be used and have storage which can ber used 24 hrs as well as solar seasonal storage in tanks, the earth or undergrouns with compressed air plus other systems ref the Storage Proceedings at the CPUC and work dont at the CEC all records incorporated herein by reference and the Ca Styorage Association. Alliance etc national and international and proceedings of the ASES American Solar Energy Society and ISES the Interbational Solar Energy Society innnnnnnnnnnnncorporated by reference herein in these records of proceedings by reference.

H-2

8) The SCD committee on BACT and BARCT plus more stringent federal standards should meet and declare various solar technologies as such and include them in various rule makings and in the 2012 AQMP Plan as part of the 5 year ITSCP, Immediate Total Solar Conversion Plan. This committee needs to meet and do this now and incorporate reports and records from Technology Advancement on Solar etc into the record as well as NREL the National Renewable Energy Lab (which was the SERI the Solar Energy Research Institute under Carter all reports and studies on the technology solar etc herein the record as well as that of other countries and companies incorporated herein by reference. We're headed for hell in a handbasket and there's no time to wait.

9) This is a proposal for a 5 year total solar conversion plan ITSC Now The Solar Future is now. This includes solar cogeneration with solar process heating space heating and cooling (absorption) and solar district CHIP. We may have to tear up the streets to lay the pipes and it won't be easy but it can be done and seasonal solar storage using the earth as has been proven in the past can be done and fast putting people to work doing this. Unemployment is over 10% in the SCD Southern Cal and will soon hit 15% if the economy continues to falter with underemployed at 20-25% and youth unemployment at 25-50%. Action is needed now. Climate change with GHG/ and criteria and toxics worst than previously thought with an exponential increase in methane CH4 with 90% of the wells new wells fracked and the tundra melting with arctic warming faster and faster and the oil companies wanting with the Russians planting their flag at the bottom of the north pole getting ready with our oil and gas companies to drill in the arctic for fossil fuels on last gasp, grasp for the final demon. It's insane. Like Einstein said doing the same thing over and over again and getting no different result is crazy. He also said that the most powerful thing is the power of compound interest. We need to invest in a solar future. it is now...

The economy is slowing in China and the developing world with mounting problems in Europe, Greece, Spain, Italy etc and the Germans to bail them out remember the German inflation of the 20s after WW1 there worried about inflation like the fight and the Teaparties are here the gold bugs and the anti feds. with the LIBOR scandal with Bernanke testifying today before congress the world economy and the world is slowing down

Subject: Part 3 Comments on 2012 Draft AQMP Plan & Public Review Draft June 27, 2012 Vision for Clean Air & Addendum.. This is Part 3A part 3 B will follow. From Harvey Eder and Public Solar Power Coalition 7/18/12 8:06 am

Howdy Steve Smith et al.,

7/18/12 8:15 am

This is part 3 of comments on the Public Review Draft June 27, 2012 Vision for Clean Air: a Framework for Air Quality and Climate Change Planning and its' Appendix Actions for

H-2

Development, Demonstration, and Deployment of Needed Advanced Technologies and Notice Of Preparation Of A Draft Program Environmental Impact Report, 2012 Air Quality Management Plan (AQMP) from, by Harvey Eder and Public Solar Power Coalition.

This supplemental is in addition to Parts 1 and 2 submitted yesterday 7/17/12.

10. The documents here emphasize biofuels which emit criteria and toxic pollutants which is not the case with direct solar or wind and hydro. It is true that in manufacturing the solar systems if not done on a solar breeder there are some emissions and this will have to be studied further some work has been done on this already as well as net energy work and the solar systems perform well in comparison to fossil fuels and biomethane and biofuels solar hydrogen is also proposed as well as solar electric (a Santa Cruz man Paul Scott has an electric car that he has driven over 100,000 miles on with solar energy/electricity as one example as have many other people that have testified on the record in the past to SCAQMD etc members of Plug In American has many members that do this in the District and are featured in the documentary Who Killed The Electric Car, which is also hereby herein placed in the record in these proceedings by reference !%@

this shows the past record of SCD and CARB about electric cars etc..

Subject: Part 4 Comments Testimony for on the 2012 Air Quality Management Plan (Notice of Preparations of a Draft Program) under ceqa as well as for Public Review Draft June 27, 2012 Vision for Clean Air: A Framework for Air Quality and Climate Pla...

Howdy Steve Smith et al.,

This is Part 4 of Comments/testimony for on the 2012 Air Quality Management Plan (AQMP subject: Notice of Preparation of a Draft Program Environmental Impact Report and for the Public Review Draft June 27, 2012 Vision for Clean Air: A Framework for Air Quality and Climate Planning and its' Appendix: Actions for Development, Demonstration, and Deployment of Needed Advanced Technologies for by Harvey Eder and the Public Solar Power Coalition at 9:13 am July 18, 2012 continuing etc timely submitted.

12 I/we hereby, herein incorporate by reference all submittals in writing and orally to the SCAQMD since 1985 made by Harvey Eder and PSPC Public Solar Power Coalition in reference to solar energy as well as all written and oral statements and or comments made to the CPUC, CEC, NRC, CASIO, including all state and federal government incorporate into the record in this proceeding CEQA Drafts etc July 18, 2012, EPA etc..

13 This is a 5 year immediate total solar conversion plan by 2017 which allows the federal government to pay for 1/2 (through Federal 30% tax credits and an additional 20-30% present value for accelerated depreciation ACRS or with AQCRS 10% etc.) of the cost of the conversion

H-2

This is Part 5 Comments on Draft 2012 Air Quality Management Plan (AQMP) due today by 5pm 7/18/12 as well as comments for Public Review Draft June 27, 2012 Vision for Clean Air: A Framework for Air Quality and Climate Planning from Harvey Eder & PSPC Public Solar Power Coalition.

15 The Natural Gas and all methane programs /subsidies for using ch4 ie Moyer Program and school bus funding etc power plants etc by SCAQMD and other Districts and CARB must be stoped at once and Immediate Total Solar Conversion Plan must be implemented at once. Over a 20 year time frame see documents in Part 1 of Comments etc. Howarth et al. incorporated into the record herein by reference natural gas and or methane ch4 has 100 times the GWP Global Warming Potential /Impact of co2 equalivent and the numbers used by SCD and CARB are wrong for trading cap and trade CPUC, CEC etc EPA, LCFS Low Carbon Fuel Standfard and are enjoined by writ of mandamus to stop subsidizing by all government entities now for solar electric, hydrogen etc solar xyz...This was illegally with held by SCAQMD and CARB as well as the CPUC GHG proceedings and is entered bby reference in those proceedings in pastt and present and future proceedings etc.

16 Subsidies for solar (tax incentivesd etc. must be made through progressive taxes on the weathy (like Obamas tax increase and more). Federal Income Taxes have been over 70-90% for vast majority of the past centruy and should be increases to fund the solar conversion plan and help the poor and low, and low middle income which is Environmental Justice. Even with the low rate of apx 40% under Clinton which was reduced by Bush to apx. 35% 10 years ago the economy was better and unemployment was less under the higher rate in the 1990 than over the past 10 years (and job creation) This is also true since the end of WW2 in the late 40s and in the 50s and 60 etc which was a boom period which negates the reactionary right wing arguments that higher taxes on the wealthy will hurt the economy. This if false the US Economy performed just fine with double the Fed Income Tax on the Rich like Romney. As cited in the July 13 SCD meeting in Santa Monicalast week the Republicans support coal while the Democrates support natural gas while 4 years ago Obama supported Solar/renewables which is needed now . tens and 100s or biooions of dollars are spent supporting climate changing dirty oil coal and gas fossil fuels while polling proves that 80-90% plus of voters and the US Public supports Solar Energy., and are solar "energy voters".

17 The CCA law was passed when Enron was gaming the state for outrageous profit and they caused blackouts in CA and they went bankrupt like PG&E and So Cal Edison was withing days or rather hours from not also going bankrupt as well, Theirs is a wrong and bankkrupt policy cupporting fossil fuels and nuclear energy (Diablo and SONGS etc)
Global warming Climate Change melting the Artic sea ice etc...

Subject: Part 6 Comments draft CEQA 2012 Air Quality Management Plan & Public Review Draft June 27,2012 vision for Clean Air: A Framework for Air Quality and Climate Planning & Appendix..from/by Harvey Ederand PSPC Public Solar Power Coalition 7/18/12

Howdy Steve Smith et al.,

July 18,2012 4:40PM

Part 6 Comments on Notice Of Preparation Of A Draft Program Environmental Impact Report, 2012 Air Quality Management Plan (AQMP) and Public Review Draft June 27,2012 Vision for Clean Air: A Framework for Air Quality and Climate Planning of,by from Harvey Eder and PSPC the Public Solar Power Coalition and the Appendix....Vision for Clean Air.

18 Solar Cal was presented to the joint meeting on the Integrated Energy Policy Report Last month at the Cal Trans Building in LA where in the afternoon Dr. Walerstein presented for the District information. There was comissioners from the CPUC , the CEC , Cal ISO and the Director goldstene from CARB and others present. The state would own the transmission and distribution system now controlled by the IOUs and they would operate and manage the system as they do now on a cost plus 10% basis. 10 years the whole system could has been bought for apx \$10 billion now it will sell with eminate domaine for \$12-15 Billion for the T&D and the CPUC will regulate the operation of the systemlike they are doingtoday at cost plus 10% . The IOUs were also at the IEPR meeting as well along with other groups and citizens.

At the meeting on July 13 in Santa Monica MTBE pollution was brought up which increased the efficiency of engineswhich mentless emissions in the air but gas tanks leaked into the ground water contaminating the City of Santa Monicas' warter. This resulted in \$100s million in litigation paid by the oil companies to clean the water. Now fracing for oil and gas 1/3 to 1/2 plus of which comes from fracked wellsss in California from Texas, Lousiana NM and wyoming and Colorado threaten the ground water. the Resources Agency and its Department of Conservation and its DOGGR Division Of Oil Gas and Geothermal Resources is holding meetings around the state that will lead to regulations. As Marshal of DOC stated Fracking in CA is "Regulated but not reported.

Existing law covers this now but nothing is being done about, so the Sierra Club and Center for Biological Diversity have gone to court over an estimated 10-15 billion barrels of oil in the Monterey Shale (the biggest field in the USA / Prudo Bay in Alaska was about the same size as this and there is a gold/oil rush going on to develope this. At todays prices its worth a trillion dollars or two plus which if developed and produced should be used for the ITSCP the Immediate Total Solar Conversion Plan just 86 ground water or ? This could be done through a 90% severence tax (Alaska has a 25% tax - the state did own all of the oil but took 1/8 in royalties / tax which went to Alaska Permantant Fund) in California to help finance ITSCP which should help fund low and low middle income ITSCPPlan cited herein. There is a meeting

H-2

which it was mentioned that the District should be at of the Water Agencies on July 24th in Long Beach on Fracking, the day before DOGGRs last meeting in Sacramento on July 25th 2012. Regulations for the state wouldn't be implemented until mid 2013 for CA just as federal EPA regulations and studies won't be released until after the Fall November elections. The District is planning a meeting on fracking in September with Doggr and EPA etc.

The District should not wait until 2015 to submit a SIP on PM 2.5 to the feds but do it now as well as cover ultra fines which the District has had a meeting on a few years ago. This must be part of the AQMP this year 2012 as part of the ITSC Plan cited herein etc for 5 year conversion Plan etc..

GHG Howarth et al must be googled (natural gas fracking 2011 and 2012 both papers are in onlinks submitted with Comment Part 1 shows as submitted to the District in the past that 105 times the ghg impact of co2e using a 20 yr time frame for methane/natural gas rather than 21 used by SCAQMD or 25 used by CARB or 33 used by James Hanson NASA Gottard Institute several years ago over a 100 year time frame. With all of the rush to frack (Howarth states on the attached recording of last Thursday June 12, 2012 fracking phone call that oil fracking is as bad (value _ yeilds as much methane as fracking for gas incorporated herein hereby in the record by reference as well) Warming as happening much faster in the Artic than science predicted and if the tundra melts methane ch4 will be released in a great amount (a negative positive feedback loop).

Gov Brown wants 12 GW of distributed generation solar to be on line in Ca by 2020. At the IERP meeting in LA last month Commissioner (CPUC) Florio stated that there is already more that 33% of the load/ solar signed for use by 2020 . There has been for several years now. This is too modest a program. That's why ITSCPlan presented here needs to be implemented now.

H-2

Responses to Comment Letter H
Harvey Eder

Response to Comment H-1:

We appreciate the references and information sent over on the environmental impacts from hydraulic fracturing. These concerns are something we have been monitoring and tracking carefully and are informing the public along with addressing these issues with industry. Recently at AQMD we held a forum focused on the environmental impacts of hydraulic fracturing and provided policy level discussions. In addition, we are working with both the state and federal government in developing regulations and enforcement policies. Finally, staff will be working on development of fracking regulations, if feasible and appropriate.

Response to Comment H-2:

The AQMD recognizes the clean air benefits renewable energy provides to both the electric power grid and other services such as hot water heating. Chapter 10 of the AQMP addresses the implementation of the states 33% renewable portfolio standard along with the benefits increased efficiency provides on reducing fuel and energy demands. This chapter shows the total energy consumption in Sothern California was near 2.1 quads in 2008 and is expected to show a slight 0.1 quad increase by 2023. However, the slight increase in projected energy use in Southern California will be met with an increase in energy prices; in 2008 close to \$54 billion was spent on energy and the projected cost of energy consumption in 2023 is \$74 billion. Overall the projected 5% increase in energy consumption is going to be met with a 27% increase in energy prices. As mentioned within this chapter, significant implementation of renewable energy coupled with the transportation system will help lower emissions, reduce impacts from volatile energy prices, help localize dollars spent on energy, and provide some isolation from increasing energy costs.

The AQMD endorses solar power as a clean air solution to help provide emission free electricity to residences and businesses whenever feasible. We have been an early supporter of implementing new solar technologies. At the AQMD headquarters, we currently have over 180kW of solar panels installed that are demonstrating three different solar technologies. Additionally, we are funding and undertaking several technology demonstration projects that help address the limitations of solar, such as, coupling solar power production with energy storage to help with intermittency. We also promote the benefits electrification technologies provide to clean the air such as electric vehicles, and as mentioned earlier, advocate for the electrical supply to be from clean air sources such as renewables.

The prices of solar panels have come down nearly a third in the past couple of years due to less expensive ways to manufacture polysilicon, an increase in solar

manufacturers, and expiring solar incentives in other countries. Resulting price declines have made PV solar very competitive with conventional generating technologies. This decline in prices has helped implement this technology in Southern California as there are now many solar installation companies that employ thousands in this sector. The recent increase of roof-top solar PV installations does not show any indication of slowing down in the near future since financing mechanisms have become available along with local incentives and federal tax credits. Additional incentives for solar installations are also likely in the near future as a portion of the revenues utilities start to receive from the CARB GHG Cap and Trade program under AB 32.

Unfortunately, solar power does not currently provide a standalone solution to providing all the electrical generation needs for Southern California. Until the intermittency problem is addressed, large storage technologies, and increased panel efficiencies become more cost effective, existing natural-gas fired power generating technologies are required to provide base loads, ramp rates, and other ancillary services such as frequency regulation. Additionally, the clean air benefits renewable energy sources such as solar power provides in Southern California will be best realized as transportation technologies such as electrification are implemented at a faster rate.

In a Vision for Clean Air: A Framework for Air Quality and Climate Planning biofuels was presented as a one component among several to meet the GHG goals of the State. The use of biofuels does not typically provide an advantage in reducing criteria pollutants if they are combusted in standard IC engines such as diesels. Therefore in the document it was stated “In the longer-term, to meet the greenhouse gas targets, any combustion-based heavy-duty trucks would rely predominantly on efficiency and renewable and biofuel solutions. However, to achieve the air quality standards in the South Coast, a technology transition to zero- and near-zero emission trucks (e.g., electric, fuel cell, or hybrid with all electric range) to reduce NOx emissions is also needed.” In summary, staff supports the development and implementation of solar energy technologies to the maximum extent feasible and cost-effective. These technologies are not needed to attain the PM2.5 standards, but staff will continue to support solar technologies for attaining the ozone standards in the future.

RE: 2012 Air Quality Management Plan – Santa Monica Airport

Dear Dr. Fine and Mr. Cassmassi,

We are writing on behalf of Neighbors of Santa Monica Airport (“NoSMO”) regarding Santa Monica Municipal Airport (“SMO”) located at 3223 Donald Douglas Loop South, Santa Monica, California 90405. NoSMO is a coalition composed of residents and community leaders from Santa Monica and Los Angeles neighborhoods impacted by SMO. We request that South Coast Air Quality Management District (“SCAQMD”) review, propose, approve, and submit to California Air Resources Board (“CARB”) an Indirect Source Review Rule regulating air pollution emissions originating from activities at SMO.

SMO has a disproportionate environmental health impact on local residents. SMO is unique in having dense residential development less than 300 feet from the east and west ends of the runway. Unlike other Southern California airports, SMO has almost no buffer zone between the runway ends and the surrounding community. Adrian Castro, et al, *Santa Monica Airport Health Impact Assessment* (2010). A UCLA study noted that “[s]mall airports in heavily populated areas do not necessarily have ... buffers ... so residents may be more directly exposed to aircraft emissions.” Shishan Hu, et al *Aircraft Emissions Impacts in a Neighborhood Adjacent to a General Aviation Airport in Southern California*, 43 Environ. Sci. Technol. 8039, 8039 (2009). The UCLA study went on to conclude that the residential neighborhoods surrounding

Page 1 of 6

I-1

Neighbors of Santa Monica Airport
P.O. Box 643033 Los Angeles, California 90064

SMO have "markedly high concentrations of air pollutants ... suggesting ... [that the] buffer areas around ... [SMO] may be insufficient." The proximity between the airport and the surrounding community creates a dangerous health risk for local residents.

Local residents living in proximity with the airport face an elevated risk of cancer. According to a study sponsored by the Los Angeles Unified School District, cancer risk arising from maximum exposure to air pollution generated by activities at SMO for local residents ran thirteen to twenty-six in one million. Bill Piazza, Santa Monica Municipal Airport: A Report on the Generation and Downwind Extent of Emissions Generated From Aircraft and Ground Support Operations 2 (1999). Cancer risks to local residents from SMO significantly exceed the guideline lifetime cancer risk of one in a million individuals for cancer risk from maximum exposure to a source of air pollutants under the Federal Clean Air Act. 42 U.S.C. § 7412.

I. **South Coast Air Quality Management District is Legally Obligated to Implement an Indirect Source Review Rule Regulating Emissions from Santa Monica Airport.**

SCAQMD is legally required to implement an Indirect Source Review rule controlling emissions from Santa Monica Airport. The California Clean Air Act requires that SCAQMD "provide for indirect source controls in those areas of the south coast district in which there are high-level, localized concentrations of pollutants" Cal. Health & Safety Code § 40440(b)(3).

Multiple studies have demonstrated that there are elevated levels of air pollutants such as lead, black carbon, and ultrafine particulate matter on Santa Monica Airport property as well as in neighboring residential areas. *Infra*.

Modeling studies have shown that concentration of ambient lead levels near, at and exceeding the National Ambient Air Quality Standard ("NAAQS") at Santa Monica Airport as well as at nearby residential neighborhoods. Studies conducted by the U.S. Environmental Protection Agency ("USEPA") and SCAQMD found areas on Santa Monica Airport's runway with lead levels violating the current lead NAAQS. U.S. Environmental Protection Agency, Development and Evaluation of an Air Quality Modeling

I-1

I-2

Neighbors of Santa Monica Airport
P.O. Box 643033 Los Angeles, California 90064

Approach for Lead Emissions from Piston-Engine Aircraft Operating on Leaded Aviation Gasoline 72 (2010); South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study 20-21 (2010). In addition, both studies found elevated ambient lead levels that often exceeded, but averaged near the NAAQS in surrounding residential neighborhoods. *Id.*

Lead can have irreversible brain and nerve damage, severe developmental impacts on children as well as adverse impacts on adults. Lead has been found to have neurological impacts on children, leading to behavioral problems, learning problems, and lowered IQ. Adults, when exposed to lead, can suffer cardiovascular problems such as high blood pressure, and heart disease. Finally, lead exposure has also been found to have negative impacts on the nervous system, kidney function, immune systems, and reproductive ability. U.S. Environmental Protection Agency, Lead in Air: Health (2011), <http://www.epa.gov/airquality/lead/health.html> (last visited Nov. 11, 2011).

Elevated levels of Black Carbon have also been found to have been generated by activities at SMO. Jet takeoffs at SMO have been found to result in large spikes in concentrations of Black Carbon in and around the airport. Hu, 43 Environ. Sci. Technol. at 8039 (2009); South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study: Follow-up Monitoring Campaign at the Santa Monica Airport 3 (2011).

Black carbon, as a component of particulate matter, has been linked to increased risk of cardiovascular disease, respiratory disease, cancer, and premature death. United Nations Environmental Program, World Meteorological Organization Integrated Assessment of Black Carbon and Tropospheric Ozone (2011) 113-15.

Very high levels of ultrafine particulate matter have also been found at SMO. Studies conducted by the University of California, University of Southern California, CARB, and SCAQMD found elevated ultrafine particle concentrations in the downwind residential areas directly attributable to SMO aircraft operations. South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study

Neighbors of Santa Monica Airport
P.O. Box 643033 Los Angeles, California 90064

(2010); South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study: Follow-up Monitoring Campaign at the Santa Monica Airport (2011); Shishan Hu et al, *Aircraft Emissions Impacts in a Neighborhood Adjacent to a General Aviation Airport in Southern California*, 43 Environ. Sci. Technol. 8039 (2009).

Ultrafine particles have been linked to premature death from respiratory and cardiovascular disease. University of California Los Angeles Community Health and Advocacy Training PGY-2 Pediatric Residents, Santa Monica Airport Health Impact Assessment 10 (2010). Ultrafine particulate matter may pose a greater health risk than other, larger forms of particulate matter due to their tendency to penetrate deeper into the body. Ning Li et al, *Ultrafine Particulate Pollutants Induce Oxidative Stress and Mitochondrial Damage* 111 *Env'tl Health Perspectives* 455, 455 (2003).

Airports are a significant source of emissions of Volatile Organic Compounds (VOCs) as well as Nitrogen Oxides (NOx), both of which are ozone-forming pollutants. Colleen Callahan, The Plane Truth: Air Quality Impacts of Airport Operations and Strategies for Sustainability: A Case Study of the Los Angeles World Airports 7-10 (2010); U.S. EPA, Documentation for Aircraft Component of the National Emissions Inventory Methodology (2011).

Ozone has been shown to cause decreased lung function, chest pain, as well as aggravate existing respiratory illnesses such as asthma, pneumonia, and bronchitis. U.S. EPA, Ground Level Ozone: Health, <http://www.epa.gov/air/ozonepollution/health.html> (accessed on March 25, 2012). SMO is located in Northwest Coastal LA County, which exceeded both the State and Federal Ozone standards in 2010 and 2009. South Coast Air Quality Management District, 2010 Air Quality (2011); South Coast Air Quality Management District, 2009 Air Quality (2010).

The California Clean Air Act requires SCAQMD to promulgate Indirect Source controls to regulate pollution from SMO. SCAQMD is required to impose Indirect Source controls in areas where there are "high level, localized concentrations of pollutants." Cal. Health & Safety Code § 40440(b)(3). A study

I-2

Neighbors of Santa Monica Airport
P.O. Box 643033 Los Angeles, California 90064

concluded that there are "high concentrations of air pollutants in the residential neighborhoods downwind of SM[O] due to aircraft activities" Hu at 8039. SCAQMD should act to regulate emissions from Santa Monica Airport.

I-2

II. South Coast Air Quality Management District has the Authority under the Federal Clean Air Act to Impose Indirect Source Controls on Santa Monica Airport.

Arguably, SCAQMD is federally preempted from imposing Indirect Source controls on SMO. Both the Federal Aviation Agency and the USEPA have exclusive federal authority over aircraft operations, design, and manufacture. However, SCAQMD has the authority to regulate pollution from SMO with the approval of CARB with its delegated authority under the Federal Clean Air Act. Federal courts have found that states may regulate *emissions* from aircraft engines under the Federal Clean Air Act as long as it does not directly regulate aircraft operations, design, or manufacturing. *California v. Navy*, 431 F.Supp. 1271 (1977). SCAQMD and CARB have federally delegated authority to impose Indirect Source controls on facilities such as airports. 42 U.S.C. § 7410(a)(5).

I-3

III. Santa Monica Airport Could Implement Reasonably Available Control Measures to Reduce its Environmental Health Impact on Local Residents.

SMO could implement control measures to abate its impact on the surrounding community and comply with emissions limits imposed under an Indirect Source Rule. SMO could adopt a number of measures under its proprietary authority to reduce the amount of air pollutant emissions from its facility, including increased landing fees, reducing available parking spaces for large aircraft, etc.

I-4

IV. South Coast Air Quality Management District Should Impose Indirect Source Controls on Air Pollutant Emissions from Santa Monica Airport.

SCAQMD should impose an Indirect Source Review Rule on SMO. In light of SCAQMD's legal obligations, the significant public health risks and the feasibility of control measures that could be adopted, SCAQMD should act to abate SMO's impact on its surrounding communities.

Responses to Comment Letter I
Neighbors of Santa Monica Airport

Response to Comment I-1:

AQMD has not observed elevated levels of PM_{2.5} in neighborhoods near the airport so this plan will not include a measure specific to the airport. AQMD will continue to explore possible ways of reducing emissions at the airport. The health effects of air pollutants are addressed in Appendix I. Regarding cancer risk, The AQMD's MATES III study estimates life time risk for air toxics near the Santa Monica Airport at about 930 per million which is less than the regional average of 1194 in a million.

Response to Comment I-2:

See Response F-3. Also, although some airports are significant sources of VOC and/or NO_x, which are precursors to ozone, ozone is not a “localized” pollutant and is not the target of H&S Code §40440(b)(3).

Response to Comment I-3:

The AQMD staff agrees that it has the authority under state and federal law to adopt indirect source controls. Such authority is not preempted by the Clean Air Act, as held in *National Association of Home Builders v San Joaquin Valley APCD*, 627 F. 3d 730 (9th Cir. 2010). Whether any other federal statute would have preemptive effect would likely depend on the particulars of any proposed indirect source rule.

Response to Comment I-4:

In the absence of high-level localized emissions of criteria air pollutants, an indirect source control measure for Santa Monica Airport is not required. While airports in general produce VOC and NO_x emissions, which contribute to ozone, there is no technical basis to single out Santa Monica Airport in an effort to reduce ozone pollution. As efforts to implement ozone measures and reduce the size of the “black box” for ozone, staff will continue to explore methods of reducing emissions of NO_x at a variety of sources including airports.

Response to Comment I-5:

AQMD staff does not believe that this request should be addressed as part of the 2012 AQMP, but will continue to consider whether such an approach would be viable to reduce emissions in the future.

J. CA Trucking Association, August 30, 2012

August 30, 2012

Dr. William A. Burke, Chairman
Members of the SCAQMD Governing Board
South Coast Air Quality Management District
21865 Copley Dr.
Diamond Bar, CA 91765

RE: 2012 Draft Air Quality Management Plan

The California Trucking Association (CTA) is a nonprofit trade association representing thousands of trucking companies operating in and out of California, including the many residing in the vital goods movement, manufacturing and trade hub contained in the South Coast Air Basin (SCAB). We thank you for the opportunity to offer comments on the South Coast Air Quality Management District's ("the District") 2012 Draft Air Quality Management Plan (AQMP).

Demonstrating attainment of future ozone standards in the South Coast is a challenge that will require an open and ongoing dialogue between local business owners and the District.

CTA Recommends Additional Evaluation of On-Road Control Measures for NOx

We request that ONRD-03, ONRD-04, and ONRD-05 be subject to additional evaluation to review the following:

- i. Cost-effectiveness
- ii. Commercial availability and scope of Best Available Control Technology (BACT) to achieve goals of ONRD-05
- iii. Unprecedented nature of mobile source "black box" control measures, possible jurisdictional issue with ARB

Cost Effectiveness

We would like to specifically address ONRD-05 to express frustration, no doubt similar to other stakeholders, with regards to lack of time and available data to assess cost-effectiveness of proposed control measures as required by California Health and Safety Code 40922.

Given the entirely reasonable expectation that technology used to achieve the reductions targeted in ONRD-05 will be the first commercially available of their kind, the CTA recommends a robust economic analysis be conducted to ensure that the near-dock rail drayage market will support adoption of high incremental cost advanced technologies.

J-1

As previously expressed to staff at both the District and ARB, CTA has offered to help facilitate meetings with motor carriers who currently service the ICTF rail facility to open a dialogue over achieving emission reductions in this sector and realistic pathways and timelines forward to zero and near-zero emission technologies.

J-1

BACT Not Commercially Available; ONRD-05 Language Vague

The District specifically names “battery-electric trucks, fuel cell trucks, hybrid-electric trucks with all electric range (AER) and zero-emission hybrid or battery-electric trucks with —wayside power (such as electricity from overhead wires)...zero-emission fixed guideway systems such as electric, maglev or linear synchronous motor propulsion or any other technologies that result in zero-emission track miles” as possible technology pathways towards satisfying ONRD-05.

The District further states “such systems are not currently in use for full-scale port to railyard operations and, depending on the technology, may require different levels of additional development and optimization” and that measures such as ONRD-05 should “create a positive signal to technology developers by requiring the use of zero-emission technologies”.

CTA would like to ask that the District elaborate further on the expected performance standard called for by ONRD-05. For instance, it is unclear whether a traditional diesel engine retrofit with a hybrid electric system compatible with overhead catenary would meet the performance standard if that configuration resulted in “zero-emission track miles” only while receiving wayside power. In order to create a clear signal to technology developers, it is incumbent on the District to specify what parameters it expects these technologies to achieve.

J-2

Also, because none of the named technologies are commercially available, we question the utility of including this measure in the 2012 AQMP given that the District is committing the ARB to enforceable implementation deadlines. Forced advancement, for what the District acknowledges is about 1000 trucks, is unlikely to result in vendors producing reliable, stable technology for this important segment of port drayage operations, setting economics completely aside. Near-dock rail facilities are currently responsible for 10% of all throughput¹, a figure surely to increase once construction of the Southern California Intermodal Gateway is completed. Reliable near-dock drayage service is vital to the economy of the SCAB.

Unprecedented Nature of Mobile Source Control Measures

We would like to note that the nature of ONRD-05 (and, by extension, ADV-01) is unique in the recent history of the District’s AQMP adoption in that the District is calling for a control measure that would require ARB to adopt a mobile sources control measure prior to ARB initiating a rulemaking in conformance with California’s Administrative Procedures Act.

J-3

While we do not enter into the question of what authority is granted the District by 182(e)(5) of the Clean Air Act (CAA), we simply note the ARB's traditional role as the State's primary regulator of mobile source emissions.

Further discussion should be held regarding the role of local air districts in setting or suggesting mobile source emission reduction strategies as extreme non-attainment areas attempt to shrink the "black box". Mobile sources are, by their nature, more exposed to interstate and inter-district commerce and, thereby, must be able to maintain the operational flexibility to serve a vast and diverse set of economic interests and geographies. While the pursuit of local mobile source reduction goals are understandable in the scope of the AQMP, the State and Federal role in establishing mobile source emission reduction goals, including their unique ability to achieve economies of scale, cannot be overlooked.

J-3

CTA Supports the Southern California Business Coalition's Comments

CTA was a co-signatory to a letter representing the concerns of a diverse base of local business interests. Specifically, we support the call to focus the current AQMP on PM2.5 attainment, which would allow the District and impacted stakeholders additional time to assess proposed 182(e)(5) control measures. As noted in this letter, the vast majority of cost associated with the AQMP is derived from additional, early measures to address ozone to the extent that cost estimates have been provided by the District.

J-4

CTA Encourages the District to Engage in More Industry Outreach and Partnership

California's trucking industry has repeatedly shown a willingness to demonstrate heavy duty natural gas, hybrid, all-electric and fuel cell pilot vehicle projects. In 2012, CTA staff reviewed its current "technology and fuel neutral" policy to assess the developmental states of multiple advanced heavy duty alternative technology trucks and came to a similar conclusion as the District has in the AQMP with regards to zero and near-zero emission technologies; while multiple promising technologies are in developmental stages, the pathway to zero or near-zero emissions is still uncertain.

Little to no outreach was done to the trucking industry prior to the District's proposal of ONRD-05. We cannot envision how the District's goals of technology advancement can be achieved without a full and committed engagement with the actual end users of this technology. Through our initial conversations with District staff, we believe we have begun a dialogue on the technological, operational and economic challenges that ONRD-05 will encounter, but those discussions, to date, have barely scratched the surface of what is needed to make such a program successful.

J-5

We would encourage the District, if it chooses to act on the Southern California Business Coalition's recommendation to solely focus the 2012 AQMP on PM2.5 attainment, to use this

additional time to seek additional trucking industry input on ONRD-05 prior to adopting a new proposed control measure.

Thank you for the opportunity to comment on the 2012 Draft AQMP and we would like to reaffirm our commitment to continue work with the District on this project, and others, in the future.

J-5

Thank You,

Eric Sauer, Vice President of Policy and Regulatory Development
2012 AQMP Advisory Group Member
California Trucking Association
(916)373-3562

Responses to Comment Letter J
California Trucking Association

Response to Comment J-1:

Many of the control measures proposed in the AQMP recognize the potential for the development of advanced vehicle technologies to be commercially available in the near-term. As such, ONRD-05 recognizes that the current state of development of trucks operating in a "zero-emission" mode may be realized in the next few years and the "commercial" cost is not available at this time. As part of the implementation of the measure, whether through a regulatory process or other enforceable mechanism), a technology assessment will be made to determine commercial availability and a cost-effective analysis will be conducted.

Response to Comment J-2:

See Response to Comment J-1. In addition, ADV-01 is provided to complement ONRD-05, in that the measure calls for actions that will lead to development of zero- and near-zero emission trucks.

Response to Comment J-3:

The control measure/regulatory development process is not unprecedented. Prior AQMPs and SIPs included control measures which led to regulatory development by CARB. ONRD-05 recognizes CARB's authority to develop regulations for on-road mobile sources. As part of CARB's assessment on the need for a regulation, other actions that lead to deployment of zero-emission vehicles will be assessed. Such actions could be similar to the San Pedro Bay Ports Clean Truck Program or funding incentives to deploy such trucks. As such, the Ports of Los Angeles and Long Beach as well as the AQMD are listed as implementing agencies.

Response to Comment J-4:

Since the 182(e)(5) measures are part of the 2007 Ozone SIP for the South Coast Air Basin, the AQMD staff believes that it is appropriate to identify actions that practically fulfill the emission reduction commitments of the 182(e)(5) measures. Waiting until the next plan revision will severely limit the time frame to attain the ozone air quality standard by 2023 and would place a greater burden on all sources to reduce emissions within a shorter timeframe.

Response to Comment J-5:

Staff appreciates CTA's effort to outreach on the development of zero- and near-zero emission trucks. Staff believes as the region moves forward with implementation of the 2012 AQMP that there will be opportunities to continue such dialogue with all affected stakeholders.

Mr. Michael Krause
South Coast Air Quality Management District
21865 East Copley Drive
Diamond Bar, CA 91765

Dear Mr. Krause:

Subject: 2012 Draft Air Quality Management Plan Comments

Thank you for the opportunity to comment on the Draft Air Quality Management Plan (AQMP). While ozone air pollution is improving in the Santa Clarita Valley, this valley continues to have air quality that rests amongst the worst in the country. The area's air quality may be further threatened by the Soledad Canyon mine proposed by CEMEX. If permitted and constructed, as proposed, the sand and gravel mine would likely result in significant amounts of fugitive dust and emissions being released into the air. The City of Santa Clarita respectfully requests fugitive dust rules included in the new AQMP be appropriately reflective of potential emissions from the proposed mining operation.

I am grateful for the South Coast Air Quality Management District's efforts to help reduce air pollution affecting the Santa Clarita Valley and the South Coast region. By working together, we can help protect the health of this community and others by assisting to provide clean air for current and future generations.

Sincerely,

Handwritten signature of Travis Lange in black ink.
Travis Lange

Responses to Comment Letter K
City of Santa Clarita

Response to Comment K-1:

The AQMD currently has several rules on the books that are applicable to the Soledad Canyon sand and gravel mining project. In fact, since the December 2000 comments provided by this agency on the draft Environmental Impact Report for the project, the AQMD Governing Board adopted a rule directly aimed at such operations. Specifically, Rule 1157 – PM10 Emission Reductions from Aggregate and Related Operations was adopted in January 2005 and establishes requirements regarding control of fugitive dust emissions from sources that include, but are not limited to: internal paved and unpaved roads; material storage piles; loading/unloading/transfer of material; conveyors; screening and crushing equipment; and track-out onto public roadways. The rule also established opacity limits from any activity, equipment, storage pile, or disturbed surface area, and limits any visible fugitive dust plume from traveling 100 feet in any direction from these sources.

Other applicable rules include Rule 403 – Fugitive Dust, which among other applicable requirements, includes a requirement that no fugitive dust shall cross the facility property line and the rule requires facility operators to take an AQMD taught Fugitive Dust Class to ensure applicable requirements are adhered to. In addition, Rule 1155 – PM Control Devices, adopted in December 2009, establishes a no-visible emissions threshold from any particulate matter control device or dust collector, such as a baghouse, cyclone, wet scrubber, and electrostatic precipitator (ESP), and requires demonstration of proper operation and maintenance and that the largest filtration devices be equipped with detection systems to ensure repair/replacement of filters before visible emissions are seen from the device.

Therefore, staff feels that the necessary requirements are in place to minimize fugitive dust from the mine and is willing to work with the city to ensure the mine is held in compliance with all applicable rules and regulations, including those that go beyond fugitive dust (e.g., off-road equipment).

L. ISSA, August 31, 2012

August 31, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
via e-mail - echang@aqmd.gov

Subject: 2012 Air Quality Management Plan (AQMP)

Dear Dr. Chang:

ISSA appreciates the opportunity to offer initial comments on the South Coast Air Quality Management District's ("South Coast's" or "AQMD's") Draft 2012 Air Quality Management Plan (AQMP), which was issued for comment on July 25, 2012. The comments focus on the Stationary Source Control Measures for Coatings and Solvents numbered CTS-01, CTS-02, CTS-03 and CTS-04. ISSA strongly objects to the inclusion of these measures in the draft AQMP, and urges that the measures not be included in the final 2012 AQMP. As such, ISSA supports the comments submitted by the American Coating Association and the Consumer Specialty Products Association on the AQMP.

Statement of Interest

ISSA is the Worldwide Cleaning Industry Association that represents the institutional and industrial cleaning industry. ISSA members manufacture, formulate, distribute, and market cleaning products, in addition to providing cleaning services. Our association represents over 6,000 manufacturer, distributor, building service contractor, and in-house cleaning service provider members worldwide. In the aggregate, ISSA member companies employ hundreds of thousands of workers. As such, ISSA is concerned with the implications raised by the draft 2012 Air Quality Management Plan and the ultimate impact it would have on its members.

There are close to 400 ISSA members located in California employing tens of thousands of employees across the state. Over the years, ISSA formulator members have worked diligently to reduce the VOC content in their cleaning products by making substantial investments in reformulating the dozens of products that are covered by CARB Consumer Product Regulations as well as the AQMD VOC regulations.

Comments

ISSA is concerned with the proposal to include further reductions in VOCs from consumer products as well as the elimination of the LVP exception in this AQMP because those actions are neither necessary nor cost effective. In addition, these proposed approaches are technologically and commercially infeasible. In effect, the proposed AQMP would not significantly reduce ozone levels, but would impose substantial costs and other burdens upon the institutional and industrial cleaning industry.

ISSA and its membership are particularly concerned with the four control measures that will have a potential impact on consumer products: CTS-01, Further VOC Reductions from Architectural Coatings; CTS-02 Further Emission Reduction from Miscellaneous Coatings, Adhesives, Solvents, and Lubricants; CTS-03 Further VOC Reductions from Mold Release Products; and CTS-04 Further VOC Reductions from Consumer Products.

L-1

These CTS measures are neither effective nor necessary for ozone attainment. Air modeling demonstrates that further VOC reductions from consumer products will not significantly reduce ozone. As NOx levels and ozone levels are lower and lower, VOC reductions become less effective in reducing ozone. Any VOC reductions needed in the short term should be focused on where they often can be attained with the NOx reductions and not the VOCs in consumer products. Moreover, the elimination of the LVP exception will do nothing to further the goal of ozone attainment. LVPs have minimal impacts on VOC emissions and ozone formation, and have become part of the solution and not part of the problem as treated in the AQMD proposal.

ISSA formulator members have collectively spent millions of dollars over the years in research and development in order to produce cleaning products with an overall superior environmental profile. A significant part of this effort was dedicated to reformulating cleaning products to reduce the VOC content in order to comply with CARB and AQMD VOC limitations. Additional VOC limits and the elimination of the LVP exception will necessitate additional research and development and ultimately the reformulation of hundreds of products that will impose substantial costs upon industry at a time when it is economically most vulnerable. Moreover, we are concerned that the AQMD proposals may result in the substitution of materials that may degrade the overall environmental profile of numerous cleaning products at the same time the AQMD proposals would do little to reach the goal of ozone attainment.

The AQMD proposals are also likely to result in numerous products being dropped from the marketplace. Many institutional and industrial cleaners are produced and sold in low volumes to meet the specialty needs of their commercial customers. It is common for many of these products to generate sales within California that are well below \$10,000 per year. While these products serve a valuable function in maintaining a healthy indoor environment, they do not generate sufficient revenues to justify the potential investment needed to reformulate such products to meet the unique requirements proposed by AQMD. Consequently, we believe many products will simply be dropped from the market because of sheer economic reaction to the AQMD proposals.

Furthermore, in many cases, institutional and industrial cleaning products have been reformulated to the point where any further reduction in VOC content or elimination of the LVP exception will significantly impact the efficacy of the product. In fact, ISSA members who provide cleaning services have noticed deterioration in the performance of certain product formulations. Consequently cleaning service providers are concerned with further degradation of product efficacy due to additional VOC reductions and the adverse impact it will have on their ability to deliver effective cleaning services to their customers such as hospitals, schools, hotels, food processing plants, and other institutional and industrial facilities whose thousands of occupants and operations depend on effective cleaning products and services to render their facility in a clean and sanitary condition.

Summary and Conclusions

ISSA appreciates the opportunity to comment on the 2012 Air Quality Management Plan (AQMP). We point to the SCAQMD goal statement: "We are committed to protecting the health of residents, while remaining sensitive to businesses" when analyzing the impact of these control measures on the consumer products industry and our ability to develop and market commercially and technologically feasible products. The control measures impacting consumer products noted in the draft 2012 AQMP are not feasible, necessary or cost-effective. In addition, the AQMD proposals will impose substantial and unnecessary costs on industry that will artificially lead to the elimination of many products critical to the quality of the indoor environment and the health and well being of those who occupy institutional and industrial facilities. Lastly, these proposals could have the unanticipated consequence of degrading

L-1

the overall environmental profile of those products subject to the AQMD proposals. Therefore, ISSA urges AQMD to exclude the aforementioned proposals from its final 2012 AQMP.

Sincerely,

Bill Balek

Responses to Comment Letter L
ISSA

Response to Comment L-1:

The commenter supports, and provides similar comments, to comments submitted by the Consumer Specialty Products Association. Please refer to the responses to comments for the Consumer Specialty Products Association (Comment Letter SS). Staff appreciates the efforts made by ISSA formulator members to comply with CARB and AQMD VOC limitations. While there will be some need for reformulation of products, the District, through the implementation of the Certified Clean Air Cleaners Program and Rule 1143 – Consumer Paint Thinners and Multi-Purpose Solvents, has identified alternative low-VOC, cost-effective technologies that are currently commercially available and used that do not rely upon the LVP-VOC exemption. Contrary to the assertion that these products may degrade the environmental profile, many of the products that do not rely on the LVP-VOC exemption are specifically designed to meet stringent environmental profiles. Many are certified as environmentally preferred products through programs like Certified Clean Air Choices Cleaners and U.S. EPA’s Design for the Environment or third party certification organizations like Green Seal and EcoLogo. When already environmentally preferable certified products were tested, less than ten percent relied on the LVP-VOC exemption to meet the VOC limits. See table below.

Environmentally Preferable Products VOC Content (No LVP-VOC Exemption)

Product Type	Dilution Rate	VOC (g/l)

GRACE ROBINSON CHAN
Chief Engineer and General Manager

August 30, 2012

Elaine Chang, Dr. P.H.
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765

Dear Dr. Chang:

2012 Draft Air Quality Management Plan Comments

Thank you for this opportunity to review and comment on the 2012 Draft Air Quality Management Plan (Draft Plan). The document is generally very well written, understandable and very ambitious. We think the episodic strategies for control of directly-emitted PM2.5 are a viable means of efficiently meeting most of the PM2.5 target. We are not completely clear how the anticipated 1-hour ozone SIP call will impact the Section 182 (e)(5) measures specified within the draft plan and are concerned about any potential changes that might occur to the draft plan when that action does occur. We have divided our comments below into a) general thoughts and remarks and b) specific comments on individual control measures.

General Remarks

- 1. The discussion of threshold costs and procedures to be followed in the event they are exceeded described on Page 4-42 of the Draft Plan appear to be reasonable, however, there is no ultimate ceiling or maximum cost at which point Congress should be petitioned in accordance with the spirit of the Legislative Committee agenda for 2012. We believe this is a critical policy issue that needs to be addressed. The final plan should not simply assume that the attainment endpoint is a given irrespective of the cost and impacts to the regulated community.
2. Table 4-1: Criteria for Evaluating Control Measures. This table ranks "technical feasibility" of a control measure dead last. Even the more nebulous "public acceptability" is ranked higher. It seems to us that even before cost effectiveness can be determined, there needs to be a basic determination that the proposed control measure has a chance of accomplishing what it will be

M-1
M-2

- designed to do. We suggest moving the technical feasibility criteria to the second position. } M-2
3. The "All Feasible Measures" control measures seek to apply BARCT, potentially across *all* source categories, a one size fits all approach, without any specifics as to technology availability, affordability etc., potentially leading to a situation similar to the current implementation of existing Rule 1147. The lack of any control measure description or explanation (beyond the generic application of BARCT) does not allow for any intelligent feedback during this comment period by any potentially regulated sources. This control measure might be best suited to a two-phase rulemaking procedure to first confirm the existence, feasibility and affordability of the rule-dependent technology, followed by the command and control rule, after the technology assessment has been completed. } M-3
4. We believe the focus net of the EDU measures should be more broadly cast. This measure should be expanded to include aggressive general household education on the nexus between human activity and air pollution. While consumer education about energy efficiency and the other ideas are generally good, the average citizen still is very much unaware of their personal connection and contributions to poor air quality. While some members of the community might be aware of rideshare programs and HOV lanes and lawnmower/blower exchange programs, etc., most probably do not think in terms of their personal connection to air quality. Former Board member Jane Carney made this point during a 2011 Legislative Committee meeting. Perhaps one form of such education could be a video or movie where a family might be followed throughout the course of a normal day and the air quality consequences of their activities, individually and collectively, pointed out by a commentator with suggestions to lowering the impacts. Such an approach spreads the burden of attaining the goals of the Draft Plan to the broader population base where it better belongs. } M-4
5. We are unclear as to the impacts of the imminent 1-Hour ozone SIP call on the proposed Section 182 (e)(5) measures are and would like to see more explanation of what could happen in that event. } M-5
6. CEQA: Enhanced Environmental Analysis: Impact of the Environment on a Project (Pages 9-26, 27): We hope that the decision to require these additional analyses and mitigations, if necessary, in your reviews as a responsible agency will not further increase the likelihood of litigation. } M-6

7. Renewable energy sources such as biogas seem to be at odds many times with criteria pollutant control measures. While the Sanitation Districts appreciated the SCAQMD's support on renewable energy legislation in the 2012 legislative season, our attempts to influence CARB, the CEC and the CPUC with respect to favorable treatment of renewable biogas have largely failed, in essence making the economic viability of many future energy development projects questionable. We remain of the opinion that the productive use of biogas renewable fuels is a judicious way to go in terms of air quality planning and hope to continue our partnership with the District in this area.

M-7

Short Term PM 2.5 Measure Comments

1. BCM-04 Further Ammonia Reductions from Livestock Waste (Page IV-A-31). While the Chino area may have an operative desalter project, other areas of the air basin may not. Accordingly, soil and groundwater salt content for the water and wastewater agencies could be an issue.
2. EDU-01: Please see our general comment above.
3. MCS-01(formerly Facility Modernization, now All Feasible Measures aka Application of All Feasible Measures aka All Feasible Measures for All Pollutants aka All Feasible Measure Application)(Page IV-A-44): The name of this control measure should be consistent throughout the document. The balance of our comments on this control measure are in the general comments above.

M-8

M-9

Section 182 (e)(5) Ozone Measures

1. CMB-02 NOx Reductions from Biogas Flares (IV-A-61): The \$20,000 per ton estimate for this control measure is probably low given that very little biogas is actually flared. This could change however as other biogas combustion-related control measures require higher and higher control efficiencies making it difficult to sustain cost-effective onsite distributed generation. Biogas producers should not be penalized for flaring if that is their only recourse. We also look forward to seeing the emissions estimates for this control measure in the final plan.
2. MCS-01 (Page IV-A-76): We have the same comment as on MCS-01 above.

M-10

- 3. MCS-02 Further Emissions Reductions from Greenwaste Processing-Chipping and Grinding Operations Not Associated with Composting (Page IV-A-77): Cal Recycle is currently raising the AB 939 landfill diversion goal through the implementation of AB 341 from 50% to 75% by 2020. Composting is seen as a logical outlet for biodegradable material no longer going to a landfill. We believe your disclaimer that AB 939 diversion goals will not be impacted requires more examination as part of the background to this measure.
- 4. MCS-03 Improved Start-up, Shutdown and Turnaround Procedures (Page IV-A-81): As a holder of many SCAQMD permits, we are very concerned about regulations limiting start-up and shutdown procedures and flexibility. We believe that most equipment operators strive to bring equipment up and down slowly to avoid stresses, to confirm it is operating properly before bringing it to the next level of operation, and to prolong its life as far as practicable. Many of the larger equipment items we operate have CEMS installed and these reflect startup and shutdown history. Combustion equipment on landfill or digester gas may also have many start cycles because of the variable nature of the renewable fuels i.e., the quantity and quality changes frequently.
- 5. INC-01 Economic Incentives to Adapt Zero and Near Zero Technologies (Page IV-A-84): We support the concept of funding renewable energy projects but we are unclear as to the source of funding for this control measure.
- 6. EDU-01 (Page IV-A-91): See our general comment above.

M-11

M-12

M-13

Appendix IV-B Proposed Section 182(e)(5) Implementation Measures

We wish you every success trying to accomplish the ambitious agenda included in this appendix.

- 1. Page IV-B-83: The Baltic Sea comment may not be appropriate.
- 2. Page IB-B-88: The Sanitation Districts would appreciate a position on the off-road equipment working group. The Sanitation Districts operates a large fleet of heavy duty off-road equipment and we have provided test sites and equipment platforms for many CARB control technology studies.

M-14

M-15

Elaine Chang, Dr. P.H.

- 5 -

August 30, 2012

Miscellaneous Comments

- 1. AQMP Pages 3-12 & 13: We appreciate the formation of a working group to explore the landfill emissions data. There was insufficient time to review the CARB input to these data prior to the finalization of the emissions inventory.
- 2. The relative importance of pre-cursor emissions reductions of ammonia could use some more explanation. Page 4-5 of the draft AQMP is one of the few places in the report where ammonia is mentioned. More explanation would help as to how the concentration of ammonia is embedded in the NOx and SOx factors. We also wonder if better episodic enforcement of permit conditions dealing with ammonia emissions in the Chino area might help to mitigate localized ammonium sulfate and nitrate emissions.

M-16

M-17

Again, we appreciate this opportunity to comment and think the Draft Plan represents a remarkable effort.

Very truly yours
Grace Robinson Chan

Gregory M. Adams
Assistant Departmental Engineer
Air Quality Engineering
Technical Services Department

Responses to Comment Letter M
LA County Sanitation District

Response to Comment M-1:

The Socioeconomic Report on the 2012 AQMP was released on September 28, 2012, and includes the costs, benefits, and employment impact from implementing the Plan. Most of the proposed control measures (see Appendix IV-A and Appendix IV-B) include cost effectiveness values in dollars per ton of emission reduction, and the proposed control measures are ranked (see Chapter 6 of the Plan) based on these cost effectiveness values. As noted in Chapter 4 of the Plan, the District proposes to establish a cost effectiveness threshold of \$16,500 per ton of VOC reduction and \$22,500 per ton of NOx reduction. This threshold will trigger further evaluation and a pre-hearing at the District Board prior to the final rule being proposed. Only one control measure, CTS-01, has the potential to exceed the VOC threshold on the upper end of the cost effectiveness range. All the other proposed control measures have a cost effective value less than the threshold. Regardless, it should be noted that during rule development a public review and decision process is instituted to seek lower viable cost alternatives.

Response to Comment M-2:

Table 4-1 was not intended to imply any ranking or priority of the evaluation criteria. The text and table title have been modified to clarify that no ranking is intended.

Response to Comment M-3:

The control measure MCS-01 (Application of All Feasible Measures Assessment) is intended to focus on new technology developed in the future subsequent to the Plan approval, so the specific description of the future actions under the control measure is not possible at this time. However, the triggering of the control measure is likely to occur when new feasible cost-effective best available retrofit control technology is developed and made available. The implementation of MCS-01 could take place in two phases if a technology study is warranted. However, if an assessment of the feasibility, cost effectiveness, and availability of new technology has already been prepared and properly peer-reviewed, a two phase approach might not be necessary.

Response to Comment M-4:

Suggestion noted in EDU-01 measure.

Response to Comment M-5:

U.S. EPA recently proposed to require a new 1-hour ozone attainment demonstration for the South Coast Air Basin. In order to demonstrate attainment with this revoked

standard by 2022, all feasible measures must be included in the SIP revision. Making enforceable emissions reductions commitments based on specific measures as they are identified is the best way to demonstrate that the District is dedicated to realizing the emission reductions necessary to achieve the 8-hour and 1-hour ozone standards. The attainment demonstration for the 1-hour ozone standard will be analyzed and the results provided in a separate attachment to the 2012 AQMP for consideration of the Governing Board at the same time. Future AQMPs will need to further identify specific measures and associated emissions reductions that will allow the “black box” commitments to shrink to zero by 2019 for the 1-hour ozone or 2020 for the 8-hour ozone.

Response to Comment M-6:

The "enhanced environmental analysis" noted by the commenter is not required under any AQMD rules or CEQA statute (with the exception of new school sites). However, lead agencies retain the authority to conduct an analysis of potential health effects on project occupants either within a CEQA document, or outside of it prior to making a decision on the project. The AQMD staff has previously reviewed residential development projects where the lead agency has analyzed and presented the potential health effects to their project, so decision makers were aware of potential impacts on future residences. Text has been added to Chapter 9 to clarify that AQMD staff recommendations for enhanced environmental analysis will continue to be consistent with existing guidance from both the CARB Air Quality and Land Use Handbook and the AQMD Clean Communities Plan.

Response to Comment M-7:

The AQMD will continue to support efforts to encourage the productive use of biogas without its air quality objective.

Response to Comment M-8:

AQMD staff agrees that it could be an issue and intends to assess the potential impact of salt loading on groundwater from the land spreading of manure treated with SBS. Although the incremental increase is expected to be low, the overall impact relative to Regional Water Quality Control Board threshold requirements will need to be examined. Staff intends to work with stakeholders at the water board relative to the potential ground water impacts.

Response to Comment M-9:

The title of the control measure MCS-01 (Application of the All Feasible Measures Assessment) has been made consistent throughout the 2012 AQMP to avoid any confusion.

Response to Comment M-10:

The cost-effectiveness of this control measure will be subject to further refinements during the rulemaking process. In addition, recent staff analysis of the Rule 1110.2 amendment indicated that the control options for biogas internal combustion engines were very cost-effective. Such cost-effective control equipment should help in maintaining the sustainability of onsite distributed generation. The funding for the deployment of the potentially cost-effective alternative of selective non-catalytic reduction emission control technologies as well as subsequent technology assessments should provide further means of maintaining the sustainability of onsite distributed generation.

Response to Comment M-11:

Implementation of the measure is intended to be in harmony with not only the AB 939 diversion goals in the future, but also the amendments to Title 14 currently under development. This measure is meant to focus on the disposition of green material by determining its volume and intended in use. This measure is intended to focus on emission reductions from chipping and grinding operations and should not impact composting and associated operations governed under Rule 1133.3 – Emission Reductions from Greenwaste Composting operations adopted in July 2011. The control measure has been expanded to include a greater discussion of AB 939 requirements.

Response to Comment M-12:

Control measure MCS-03 is carried over from the 2007 AQMP. Although the initial scope of review for startup, shutdown and turnaround activities is likely focus on the minimization of potential flaring emissions at refineries, staff believes that it is possible to develop procedures that can lead to optimization, operational efficiency and emission minimization opportunities applicable to other industries.

The District approach under MCS-03 would be to initially focus on better quantifying emission impacts from startup, shutdown and turnaround activities at refineries, as well as analyzing emission reduction potential. Should the results of these analyses and emission assessments warrant further investigation, a review of potential emission reduction efforts would follow, including a determination of the applicability to other industries. Any subsequent rulemaking efforts would include technical feasibility, socioeconomic impact, and environmental impact assessments, including safety considerations, and certainly involve outreach to affected stakeholders.

Response to Comment M-13:

Funding sources will be from multiple sources such as grants, state program funding, and sources of AQMD funds.

Response to Comment M-14:

The reference to the "Baltic Sea region" is to indicate that such technologies are currently in use. Staff will clarify that such technologies could be transferred to vessels operating at California ports.

Response to Comment M-15:

As provided in ADV-06, a working group will help provide input on technology development and demonstration. The details will be developed after the AQMP is adopted. Staff appreciates the Sanitation Districts efforts in demonstrating advanced control technologies and look forward to working with the Sanitation Districts and other off-road vehicle stakeholders to bring about cleaner off-road vehicles.

Response to Comment M-16:

AQMD staff consistently seeks ways to improve the emission estimation methodology. As it relates to this particular category, we have provided the LA County Sanitation District staff with our inventory methodology, calculation worksheet, and emission factors which were used to estimate the landfill's fugitive emissions. As we have previously discussed, these emissions are the emissions that are not collected by the landfill's collection system and are considered non-permitted emissions. These emissions should have been reported in the Annual Emission Report (AER) as non-permitted emissions, but they were not. We did incorporate the Sanitation District staff's review and recommendations on using the 2008 CARBs GHG emission inventory data for the landfills, however, we were unable to accommodate the request on updating the emission factors, as sufficient information is not available at this time. Additionally, as noted in the comment, we have a mutual agreement to initiate a Landfill Gas Emission Task Force to study all the available documents and develop emission factors that could give a better estimate of the ROG/TOG fugitive emissions. We look forward to a successful partnership.

Response to Comment M-17:

As to the last sentence in page 4-5: It is assumed that the ammonia sources referenced in the Chino area are dairies, which would be the single largest source of ammonia in that area. The primary permits for dairies in the region are only on those that meet the definition of Large Confined Animal facility. Fewer than 30 of the more than one hundred dairies in the Basin are permitted in that way, which excludes a large number of dairies in the region as not subject to the same requirements as in AQMD Rule 223 – Emission Reduction Permits for Large Confined Animal Facilities. Each farm subject to permit is required to meet a menu of requirements outlined in the Rule. Dairies under permit are required to submit rule 223 compliance plans when obtaining a permit and are subject to annual permit renewals. Compliance plans only need to be resubmitted if changes to the plans occur (i.e., change is menu options under the rule).

In that respect, this is the reason for proposed control measure BCM-04 – Further Ammonia Reductions from Livestock Waste which outlines how staff intends to conduct an assessment of using Sodium Bisulfate to treat manure and reduce ammonia emissions, which will include an evaluation of the potential for episodic-only application requirement to focus on poor air quality days.

It should be noted that all dairies are required to report under the Annual Emissions Reporting (AER) Program for PM, VOC, and ammonia. Reports summarize manure production and give emissions credit depending on the manure disposal practice. Use of sodium bisulfate can be reported in the AER Program. At this time, no significant issues with existing requirements exist.

Dr. William A. Burke
Members of the SCAQMD Governing Board
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

RE: 2012 Air Quality Management Plan – Santa Monica Airport

Dear Chairman Burke and Governing Board Members,

I am writing on behalf of the Westside Neighborhood Council, the Mar Vista Community Council, the Venice Neighborhood Council, the West Los Angeles Neighborhood Council, the North Westdale Neighborhood Association, the Neighbors of Santa Monica Airport, and Concerned Residents Against Airport Pollution (“Supporting Organizations”) regarding Santa Monica Municipal Airport (“SMO”) located at 3223 Donald Douglas Loop South, Santa Monica, California 90405. The Supporting Organizations are primarily local neighborhood associations who represent more than 100,000 residents and others who live and/or work near SMO. Moreover, the Santa Monica Airport Commission, an advisory governmental body to the Santa Monica City Council, recently voted to recommend that this letter be adopted by Santa Monica City Council.

The Supporting Organizations request that South Coast Air Quality Management District (“SCAQMD”) review, propose, approve, and submit to California Air Resources Board (“CARB”) an Indirect Source Review Rule regulating air pollution emissions originating from activities at SMO. An Indirect Source Review Rule for SMO should be integrated as a potential control measure in the 2012 Air Quality Management Plan (“AQMP”).

} N-1

While a number of these groups have previously contacted South Coast Air Quality Management District (“SCAQMD”) requesting that SCAQMD impose regulations on SMO, the Supporting Organizations have voted to support this letter to show that there is widespread support

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
August 28, 2012

among these communities for SCAQMD to take action in order to abate the air pollution health impacts that ravage the communities impacted by SMO. The communities have been particularly affected by an increase in jet traffic at the airport over the past 20-plus years that has markedly increased the amount of pollution that is affecting the surrounding community. Martin Rubin, SMO Jet Operations Growth From 1983 (2012) (Exhibit 12).

SMO has a disproportionate environmental health impact on local residents. SMO is unique in having dense residential development less than 300 feet from the east and west ends of the runway. Unlike other Southern California airports, SMO has almost no buffer zone between the runway ends and the surrounding community. Adrian Castro, et al, Santa Monica Airport Health Impact Assessment (2010). A UCLA study noted that “[s]mall airports in heavily populated areas do not necessarily hav . . . buffers . . . so residents may be more directly exposed to aircraft emissions.” Shishan Hu, et al Aircraft Emissions Impacts in a Neighborhood Adjacent to a General Aviation Airport in Southern California, 43 Environ. Sci. Technol. 8039, 8039 (2009) (Exhibit 1). The UCLA study went on to conclude that the residential neighborhoods surrounding SMO have “markedly high concentrations of air pollutants . . . suggesting . . . [that the] buffer areas around . . . [SMO] may be insufficient.” The proximity between the airport and the surrounding community creates a dangerous health risk for local residents.

Local residents living in proximity with the airport face an elevated risk of cancer. According to a study sponsored by the Los Angeles Unified School District, cancer risk arising from maximum exposure to air pollution generated by activities at SMO for local residents ran *thirteen to twenty-six in one million*. Bill Piazza, Santa Monica Municipal Airport: A Report on the Generation and Downwind Extent of Emissions Generated From Aircraft and Ground Support Operations 2, (1999) (Exhibit 2). Cancer risks to local residents from SMO significantly exceed the guideline lifetime

N-2

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
August 28, 2012

cancer risk of one in a million individuals for cancer risk from maximum exposure to a source of air pollutants under the Federal Clean Air Act. 42 U.S.C. § 7412.

N-2

I. South Coast Air Quality Management District is Legally Obligated to Implement an Indirect Source Review Rule Regulating Emissions from Santa Monica Airport.

SCAQMD is legally required to implement an Indirect Source Review rule controlling emissions from Santa Monica Airport. The California Clean Air Act requires that SCAQMD “provide for indirect source controls in those areas of the south coast district in which there are high-level, localized concentrations of pollutants” Cal. Health & Safety Code § 40440(b)(3).

Multiple studies have demonstrated that there are elevated levels of air pollutants such as lead, black carbon, and ultrafine particulate matter on Santa Monica Airport property as well as in neighboring residential areas. *Infra*.

Modeling studies have shown that concentration of ambient lead levels near, at and exceeding the National Ambient Air Quality Standard (“NAAQS”) at Santa Monica Airport as well as at nearby residential neighborhoods. Studies conducted by the U.S. Environmental Protection Agency (“USEPA”) and SCAQMD found areas on Santa Monica Airport’s runway with lead levels violating the current lead NAAQS. U.S. Environmental Protection Agency, Development and Evaluation of an Air Quality Modeling Approach for Lead Emissions from Piston-Engine Aircraft Operating on Leaded Aviation Gasoline 72 (2010) (Exhibit 3); South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study 20–21 (2010) (Exhibit 4). In addition, both studies found elevated ambient lead levels that often exceeded, but averaged near the NAAQS in surrounding residential neighborhoods. *Id*.

N-3

Lead can have irreversible brain and nerve damage, severe developmental impacts on children as well as adverse impacts on adults. Lead has been found to have neurological impacts on children, leading to behavioral problems, learning problems, and lowered IQ. Adults, when exposed

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
August 28, 2012

to lead, can suffer cardiovascular problems such as high blood pressure, and heart disease. Finally, lead exposure has also been found to have negative impacts on the nervous system, kidney function, immune systems, and reproductive ability. U.S. Environmental Protection Agency, Lead in Air: Health (2011), <http://www.epa.gov/airquality/lead/health.html> (last visited Nov. 11, 2011).

Elevated levels of Black Carbon have also been found to have been generated by activities at SMO. Jet takeoffs at SMO have been found to result in large spikes in concentrations of Black Carbon in and around the airport. Hv at 8039; South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study: Follow-up Monitoring Campaign at the Santa Monica Airport 3 (2011) (Exhibit 5).

Black carbon, as a component of particulate matter, has been linked to increased risk of cardiovascular disease, respiratory disease, cancer, and premature death. United Nations Environmental Program, World Meteorological Organization Integrated Assessment of Black Carbon and Tropospheric Ozone (2011) 113–15 (Exhibit 6).

Very high levels of ultrafine particulate matter have also been found at SMO. Studies conducted by the University of California, University of Southern California, CARB, and SCAQMD found elevated ultrafine particle concentrations in the downwind residential areas directly attributable to SMO aircraft operations. South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study at 50–55; South Coast Air Quality Management District, General Aviation Airport Air Monitoring Study: Follow-up Monitoring Campaign at the Santa Monica Airport at 22; Hv at 8039.

Ultrafine particles have been linked to premature death from respiratory and cardiovascular disease. University of California Los Angeles Community Health and Advocacy Training PGY-2 Pediatric Residents, Santa Monica Airport Health Impact Assessment 10 (2010) (Exhibit 7).

N-3

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
August 28, 2012

Ultrafine particulate matter may pose a greater health risk than other, larger forms of particulate matter due to their tendency to penetrate deeper into the body. Ning Li et al, *Ultrafine Particulate Pollutants Induce Oxidative Stress and Mitochondrial Damage* 111 *Env'tl Health Perspectives* 455, 455 (2003) (Exhibit 8).

Airports are a significant source of emissions of Volatile Organic Compounds (VOCs) as well as Nitrogen Oxides (NOx), both of which are ozone-forming pollutants. Colleen Callahan, The Plane Truth: Air Quality Impacts of Airport Operations and Strategies for Sustainability: A Case Study of the Los Angeles World Airports 7–10 (2010) (Exhibit 9); U.S. EPA, Documentation for Aircraft Component of the National Emissions Inventory Methodology (2011) (Exhibit 10).

Ozone has been shown to cause decreased lung function, chest pain, as well as aggravate existing respiratory illnesses such as asthma, pneumonia, and bronchitis. U.S. EPA, Ground Level Ozone: Health, <http://www.epa.gov/air/ozonepollution/health.html> (accessed on March 25, 2012). SMO is located in Northwest Coastal LA County, which exceeded both the State and Federal Ozone standards in 2009 and 2010. South Coast Air Quality Management District, 2010 Air Quality (2011); South Coast Air Quality Management District, 2009 Air Quality (2010).

The California Clean Air Act requires SCAQMD to promulgate Indirect Source controls to regulate pollution from SMO. SCAQMD is required to impose Indirect Source controls in areas where there are “high level, localized concentrations of pollutants.” Cal. Health & Safety Code § 40440(b)(3). A study concluded that there are “high concentrations of air pollutants in the residential neighborhoods downwind of SM[O] due to aircraft activities” Hu at 8039. SCAQMD should act to regulate emissions from Santa Monica Airport.

N-3

N-4

Concerned Residents Against Airport Pollution
2012 Air Quality Management Plan – Santa Monica Airport
August 28, 2012

II. South Coast Air Quality Management District has the Authority under the Federal Clean Air Act to Impose Indirect Source Controls on Santa Monica Airport.

Arguably, SCAQMD is federally preempted from imposing Indirect Source controls on SMO. Both the Federal Aviation Agency and the USEPA have exclusive federal authority over aircraft operations, design, and manufacture. However, SCAQMD has the authority to regulate pollution from SMO with the approval of CARB with its delegated authority under the Federal Clean Air Act. Federal courts have found that states may regulate *emissions* from aircraft engines under the Federal Clean Air Act as long as it does not directly regulate aircraft operations, design, or manufacturing. *California v. Navy*, 431 F.Supp. 1271 (1977) (Exhibit 11). SCAQMD and CARB have federally delegated authority to impose Indirect Source controls on facilities such as airports. 42 U.S.C. § 7410(a)(5).

N-5

III. Santa Monica Airport Could Implement Reasonably Available Control Measures to Reduce its Environmental Health Impact on Local Residents.

SMO could implement control measures to abate its impact on the surrounding community and comply with an Indirect Source Rule. Possible control measures could include reduced idling and holding times for jet aircraft as well as re-directing the exhaust from pre-flight run up tests.

N-6

IV. South Coast Air Quality Management District Should Impose Indirect Source Controls on Air Pollutant Emissions from Santa Monica Airport.

SCAQMD should impose an Indirect Source Review Rule on SMO. In light of SCAQMD's legal obligations, the significant public health risks and the feasibility of control measures that could be adopted, SCAQMD should act to abate SMO's impact on its surrounding communities.

N-7

Thank you for considering these comments. Please put the undersigned on the mailing list for the 2012 AQMP. Should you have any questions or need more information, please contact Mitchell Tsai at (714) 881-4876 or tsai.mitchell@gmail.com.

Responses to Comment Letter N
Concerned Residents Against Air Pollution, et al

Response to Comment N-1:

The AQMD has not observed elevated levels of PM_{2.5} in neighborhoods near the airport so this plan will not include a measure specific to the airport. AQMD will continue to explore possible ways of reducing emissions at the airport.

Response to Comment N-2:

The health effects of air pollutants are addressed in Appendix I. Regarding cancer risk, the AQMD's MATES III study estimates lifetime risk for air toxics near the Santa Monica Airport at about 930 per million, which is lower than the regional average of 1194 per million.

Response to Comment N-3:

The comment cites levels of lead, black carbon, and ultrafine particulate matter. AQMD monitoring studies have not detected exceedances of lead standards either on the runway area or in neighboring residential areas. US EPA modeling studies did not project exceedances in neighboring residential areas but did project exceedances at the blast fence. This was not confirmed by AQMD studies. The statement that both studies found levels often exceeding the NAAQS but averaging at the NAAQS is misleading because the NAAQS itself is in the form of a three month average. The NAAQS itself was not exceeded. Additional discussion of health effects of particulate matter, ozone and nitrogen dioxide are in Appendix I, and additional discussion of ultrafine particulate matter health effects and sources is contained in Chapter 9. AQMD has not observed elevated levels of PM_{2.5} near the airport. There is currently no NAAQS or SAAQS for ultrafines. So, it is not feasible to determine a level to which emissions should be reduced. Therefore, the cited statute does not require regulation.

Response to Comment N-4:

The commenter states that AQMD must adopt an indirect source rule for the airport because state law calls for indirect source rules in areas where there are “high-level, localized concentrations of pollutants” and a study by Hu concluded that there were “high concentrations of air pollutants in the residential neighborhoods “ downwind of the airport. However, this study referred to levels of black carbon and ultrafine particles, not criteria pollutants. Neither EPA nor CARB has yet developed any ambient standards for these particular pollutants. Therefore, it is uncertain what levels of such pollutants would be considered unacceptably “high.” Accordingly, the cited statute does not require regulation. The 2012 AQMP contains a chapter discussing the emerging science relating to ultrafine particles and AQMD staff will continue to monitor the situation.

Response to Comment N-5:

The AQMD staff agrees that it has the authority under state and federal law to adopt indirect source controls. Such authority is not preempted by the Clean Air Act, as held in *National Association of Home Builders vs. San Joaquin Valley APCD*, 627 F. 3d 730 (9th Cir. 2010). Whether any other federal statute would have preemptive effect would likely depend on the particulars of any proposed indirect source rule.

Response to Comment N-6:

See Response to Comment N-5.

Response to Comment N-7:

AQMD staff does not believe that this request should be addressed as part of the 2012 AQMP, but will continue to consider whether such an approach would be viable to reduce emissions in the future.

To: Joe Cassmassi
Subject: Questions about AQMD draft plan and landfill and composting questions

Hello again Joe,

I would like to ask about a few additional AQMD's **stationary source control measures**, and thank you again for your help.

Multiple Component Sources:

MCS-03 (formerly MCS-06 on 2007 AQMP) Improved Start-up, Shutdown, and Turnaround Procedures [All Pollutants].

- *Would this apply to equipment used at landfills and composting facilities? Does it apply to waste-to-energy processes or facilities?*

Incentive Programs:

INC-01 Economic Incentive Programs to Adopt Zero and Near Zero Technologies [NOx]

- *Would this apply to waste to energy facilities at landfills or other processes at landfills?*

INC-02 Expedited Permitting and CEQA Preparation Facilitating the manufacturing of Zero and Near-Zero Technologies

- *Would this apply to something like new conversion technology facilities?*

Thank you again, enormously, for your help!!

Claudia Holguin

[Claudia Holguin wrote]:

Hello Joe,

Your colleague Chris Hynes has recommended that I contact you regarding my question about the AQMD's Draft EIR Master Plan. I am an intern in L.A. County's DPW Environmental Programs Division.

May I ask about the AQMD's **stationary source control measures**? Specifically, I would like to ask about the 2012 Air Quality Management Plan Combustion Sources reductions **CMB-01 phases I and II**. Do the proposed **NOx reductions from RECLAIM apply to landfills as well as other sources**? (This information is found in Table 1-3).

Thank you very much for your time!

Responses to Comment Letter O
LA County DPW, Cynthia Holguin

Response to Comment O-1:

Control measure MCS-03 is carried over from the 2007 AQMP. Although the initial scope of review for startup, shutdown and turnaround activities will likely focus on the minimization of potential flaring emissions at refineries, staff believes that it is possible to develop procedures that can lead to optimization, operational efficiency and emission minimization opportunities applicable to other industries.

The District approach under MCS-03 would be to initially focus on better quantifying emission impacts from startup, shutdown and turnaround activities at refineries, as well as analyzing emission reduction potential. Should the results of these analyses and emission assessments warrant further investigation, a review of potential emission reduction efforts would follow, including a determination of the applicability to other industries. Any subsequent rulemaking efforts would include technical feasibility, socioeconomic impact, and environmental impact assessments, including safety considerations, and certainly involve outreach to affected stakeholders.

Response to Comment O-2:

These incentives can apply to waste to energy processes or other landfill processes as long as they are not needed to comply with current regulation or other legally-enforceable requirement.

Response to Comment O-3:

The incentive program, INC-02, has yet to be developed so specific qualifications for the incentives have not yet been determined. However, the intent of the control measure is to encourage the manufacturing of zero and near-zero emission technologies, such as fuel cells and electric batteries, to be used by a variety of stationary and mobile source applications resulting in zero end-use emissions. This can be accomplished with the manufacturing of either advanced technology or control equipment. Conversion technology could be considered advanced technology converting post-recycled solid waste into useful products. The process has beneficial effects as compared to incineration or sending materials to the landfill. However, the inclusion into the program would depend on whether this process is generating products producing zero or near-zero end-use emissions. For example, the renewable energy produced would reduce greenhouse gases, and air emissions would be comparatively lower, but it would need to be determined if the resulting emissions are zero or approaching zero. A stakeholder working group will be established to discuss and propose program designs so the commentator is encouraged to participate.

P. American Coatings Association (ACA), David Darling, August 31, 2012

August 31, 2012

Dr. Elaine Chang
Deputy Executive Officer, Planning, Rules & Area Sources
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

RE: South Coast Air Quality Management District Draft 2012 Air Quality Management Plan; ACA Comments

Dear Dr. Chang:

The American Coatings Association (ACA)¹ submits the following comments on the South Coast Air Quality Management District's (SCAQMD or the District) Draft 2012 Air Quality Management Plan (Draft 2012 AQMP) released on July 18, as well as incorporates by reference its earlier comments on proposed elements of the AQMP. Please see the attached documents for reference to ACA's previous comments.

I. Introduction

ACA believes that the SCAQMD should remove the proposed VOC reduction control measures – CTS-01, CTS-02, CTS-03, and CTS-04 – from the Draft 2012 AQMP for the following reasons:

- The coatings industry has made significant strides in reducing its products' VOC emissions in the past, and the District should focus on other sources for further emissions reductions instead of unfairly targeting the coatings industry.
- The District should take credit for the emissions reductions outlined in the 2007 AQMP CTS-02 "Clean Coating Certification Program" emission credits resulting from the Rule 314 AIM fee rule, which amount to more than double the emission estimates from the current draft CTS-01. Given these credits, the 2012 AQMP CTS-01 is not needed.
- Reducing VOC emission will have no appreciable impact on ozone formation since the SCAQMD region is NOx limited. ACA urges the District to continue to focus on NOx reductions and remove the proposed VOC measures from the AQMP, especially since VOC measures are not cost effective for reducing ozone compared to NOx reductions.

P-1

¹ The American Coatings Association (ACA) is a voluntary, nonprofit trade association working to advance the needs of the paint and coatings industry and the professionals who work in it. The organization represents paint and coatings manufacturers, raw materials suppliers, distributors, and technical professionals. ACA serves as an advocate and ally for members on legislative, regulatory and judicial issues, and provides forums for the advancement and promotion of the industry through educational and professional development services.

- The District should remove CTS-01 to CTS-04 from the 2012 AQMP, or at the very least, remove the hard VOC targets from the Plan.
- ACA has a number of particular concerns with the individual control measures outlined in CTS-01, CTS-02, and CTS-03. These concerns are described in detail below in section IV.
- ACA respectfully requests additional time to comment on the Draft 2012 AQMP and additional time for the District to fully address and respond to stakeholder input concerning this crucial planning document.

P-1

III. The Coatings Industry and VOC Reductions

The coatings industry has made substantial progress in reducing the level of VOCs in its products in the South Coast Air Basin as a result of regulatory pressure, increased demand for green products, and individual corporate sustainability initiatives. ACA seeks to assure that appropriate inventory credit is given for the significant reductions already achieved in mass and reactivity of VOC emissions from architectural and associated coatings. Even given this significant progress, the coatings industry continues to be the target for further VOC reduction measures in the Draft 2012 AQMP. Continuing to target the paint and coatings industry and imposing further VOC reduction commitments is unreasonable, and ACA urges the District to focus on different options and sources, especially a NOx heavy approach, to reduce ozone in the South Coast Air Basin.

The coatings industry has been one of SCAQMD’s primary targets for VOC reductions over the course of the last three decades as the District continues to impose increasingly stringent rules on the coatings industry. Recently, the District estimated emissions from the coatings industry were lowered from 49 tons per day (tpd) in 2002 to 22 tpd in 2008, including colorants. The District estimates that this level will be further reduced to just 15 tpd by 2014, including colorants, reflecting a drop of approximately 37 to 40 tpd from architectural coatings alone in the past 12 years. This drop represents over 70% of the VOC emissions inventory from this source category – a severe cut by any standards.

P-2

ACA believes that the coatings industry has contributed a significant amount to reducing ozone in the South Coast Air Basin and should not be a constant “bull’s eye” for further reductions. Just since the 2007 AQMP, the District has obtained nearly 26 tpd of VOC emission reductions at a cost of \$73.8 million, as documented in the table below.

Rule	Adoption Date	Summary	VOC Reductions	Estimated Costs
Rule 314	June 6, 2008	AIM Fee Rule	10 tpd*	\$13.65 Million
Rule 1143	March 6, 2009	Consumer Paint Thinners and MPS	9.75 tpd	\$41.4 Million
Rule 1113	June 3, 2011	AIM Rule Amendments	4.4 tpd	\$10 Million
Rule 1107	November 2012	Coating of Metals Parts and Products Amendments	2.21 tpd	\$8.7 Million
Total			26.36 tpd	\$ 73.8 Million

* ACA Estimated

The District even acknowledges that “[w]ithout an adequate and fair-share level of reductions from all sources, the emissions reduction burden would unfairly be shifted to sources that have already been doing their part for clean air.” Draft 2012 AQMP, pg. 4-6. The coatings industry has been doing its part for clean air, and the District should explore other options to obtain further ozone reductions; for example, the District and its partner agencies at the local, state, and federal levels should focus on passenger cars, off-road equipment, light duty trucks, recreational boats, and petroleum marketing, among other sources.

Furthermore, it is critical that the AIM inventory is accurate and reflects the significant VOC reductions from the coatings industry since the AQMP and all future regulatory actions are based on these estimates. In our July 5, 2012 AQMP comments, ACA suggested that the District take credit for emission reductions from the Rule 314 AIM Fee Rule (see Attachment A). Initial reactions from the District suggest that the District would need to review this concept with EPA. ACA believes that since the 2007 CTS-02 control measure “Clean Coating Certification Program”, has already been approved in the State Implementation Plan (SIP), there should be no hurdles in the District taking credit for emission reductions as the result of the Rule 314 AIM Fee Rule. The following is a description of CTS-02 from the 2007 AQMP:

“PROPOSED METHOD OF CONTROL

First, a certification criteria would be established for distinguishing products that are considered super compliant (i.e. low-, ultra low-, or zero-VOC content levels), from other compliant products. Secondly, a certification process would be established for those products meeting the ‘Clean Air Coating’ criteria. Certified products would be allowed to use the District certification and promote the products as being ‘environmentally friendly.’ *Should the District produce fee related programs for VOC products, consideration will be given to promote super compliant products.*

EMISSIONS REDUCTION

This voluntary certification program's objective is to positively influence industrial, commercial, and consumer behavior in selecting ultra-low volatile organic compound (VOC) coatings and foster the marketing of ultra-low polluting technologies in an overall effort to reduce VOC emissions. *Any VOC reductions due to promoting the use of ultra-low VOC coatings will be quantified via future SIP revisions.”*

While the District did not develop a coating certification program under Rule 314 (please note that ACA does not support a certification system), the District did set a threshold in Rule 314 – 5 g/l material VOC – at which fees would not be assessed, and the District also maintains a Super-Compliant Architectural Coatings Manufacturers and Industrial Maintenance Coatings List on the District website. ACA also suggests that the fees imposed under Rule 314 likely resulted in more emission reductions than a certification program. Based on Rule 314 data (see below), ACA believes that the District should quantify and take credit for at least 10 tpd of emission reductions as a result of Rule 314.

P-2

	2008	2014	2019/2020	2023
2007 AQMP	22.65	24.19	26.55	25.81
2012 AQMP (table A-1 – A-5)	21.9	15.46	16.17	16.71
Additional colorant reduction	3.0	3.0	3.0	3.0
Excess emission reductions	3.75	11.73	13.38	12.1

P-2

The emissions credits from Rule 314 amount to more than double the emission estimates from the proposed 2012 AQMP CTS-01 control measure. For these reasons, the District can quantify and demonstrate further VOC reductions from coatings, and CTS-01 is, therefore, unnecessary.

III. VOC Reduction Measures in the Draft 2012 AQMP

ACA strongly objects to the inclusion of the VOC reduction measures contained in CTS-01, CTS-02, CTS-03 and CTS-04 in the 2012 AQMP since SCAQMD has failed to provide an adequate justification for incorporating these VOC reduction commitments in the SIP. The District readily admits that reducing VOCs will not reduce ozone. The District should focus solely on NOx reductions measures. Without a showing of necessity, the District should remove these specific VOC measures from the 2012 AQMP and refrain from locking in VOC emissions targets for these particular sources.

ACA questions SCAQMD’s decision to include ozone attainment provisions in the 2012 AQMP. Even if SCAQMD finds a continuing need to include ozone reduction measures in California’s SIP, the District has failed to demonstrate why further VOC reductions, in particular, are necessary to achieve its ozone attainment goals. According to the federal Clean Air Act (CAA), States are only required to submit SIPs that “include enforceable emissions limitations, and such other control measures, means or techniques...as may be necessary or appropriate to provide for attainment of such standards...” CAA § 172(a)(6); § 110(a)(2)(A). Nothing in the Draft 2012 AQMP or CTS-01 to CTS-04 explains why VOC reductions are necessary. SCAQMD provides one statement in the AQMP in defense of the VOC reductions, arguing that “VOC reductions are, however, still needed to provide additional benefits, especially in the western areas of the Basin.” Draft 2012 AQMP, pg. ES-4. This assertion is not substantiated by any further information or explanation as to why these VOC reductions are deemed necessary to reduce ozone. The District should explain in detail why the VOC reductions are necessary to achieve ozone attainment in the South Coast Air Basin or should remove these VOC reduction measures from the 2012 AQMP and California SIP submittal.

P-3

Reducing VOC emission in the South Coast Air Basin will not reduce ozone. And it appears that the District does not dispute this point. The District concluded in the 2007 AQMP that major reductions in emissions of oxides of sulfur (SOx), particulate matter less than 2.5 microns (PM2.5) and NOx are necessary to attain the air quality standards for ozone and particulate matter by the dates mandated by federal law. In the Draft 2012 AQMP, the District again determined “that a strategy focusing primarily on NOx reductions has been deemed the best way to achieve long-term ozone attainment objectives,” especially “given that a heavy VOC reduction strategy alone could not achieve the ozone standards....” Draft 2012 AQMP, pg. ES-4. Given this, the 2012 AQMP ozone measures should focus on NOx reductions since VOC control measures will have little or no impact on ozone attainment in the District.

As an aside, focusing on NOx reductions in the SIP will not handicap the District since it clearly has the authority to impose further VOC reductions in the future, through Rule 1113 for example, without locking any VOC commitments into the 2012 AQMP. ACA suggests the District go even further in the 2012 AQMP and provide more background discussions and modeling information on the benefits of NOx reductions as opposed to VOC reductions.

Next, ACA is extremely concerned that if the extreme and unproven reductions are approved, especially in CTS-01 and CTS-02, the coatings industry will be forced to achieve the VOC targets regardless of whether the control measures are necessary and technologically feasible. Setting a hard target and then later justifying that target with subsequent analyses is inappropriate and defeats the critical safeguards provided by the administrative rulemaking process.

ACA is encouraged that the District has at least included some language that allows for future flexibility, or clearly state that any specific numeric goals or targets are subject to the District's future analyses and the rulemaking process and may be adjusted based on technical and economic concerns such as the following statement: "The District is committed to adopt the control measures in Tables 4-2 and 4-4 unless these measures or a portion thereof are found infeasible. . . ." Draft 2012 AQMP, pg. 4-41. The Draft 2012 AQMP describes infeasibility where "the proposed control technology is not reasonably likely to be available by the implementation date in question, or achievement of the emission reductions by that date is not cost-effective." The District, however, should go further and remove the hard VOC targets from the individual source sections in CTS-01 to CTS-04.

Lastly, under California law, a SIP must "include an assessment of the cost effectiveness of available and proposed control measures and shall contain a list which ranks the control measures from the least cost-effective to the most cost-effective." Cal. Health & Safety Code Section 40922(a). The District must also consider other factors as well, including "technological feasibility, total emission reduction potential, the rate of reduction, public acceptability, and enforceability." Cal. Health & Safety Code Section 40922(b). When assessing cost effectiveness, ACA urges the District to not only consider the cost effectiveness of the tons per day of VOC reductions, but the cost effectiveness of the control measure in reducing ozone itself, since this is the ultimate goal of the regulations. Although VOC reductions may appear to be cost effective when viewed alone, VOC reductions are not cost effective if they do little or nothing to reduce ozone levels in the South Coast Air Basin. After conducting such analysis, the District will be able to determine whether the VOC reductions are truly cost effective.

IV. Concerns Regarding the Specific Implementation Measures for Ozone

Although ACA objects to the inclusion of any of the VOC control measures in the Draft 2012 AQMP, we provide the following specific comments on the District's proposed implementation measures for ozone that specifically target individual sources for VOC reductions in Appendix IV(A) in sections CTS-01, CTS-02, CTS-03, and CTS-04.

A. CTS-01: Further VOC Reductions from Architectural Coatings

ACA appreciates that the District lowered the VOC commitment for architectural coatings to 2-4 tpd, but the District has still not explained why a minimum of 2 tpd is necessary to meet its

P-3

ozone attainment goals. Beyond this general complaint, ACA has the following concerns with CTS-01.

1. Emissions inventory for architectural coatings

ACA requests that the District make the following changes to the architectural coatings emissions inventory.

First, the District’s architectural coatings emissions estimates vary from the Draft 2012 AQMP Chapter 3 Base Year & Future Emissions, which reference Appendix III, to the estimates included in CTS-01 in Appendix IV(A). There is a discrepancy between the estimates for 2019 and 2023, varying as much as 1.33 tpd and 2.59 tpd respectively between the two sections. See the following comparison:

	2008	2014	2019	2023
CTS-01	21.9 tpd	15.8 tpd	17.5 tpd	19.3 tpd
Chap. 3/Appendix III	21.9 tpd	15.46 tpd	16.17 tpd	16.71 tpd

ACA suggests that the District update CTS-01 with the lower Chapter 3 Base Year & Future Emissions estimates.

Second, the District has traditionally assumed that AIM VOC emissions are directly correlated to the volume of coatings sold in the District; as the volume of AIM coatings increases, the VOC emissions from AIM coatings increase as well. The District also assumed that once the economy improved, AIM Coatings sales would increase and AIM VOC emissions would return to 2008 levels. Recent Rule 314 emission data (see below) suggest this is not be the case. While volumes increased by approximately 7%, emissions decreased by approximately 2%. ACA suggests that the VOC content of coatings has drastically decreased as the result of Rule 314 AIM Fee Rule, and the general industry market reformulation towards zero or low-VOC coatings. ACA requests that the District review its assumptions with regards to AIM coatings and revise these assumptions accordingly to match the known historical trends.

	2008	2009	2010	2011
Coatings Volume	39,986,966 gal	34,726,037 gal	35,001,778 gal	37,749,674 gal
VOC Emissions	16.10 tpd	12.05 tpd	12.05 tpd	11.86 tpd

2. VOC Limits for Flat, Nonflat and Primer, Sealer, Undercoaters

The 1.7 tpd reduction from the flat, nonflat, and primer, sealer, undercoater (PSU) categories assumes that the limits for these entire categories will be lowered to 25 g/l regulatory VOC content, even though the CTS-01 description mentions the potential creation of new draft subcategories (e.g., primers for metals). Note that the creation of these categories is not included in the 1.7 tpd reduction estimate. CTS-01 should include a range of emissions reductions based on the likely reductions from amending the flat, nonflat, and PSU categories, not just the best case scenario if the entire categories are reduced to 25 g/l.

P-4

P-5

ACA is concerned that limits below 50 g/l for flat and nonflat and 100 g/l for PSUs may be difficult to achieve given the current problems associated with VOC test methods. Depending on a test method that is unreliable at lower VOC levels will create a significant enforcement problem. In addition, ACA suggests the District complete a technology assessment to be sure that it is technologically feasible to lower the VOC limits, especially since certain products require higher VOC content levels to adequately perform.

P-5

3. Small Container Exemption

ACA is concerned that eliminating the small container exemption, or even eliminating the exemption for certain categories, is problematic since the small container exemption is a crucial compliance option. This exemption provides a safety valve or a last resort option that allows for traditional, high performing products for challenging application situations where the limits in certain categories are exceptionally low or a category is eliminated, especially since the SCAQMD Rule 1113 limits are the most stringent in the United States. There are also a host of niche coatings that manufacturers can now sell in small containers that would need to be recategorized if the small container exemption is modified or removed.

ACA is very concerned that the current language only mentions the complete phase out of the small container exemption embedded in SCAQMD Rule 1113, and not any of the other available options. Under the most recent version of CTS-01 in the Draft 2012 AQMP's Appendix IV(A), under the Proposed Method of Control section, the small container exemption section excludes any reference to other potential options for emissions reductions. Given the importance of this exemption for the industry, ACA urges the District to revise the language in the current 2012 Draft AQMP by reincorporating the following draft language from June 2012:

P-6

"Staff will evaluate various options for the SCE, including a complete phase out of the exemption, creating certain new categories with higher VOC limits (e.g., primer for recycled rubber floor), creating a maximum allowable VOC limit, or phasing out the SCE for certain coating categories."

This language ensures that the District will evaluate several options beyond just a complete phase out of the exemption when the District amends Rule 1113 in the future.

Along a similar vein, CTS-01 should include a range of target emissions reductions based on the likely reductions from amending the small container exemption, not just the best case scenario of eliminating the entire exemption. The current 1.9 tpd estimate for reductions resulting from amendments to the small container exemption assumes the complete elimination of the entire exemption. The estimate should factor in the other available options, including the creation of certain new categories with higher VOC limits (e.g., primer for recycled rubber floor), a maximum allowable VOC limit, or a phase out of the small container exemption for only certain coatings categories.

B. CTS-02: Further Emission Reductions from Miscellaneous Coatings, Adhesives, Solvents and Lubricants

P-7

The District should further elaborate on its proposed control measures in CTS-02. It is impossible to comment on CTS-02 given the lack of any particular details in the control measure

summary. While the District mentioned the possibility of lowering the VOC limits in eight different rules, the District did not list any specific categories that may be impacted or possible VOC limits or reduction measures. ACA requests that the District provide more details on potential VOC limit reductions so that stakeholders can submit substantive comments on CTS-02.

ACA objects to the District's proposal to reduce the VOC limits of some of the coating categories listed in rules 1106 and 1106.1 because, as the following paragraphs explain in greater detail, it is not technologically feasible to make further reductions.

Rule 1106.1 has had a negative effect on South Coast's pleasure craft business since it was introduced in 1992. In the 1970's and 80's, California was considered by many to be the pleasure craft building capital of the world. The following pleasure craft builders operated in California prior to rule 1106.1: Catalina Yachts, Columbia Yachts, Islander Yachts, Capital Marine, Corsair Marine, Ericson Yachts, Laguna Yachts, Westsail, Pacific Seacraft, Bill Lee Yachts, Pacific Boats, Moore Bros, Express, and Wilderness Boats. The introduction of Rule 1106.1 drove these builders out of South Coast and California into other parts of the United States, or to other countries. Even today, the coatings industry has yet developed coatings which meet customer expectations and requirements and which also meet VOC limits in the following categories: Extreme High Gloss; Finish Primer/Surfacer; Other Substrate Antifoulant; and Antifouling Sealer/Tie Coat.

The situation for rule 1106 is similar to that for rule 1106.1. Industry has struggled to meet the VOC limits listed in this rule and does not yet have technologically sound solutions to provide coatings of lower VOC content. Therefore, it is not possible to lower VOC limits in many of the coating categories in this rule. As a result of developments from the International Maritime Organization (IMO) Antifouling Systems Convention (2001), there is a requirement for at least one additional specialty category – Antifouling Sealer/Tie Coat – which industry recommends a level of 420g/L; this also applies to Rule 1106.1

ACA welcome the opportunity to discuss revisions to both rule 1106 and rule 1106.1 with the District in greater detail in due course.

C. CTS-04: Further VOC Reductions from Consumer Products

As mentioned earlier, the SCAQMD basin is NOx limited and therefore insensitive to additional VOC reductions, including the proposed measures in CTS-04. In addition, scientific studies and analysis clearly show that LVPs have minimal impacts on VOC emissions and ozone formation. Further, the LVP exemption is an important compliance mechanism that is necessary at this point to comply with the stringent VOC limits in the California consumer product regulations.

V. California State Implementation Plan Schedule

SCAQMD should abandon its accelerated schedule for adopting the Draft 2012 AQMP and submitting it to the California Air Resources Board (CARB). SCAQMD should establish a more realistic and reasonable schedule for the adoption of its five-year air quality management plan. The District released the 379-page Draft 2012 AQMP and its six appendices on July 18, 2012 – over 1,000 pages are contained in these documents. The District cannot reasonably expect

P-7

P-8

P-9

ACA Comments – South Coast Draft 2012 AQMP

August 31, 2012

stakeholders to analyze these documents and provide substantive comment by August 31, 2012. This 44-day time frame is insufficient for stakeholders to adequately respond to the District's proposal.

Furthermore, South Coast staff has indicated the District's intention to raise the final version of the 2012 AQMP to the SCAQMD's Governing Board on November 2, 2012. We appreciate the District moving the date back by one month; however, we are still concerned that this schedule does not provide nearly enough time for the District to fully consider all stakeholder comments and incorporate changes into the Draft 2012 AQMP.

Given the importance of the 2012 AQMP – it effectively locks air quality targets into the California SIP and guides the agency's decision-making for planned future regulatory actions that impact a range of regulated entities – the District's should decelerate its schedule. ACA respectfully requests additional time to comment on the Draft 2012 AQMP and additional time for the District to fully address and respond to stakeholder input concerning this crucial planning document. For more information, please refer to our formal request letter dated August 29, 2012.

VI. Conclusion

The District should remove CTS-01, CTS-02, CTS-03, and CTS-04 from the 2012 AQMP, given the fact that additional VOC reductions will have no impact on ozone formation. The District should instead focus its efforts on other source categories for further reductions.

Thank you for the opportunity to comment. If you have any questions or need any further information on the issues discussed here, please feel free to contact me at (202) 462-6272.

Sincerely,

/s/

RE: SCAQMD 2012 Air Quality Management Plan (AQMP) Advisory Group Meeting #10 – Control Measure Concepts; ACA Comments

Dear Dr. Chang:

The American Coatings Association² (ACA) submits the following comments on CTS-01 *Further Emission Reduction from Architectural Coatings (Rule 1113)*.

Introduction

The following is an overview of ACA’s concerns with the Air Quality Management Plan (AQMP) and CTS-01:

1. The District has made several recent reductions to the Architectural Coatings 2008, 2014, 2019 and 2023 inventories. ACA suggests that additional reductions are needed since the current estimates are likely too high and requests additional background on the development of the inventory estimates.
2. Given the fact that the District is actually showing an excess of 4.0 tons per day (tpd) of volatile organic compounds (VOC) reductions in the SIP commitment outlined in the 2007 AQMP, ACA suggests that 4.6 tpd from CTS-01 is not needed.
3. ACA is very concerned that the estimated 4.6 tpd reductions from CTS-01 amounts to nearly a 40% reduction in the architectural and industrial maintenance (AIM) coatings inventory which is excessive on its face and unreasonable.
4. The 4.6 tpd CTS-01 emission reduction estimate is based on a best case scenario and very “optimistic” assumptions that are not consistent with the CTS-01 descriptions and are therefore too large. If the District does not obtain these reductions, they will once again be forced to lower VOC limits for other AIM coatings categories to reach the 4.6 tpd goal.
5. The CTS-01 Control Measures are technically problematic and ACA requests additional background on the development of these measures.
6. SCAQMD is not giving adequate consideration to the science-based fact that ozone formation in the SCAQMD region is ultimately NOx-limited.

P-10

Architectural and Industrial Maintenance (AIM) Coatings Inventory

ACA seeks to assure that appropriate inventory credit is given for the significant reductions already achieved in mass and reactivity of VOC emissions from architectural coatings. It is critical that the AIM inventory is accurate since the AQMP and all future regulatory actions are based on these estimates. The District must fully explain its emissions calculations, and all of its underlying assumptions, to provide a well-grounded basis for its decision making and future regulatory actions. Relying on faulty assumptions and inadequate or unrealistic emissions estimations is arbitrary and capricious, and will have an unjustified, negative impact on the paint

P-11

² The American Coatings Association (ACA) is a voluntary, nonprofit trade association working to advance the needs of the paint and coatings industry and the professionals who work in it. The organization represents paint and coatings manufacturers, raw materials suppliers, distributors, and technical professionals. ACA serves as an advocate and ally for members on legislative, regulatory and judicial issues, and provides forums for the advancement and promotion of the industry through educational and professional development services.

and coatings industry. The lack of information concerning the District’s calculations also denies affected stakeholders the opportunity to fully analyze and comment on the District’s inventory estimates. To allow ACA to fully comment on CTS-01, ACA requests detailed information on Rule 314 data including sales volume; sales weighted average VOC content; emissions, etc. for each category for years 2008-2011, including the small container exemption.

The District should explain the considerable variability between its different AIM inventory estimates over the last few months, and account for this variability in the AQMP. The AIM inventory estimates have varied drastically over the last several months. For example, at the May AQMP meeting, staff released a preliminary draft AIM inventory of 26.16 tpd for 2008, 22.87 tpd for 2014, and 24.72 tpd for 2023. The revised inventories released at the June 14 meeting were 21.91 tpd for 2008, 15.46 tpd for 2014, 16.17 tpd for 2019 and 16.71 tpd for 2023. The CTS-01 Summary also includes an estimate of 19.1 tpd for 2008, and 17.3 tpd for 2019. As summarized in the table below, the CTS-01 AIM estimate for 2008 is 7 tpd less than the May 17 estimates, far exceeding the estimated 4.6 tpd expected from the control measure. It appears that the control emission reductions are needed since the revisions to inventory are larger than the expected control measure reductions.

**South Coast Air Quality Management District
Estimated Emissions from Architectural & Industrial Maintenance Coatings**

	2008	2014	2019	2023
May 17 AQMP Meeting	26.16 tpd	22.87 tpd		24.72 tpd
June 14 AQMP Meeting	21.91 tpd	15.46 tpd	16.17 tpd	16.71 tpd
Difference	4.25 tpd	7.41 tpd		8.01 tpd
% Change	16%	33%		33%
CTS-01	19.1 tpd		17.3 tpd	
Difference from May 17	7.06 tpd			
Difference from June 14			1.13 tpd	
% Change	27%		7%	

P-11

Further, it is important to note that based on information from a meeting with District staff on June 14, the CTS-01 2008 estimate of 19.1 tpd actually includes 13.3 tpd for architectural coatings, 3.0 tpd for colorants and 2.8 tpd for solvent usage. The colorant and solvent usage tonnage will be reduced to nearly zero by 2014 based on recent rule amendments. So it is unclear how the District estimated 17.3 tpd in 2019. Assuming the inventory of 12 tpd from 2009, 2010, and 2011 continues into the future, ACA questions the CTS-01 estimate of 17.3 tpd for 2019; this estimate is likely 5.3 tpd, much higher than the estimated CTS-01 4.6 tpd control measure reduction. As such, ACA requests additional information regarding the CTS-01 2014, 2019, and 2023 inventory estimates. The District should account for the additional future reductions resulting from requirements for colorants, VOC limit reductions, thinning/cleaning solvents, reductions from Rule 314 AIM fees as well as reductions from “green marketing” formulation changes that will offset any increases.

The District should also explain its assumptions that recent reductions in the architectural coatings emissions inventory were the result of the economic recession. In the past the District assumed that once the economic growth increased, the emissions from architectural coatings would also increase. However, at the June 14 meeting, Staff confirmed that Rule 314 emissions data indicate that even though architectural coatings volumes have increased by 7% from 2010 to 2011, the emissions have decreased by 2%. ACA suggests any "rebound" assumptions in the inventory be revised. ACA also questions the District's assumption that increased population in the future will directly increase architectural emissions as well. ACA suggests the District review and release the inventory estimates and lower any assumed emission increases either due to improved economic growth or population increases in the district. The breakdown should include assumptions for population growth, economic impacts, predicted sales volumes, and AIM regulations.

P-11

The District has significantly lowered the 2008 AIM inventory estimates since the May 17 meeting – a total of 7.06 tpd. ACA believes the 2019 estimate is still likely to be at least 5.3 tpd too high. Bottom line, the District's changes to the AIM inventory since the May 17 AQMP meeting and the potential over estimation of the 2019 AIM inventory will result in nearly 3 times the estimated reductions that would be achieved via CTS-01. Given the significant impact of these emissions inventory calculations, the District should explain each of the individual elements that comprise the emissions estimate and projected future inventory, so that the industry can adequately comment on the AQMP.

District Progress Implementing the 2007 AQMP

On table 1-1 of the CEQA, the District is actually showing an excess of 4.0 tpd of VOC reductions SIP commitment outlined in the 2007 AQMP. ACA suggests that if the District is running 4 tpd excess VOC emissions from the 2007 AQMP, the 4.6 tpd from CTS-01 is not needed.

P-12

ACA Inventory Monitoring Concept

ACA is very concerned that the estimated reductions from CTS-01 of 4.6 tpd would result in a roughly 40% reduction in the 2019 AIM inventory, relying on ACA's 12 tpd estimate. Requiring a 40% reduction in emissions from a single source category is excessive and unreasonable.

ACA suggests the District develop an AQMP strategy that relates development and implementation of CTS-01 to future AIM emissions. If, for example, the District is able to document (through Rule 314) that the AIM emissions in 2012 are less than 12 tpd (hypothetical number), then the District would not need to develop and implement CTS-01, since the District could take credit for the reductions in Rule 314. If, on the other hand, the AIM emissions in 2012 are more than 12 tpd, then the District could develop and implement CTS-01 to reduce the source category's emissions to below 12 tpd. Another benefit of this option is that it resolves the District's concern that recent inventory reductions are solely related to the economic downturn (i.e. the emissions will increase once the economy improves).

P-13

AIM VOC Reduction Estimates are Overly Optimistic

The District estimated reductions from CTS-01 to be 4.6 tons per day. Based on discussions with District Staff at the June 14, 2012 meeting, the 4.6 tpd reduction estimate is based on a best case scenario and very optimistic assumptions that are not consistent with the CTS-01 descriptions. As such, ACA believes that this emission reduction estimate of 4.6 tpd is too high. If, for example, the District does include a new subcategory for primers, or does not completely phase out the small container exemption, the District will once again be forced to lower VOC limits for other AIM coatings categories to reach the 4.6 tpd goal since the maximum tonnage reductions are included in the AQMP.

P-14

Arbitrary Control Measures Will Result in Need for Additional AIM Reductions

Once again, similar to our comments on the 2007 AQMP (letter dated December 7, 2006), ACA is concerned that if these extreme and unproven reductions are approved, the industry will be forced to achieve the VOC targets regardless of whether the CTS-01 control measures are technologically feasible. Once these reduction estimates are approved in the AQMP and cemented into the State Implementation Plan (SIP), the District may sidestep technical or economic concerns with the regulations by claiming that it has no choice since the reductions are already "locked" into the AQMP and SIP. Setting a hard target and then later justifying that target with subsequent analyses is inappropriate and defeats the critical safeguards provided by the administrative rulemaking process. Given these significant concerns, the Plan should clearly state that any specific numeric goals or targets are subject to the District's future analyses and the rulemaking process and may be adjusted based on technical and economic concerns. Providing a range for the emissions reductions targets would give the District needed flexibility.

P-15

CTS-01 Control Measures are Technologically Problematic

ACA offers the following comments regarding concerns with the specific proposed measures outlined in CTS-01:

1. Reduce VOC Emissions from Flat, Nonflat and Primer, Sealer, Undercoaters

The 1.7 tpd reduction from the flats/nonflats/PSU categories assumes that the limits for these entire categories will be lowered to 25 g/l regulatory VOC content, even though the CTS-01 description mentions the potential creation of new draft subcategories (e.g., primers for metals). Note the creation of these categories is not included in the 1.7 tpd reduction estimate. CTS-01 should include a range of emissions reductions based on the likely reductions from amending the flat, nonflats, and PSU categories, not just the best case scenario if these categories are completely reduced to 25 g/l.

P-16

ACA is concerned that limits below 50 g/l (flat and nonflat) and 100 g/l (PSU's) may be difficult given the current problems associated with VOC test methods. Depending on a test method that is unreliable at lower VOC levels will create a significant enforcement problem. In addition, ACA suggests the District complete a technology assessment to be sure that it is technologically

feasible to lower the VOC limits, especially since certain products need to be kept at the current limits.

2. Small Container Exemption

The 1.9 tpd reduction from the Small Container Exemption (SCE) assumes complete elimination of the entire small container exemption, even though the CTS-01 description mentions creating certain new categories with higher VOC limits (e.g., primer for recycled rubber floor), creating a maximum allowable VOC limit, or phasing out the SCE for only certain coating categories. Note these options are not included in the 1.9 tpd reduction estimate. CTS-01 should include a range of target emissions reductions based on the likely reductions from amending the small container exemption, not just the best case scenario of eliminating the entire exemption.

ACA is concerned that eliminating the small container exemption, or even eliminating the exemption for certain categories, is problematic since the small container exemption is critical given the fact that the SCAQMD Rule 1113 limits are the most stringent in the US. This exemption provides a "safety valve" or a last resort option that allows for traditional products in problem situations when the limits in categories become increasingly more stringent or a category is eliminated. There are also a host of niche coatings that manufacturers can now sell in small containers that would need to be categorized if the small container exemption is modified or removed.

P-17

3. Application Techniques with Greater Transfer Efficiency

The 1.0 tpd reduction from the Spray gun efficiency requirements assumes a first phase would incorporate the laser targeted technology, commercially proven to reduce coating usage by 30%. The second phase of incorporating transfer efficiency requirement of 65% may potentially reduce coating usage by up to an additional 30%. ACA requests additional information on the assumptions used to develop the 1.0 tpd estimate, since ACA seriously questions whether the use of laser technology or more efficient spray guns will result in 1.0 tpd of reductions. The District should ensure its emission reductions estimates are realistic before incorporating an arbitrary figure into the AQMP.

ACA is concerned the District's reduction estimates are overly optimistic and we do not believe either the laser technology nor a more efficient spray guns will result in a 30% reduction in coating usage. Spray application of coatings on large flat buildings is drastically different than spraying small odd shaped parts – there is very little over spray associated with spraying buildings. The District should not rely on estimated reductions based on spray booth applications when calculating the potential reductions for architectural coatings applications. Further, since architectural coating contractors already have a financial incentive to reduce coating usage, it is very unlikely that increased gun efficiency will reduce coatings usage by 30%. ACA requests background information the District used to estimate the 30% reduction so that we can adequately comment on this issue.

P-18

Reducing VOC Emissions in South Coast will Not Reduce Ozone

ACA Comments – South Coast Draft 2012 AQMP

August 31, 2012

ACA is concerned that SCAQMD is neglecting to adequately consider the science-based fact that ozone formation in the SCAQMD region is ultimately limited by nitrogen oxides (NOx), or is NOx-limited. The District concluded in the 2007 AQMP that major reductions in emissions of oxides of sulfur (SOx), particulate matter less than 2.5 microns (PM2.5) and NOx are necessary to attain the air quality standards for ozone and particulate matter by the dates mandated by federal law. Less emphasis is placed on emission reductions of VOCs because of the greater emphasis on NOx emission reductions, which is a precursor to both ozone and PM. ACA suggests the District go even further in the 2012 AQMP and provide more background discussions and modeling information on the benefits of NOx reductions as opposed to VOC reductions. Given this, the District should focus its efforts on adopting NOx reduction control measures, since VOC control measures will not have any impact on ozone attainment in the District.

P-19

Thank you for the opportunity to comment. If you have any questions or need any further information on the issues discussed here, please feel free to contact me at (202) 462-6272.

Sincerely,

Attachment B (June 13, 2012 ACA Comments)

June 13, 2012

Dr. Philip Fine and Joe Cassmassi
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

RE: SCAQMD 2012 Air Quality Management Plan (AQMP) Advisory Group
Meeting #9 – Control Measure Concepts; ACA Comments

Dear Dr. Fine and Mr. Cassmassi:

ACA Comments – South Coast Draft 2012 AQMP

August 31, 2012

The American Coatings Association (ACA) submits the following initial comments on CTS-01 *Further Emission Reduction from Architectural Coatings (Rule 1113)* that were presented at the May 17, 2012 Air Quality Management Plan (AQMP) Advisory Group Meeting.

Architectural and Industrial Maintenance (AIM) Coatings Inventory

ACA wants to assure that appropriate inventory credit is given for the significant reductions already achieved in mass and reactivity of VOC emissions from architectural coatings, and additional reductions to come from requirements for colorants, VOC limit reductions and thinning/cleaning solvents.

SCAQMD should fully explain any discrepancies or changes to the architectural and industrial maintenance (AIM) coatings inventory. At the May AQMP meeting, staff released a preliminary draft AIM inventory of 26.16 tpd for 2008, 22.87 tpd for 2014, and 24.72 tpd for 2023. Recent revised information suggests the inventory for 2008 is now 21.9 tpd (16.1 tpd for AIM coatings; 2.8 tpd for thinning/ cleaning/additives; and 3.1 tpd for colorants). ACA requests additional information on what the 2.8 tpd for thinning, cleaning and additives includes. ACA has also requested additional information on the 2014 inventory. ACA suggests the estimated 2014 inventory is too high, considering the 2011 Rule 1113 Staff Report where the District estimated the 2009 inventory to be as low as 11.6 tpd. Assuming the 2009 and 2014 inventories are similar (11.6 tpd), the original 2014 estimate of 22.87 tpd may be as much as two times too large. Instead of accounting for 22% of the AIM inventory, the proposed CTS-01 would instead account for nearly 43% of the AIM inventory.

ACA suggests the District develop an AQMP strategy that relates development/implementation of CTS-01 to future AIM emissions. If for example the District is able to document (via Rule 314) that the AIM emissions in 2012 are less than say 12 tpd (hypothetical number), then the District would not need to develop/implement CTS-01, since the District could take credit for the reductions in Rule 314. If on the other hand, the AIM emissions in 2012 are more than 12 tpd, then the District would develop and implement CTS-01 to reduce the industry emissions to below 12 tpd. Another benefit of this option is that it resolves District concern that the recent inventory reductions are economy related (i.e. the emissions will increase once the economy improves).

AIM VOC Reduction Estimate

ACA assumes that the 4-5 tons per day in CTS-01 will come from reductions from the recent Rule 1143 (9.75 tpd) and Rule 1113 amendments (4.4 tpd) since the estimated a 4-5 tpd reduction from CTS-01 is too large based on the associated CTS-01 synopsis. In comparison, the 2011 Rule 1113 amendments resulted in estimated reductions of 4.4 tpd, which included VOC limit reductions for 11 categories (0.4 tpd), changes/phase-out of the averaging provision (1.2 tpd) and limits on colorants (2.8 tpd). ACA requests further details on the estimated CTS-01 reductions, since ACA is concerned that the reductions detailed in the synopsis will not result in 4-5 tpd of reductions, therefore the District will be forced to lower VOC limits for other coatings categories.

Further, similar to our comments on the 2007 AQMP (letter dated December 7, 2006), ACA is concerned that if these extreme and unproven reductions are approved, the industry will be

16

forced to achieve the VOC targets regardless of whether the CTS-01 control measures are technologically feasible. As ACA commented in the past, we are concerned that once these reduction estimates are approved in the AQMP and the State Implementation Plan, the District may sidestep the technical concerns claiming that it has no choice since the reductions are “locked” into the Plan/SIP. Given this significant concern, the Plan should clearly state that any specific numeric goals or targets are subject to the District’s statutory authority to regulate non-mobile sources and may be adjusted in the future based on technological feasibility analyses.

CTS-01 Control Measure Technological Concerns

ACA is currently reviewing the potential control measure concepts in CTS-01, however ACA offers the following initial comments:

1. Reduce VOC Emissions from Flat, Nonflat and Primer, Sealer, Undercoaters (PSU)

ACA is concerned that limits lower than 50 g/l (flat and nonflat) and 100 g/l (PSU’s) may be difficult given the current problems associated with VOC test methods. In addition, ACA suggests the District complete a technology assessment to be sure that it is technologically feasible to lower the VOC limits, especially since certain products need to be kept at the current limits. See attached ACA comments dated 2/4/2011.

2. Small Container Exemption

ACA is concerned that eliminating the small container exemption, or eliminating the exemption for certain categories is problematic since the small container exemption is critical given the fact that the SCAQMD Rule 1113 limits are the most stringent in the US. This exemption provides a “safety valve” or a last resort option that allows for traditional products in problem situations when the limits in categories become more stringent or a category is eliminated. There are also a host of niche coatings that manufacturers can now sell in small containers that would need to be categorized if the small container exemption is modified or removed. See attached ACA comments dated 2/4/2011.

3. Application Techniques with Greater Transfer Efficiency

ACA is concerned the District is imposing transfer efficiency requirements on equipment used to apply AIM coatings. With regards to the laser paint targeting system, ACA is concerned that the system is sold exclusively by Iowa University and has not been widely distributed throughout the US. While this technology may be useful for training contractors to properly apply coatings in an automotive refinish shop under controlled conditions, this technology may not be applicable to field applied coatings. As such, ACA is concerned that it may be difficult for the District to document and receive SIP credit for increased efficiency from the use of this technology. Further, this equipment is expensive – approximately \$100 per unit (not including replacement of the lithium battery that has a tested average life of only 20 hours). Also, ACA is concerned that this technology was designed for auto refinish coatings shops, and it may not work on AIM spray equipment that is used in the field (large areas, use of wands, rough texture substrates, sunny locations). Finally, it’s unclear whether these units can be properly cleaned.

ACA Comments – South Coast Draft 2012 AQMP

August 31, 2012

ACA is also concerned that if the laser paint targeting system control measure is abandoned for some reason the District will be forced to impose the 65% efficiency requirements for all AIM spray equipment, which is problematic.

Lack of Technological or Economic Assessment

ACA is also generally concerned with the absence of the following in the AQMP:

- (1) No assessment of technological or economic feasibility of the proposals, which may amount to pointless bans on useful products.
- (2) No assessment of potentially significant unintended adverse environmental impacts from either (a) substitution of inadequate alternatives, or (b) lack of adequate protective maintenance painting.
- (3) No demonstration that further reductions in VOC emissions from architectural coatings would be necessary or helpful in achieving ozone attainment under the increasingly NO_x-limited conditions of the South Coast Air Basin.

Thank you for the opportunity to comment. If you have any questions or need any further information on the issues discussed here, please feel free to contact me at (202) 462-6272.

Sincerely,

/s/

David Darling, P.E.
Director, Environmental Affairs

The following is a copy of comment letter received for the 2007 AQMP, responses can be found at: http://www.aqmd.gov/aqmp/07aqmp/07AQMP_modified.html.

Attachment C (December 7, 2006 Comments)

December 7, 2006

Mr. Joseph Cassmassi
Manager Planning, Rule Development and Area Sources SCAQMD
21865 Copley Drive
Diamond Bar, CA 91765-4182

RE: 2007 Air Quality Management Plan (AQMP); NPCA Comments

Dear Mr. Cassmassi,

NPCA³ is pleased to submit the following initial comments on the SCAQMD Preliminary Draft 2007 AQMP.

The Draft AQMP appears to recognize that additional mass-based VOC reductions, beyond those already required by the limits SCAQMD has previously imposed on architectural and industrial maintenance coatings are not feasible based on currently available technology. NPCA agrees that the 56 ton reduction in emissions that SCAQMD expects to achieve from AIM coatings and other solvents must remain in the "black box" reactivity-based controls as proposed (as CM #2007LTM-01) for Architectural Coatings, Miscellaneous Coatings and Solvents, and Consumer Products, and as to other potential "advanced technologies" discussed in the Draft AQMP. NPCA is greatly concerned that if this extreme and unproven reduction target is adopted by the SCAQMD Board as a short- or mid-term control measure of the AQMP, and approved as part of the California SIP by ARB and EPA, the industry will be arbitrarily "locked" into achieving the target whether or not it is technologically possible -- in which case the regulation becomes a wholesale ban on architectural coatings. NPCA and the paint industry have been subject to other SIP-approved AQMP control measures in the past, and SCAQMD sidestepped technical concerns claiming it was "locked" into these measures through the SIP approval and enforcement process. On Page 4-63, the proposed SCAQMD plan itself notes that "reformulation based on lower reactive compounds need to be evaluated and considered" and does not know what additional reductions are actually achievable. NPCA does not want to see this happen again with the 2007 AQMP. Given this concern, NPCA recommends that a specific numerical goal not be set until technical feasibility issues are carefully examined.

NPCA recognizes that the technological and economic feasibility of the proposed "black box" measure cannot be fully assessed at this time. However, NPCA believes it is critical that it be documented that any specific numerical "goal or target" can be adjusted in the future based on technological and economic feasibility findings. If this long-term "black box" measure is adopted, NPCA is prepared to work with the District in ensuring that any future emissions rulemakings implementing the control measure be technologically and commercially feasible.

We note that the control measure proposes to require that paints be reformulated with "50 percent minimum by volume acetone reactivity-equivalent materials by 2015." The main problem with this is that while industry has long advocated consideration of reactivity-based limits for architectural coatings, no reactivity-based regulation exists today, nor is it yet understood how much, if any, *additional* reduction in ozone-formation potential may be possible by means of a reactivity-based rule. We believe that, to set an extreme goal of 50 percent reduction without any technical basis to assure feasibility is unwarranted.

At the November 16th SCAQMD Public Workshop, NPCA requested information on how the control measure reduction target was selected. SCAQMD staff responded by saying that the

³ NPCA is a voluntary, nonprofit trade association representing some 350 manufacturers of paints, coatings, adhesives, sealants, and caulks, raw materials suppliers to the industry, and product distributors. As the preeminent organization representing the coatings industry in the United States, NPCA's primary role is to serve as ally and advocate on legislative, regulatory and judicial issues at the federal, state, and local levels. In addition, NPCA provides members with such services as research and technical information, statistical management information, legal guidance, and community service project support.

ACA Comments – South Coast Draft 2012 AQMP

August 31, 2012

target had no technical basis other than the district's own computer modeling estimates as to what degree of VOC reduction would be needed to project attainment of the ozone standard. We note that § 182(e)(5) of the Clean Air Act requires the District to identify enforceable contingency measures if a "black box" control measure is ultimately incapable of achieving the proposed reductions. LTM-01 states that the proposed 56 ton emission reductions would be achieved through mass-based limits if reactivity is not feasible. It is not clear whether SCAQMD intends that mass-based reductions are to be the contingency measure, should reactivity-based controls be insufficient to achieve the reductions. Since the current mass-based limits for architectural coatings in the SCAQMD are already so low, NPCA believes that further reductions to such an extreme degree will not be possible via reactivity nor mass-based limits, and the entire control measure, whether the reductions are based on limits on VOC reactivity, or VOC mass, must remain in the "black box," and specific contingency measures be proposed if such reductions are not achievable.

In addition, NPCA is concerned that SCAQMD is not giving adequate consideration to the science-based fact that ozone formation is ultimately NOx-limited. As such, with sufficient NOx reductions, VOC control will not further contribute to attainment of the ozone standard.

Finally, NPCA supports SCAQMD suggestion (page 4-50) that additional reactivity research is necessary especially for the magnitude of reductions suggested by SCAQMD. NPCA also suggests that SCAQMD incorporate atmospheric availability in its inventory assessment - since the current assumption that 100% of solvents in coatings are available for ozone formation is not accurate.

Thank you for your consideration of our comments.

Sincerely,

/s/

David F. Darling, P.E.,
Director, Environmental Affairs

Responses to Comment Letter P
ACA

Response to Comment P-1:

Staff acknowledges that the architectural coatings industry has made great strides in lowering the VOC emissions from architectural coatings. Even with these reduced emissions, this category is one of the largest sources of VOC emissions under the AQMD's regulatory purview. Staff continues to look at all sources of emission for further reductions and is not seeking to focus solely on the architectural coatings manufacturers.

The reporting pursuant to Rule 314 – Fees for Architectural Coatings indicates that many coatings manufacturers are formulating coatings well below the current VOC limits. While the AQMD is unable to seek SIP credit for the lower emissions as a result of Rule 314 expected in the future due to the fact that the rule does not include enforceable caps that limit emission on a permanent basis, the 2008 baseline in the AQMP is based on the Rule 314 data so it does reflect the lower emissions in the inventory.

The Clean Coatings Certification Program (CTS-02 from the 2007 AQMP), was not implemented and did not include any SIP reductions. The control measure did discuss the concept for seeking SIP credit for reductions due to promoting the use of certified ultra-low VOC coatings. Manufacturers have reported ultra-low VOC coatings under Rule 314, but any emission reductions from those ultra-low VOC coatings are not enforceable and permanent because manufacturers have the ability to increase the VOC content of coatings up to the applicable VOC limits in Rule 1113, depending on a shift in market demand. Therefore, these emissions reductions cannot be considered permanent or enforceable, two of the four key parameters necessary for SIP emission reductions to be credited on a forward looking basis.

The long term strategy achieves attainment of the ozone standards at all the air quality monitoring stations throughout the Basin by 2023. Modeling analysis shows that significant NOx emissions reductions are the only viable path to attain the 8-hour ozone standards in the Basin. Therefore, the ozone strategy focuses primarily on NOx reductions. However, VOC emissions reductions can also be cost-effective in progressing towards attainment of the ozone standards, especially in the western portions of the Basin. Furthermore, there is a significant health benefit to meeting the ozone standards as soon as possible in as many areas of the Basin as possible. While the current 8-hour ozone design value site is at Crestline in the San Bernardino Mountains, projections in 2023 show that the design value site will be at Glendora in the San Gabriel Valley to the west. As shown in the 2023 baseline 8-hour ozone NOx/VOC isopleths for Glendora and other western sites presented in the attachment to

Appendix V, VOC reductions will help to lower ozone concentrations in the San Gabriel Valley and Western portions of the Basin. This is true near the level of the 8-hour ozone standards, but is even more significant along the path to attainment. This is due to the higher VOC/NO_x ratios projected to occur in future years, especially in the western Basin.

To this end, short-term VOC controls (through 2020) will help offset the impact of the increased VOC/NO_x ratio in the impacted areas of the Basin, such as the San Gabriel Valley, that are immediately downwind of the primary emissions source areas. As such, a nominal amount of VOC reductions are proposed in the Draft 2012 AQMP. The proposed VOC control measures in the Plan are based on implementing all feasible control measures through the application of available technologies and best management practices, while seeking a fair share reduction from both mobile and stationary sources. As zero and near-zero technologies are implemented for mobile sources to reduce NO_x emissions, concurrent VOC reductions from mobile sources are expected. Thus, stationary sources must continue to achieve their fair share of VOC reductions in the future. This plan proposes a modest 6 tpd of VOC emissions reductions out of a total 21 tpd of VOC reductions needed for basin-wide attainment in 2023.

Response to Comment P-2:

Again, staff concurs that the coatings industry has made great strides in lowering the VOC emissions from architectural coatings. Staff agrees that this may in part be attributed to market demands, as well as the financial incentives in Rule 314. However, staff notes that majority of the emissions reductions achieved are the result of three main phases of amendments to Rule 1113 – Architectural Coatings (previously included in the AQMP) that took place over a 12 year period, often with litigation from the architectural coatings industry.

While staff is not taking forward looking SIP credit for the coatings that are sold below the current VOC limits, the baseline VOC emission inventory will reflect those lower VOC coatings. With the adoption of Rule 314, the inventory is more accurate as the estimates are based on the coating sold into and within the AQMD as reported by the manufacturers on an annual basis. Prior to 2008, the AQMP relied on data collected by CARB for coatings sold throughout California which were reported every 4 – 5 years. The inclusion of Rule 314 data ensures that the emission inventory included for planning purposes is current.

Many factors contribute to the significant emissions reductions that have been achieved in architectural coatings, including implementation of Rule 314. However, staff is unable to attribute quantifiable emission reductions or the 10 tons of reductions mentioned in the comment to Rule 314. In addition to the strides the manufacturers have shown in lowering the VOCs, and the change to incorporate Rule 314 data to

calculate the emissions inventory, the industry experienced a large compression due to the economic recession. However, the VOC reductions achieved from the recessionary sales of architectural coatings are not permanent. Moreover, manufacturers have the ability to increase the VOC content of coatings up to the applicable VOC limits in Rule 1113, depending on a shift in market demand. Therefore, these emissions reductions cannot be considered permanent or enforceable, two of the four key parameters necessary for SIP emission reductions to be calculated on a forward looking basis.

Staff concurs with the costs associated with Rule 1113 amendments and Proposed Amended Rule 1107. However, staff is unable to determine how the ACA estimated the cost of \$41.4 million for the implementation of Rule 1143. The March 6, 2009 staff report estimated the annualized cost at approximately \$12 million. Staff is also unclear how the ACA estimated the cost of \$13.65 million for implementing Rule 314. Since Rule 314 implementation starting in CY-2009, the AQMD has received a total of less than \$8 million over four years, well below the projected revenue of \$14.5 million.

While the district agrees that passenger cars, off-road equipment, light duty trucks, etc. need to be considered in the overall control strategy for meeting the federal and state requirements, architectural coatings and low vapor pressure solvents found in consumer products also need consideration for additional control. Even with the lower emission baseline for 2008, architectural coatings remain the highest source of VOC emissions under the AQMD's current regulatory authority.

Staff agrees that the fee program may provide some incentive for formulation of lower VOC coatings, which was one of the goals of implementing Rule 314 and including the fee exemption for coatings that are less than 5 g/L of material. The benefits of those lower-VOC coatings cannot be quantified and credited on a forward looking basis because they cannot be considered permanent or enforceable. To the extent, however, the emission reductions currently experienced as a result of Rule 314 and other factors, reflect a permanent trend in future emission inventories, such reductions can play a role in shaping the scope of future amendments to the architectural coatings program.

Response to Comment P-3:

For comments regarding the need for further VOC reductions, please see response to comment P-1.

As staff works to implement CTS-01, they will work with stakeholders to ensure future limits are technically feasible and cost effective. Instead of including a hard target for the projected VOC emission reductions, staff included a range of reductions in CTS-01 (2 -4 tpd) and has yet to quantify the potential reductions in CTS-04.

Response to Comment P-4:

Staff has investigated the source of the discrepancy in the emission numbers between the table in CTS-01 and chapter 3 Appendix III and the necessary corrections have been made in the Final 2012 AQMP.

Staff is encouraged to see that while the volume of architectural coatings has increased, the emissions have remained relatively flat. Staff would like to see this trend continue. It is not likely that emissions will increase to the levels they were in 2008 in the near future, largely because the VOC limits in Rule 1113 have decreased since 2008. But as the housing market recovers and coating sales continue to rise, the VOC emissions from the application of architectural coatings will inevitably increase, albeit not potentially at same rate as previously seen. Due to the adoption of Rule 314, staff will be able to monitor the emissions on an annual basis.

Response to Comment P-5:

CTS-01 lists the potential emission reductions for lowering the VOC limit for flat, non-flat and primer, sealer, undercoater categories as “up to” 1.7 tpd, it is not a hard target of 1.7 tpd. Further, the table lists the total VOC reductions for architectural coatings as a range between 2 – 4 tpd. Staff notes that the lower end of the range will be submitted into the SIP and individual strategy targets will not be placed in the SIP.

Staff agrees that improvements in VOC test method, and/or a change in the metric to VOC of material will likely be necessary to implement a 25 g/L VOC limit, as proposed. Staff will work with industry, the U.S. EPA, CARB and academia in an effort to incorporate an improved test method.

Response to Comment P-6:

Staff does not agree that this exemption is a necessary safety valve for the VOC limits in Rule 1113. Aside from a few niche categories or new categories that may be necessary, there are ample products available in the marketplace that meets the VOC limits in Rule 1113. Staff is mindful, however, of the usefulness of the small container exemption to manufacturers and end users, especially for niche products, as well as repair, touch-up and maintenance. As part of the rule development process, staff will consider all options in regard to the small container exemption, including creating small volume categories with higher VOC limits if necessary.

The control measure states that the elimination of the small container exemption may potentially reduce VOC emissions by “up to” 1.9 tpd; it is not a hard target of 1.9 tpd. The estimates for individual strategies relative to the architectural coatings will not be included in the SIP.

Response to Comment P-7:

Please note that even though multiple rules are listed in the control measure, its scope and emission reduction commitment is fairly modest. The objective of the control measure is to be achieved by focusing on a few select coating/product categories of a few rules and not through a wholesale or across the board lowering of VOC limits. Staff has revised the language of CTS-02 to specifically to identify the four main rules that have been targeted for emission reduction potential. Rules 1124, 1144, 1168, 1171 include certain product categories, as indicated in the control measure source category description, that are being considered, including coatings used in aerospace applications, adhesives used in a variety of sealing applications, solvents usage, cleaning or graffiti abatement activities, and lubricants used as metalworking fluids to reduce heat and friction to prolong life of the tool, improve product quality and carry away debris. Staff agrees that the marine and pleasure craft coatings activities in the District do not currently represent a significant portion of emissions or emission reduction potential. As such, specific reference to Rule 1106, 1106.1, as well as to the other two rules identified in the draft control measure have been removed to indicate that the estimated emission reductions do not rely upon rule amendments in those areas.

The District remains committed to considering all miscellaneous coatings, adhesives, solvents and lubricant categories for incorporation as feasible measures as required by the Clean Air Act Section 172(c)(1); however, the extent such measures are available and technologically and economically feasible to implement in the aforementioned non-specified rules is expected to be limited as reflected in the revised language.

Response to Comment P-8:

Please see response to comment P-1.

CTS-04 represents potentially one of the largest VOC emission source categories. VOC emissions from consumer products are projected in 2020 to be the largest source of emissions in the district exceeding light duty passenger vehicles and dwarfing emissions from stationary sources such as coatings and petroleum marketing. As such, it is incumbent on the AQMD to investigate all areas for potential emission reductions, including evaluation of any existing regulatory exemptions or exclusions.

Current USEPA, CARB and AQMD emissions inventory and photochemical air quality models include speciation profiles that account for total organic gases (TOGs), including reactive compounds, unreactive and exempt compounds, as well as LVP-VOC compounds. Model results for ozone non-attainment areas have demonstrated that even compounds with low photochemical reactivity or LVP-VOCs contribute to photochemical ozone formation and not including these would compromise the ozone attainment demonstrations. Staff recognizes that some multi-media models that incorporate partitioning concepts such as “Atmospheric Availability” or

“Environmental Fate” may have been recently developed; however, current peer-reviewed ambient ozone models used by CARB and AQMD do not include such partitioning concepts. District staff will continue to work with USEPA and CARB staff on ozone model improvements, especially if additional peer-reviewed environmental fate and atmospheric availability studies justify incorporation into these predictive models.

Because substitution of traditional VOC containing materials indicates an increased use of LVP-VOCs, a review of the specific and extent of LVP-VOCs utilized and the associated applications is required to ensure that VOC emission reductions and ozone reduction benefits are maintained as originally intended. Following a study, “Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds”, U. Vø and M. Morris, August 2012

(<http://www.aqmd.gov/prdas/Coatings/VOCs/RedefiningVOCs.pdf>), that indicates that some LVP-VOCs can evaporate nearly as rapidly as other VOC materials, AQMD staff believes that additional review of specific materials and applications and the associated LVP-VOC qualification criteria may help identify air quality improvement opportunities.

The proposed control measure is intended to further study the air quality improvement potential for replacing LVP-VOC containing compositions with alternative low VOC formulations. The AQMD, through the implementation of the Clean Air Cleaners Program and Rule 1143 – Consumer Paint Thinners and Multi-Purpose Solvents, has identified alternative low-VOC, cost-effective technologies that are currently commercially available and used that do not rely upon the LVP-VOC exemption. The proposed control measure may involve eliminating or amending the CARB LVP-VOC criteria based on scientific data, which may include MIR and similar photochemical reactivity parameters. Consultation with external stakeholders including technical experts as well as manufacturers, end users and other concerned interests is expected during the rule development process to ensure overall efforts are feasible, productive and cost-effective. Further, the control measure includes requirements for CARB to collect speciated LVP-VOC data by category as a part of future surveys. This information will assist CARB and AQMD, as well as industry, in identifying additional categories that have the types and greatest LVP-VOC penetration, and result in more focused changes to the LVP-VOC exemption.

Response to Comment P-9:

AQMD staff agrees that the 2012 AQMP development schedule was initially compressed. The attainment demonstration modeling could not begin until input data from SCAG’s 2012 RTP and CARB’s emissions inventories were available. AQMD staff has made every effort to provide all data and information to the public as soon as it became available in an open and transparent process. The review period for many of

the documents has also been extended, additional workshops and regional public hearings have been added scheduled for November 13 - 15, and the Governing Board adoption hearing date has been delayed to December. The AQMD staff is committed to providing sufficient time for public comment, and continues the enhanced outreach efforts to all stakeholders, while keeping the U.S. EPA submittal deadline in December of 2012 in mind.

Response to Comment P-10:

The recent VOC reductions achieved in Rules 1113 and 1143 have been accounted for in the VOC inventories included in the 2012 AQMP. The following table summarizes the reductions and full implementation dates:

	2008 Emissions (tpd)	2014 Reduction (tpd)	2015 Reduction (tpd)
Architectural Coatings	16.1	1.3	0.3
Solvents (Thinning/Cleaning/Additives)	2.8	2.66	
Colorants	3.0	2.8	
Total	21.9	6.76	0.3

Draft control measure CTS-01 also summarizes VOC inventories for 2019 and 2023, which includes the earlier VOC reductions but include a growth factor to account for increased coatings usage due to population growth.

As staff works to implement CTS-01, staff will work with stakeholders to ensure future limits are technically feasible and cost effective. Instead of including a hard target for the projected VOC emission reductions, staff included a range of reductions in CTS-01 (2 -4 tpd) and has yet to quantify the potential reductions in CTS-04.

Staff acknowledges that the VOC reductions achieved surpass the commitments in the 2007 AQMP. However, modeling shows the need for modest VOC reductions, and the ozone levels are affected by an atmospheric ratio of VOC to NOx. The long term strategy achieves attainment of the ozone standards at all the air quality monitoring stations throughout the Basin by 2023. Modeling analysis shows that significant NOx emissions reductions are the only viable path to attain the 8-hour ozone standards in the Basin. Therefore, the ozone strategy focuses primarily on NOx reductions. However, aggressive NOx reductions can increase ozone levels in the western portions of the Basin. VOC emissions reductions can also be cost-effective in progressing towards attainment of the ozone standards, especially in the western portions of the Basin. Furthermore, there is a significant health benefit to meeting the ozone standards as soon as possible in as many areas of the Basin as possible. While the current 8-hour ozone

design value site is at Crestline in the San Bernardino Mountains, projections in 2023 show that the design value site will be at Glendora in the San Gabriel Valley to the west. As shown in the 2023 baseline 8-hour ozone NO_x/VOC isopleths for Glendora and other western sites presented in the attachment to Appendix V, VOC reductions will help to lower ozone concentrations in the San Gabriel Valley and Western portions of the Basin. This is true near the level of the 8-hour ozone standards, but is even more significant along the path to attainment. This is due to the higher VOC/NO_x ratios projected to occur in future years, especially in the western Basin.

To this end, short-term VOC controls (through 2020) will help offset the impact of the increased VOC/NO_x ratio in the impacted areas of the Basin, such as the San Gabriel Valley, that are immediately downwind of the primary emissions source areas. As such, a nominal amount of VOC reductions are proposed in the Draft 2012 AQMP. The proposed VOC control measures in the Plan are based on implementing all feasible control measures through the application of available technologies and best management practices, while seeking a fair share reduction from both mobile and stationary sources. As zero and near-zero technologies are implemented for mobile sources to reduce NO_x emissions, concurrent VOC reductions from mobile sources are expected. Thus, stationary sources must continue to achieve their fair share of VOC reductions in the future. This plan proposes a modest 6 tpd of VOC emissions reductions from stationary sources out of a total 18 tpd of VOC reductions needed for basin-wide attainment in 2023.

Since the submittal of this comment letter, the inventory and anticipated emission reductions have been modified. In 2023, the VOC inventory is estimated to be 19.3 tpd and the projected reductions from CTS-01 are 4.4 tpd. Thus, the VOC reductions will be much less than 40% of the inventory. The initial draft control measure CTS-01 has been revised, listing the VOC reductions as a range between 2 – 4 tpd. Staff further notes that the lower end of the range will be submitted into the SIP. Staff believes that the proposed control measure is technically feasible, and staff will conduct a thorough technology assessment a part of a public rule amendment process.

Response to Comment P-11:

Staff acknowledges that using the most accurate and currently available VOC inventory is vital when considering VOC reductions. With the adoption of Rule 314 in 2008, the 2008 and subsequent inventory is more accurate as the estimates are based on the coating sold into and within the AQMD as reported by the manufacturers on an annual basis. Prior to 2008, the AQMP relied on data collected by CARB for coatings sold throughout California which were reported every 4 – 5 years. The inclusion of Rule 314 data ensures that the emission inventory included for planning purposes is current. The differences in the inventory data that was released in the preliminary draft and prior meeting on the AQMP included references to the earlier estimates based on the older

CARB survey data. Those discrepancies have been addressed and the current inventory estimates and projections are based on the Rule 314 data and include the recent VOC reductions achieved through Rules 1113 and 1143. The following table summarizes the projected emission trends:

	2008	Rule reductions by 2014	2014	Rule reductions by 2015	2019	2023
Inventory	21.9		15.8		17.5	19.3
Reductions					2.0 – 4.0	2.2 – 4.4
Remaining					13.5 – 15.5	14.9 – 17.1
Rule Reductions		6.76		0.3		

Staff is encouraged to see that while the volume of architectural coatings has increased, the emissions have remained relatively flat. Staff would like to see this trend continue. It is not likely that emissions will increase to the levels they were in 2008 in the near future, largely because the VOC limits in Rule 1113 have decreased since 2008. But as the housing market recovers and coating sales continue to rise, the VOC emissions from the application of architectural coatings will inevitably increase, albeit not potentially at same rate as previously seen. Due to the adoption of Rule 314, staff will be able to monitor the emissions on an annual basis.

Response to Comment P-12:

Please see response to comment P-10.

Response to Comment P-13:

Staff originally estimated that draft CTS-01 may potentially achieve VOC reductions of 4.4 tpd. Based on the concern and subsequent discussions with the industry, CTS-01 has been revised to reflect potential emission reductions ranging from 2-4 tpd, with 2 tpd to be included in the SIP, which is technically feasible based on currently available technology. Developing a VOC cap for architectural coatings is an interesting suggestion, but even with the suggested 12 tpd target, architectural coatings remain the highest source of VOC emissions under the AQMD’s current regulatory authority, and the AQMD is obligated to evaluate each and every feasible approach toward attaining the ozone standards.

Response to Comment P-14:

Based on the concern and subsequent discussions with the industry, CTS-01 has been revised to reflect potential emission reductions ranging from 2-4 tpd, with 2 tpd to be included in the SIP.

Response to Comment P-15:

CTS-01 has been revised to include a range of potential emission reductions from 2-4 tpd. As clearly demonstrated in previous rule amendments to Rule 1113, District staff will evaluate technical feasibility during the rule development process, working closely with the manufacturers on any specific rule proposals.

Response to Comment P-16:

Based on the concern and subsequent discussions with the industry, CTS-01 has been revised to reflect potential emission reductions ranging from 2-4 tpd, with 2 tpd to be included in the SIP. The range of potential emission reductions reflects the alternative options for each of the three strategies, including potentially creating subcategories from the large volume coating categories for certain niche uses, as necessary.

Staff agrees that an improved VOC test method is needed in order to achieve further VOC reductions. Draft CTS-01 includes a proposal to lower VOC limits in conjunction with the adoption of a gas chromatographic test method for more accurately measuring of VOC content, and a change of the metric from VOC of coating to VOC of material. In addition, staff plans to perform a technology assessment, in conjunction with the industry, as part of the rule amendment process.

Response to Comment P-17:

Based on the concern and subsequent discussions with the industry, CTS-01 has been revised to reflect potential emission reductions ranging from 2-4 tpd, with 2 tpd to be included in the SIP. The range of potential emission reductions reflects the possibility of carving out new, higher-VOC categories for niche uses.

Staff does not agree that the small container exemption is a necessary safety valve for the VOC limits in Rule 1113. As part of any rule development activities, staff will evaluate the need for any niche categories with higher VOC limits that may be necessary for certain small volume uses. However, based on a review of data submitted by manufacturers, there are ample products available in the market place that meet the VOC limits in Rule 1113.

The District has not yet attained compliance with national air quality standards, and has a continued need to evaluate all technically-feasible and cost-effective reductions for criteria pollutants, including VOCs. With consideration for potential more stringent ozone standards in the near future, it is vital to fully evaluate the need for any and all exemptions from VOC rules, including Rule 1113.

Response to Comment P-18:

Draft CTS-01 inclusion of transfer efficiency requirements focuses on application equipment, including the laser paint targeting tool, with data supporting an increase in transfer efficiency by 30%, and HVLP or equivalent technology, with data supporting 65% transfer efficiency. Staff took a conservative estimate ranging from 2% to 10% reduced coatings usage, which can potentially result in significant reductions in volume of coating used, estimated to be between 150,000 to 685,000 gallons annually.

Staff plans to conduct a thorough technical analysis, including evaluating cleaning and maintenance, during the rule development period.

Response to Comment P-19:

Please see response to comment P-10.

Subject: Draft 2012 Air Quality Management Plan (AQMP)

Dear Sir or Madam,

S. C. Johnson & Son, Inc. (SC Johnson) appreciates this opportunity to provide comments on the Draft 2012 Air Quality Management Plan (AQMP) released by the South Coast Air Quality Management District on July 19, 2012.

By way of background, SC Johnson is a family-owned and managed business dedicated to innovative, high-quality products, excellence in the workplace, and a long-term commitment to the environment and communities around the world in which it operates. Based in Racine, Wisconsin, our company is one of the world's leading manufacturers of household cleaning products and products for home storage, air care, shoe care, and insect control. Among the well-known leading brands we market in the U.S. are GLADE®, PLEDGE®, OFF!®, RAID®, SCRUBBING BUBBLES®, SHOUT®, WINDEX®, KIWI®, and ZIPLOC®. Founded 126 years ago, SC Johnson has more than \$9 billion in annual sales, employs approximately 13,000 people globally, and markets products in virtually every country in the world.

Our company takes very seriously our responsibility to act as the environmental steward of our products, thus we continuously seek to improve them, particularly relative to human health and environmental impact. This effort is driven in part by Greenlist™, our patented internal environmental classification program that institutionalizes a greener, more informed selection process that surpasses regulatory requirements and motivates our scientists and formulators to use raw materials and ingredients that are safer for consumers and better for the environment. Through Greenlist™, we strive to ensure that our products have the least impact on the environment, while also delivering the performance, efficacy, and other benefits that consumers have come to expect from our products – including essential public health benefits associated with our pest control products.

Working directly and through our trade association, the Consumer Specialty Products Association (CSPA), we have engaged the California Air Resources Board (CARB) over the years to develop and implement a number of regulatory proposals for consumer products that have resulted in significant reductions in emissions of volatile organic compounds (VOC). To date, these regulations have obtained more than 50% reductions in VOC emissions from consumer products – a significant accomplishment for state regulators and our industry, which remains committed to ensuring that consumer products provide maximum benefits and minimal environmental impacts in California and elsewhere. In fact, our

Q-1

Greenlist™ program helped us meet more stringent air quality regulatory requirements by removing 1.8 million pounds of VOCs from WINDEX® glass cleaner.

Along with continuously seeking to improve our product ingredient selections, SC Johnson also continues to work on advances for our packaging. In 2010, SC Johnson launched its first aerosol product in the U.S. utilizing compressed air as the propellant rather than liquefied petroleum gas (LPG), providing a quieter spray and softer feel without the VOCs typically associated with aerosols. Early products have included PLEDGE® Multi Surface Spray, GLADE® Premium Aerosols, and WINDEX® Electronics Cleaner, and we continue to explore ways to expand the use of compressed gas technology across our product categories.

While we will continue to innovate and develop products with lesser impact on human health and the environment, the transition to developing and marketing greener, more sustainable chemistries takes time, as manufacturers must engage in a variety of complex and often costly reformulation and related research and development activities to arrive at the desired end-use product. As this transition occurs, it will be vitally important for formulators like SC Johnson to have the flexibility to utilize existing limited exemptions and alternative compliance methods previously approved by CARB. Of particular importance is the continued availability to SC Johnson and other formulators of the current exemption for Low Vapor Pressure (LVP) compounds.

We are very concerned that South Coast has included CTS-04, Further VOC Reductions from Consumer Products [VOC], which calls for working with CARB to identify categories of consumer products where it may be appropriate to “revise or eliminate the LVP-VOC exemption,” in its Draft AQMP. In addition to supporting the arguments in defense of the LVP exemption that are articulated in comments submitted to South Coast in July and August of this year by CSPA, of which we are a member, we wish to highlight a few concerns specific to SC Johnson:

- SC Johnson has invested many years and significant resources reformulating our products utilizing LVP-VOCs, water and compressed air to replace VOCs to meet the increasingly lower VOC standards;
- Almost all of SC Johnson’s products contain LVP-VOCs. SC Johnson has several hundred products currently used in North American that have been optimally formulated to meet both consumer needs and VOC standards;
- Product efficacy would be severely affected causing consumers to use more of the product resulting in more emissions; and
- Unintended consequences are very likely to occur, including but not limited to having to reformulate with less ‘green’, more toxic, less tested, and corrosive substitutes to maintain product efficacy.

We also wish to highlight our concerns with a June 21, 2012, presentation entitled “Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds,” prepared by Mike Morris and Uyen-Uyen T. Vo of the SCAQMD staff that summarizes findings from a study on evaporation of LVP compounds, specifically:

- The study does not remotely approximate LVP usage in consumer products, and should not be used as a policy basis;

Q-1

Q-2

- The authors do not specify what they mean by non-volatile, semi-volatile, and volatile. Thus, they fail to establish the million-dollar correlation: vapor pressure at 20°C (the current regulatory parameter) and evaporation. They do not seem to be even asking the right questions in this study;
- Many LVPs (such as in household cleaners) are exposed to the atmosphere for seconds, before they are wiped up and properly disposed of;
- LVPs do not usually exist as pure chemicals in consumer products. The mixing of chemicals (whether forming solutions, emulsions, or other blends) will affect the vapor pressure of the mixture as a whole, and thus, the ability of the mixture itself to evaporate. Additionally, what is in the mixture will affect the ability of individual molecules in the solution to evaporate. This has to do with relative strength or weakness of the intermolecular attraction;
- Use of hydrotreated distillates light, a complex mixture of higher and lower volatility chemicals, should not be used as representative of a process that has properly classified most LVP chemicals; and
- The presentation at best indicates that a check of potential marginal LVP materials may be prudent, but does not demonstrate that the majority of classified materials are already appropriately classified.

Q-2

For the reasons stated in CSPA's comments and the concerns we have outlined above, SC Johnson respectfully requests that SCAQMD reconsider the inclusion of Control Measure CTS-04, which is aimed at requiring CARB to remove the LVP exemption from the Consumer Products Regulation, in the final South Coast Air Quality Management Plan.

SC Johnson greatly appreciates the opportunity to comment on the Draft 2012 AQMP. We look forward to working cooperatively and collaboratively with South Coast, CARB, and other relevant stakeholders to improve air quality for all California citizens. If you have any questions regarding our comments, please feel free to contact me directly at 202-331-1186 or by email at nrlevens@scj.com.

Sincerely,

Nancy R. Levenson
Director – Global Government Relations

Responses to Comment Letter Q
SC Johnson

Response to Comment Q-1:

Staff appreciates the efforts made by S.C. Johnson to reduce VOC emissions and advance packaging technology for consumer products. The AQMD is very supportive of the use of compressed air as a propellant in lieu of a VOC (e.g., LPG) and commends S.C. Johnson's role in successfully developing and commercializing such aerosol products. AQMD staff expects that CARB will leverage your technology into future regulatory requirements to further lower VOC emissions from Consumer Products offered in aerosol form.

The inclusion of LVP-VOCs as an exemption may be accomplishing the substitution of one solvent considered to be a VOC with another that is not considered a VOC by CARB. However, the AQMD has concerns regarding the associated equivalent ozone benefits of such an approach, since many of the LVP-VOCs readily evaporate, have Maximum Incremental Reactivity (MIRs) values greater than ethane's, and therefore readily contribute to ozone formation. ("Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds", U. Vö and M. Morris, August 2012.) While there will be potential need for reformulation of products that contain LVP-VOCs, the AQMD, through the implementation of the Certified Clean Air Cleaners Program and Rule 1143 – Consumer Paint Thinners and Multi-Purpose Solvents, has identified alternative low-VOC, cost-effective technologies that are currently commercially available and used, and do not rely upon the LVP-VOC exemption.

The Certified Clean Air Choices Cleaner program has nearly 50 institutional and industrial (I&I) cleaners that do not rely upon the LVP-VOC exemption. These products consist of full I&I product lines to cover nearly all cleaning and maintenance needs. Other certification programs have several hundred I&I cleaners, most of which do not rely upon the LVP-VOC exemption. If, in fact, there are specialty cleaning operations for which no product is available, then the regulations would likely be drafted to reflect the special situation by carving out those narrow uses. It is not reasonable to minimize ozone benefits by allowing blanket exemptions, such as the LVP-VOC exemption, when the vast majority of uses do not need such an exemption.

Except for very few niche applications where efficacy of certain products may be impacted from a complete exclusion of a LVP-VOC, for the great majority of operations, environmentally preferable cleaners have equal or superior performance at equal or lower costs. Many cities and school districts have completely switched to environmentally preferable janitorial products and have found no degradation in performance at no extra cost. In some cases, lower overall costs have been seen and included in the cost-effectiveness section of the control measure. The City of Santa Monica reported spending 5% less on its cleaning products costs when it switched from conventional

cleaners to less-toxic brands a decade ago. An article entitled, “The Benefits of Green Cleaning” by Dr. Robert W. Powitz on the ISSA website (November 2008), states, “We’ve heard the excuses, most of which can be grouped into one sentence: Eco-friendly products do not work and are more expensive. But this is simply not so.” The Green Seal and EcoLogo certification programs include efficacy performance standards to address claims in deterioration of performance. Again, Green Seal and EcoLogo have certified hundreds of I&I products most of which do not rely upon the LVP-VOC exemption.

Further, under AQMD Contract #11519, the AQMD conducted a study “Evaluate Protocols for Measuring Emissions from Cleaning of Application Equipment and Surfaces using Solvents” with an objective to develop an approach to measure mass emissions from cleaning paint brushes and surface cleaning using five different low vapor pressure (LVP) solvents, as well as acetone and a commercially-available lacquer thinner formulated with 95% acetone and 5% methyl soyate. The other objective was to determine the relative amount of solvent used, and then calculate the total ozone formation potential of each solvent based on its established Maximum Incremental Reactivity (MIR) value. The study indicated that ozone formation potential of acetone and acetone-containing products was much lower than comparative LVP-VOC solvents, especially for panel cleaning. The summary of this report can be accessed from:

http://www.aqmd.gov/tao/Demonstration/Reports/2011AnnualReport_2012PlanUpdate.pdf, pages C-25 to C-26. Contrary to the assertion that these products may degrade the environmental profile, many of the products that do not rely on the LVP-VOC exemption are specifically designed to meet stringent environmental profiles. Many are certified as environmentally preferred products through programs like Clean Air Choices Cleaners and U.S. EPA’s Design for the Environment or third party certification organizations like Green Seal and EcoLogo. When already environmentally preferable certified products were tested, less than ten percent relied on the LVP-VOC exemption to meet the VOC limits. See table below.

Environmentally Preferable Products VOC Content (No LVP-VOC Exemption)

Product Type	Dilution Rate	VOC (g/l)
Air Freshener	RTU	24
Bathroom Cleaner	RTU	19
Bathroom Cleaner	1:18	5
Bathroom Cleaner	1:20	2
Carpet Cleaner	1:20	1
Carpet Cleaner	1:64	1
Dishwashing Soap	1:1536	1
Disinfectant	1:64	1
Floor Polish	1:24	2
General Purpose Cleaner	1:10	1
General Purpose Cleaner	1:08	1
General Purpose Cleaner	1:64	1
General Purpose Cleaner	1:12	1
General Purpose Cleaner	1:15	1
General Purpose Cleaner	1:512	1
Glass and General Purpose Cleaner	RTU	1
Glass and General Purpose Cleaner	1:128	1
Glass and General Purpose Cleaner	1:128	1
Glass Cleaner	1:20	1
Glass Cleaner	1:64	1
Glass Cleaner	1:15	5

RTU = Ready to Use

Please note that CTS-04 does not include an emission reduction commitment nor does it necessarily require a complete elimination of the LVP-VOC exemption. Rather, it seeks the re-evaluation of the necessity, scope of the existing exemption LVP-VOCs are currently enjoying and the efficacy of such an exemption, starting first with consumer product categories where LVP-VOCs are widely used in formulations and proceeding in later phases with other categories.

Lastly, as a part of phased implementation, CARB staff is expected to assess the efficacy of different categories that may be impacted by modification of the LVP-VOC exemption proposed under Control Measure CTS-02.

Response to Comment Q-2:

A study, “Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds”, U. Vø and M. Morris, August 2012, tested commonly used LVP-VOC compounds and a few product blends, mainly lubricants of varying viscosity. There may be some difference in evaporation rates in fully formulated products, which needs additional review and may be part of future studies. However, many fully formulated products use significant quantities of LVP-VOC in their products, some as high as 100% as is the case with certain multi-purpose solvents. Currently, these LVP-VOCs are not included in emission calculations despite, in some cases, having similar evaporation rates as the VOC solvents they were meant to replace. As a part of implementation activities, CARB is expected to conduct detailed surveys of LVP-VOC content currently found in different categories of Consumer Products in an effort to develop a revised inventory and to understand potential additional impacts from the use of LVP-VOCs.

The presentation referred to by the commenter does include charts of solvents that fall under non-volatile, semi-volatile, and volatile. The full details are included in the technical paper available on the AQMD website which can be accessed from: <http://www.aqmd.gov/prdas/Coatings/VOCs/RedefiningVOCs.pdf>. The paper specifies the criteria used for determining volatility:

- Volatile – 5% or less non-volatile after 180 days at ambient temperature
- Semi-Volatile – Between 5% and 95% non-volatile after 180 days at ambient temperature
- Non-Volatile – 95% or greater non-volatile after 180 days at ambient temperature

The current LVP-VOC exemption does not distinguish between solvents that remain exposed to the atmosphere and those that are not (i.e. wiped and disposed or “down the drain”). In fact only a few (i.e. toilet/urinal cleaners, laundry products, hand soap, motor vehicle wash, shaving products) of the numerous product categories contained in the consumer product regulation are intended to be wiped and disposed or immediately washed down the drain. The majority (i.e. adhesives, air fresheners, automotive products, most cleaners, disinfectants, insect repellants and insecticides, lubricants, multi-purpose solvents and paint thinners) are intended to remain for long periods of time exposed to the atmosphere. Even if the products are wiped and disposed quickly or flushed down the drain, atmospheric availability or environmental fate criteria are not included in the LVP-VOC exemption nor current peer-reviewed ozone models. The LVP-VOCs may readily evaporate from the wiping cloth/paper, depending on storage of the solvent-laden materials, or may be released during the wastewater treatment process.

Hydrotreated light distillates qualify as an LVP-VOC as currently defined. Hydrotreated light distillates are used as an example, since these have been used as a 100% substitute in certain multi-purpose solvents, replacing petroleum distillates used in previous formulations. It was one of more than 20 samples tested to review evaporation profiles at ambient temperatures. (“Non-Volatile, Semi-Volatile, or Volatile: Redefining Volatile for Volatile Organic Compounds”, Uyên-Uyên T. Võ, August 2012). Many of the LVP-VOCs commonly used in consumer products were found to be completely volatile at ambient temperature in less than 180 days. However, the study also found that there were organic compounds that were non-volatile and likely do not contribute to ozone formation. Many of the environmentally preferable cleaning products use non-volatile organic compounds and are representative of a process that would properly classify them as LVP-VOCs.

Staff concurs that the study indicates that a check of potential marginal LVP materials may be prudent. The study recommends a reevaluation of the criteria which currently defines LVP-VOC status to exclude materials that clearly contribute to ozone formation. The study also recognizes that there are non-volatile organic compounds which do not evaporate under ambient conditions and are already appropriately classified. Taking the overall study into consideration, Control Measure CTS-04 calls for a phased in approach and would start with the most volatile and reactive compounds that may have the greatest emission impacts.
